EXISTING WASTE WATER TREATMENT INFRASTRUCTURE

STELLENBOSCH WWTW: The Stellenbosch WWTW is an activated sludge treatment plant that has a hydraulic design capacity of 35.000 Ml/d and an organic design capacity of 35 000 kg COD/d. The plant is classified as a Class A plant and include the following treatment processes.

- Inlet Works: Three mechanical front raked screens, two wash compactors with skips, three mechanical belt screens, odour treatment system, three vortex degritters with jet pumps, two grit classifiers with skips and inflow meter;
- Four rotating brush fine screens for MBR plant
- Activated Sludge Bioreactor (8 Ml/d capacity) with anaerobic zone (six mixers), anoxic zone (six mixers) and aeration zone (five aerators)
- Three Secondary Settling Tanks
- Membrane Biological Reactor (MBR, 27 Ml/d capacity) with two aeration zones (fine bubble diffused aeration), membranes and a de-aeration zone with two vertical axial downflow agitators.
- Aerobic digestor with four fix surface aerators and two floating aerators
- Disinfection UV system
- Sludge Management: Three Belt Presses

The plant discharges into the Veldwachters River, a tributary that flows into the lower reaches of the Eerste River.

Scada overview of inlet works

Inlet works: Three front-raked screens

MCC for inlet works.

Four rotating brush fine screens

ASP Reactor, anaerobic and anoxic zones

ASP Reactor, aerobic zone

Three Secondary Settling Tanks

MBR: Two aeration zones (Fine bubble diffused aeration)

MBR: Membranes

MBR: De-aeration zone

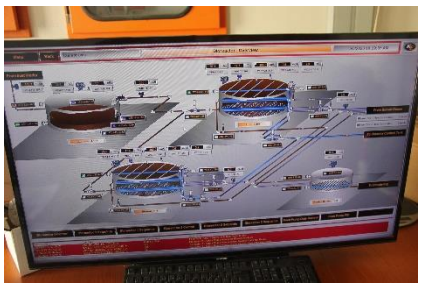
MBR: Sodium hypochlorite dosing

Disinfection UV System

Aerobic digestor with four aerators

Three Bellmer Winkelpresse Belt Presses

Laboratory with sampling equipment



An Aerial View of the Stellenbosch WWTW is indicated below.

Wemmershoek WWTW: The Wemmershoek WWTW utilises the innovative Nereda WWTW technology. The Wemmershoek WWTW was originally designed for a hydraulic capacity of 5.0 Ml/d, but due to design errors the current hydraulic capacity of the plant is only 3.6 Ml/d. The plant is classified as a Class C plant and include the following treatment processes.

- Inlet Works: Two mechanical front raked screens with Huber compactor, two vortex degritters, two mechanical fine screens, grit removal to skip and inflow meter;
- Raw feed tank;
- Two Sequencing Batch Reactors;
- Sludge Holding Tank;
- Disinfection with chlorine gas, chlorine contact channel and outflow meter;
- Sludge Management: Two Belt Presses

The plant discharges into the Wemmershoek River, a tributary that flows into the Berg River.

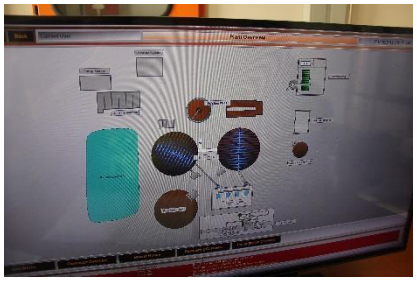
Scada overview of SBRs

Inlet Works with two mechanical front raked screens

Two final effluent irrigation pumps (Not in use)

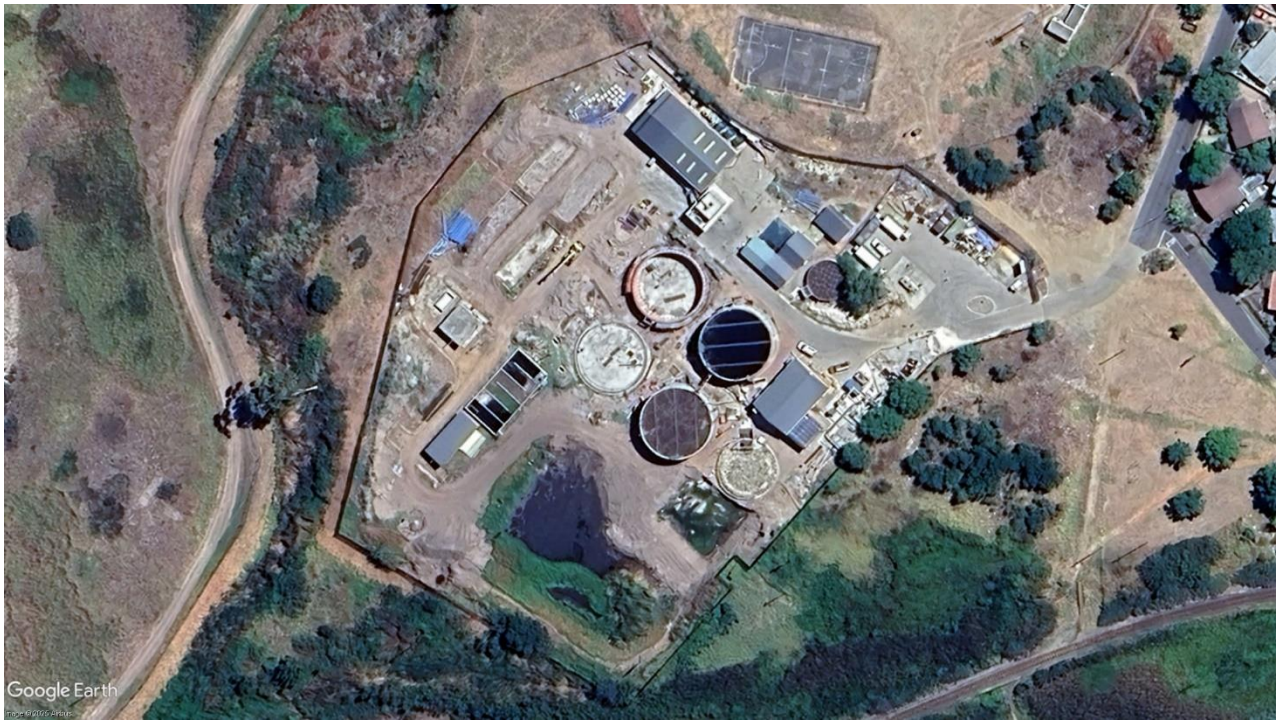
Sequencing Batch Reactor No.1

Sludge Holding Tank



Chlorine contact channels.

Disinfection: Chlorine cylinders



Two Bellmer WinkelPresse Belt Presses

SCADA overview of plant

An Aerial View of the Wemmershoek WWTW is indicated below.

Pniel WWTW: The Pniel WWTW is an activated sludge treatment plant that has a hydraulic design capacity of 4.5 Ml/d and an organic design capacity of 4 500 kg COD/d. The plant is classified as a Class C plant and include the following treatment processes.

- Inlet Works: Two mechanical front raked screens with Huber compactors, two vortex degritters and inflow meter;
- Activated Sludge Bioreactor: Anoxic basin (Two mixers), Anaerobic basin (Four mixers) and Aeration basin (Fine bubble diffused aeration);
- Two Secondary Settling Tanks;
- Sludge holding tank with floating surface aerator;
- Disinfection: UV system with outflow meters; and
- Sludge Management: Two Belt Presses and sludge drying beds as backup.

The plant discharges into the Dwars River, a tributary that flows into the Berg River.

Inlet works with two mechanical front raked screens

Reactor: Anoxic Basin with mixer

Reactor: Aeration basin (Fine bubble diffused aeration

Sludge Holding pumps

New Secondary Settling Tank

UV system with final effluent flow meters

Sludge holding tank with floating surface aerator

Two Bellmer Winkelpresse Belt Presses

Sludge drying beds (Backup)

An Aerial View of the Pniel WWTW is indicated below.

Klapmuts WWTW: The Klapmuts WWTW is an activated sludge treatment plant that has a hydraulic design capacity of 2.4 Ml/d and an organic design capacity of 2 700 kg COD/d. The plant is classified as a Class C plant and include the following treatment processes.

- Inlet Works: Mechanical front raked screen with Huber compactor and hand raked screen, two vortex grit removal tanks with jet lift pumps and grit classifier (Pista) and inflow meter;
- Activated Sludge Bioreactor (MLE) with anoxic basin (One mixer) and three aeration basins (Three aerators). Two submersible waste sludge pumps and two axial flow pumps (a-cycle);
- Sludge holding tank;
- Two Secondary Settling Tanks (13.5m diameter and 15.0m diameter);
- Disinfection with Chlorine gas or HTH tablets and chlorine contact channel with outflow meter;
- Maturation Pond; and
- Sludge Management: Belt Press and backup sludge pond.

The works discharges into the Klapmuts River, a tributary that flows into Eerste River catchment with the closest Rivers being the Plankenbrug River and the Klippies tributary to the Plankenbrug River.

Inlet Works (Mechanical front raked screen Was removed for repairs)

MLE Reactor Anoxic basin with mixer

Sludge holding tank

Secondary Settling Tank No 1

Secondary Settling Tank No 2

Chlorine Contact Channel with HTH tablets

Final effluent maturation pond

Belt Press building

Bellmer WinkelPresse Belt Press N6 1S

An Aerial View of the Klapmuts WWTW is indicated below.

Raithby WWTW: The Raithby WWTW utilises the Rotating Biological Contactors (RBCs) system for wastewater treatment and has a hydraulic design capacity of 0.150 Ml/d and an organic design capacity of 53 kg COD/d. The plant is classified as a Class D plant and include the following treatment processes.

- Inlet Works with mechanical front raked screen and inflow meter;
- Septic tank, which include sludge storage;
- Six Rotating Biological Contactors (RBCs);
- Humus tank;
- Disinfection: Chlorine gas or HTH tablets; and
- Sludge Lagoon for emergency storage of sludge.

The plant discharges into the Raithby River, a tributary that flows into the upper reaches of the Eerste River.

Inlet works with mechanical front raked screen

Septic Tank

Six rotating biological contactors

Humus tank

Chlorine Contact channel

Emergency sludge lagoon.

4. WATER SERVICES OPERATION AND MAINTENANCE

Maintenance is usually practices in two forms, preventative maintenance and corrective maintenance. A third form is called design-out maintenance, which is rather an aspect of the design considerations when the infrastructure is planned. Maintenance may be divided into planned and unplanned maintenance. The section below gives an overview of the different types of maintenance.

4.1 OPERATION AND MAINTENANCE PLAN

The focus on improvement of levels of service through creating new infrastructure at great cost results often in overlooking the importance of the development and implementation of sound asset management practices. Through the assessment of this important function WSAs are enabled to identify areas of concern and it should form the base for the development of an Asset Management Plan as discussed in Topic 3. Neglecting the implementation of best practice operational and maintenance procedures would result in ineffective service delivery and shortened life span expectancy of assets. Additional capital expenditure for refurbishment or replacement will eventually be unavoidable.

The two important aspects of asset management under consideration are:

- Operations
- Maintenance

Table 4.1.1: Definitions for Operational and Maintenance Assessments and Plans

	Element Description	Assessment Criteria

4.2 Resources	**Staff**	• Sufficient staff numbers
		• Competency level of staff at all levels
		• Level of service provided by staff
		• Empowerment and training:
		  ○ Adequately trained for position
		  ○ Safety regulation
		  ○ Commitment
		• Responsibility allocation (organisational structure) and acceptance thereof

	External resources	• Need for external resource providers • Competency level and value for money • Management and control over these providers

	Spare Parts	• Adequate materials provisioning
		• Store management
		  ○ Sufficient stock kept
		  ○ Stock control
		  ○ Delivery time

	Tools & equipment	• Adequate tools and equipment provided • Control and maintenance
	Budget	• Adequate budget provided • Budget control • Identification and documentation of needs • Budget preparation and motivation

Table 4.1.1: Definitions for Operational and Maintenance Assessments and Plans		
Element Description		**Assessment Criteria**
4.3 Information	**Manuals**	• Existence of manuals (operation / maintenance or manufacturer) • Record keeping / safekeeping and control • Utilisation of manuals by staff
	Asset register	• Existence of an asset register • Maintenance / updating of asset register • Accessibility of information • Control over assets • Stock taking
	As-built information	• Existence of as-built drawings • Existence of important reports e.g. design reports etc. • Record keeping / safekeeping and control • Accessibility of information • Updating of records
	Tools and Equipment	• Existence of information on tools and equipment • Record keeping / safekeeping and control • Accessibility of information
	Contingency and safety plan	• Compliance to safety requirements • Safety equipment and maintenance thereof • Existence of safety plan where required • Existence of contingency plan where required
4.4 Activity Control and Management	**Procedures**	• Existence of procedures for all activities • Existence of policies – standardisation, quality, operational and maintenance, etc • Correctness of procedures – if in place
	Record keeping	• Existence of record keeping system • Process of data • Actions activated

	Quality control	• Quality management plan
		• Quality assurance
		• Quality control
		  ○ Inspections
		  ○ Control charts
		  ○ Trend analysis
		• Process adjustment and rework
		• Quality improvement

	Risk management	• Risk management planning • Risk identification • Risk probability and impact assessment • Risk response planning • Risk monitoring and control

	Reporting	• Production and activity reporting
		  ○ Completeness
		  ○ Evaluation and action activation
		• Management reporting

Table 4.1.1: Definitions for Operational and Maintenance Assessments and Plans		
Element Description		Assessment Criteria
		○ Completeness ○ Evaluation and action activation ● Performance monitoring

Status Quo – The current situation on each component of the water distribution system was evaluated / assessed in terms of the previous list. The following criteria are applicable:

N/R - Not required

Z - Zero compliance (if there is no capacity / resources or information)

1 - Below minimum requirement

2 - Minimum requirement

3 - Above minimum requirement

“Minimum requirement” is considered to be a good judgement of what is required to ensure proper operation and maintenance that could be maintained given the specific conditions and infrastructure.

Impact – Secondly the impact on having access to the resources / information or capability listed should be assessed in terms of the importance for providing operational and maintenance services on each component.

Criteria applicable is as follows: C – Critical, M – Medium, L – Low and No - No impact

Operation and Maintenance Plan	Yes / No
Is there an Operation and Maintenance Plan?	Yes

Stellenbosch Municipality’s key focus is on the optimal operation and maintenance of their water and sewer networks, which will have minimum breakdowns when it is:

- Correctly designed and constructed;
- Properly operated and maintained;
- Correctly used by the customers; and
- Kept clean and protected from pollution.

Pipe bursts and other serious damage to pipes immediately interrupts services to the affected area and is rapidly addressed by Stellenbosch Municipality. O&M is a continuous process for Stellenbosch Municipality involving various activities, with the ultimate purpose of delivering good quality services to all customers at all times and keeping the percentage of water lost through pipe bursts and other serious damage to pipes as low as possible. Stellenbosch Municipality’s O&M Plan depends on a range of factors such as the age and condition of the water supply system (Pipe Replacement Study, See Section 5.1.1.3), requirements of the Municipality and DWS as the regulating authority, the availability of staff, plant, equipment, spares, money and other resources.

Stellenbosch Municipality also have standby teams available after hours and over weekends, besides the planned and scheduled O&M activities, in order to allow for unscheduled responses to service breakdowns due to mal-functioning equipment, vandalism, emergency situations, etc. This allows Stellenbosch Municipality to be able to quickly assess service breakdowns and re-allocate staff and resources to do unscheduled repairs, and then quickly return to the regular and scheduled O&M activities. The technical personnel ensure that sufficient repair materials, consumables and back-up equipment are also readily available in a well-organised store.

5. CONSERVATION AND DEMAND MANAGEMENT

Promoting the efficient use of water should be a driver of the WSDP process, particularly since South Africa is a water scarce country. Water required as a result of the service level targets may exceed water availability. There are two options in this case, either build new infrastructure (which is very costly), or institute a WC/WDM strategy, or a combination of the two. The need to implement WC/WDM is not limited to water resource requirements. The implementation of WC/WDM can have a significant impact in ensuring effective, affordable and sustainable water services with social, economic and environmental benefits.

Key WC/WDM issues, as included in the new NWRS 2, are as follows:

- The National Water Act recognises the pivotal role of WC/WDM in water resource management, with the objective of enabling all user sectors to gain equitable access to the desired quantity, quality and reliability of water.
- WC/WDM is the foremost Reconciliation Strategy to balance water supply and demand.
- WC/WDM can be implemented in a shorter time than new infrastructure development and can significantly postpone the need for new water resources infrastructure and new WTWs and WWTWs.
- WC/WDM is more cost effective than new water infrastructure development.
- WC/WDM is important in the light of climate change when more frequent droughts and floods will impact adversely on the availability of water.
- A WC/WDM Strategy is a fundamental step in promoting water use efficiency and is consistent with the National Water Act, which emphasises effective management of water resources.

WC/WDM Strategy

The Directorate Water Conservation has prepared comprehensive guidelines in this regard, including a model strategy for WSAs. The WC/WDM strategy for WSAs also needs to form part of the regional WC/WDM strategy. It is important to recognise that although WSAs are ultimately at the interface of WC/WDM initiatives the needs and objectives of the strategy need to be looked at from various perspectives including consumers, municipalities, bulk suppliers, catchment management agencies and the national perspective.

The purpose of the WC/WDM model strategies is to enhance the management of water services in order to achieve sustainable, efficient and 100 per cent affordable services to all consumers. The aim of the model strategies is to influence all functions and business plans related to water services. The emphasis of the model strategies is to influence water services to incorporate social, environmental, economic and technical considerations.

Many of the elements of such a strategy are part of the WSDP requirements. However, particularly the larger, more capacitated WSAs are encouraged to produce specific strategies based on the above-mentioned model strategy. Should this be the case, the WSA should include their strategy in the Master Plan Module of the WSDP.

The implementation of a WC/WDM strategy does not only refer to measures that reduce water wastage and inefficient use, but also include measures to effectively manage and sustain efficiency targets. Some of the priority requirements are to install systems that measure and identify certain key parameters such as minimum night flows and systems to enable detailed and regular water audits and water balances.

Depending on the circumstances, the initial focus of reducing demand could be the reduction in unaccounted for water (UAW) and a reduction on the wastage and inefficient use of NRW consumption (i.e. the reduction of involuntary water usage by non-paying consumers). However, this does not mean that Stellenbosch Municipality should not target paying consumers and should also consider implementing other activities to reduce water consumption.

The implementation of the Municipality's WC/WDM measures over the last number of years and the water restrictions during the drought periods has been extremely successful, with an average annual decrease of 0.22% of the raw water volume for all the systems over the last fifteen financial years, from 13 233 Ml in 2008/2009 to 12.807 Ml in 2023/2024. **The overall NRW for all the systems for the 2023/2024 financial year was 3 931.556 Ml (31.3%). The overall water losses for the last financial year were 3 529.523 Ml (28.1%). The Municipality is committed to continue with the implementation of specific WC/WDM measures to further reduce the current NRW and Water Losses.**

The current WC/WDM measures implemented by Stellenbosch Municipality are mostly through their Operation and Maintenance Budgets. The main water demand management interventions implemented by Stellenbosch Municipality over the last number of years, include the following:

- Meter and record all bulk water supply for the various distribution systems and improve the billed metered consumption data (Financial Department) in order to carry out more detail IWA water balances for the various distribution systems.
- Customer Services and Complaints System is implemented by the Municipality for burst pipes, leaks, etc. Standby teams are available after hours and over weekends for immediate repairs of any burst pipes or leaks.
- Strict municipal services standards for the installation of new water reticulation networks for own and private developments.
- Implementation of pressure management, continuous operation and maintenance of various PRV zones.
- Implementation of a seven-block step water tariff structure that promotes the efficient use of water and discourage wastages. Water restrictions are also implemented when required.
- Regular updating of the Water Master Plans for the various water distribution systems.
- Implementation of a Water Pipeline Replacement Programme.

A contractor was also appointed to assist the municipality with various demand management activities during the 2022/2023 financial year. The scope of works comprises of the following key components:

- The inspection and repair of plumbing defects to selected existing residential properties including the repair of leaks associated with pipes, toilets, geysers, taps and other general plumbing components;
- Removal of existing water meters and installation of new programmable domestic (Smart) water meters;
- Replacement of faulty domestic and bulk water meters;
- Installation of new pressure reducing valves and electromagnetic flow meters in the municipal water network;
- Construction of valve and bulk water meter chambers; and
- Connecting pipework to the municipal water network.

The total expenditure over the period 2018/2019 to 2023/2024 for the implementation of these WC/WDM measures over the last six financial years was R20 016 391 (Vat Excluded). The following work was done during the 2023/2024 financial year.

- 15mm dia. Smart Meters installed: 256
- > 40mm dia. bulk water meters installed: 26
- Conventional 15mm dia. water meters installed: 0
- 15mm dia. straight connections: 296
- Straight connections replaced with WDM: 231
- Faulty WDM devices or defective valves replaced: 146
- New WDM devices installed: 128
- Leaks repaired: 176
- Call outs: 1 802

A Water Conservation and Water Demand Management Strategy was drafted for Stellenbosch Municipality in February 2012, but is outdated and requires review and updating.

Stellenbosch Municipality's Scorecard for assessing the potential for WC/WDM efforts in Municipalities is included in Annexure D. The aim of the scorecard was to establish areas where the municipality has made good progress in relation to WC/WDM and where there is still room for improvement. It can be seen from the Scorecard that there are 25 questions each of which carries a maximum of 4 points providing a possible maximum score of 100. If the Municipality has the specific item completely under control, it receives the maximum points and if it is neglecting the item completely it receives no points. There are various levels between the maximum and the minimum number of points assigned to the municipality for each item depending on the level of completeness or lack thereof. **The status quo score for Stellenbosch Municipality is 69 out of 100 suggesting that the Municipality is making good progress with regard to the implementation of specific WC/WDM activities.**

5.1 WATER RESOURCE MANAGEMENT

Water resource management interventions should deal with interventions such as the removal of invading plants, artificial recharge of aquifers, and rehabilitation of wetlands and clean up campaigns of rivers. Total figures for NRW are reported as part of the water balance, however activities to reduce the percentage of NRW and water inefficiencies are unpacked in this section.

Losses (Apparent and Real) is defined as the difference between the measured volumes of water put into the supply system and the total authorised consumption. Internal plumbing leaks are leaks past the consumer meter. Such leaks can be assessed through sample surveys of consumer households and by analysing the minimum night flow of bulk meters.

5.1.1 Reducing Water Losses and Water Inefficiencies

It is not possible at this stage to differentiate between the water loss through reticulation leaks, illegal connections, un-metered connections and internal plumbing leaks. Stellenbosch Municipality's commitment is to ensure that all the connections, providing an uncontrolled volume of water, are metered. Detail IWA water balance models for each of the schemes are included in Annexure C. Leakage Benchmarking Sheets for each of the networks are also included in Annexure D.

Table 5.1.1.1: Resources available to reduce water losses and water inefficiencies

Activities	Resources Available
Night flow metering	Partially
Day flow metering	Yes
Reticulation leaks	Yes
Illegal connections	Yes
Un-metered connections	Yes

5.1.1.1 Night flow metering

The levels and the outflows for most of Stellenbosch Municipality's reservoirs are logged through the Municipality's Scada System and the night flows are therefore also monitored to some extent at these reservoirs. The Municipality will start in the future with the logging of Minimum Night Flows (MNFs) for specific zones for the monitoring of the flows and pressures and the implementation of additional pressure management projects. Leak detection will be implemented in areas with high MNFs.

The difference between the theoretical and actual MNF is called "Excess night flow" and gives a good estimate of the physical water leakage in an area. The higher the excess flow the higher the expected water leakage.

5.1.1.2 Day flow metering

All surface and groundwater sources are supplied with bulk water meters, which are read and recorded on a monthly basis. Comprehensive water management zones were also established for some of the systems as part of the pressure management initiatives, which will enable the Municipality to better monitor and manage their future NRW.

The comprehensive set of bulk water meters enables Stellenbosch Municipality to monitor their NRW and water losses accurately and to identify specific areas for the implementation of WDM activities in order to address the specific problems causing high NRW and water losses.

All new water connections are provided with water meters, once a customer apply for a new water connection. All consumer water connections are metered and communal services in informal areas are also metered. Pressure management zones are in place, which enable the Municipality to better monitor and manage their NRW and water losses.

5.1.1.3 Reticulation leaks

All leaks on reticulation systems are repaired as soon as it is noticed or reported. Standby teams are also available over weekends and after hours to repair any possible leaks on the reticulation networks.

A **pipe replacement study** was performed for Stellenbosch Municipality's entire water distribution system (June 2019). The project entailed the verification of system data, establishment of a computer model for the pipe replacement network, performing an analysis and reporting. The pipe replacement potential was determined for each of the pipelines in the water distribution systems by assessing the likelihood of failure (LF) and the consequence of failure (CF). The independent factors and their weight factors used are summarised in the tables below.

Table 5.1.1.3.1: The independent factors and the weight factors used to determine the water pipe replacement potential

Likelihood of Failure Property	Weight	Weight (%)	Consequence of Failure Property	Weight	Weight (%)
Nominal diameter (mm)	5.4	16.0%	High cost to consumer due to high water pressure (m)	2.2	8.0%
Reserve water pressure ratio	2.6	8.0%	High cost to consumer due to flow (l/s)	2.2	8.0%
Catalogue remaining useful life (yr)	4.6	14.0%	High repair cost due to pipe location	3.5	12.0%
Master Plan Item	0.0	0.0%	Flooding due to geography	7.3	26.0%
Assessed condition	5.0	15.0%	Strategic location	6.0	21.0%
Failure frequency (breaks/km/yr)	8.9	26.0%	Network redundancy (l/s)	7.3	26.0%
Leakage volume (l/min/km)	0.0	0.0%	Pavement management system alignment	0.0	0.0%
Undesired material	7.1	21.0%			
Geology	0.0	0.0%			
		100.0%			100.0%

The total pipe replacement potential was calculated for each pipeline as an index

PRP = LF x CF (In the range of 1 to 25)

The replacement values for the top 100 pipes to be replaced in Stellenbosch and Franschhoek is R6 717 370 (14.615km). The location of pipe failures should be recorded with accurate GPS coordinates. It is recommended that pipe replacement in Stellenbosch is performed in accordance with the PRP values. Pipes with the highest PRP values should be considered to be replaced first. The table below gives an overview of these pipes.

Table 5.1.1.3.2: Top hundred water pipes in Stellenbosch and Franschhoek water distribution system to be replaced based on PRP

50	Brandwacht PRV	125	R50 500	100	Uniepark 1	330	R184 140
Total (First 50 Pipes)		**5 925**	**R2 631 660**	**Total (Second 50 Pipes)**		**8 690**	**R4 085 710**

This new calibrated and tested pipe failure model identifies with a single geographical view where pipe failures are most likely to occur. It is foreseen that this model will greatly assist the pipe replacement prioritization process as it is completely based on a new scientific approach. By allocating funds to replacing those pipes most likely to fail in future, a limited budget can be spent effectively. The Municipality continued with their pipeline replacement programme during the last financial year.

The table below gives an overview of the average residual and static pressures for the different water distribution zones.

Table 5.1.1.3.3: Average residual and static pressures for the different zones

Zone	Average Residual Pressure (m)	Average Static Pressure (m)

There are currently 22 PRV zones supplied with water from 24 PRVs. There are also 5 PRVs that are currently not in operation (and can be decommissioned), 6 PRVs that are only used under emergency conditions, 4 PRVs that augment water supply to existing reservoir zones and 1 PRV on the existing Perdekloof raw water system in Franschhoek (Bulk Water Resources: Drought Intervention Projects, June 2019). Four new PRVs were installed during the 2023/2024 financial year, and the Markotter and Bosmans Crossing PRVs were replaced.

5.1.1.4 Illegal connections

The disconnection of illegal connections can be sensitive if it involves consumers who are not currently serviced by the Municipality. The Swift Analysis of February 2023 assisted Stellenbosch Municipality with the identification of potential illegal connections. The table below gives an overview of the occupied stands in the treasury data with a water meter, but with zero demand (Swift Analysis).

Table 5.1.1.4.1: Number of occupied stands in the treasury data with a very low demand and occupied stands with a water meter, but with zero demand

Area	Number of occupied erven in treasury data with a water meter, but with a very low demand (<3 kl/month)	Number of occupied erven in treasury data with a water meter, but with zero demand
Stellenbosch Town	404	112
Dwars River	50	19
Koelenhof	1	3
Franschhoek	87	29
Rural	5	8
Klapmuts	54	13
Polkadraai	1	4
Raithby	5	2
Total	**607**	**190**

The above occupied erven with a water meter, but with very low demand or zero demand, need to be investigated. All illegal connections are immediately formalised by Stellenbosch Municipality once noticed. A set of Water Services Bylaws is also in place, which support the Municipality in their effort to prevent any unauthorised connections to their water supply systems. The Municipality also make use of their IMQS and the monthly billed metered consumption data from their Finance Department to identify all erven with no water usage, in order to identify potential illegal connections.

5.1.1.5 Un-metered connections

All un-metered connections are immediately formalised by Stellenbosch Municipality once noticed. The table below gives an overview of the occupied stands in the treasury data without a water meter and number of informal units (February 2023 Swift Analysis).

Table 5.1.1.5.1: Number of occupied stands in treasury data without a water meter and number of informal units.

Area	Number of Occupied Erven in Treasury Data without a Water Meter	Informal Units
Stellenbosch Town	388	8 011
Dwars River	66	100
Koelenhof	40	-
Franschhoek	108	1 726
Rural	1	-
Klapmuts	18	595
Polkadraai	3	-
Raithby	-	-
Total	**624**	**10 432**

The occupied erven in the above table need to be investigated and water meters need to be installed for all the unmetered erven. All communal service connections in informal areas also need to be provided with water meters.

5.1.2 Leak and Meter Repair Programmes

Stellenbosch Municipality monitors the water usage of their consumers on a monthly basis through their billed metered consumption data.

In potable water distribution systems, the main component of water losses which is of concern is Unaccounted-for-Water, which can be categorised into real and apparent losses. Real losses include leakage, pipe bursts, flushing, overflows, etc., while apparent losses are inaccurate measurements and the inaccurate reading of meters. It is not possible to effectively manage real losses until steps have been taken to manage the non-physical losses, as inaccurate measurements create a "garbage in – garbage out" scenario, and can result incorrect actions being taken to curb the real losses.

Meter error is often thought to be the main cause of apparent losses (Often referred to as non-physical or paper losses) in a water system and can be due to wear and tear, incorrect meter installation, lack of maintenance, incorrect meter type or incorrect sizing. Another contribution to apparent losses in South Africa and other developing countries is theft or illegal connections. In addition to blatant theft, many accounts go unnoticed in the system. The table below gives a summary of the suggested apparent loss percentages for a typical system.

Table 5.1.2.1: Suggested apparent loss percentages for a typical distribution system

Meter age and accuracy	Good Water Quality	Poor Water Quality
Poor > 10 years	8%	10%
Average 5 – 10 years	4%	8%
Good < 5 years	2%	4%
Illegal connections		
Very high		10%
High		8%
Average		6%
Low		4%
Very low		2%
Data Transfer		
Very poor		9%
Poor		7%
Average		5%
Good		3%
Very good		1%

Table 5.1.2.2: Resources available to perform leak and meter repair programmes

Activities	Resources Available
Leak repair assistance programme	Partially
Retro-fitting of water inefficient toilets	Partially
Meter repair programme	Yes

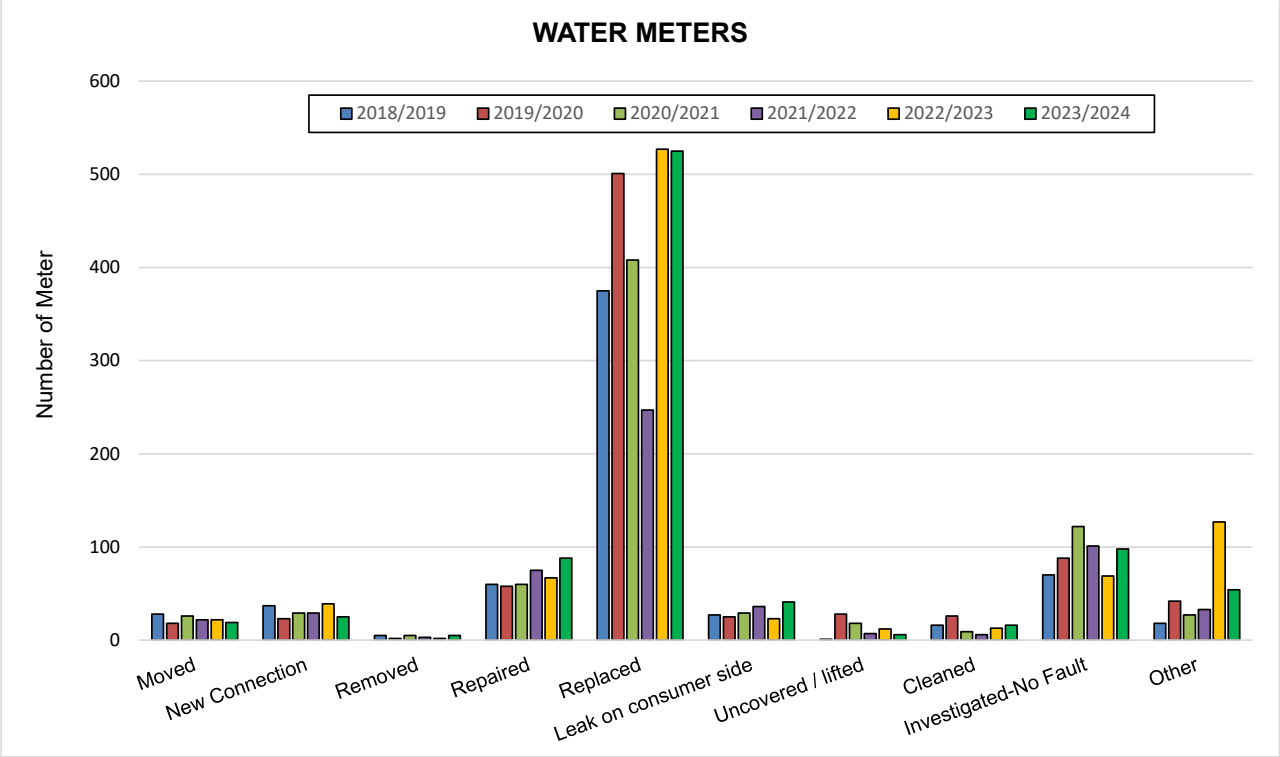
5.1.2.1 Leak Repair Assistance Programme

WSAs should prioritise assistance programmes in the informal areas. Such assistance programmes should include a number of measures that will ensure efficient water usage and build trust between consumer and the WSA. Houses in these informal areas are not always adequately maintained, which often result in significant plumbing leaks and the consumers don't always have the funds or knowledge to fix the leaks themselves or to purchase water efficient devices.

Stellenbosch Municipality repaired water leaks at properties occupied or owned by indigent households for a number of years already (Contractor was appointed for this work and other WC/WDM measures, Contract BSM 10/23 – Domestic Leak repair, Water Meter Replacement and Pressure Management).

5.1.2.2 Retro-fitting of Water Inefficient Toilets

It is a common problem in South Africa that many buildings have high internal plumbing leakage and that water in-efficient devices are still being used in the ablution facilities. One of the key contributors to water wastage in public buildings is tip-tray urinals. These urinals flush continuously and can be retrofitted with a push button flush mechanisms, which will only flush when activated by a user.



It is not known whether all automatically flushing urinals in the Municipal buildings were already replaced with manually operated push button systems. Stellenbosch Municipality also needs to actively focus on the maintenance and repairs of public ablution facilities in previously disadvantaged areas.

5.1.2.3 Meter Repair Programme

The installation of meters enables Stellenbosch Municipality to monitor and control the provision of services and to ensure that the services delivered are sustainable. The following is ensured by the installation of meters.

- For consumers to be accountable and take responsibility for the water they use.
- For real water losses to be calculated and that WC/WDM measures can be implemented.
- That the Indigent Policy can be implemented.

The graph below gives an overview of the operational work done on the water meters over the last six financial years in Stellenbosch Municipality's Management Area.

256 Smart devices were installed during 2023/2024 by the contractor appointed to conduct domestic leak repairs, water meter replacements and pressure management throughout the Municipal area.

Bulk water meters are in place to effectively monitor the treatment losses for the WTWs, the NRW and the water losses for the various water distribution systems. **The bulk water meters need to be installed in lockable meter chambers and the chambers need to be cleaned regularly.**

The main reasons for inaccuracy are incorrect selection, incorrect sizing, incorrect installation, incorrect reading and lack of maintenance. It is important for Stellenbosch Municipality to continue with the implementation of their Meter Replacement Programme, whereby all faulty and leaking meters are replace / repaired immediately and all old consumer water meters are replaced systematically, as funding becomes available.

5.1.3 Consumer / End-use Demand Management: Public Information and Education Programmes

There are a number of ways of ensuring the reduction of water demand by consumers. These can generally be divided into two categories. The first is to influence the behaviour of consumers and the second is through the implementation of assistance projects.

Assistance projects are interventions of best management practices, which are funded or partially funded by WSAs. Examples include projects to repair plumbing leaks, to retrofit dual-flush toilets, installation of dual water distribution systems and to replace exotic gardens with alternative water wise gardens.

More efficient use can also be made through recycling of water. This can be to different standards depending on what it will be used for. For example, consumers can be encouraged to use grey water, i.e. bath, shower, etc. for watering of their gardens.

Basic service must include an education component. Many water and sanitation projects carried out by Municipalities have lacked this important aspect in the past and this need to be addressed.

Education programmes could include information on:

- Sanitation promotion.
- Sources of water pollution (e.g. sewage with specific reference to downstream users of rivers and groundwater sources).
- Dangers of people using water from polluted rivers, boreholes or wells.
- Waterborne diseases.
- Health and hygiene awareness including initiatives to reduce waterborne diseases, such as hand washing.
- The need to conserve water and use it efficiently.

There are a number of different methods in which these messages can be distributed and thought should be given to which groups will be targeted, possible health messages, communication methods, roles of different institutions, timeframes, who will carry it out and how skills will be transferred.

These methods include:

- Public meetings, workshops and seminars;
- Notices on billboards, shopping centres and washrooms;
- Competitions;
- Development and distribution of leaflets, fliers and posters;
- Distribution of small gadgets and stickers;
- Radio/newspaper slots and press releases; or
- Household visits by health officials

Specific numbers of consumers targeted by Stellenbosch Municipality for awareness and education are not defined. All low income housing developments are however targeted for education, once water services were installed.

One of the key elements of a sustainable WC/WDM strategy is to develop and promote activities that are also beneficial to consumers. WSAs are encouraged to adopt a "win-win" approach and not introduce punitive measures unless they have to. One of the most effective ways to encourage consumers to use water more efficiently is through tariff mechanisms.

Table 5.1.3.1: Resources available to perform Consumer / End-use Demand Management

Activities	Resources Available
Schools targeted by education programmes	No
Consumers targeted by public information programmes	Yes

5.1.3.1 Schools Targeted by Education Programmes

The schools in Stellenbosch Municipality's Management Area are not yet targeted with awareness around water education programmes and water conservation. The following activities can form part of Stellenbosch Municipality's future WDM programme for their schools.

- Meter water use at all the schools and ensure that schools are recorded in the treasury system under a unique customer code to enable future analysis of this consumer category.

- Urinals: Tip tray flush mechanisms on urinals are widely recognised as a major source of water wastage in schools. Therefore, automatically flushing urinals should be replaced with manually operated push button systems.

- Toilet pans: Particularly as the number of toilets available in many schools is limited, pans should be inspected and broken pans and cracked pans should be replaced.

- Toilet cisterns: All the existing toilet cisterns flush volume should be recorded in a detailed study and those with a capacity of more than 13 litres per flush should be removed and replaced with modern cisterns having a 6 litre flush volume, or with 6 / 4.5 dual flush mechanisms.

- Taps: All existing conventional taps and non-SABS push taps should be replaced by SABS-approved push button taps that close automatically as soon as the pupil releases the button.

- Inspection of taps for leaks: Where leaking is noted at the head the taps should be serviced through replacement of the tap head assembly or replacement or tightening of the graphite seal.

- Pipework: Underground piping on the property should be repaired where leaks are detected.

- Municipal water meters: All the municipal meters should be inspected and those found to be faulty or inoperative should be repaired or replaced.

- Schools could be encouraged to reuse wastewater for irrigation of sports fields and / or to use borehole water for this purpose instead of potable water from the Municipal supply system.

Water saving by schools often forms the basis of WDM programmes elsewhere, because it also involves learners who experience implementation of WDM measures first hand. Schools should be encouraged to make WDM programmes part of a long term project, where learners should be actively involved. The schools WDM programme should receive high priority.

5.1.3.2 Consumers Targeted by Public Information Programmes

Stellenbosch Municipality realises the importance of good communication with the public and involving community members on a regular basis. Community members are made aware of safe handling of water, hygienic sanitation practices and how to conserve and not misuse water. Good communication ensures consumer trust and confidence.

Total transparency is therefore one of the main objectives when public notifications are distributed by Stellenbosch Municipality. High on the list of priorities in these communications, mostly through newsletters, is how to conserve water and reduce any wastage.

5.1.4 Conjunctive Use of Surface- and Groundwater

Water can be conserved by integrating the management of surface – and groundwater. This can be contained, by minimising groundwater abstraction during periods of excess surface water (i.e. resting the aquifers), or by artificially recharging aquifers whenever possible. Storing water in aquifers could, for example, minimise evaporation from dams, or provide a means to re-use treated wastewater.

Table 5.1.4.1: Conjunctive use of surface and groundwater

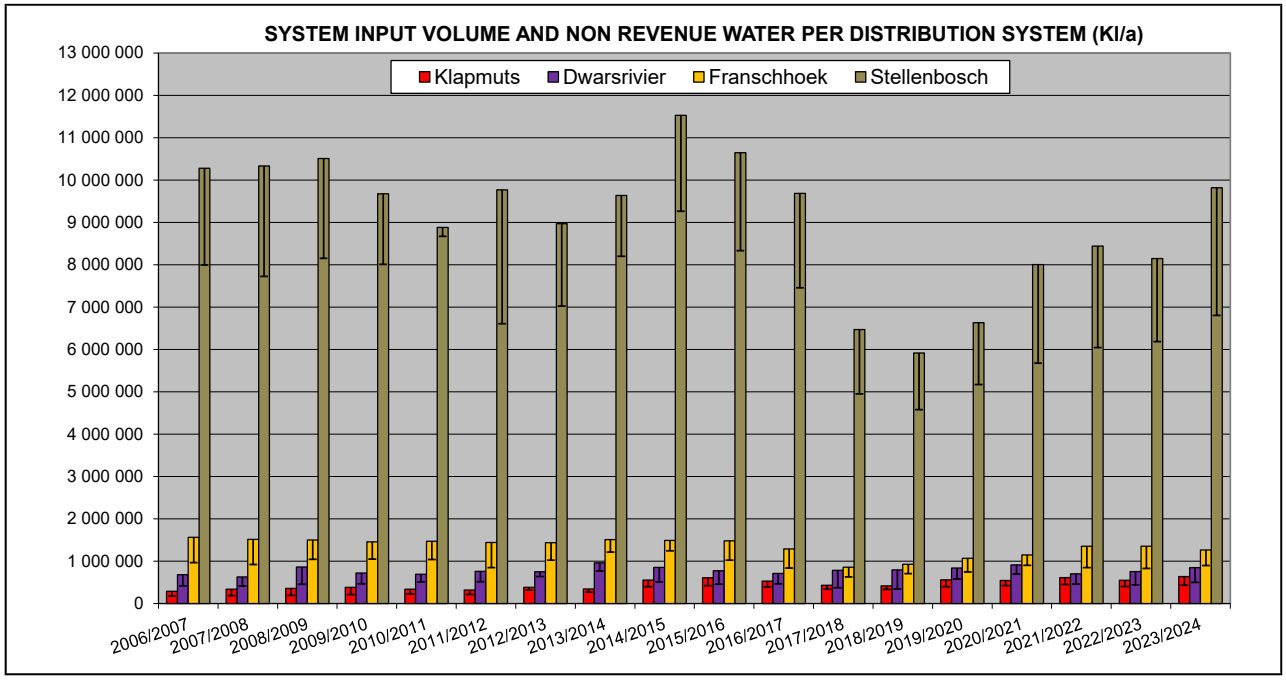
Source	Number of Settlements
Ground Water	-
Surface Water	Klapmuts, Dwars River, Franschhoek
Conjunctive Use	Stellenbosch
Artificial Recharge	-
Rain Water Harvesting	-

5.1.5 Working for Water

One of the key environmental impacts on surface water resources is the invasion of the natural vegetation on riverbanks by alien vegetation which transpires excessive water volumes. The DWS has initiated the Working for Water Programme to eradicate alien vegetation from rivers and streams and thereby conserve water resources for the in-stream environmental reserve and other priority use. The programme also aims to free clogged river channels to reduce the effect of floods. **There are currently no Working for Water projects implemented by Stellenbosch Municipality.**

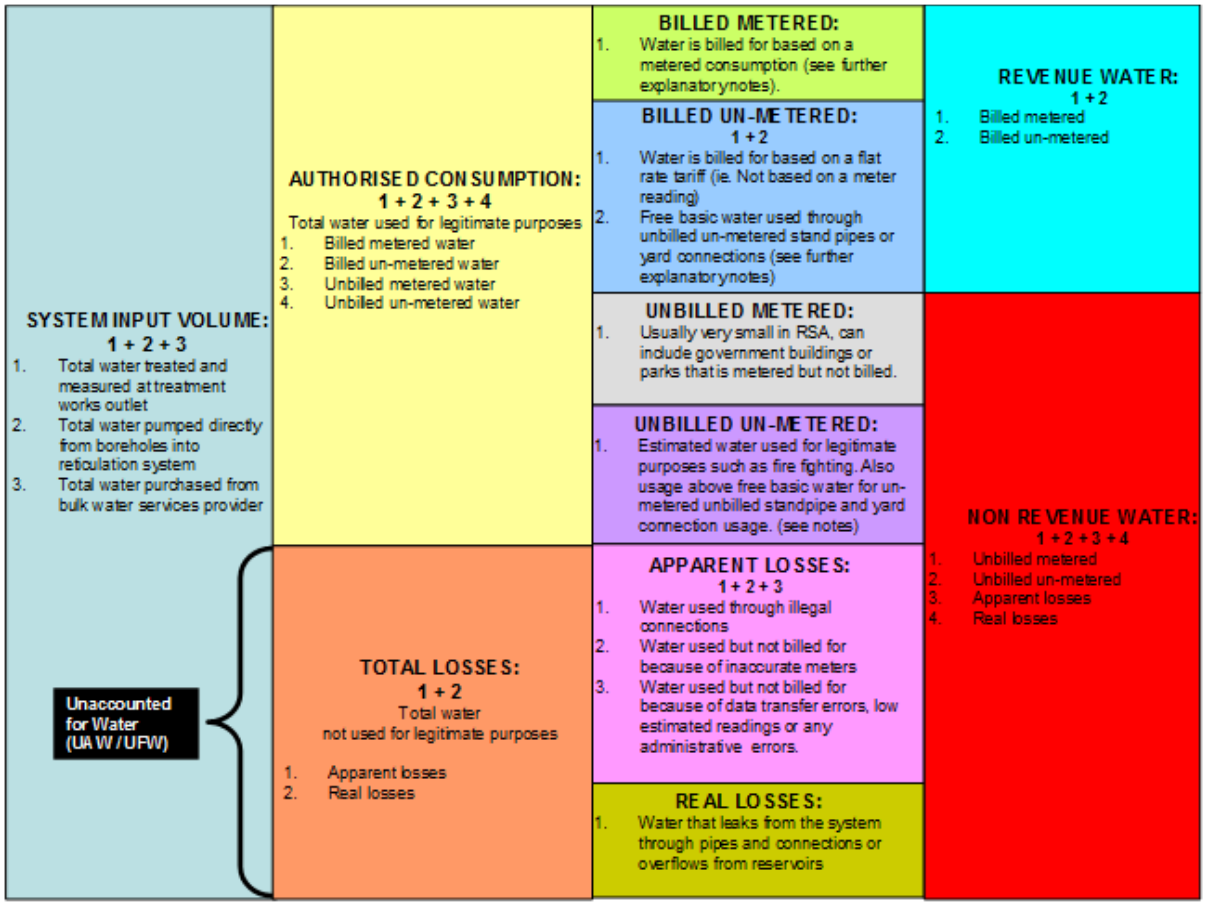
5.1.6 Water Resource Management Projects

Some of the current WDM activities implemented by Stellenbosch Municipality are funded through their O&M budget for Water Services. The only funding support available to Municipalities for WC/WDM initiatives from National and Provincial Government is through the WSIG. The funding is however very limited for the Western Cape and therefore Stellenbosch Municipality funds most of their WDM initiatives through their own budgets.



The table below gives an overview of the WC/WDM projects included in the 2024/2025 approved Capital Budget.

Table 5.1.6.1: Water resource management projects (WC/WDM)



Project name	2024/2025	2025/2026	2025/2026
Upgrade and Replace Water Meters	R1 000 000	R1 000 000	R2 000 000
Water Conservation & Demand Management	R2 000 000	R2 000 000	R2 000 000
Water Telemetry Upgrade	R1 500 000	R1 500 000	R0
Waterpipe Replacement	R6 000 000	R6 000 000	R8 000 000
Total	**R10 500 000**	**R10 500 000**	**R12 000 000**

5.2 WATER BALANCE

By undertaking a water balance, WSAs can calculate the amount of water that is being lost to their systems. The NRW provides an indicator of how efficient the water supply system is being run and provides information to the WSA on how to improve the system. NRW is a direct loss to the WSA. The graph below gives a summary of the System Input Volume (Bulk Potable Supply) and the NRW for the various distribution systems in Stellenbosch Municipality's Management Area.

The various sections that make up the water balance are presented on the diagram below and are also described in the text below.

TOTAL INFLUENT OF WATER TO WATER TREATMENT PLANTS

The total influent to water treatment plants (5) are the sum of the following:

- The volume of surface water purchased from others (1),
- Plus the volume of surface water abstracted (2),
- Plus the volume of groundwater abstracted (3),
- Plus the volume of water recycled from waste water treatment plants (14),
- Minus the volume of raw water supplied/sold (4).

The total volume of water received at the water treatment plants are generally referred to as the raw water input into the system.

SYSTEM INPUT VOLUME

The system input volume (SIV) is the total volume of potable water entering the distribution system for consumption by consumers. It is the sum of the following:

- Total volume of treated water from the water treatment plants (6). The difference between the input and output of the water treatments plants are referred to as treatment losses,
- Minus the volume of treated water supplied/sold to others (6A),
- Plus the volume of treated water purchased (7),
- Plus the volume of untreated water that enters the system (7A), usually from boreholes with water of sufficient quality to allow potable use.

REVENUE WATER

The SIV can be grouped into revenue and non-revenue water, indicating as the name suggests the volume of water generating income for Stellenbosch Municipality vs the volume of water bought, but not generating income from its usage or loss. All revenue water is considered to be authorised consumption and consists of the following:

- Billed metered consumption (8.1),
- Billed unmetered consumption (8.2). The billed unmetered portion can be further grouped into
    - the volume of water supplied at a flat rate (8.2.1), where no meter is used but the consumer is billed and
    - free basic water supplied (8.2.2). Free basic water can be claimed form equitable share and is therefore considered authorised and revenue generating.

NON-REVENUE WATER

Non-revenue water consists of an authorised consumption portion that the municipality is aware of supplying, but it is not currently metered and therefore no account can be sent and a portion of losses, either apparent or real. The components are as follows:

- Unbilled metered consumption (8.3),
- Unbilled unmetered consumption (8.4), this, together with 8.3 forms part of the authorised portion,
- Apparent losses (8.5) that can be further grouped into
    - Illegal connections (8.5.1),
    - Inaccurate meters (8.5.2),
    - Data handling errors (8.5.3),
- Real losses; these are all loss of water from the distribution system upstream of consumer connections.

TOTAL INFLUENT RECEIVED AT WASTE WATER TREATMENT WORKS

Water discharged from the distribution system and received at the waste water treatment works also form part of the water cycle and can be included in the water balance. Once the water is treated it can be grouped as follows:

- Total volume of treated water discharged from the waste water treatment works (11), this can be further grouped into:
    - Volume returned to the environment (13),
    - Recycled water supplied to the water treatment works (14),
- Other uses (12). This portion represents the volume that is either re-used for irrigation purposes or re-used on the waste water treatment plant.

The peak month factors are used in order to size bulk water infrastructure such as purification works, pumps and main supply pipes to reservoirs. An estimated peak day factor of 1.25 was also included in the models to estimate the peak day flow. The historical peak month factors were calculated, for the various schemes, and are included in the table below. The factors are the maximum peak month factors for the last five financial years and the average over the five year period. The particular months varies notably from one system to the next, but are mainly in the summer as could be expected. The month when this particular peak month factor value was recorded is also included in brackets in the table below.

Table 5.2.1: Peak month factors for the various schemes

Scheme	2019/2020	2020/2021	2021/2022	2022/2023	2023/2024	Average (19/20 – 23/24)
Stellenbosch	1.13 (Aug)	1.23 (Jan)	1.27 (Jan)	1.08 (Nov)	1.20 (Jan)	1.14 (Jan)
Franschhoek	1.30 (Sept)	1.22 (Dec)	1.31 (March)	1.35 (Jan)	1.19 (Jan)	1.20 (Jan)
Dwars River	1.18 (Jan)	1.26 (Dec)	1.14 (Dec)	1.28 (Jun)	1.49 (Jan)	1.25 (Jan)
Klapmuts	1.41 (Nov)	1.29 (Jan)	1.16 (May)	1.30 (Nov)	1.29 (Dec)	1.17 (Dec)

5.2.1 Water Balance for Stellenbosch

The table below provides a six year historical record of the IWA water balance data for the Stellenbosch water distribution system.

Table 5.2.1.1: IWA Water Balance for Stellenbosch (Ml/a)

Water Balance Component	Record : Prior (Ml/a)					2023/2024
	2018/2019	2019/2020	2020/2021	2021/2022	2022/2023	
Surface Water Purchased (1)	1 145.346	2 568.874	2 254.120	3 296.201	3 417.667	4 391.814

Note: Apparent Losses: Used 2% for illegal connections (Very Low), 10% for inaccurate meters (>10yrs) and 1% for data errors (Very good).

5.2.5 Total influent received at treatment works

For planning purposes, it is a reasonable assumption that the seasonal distribution of the influent can be based on the corresponding distribution of the water demand. Similarly, where treated effluent is not used for irrigation, it is reasonable to assume that the majority of the influent is returned to the Water Resource System, with the exception of local losses for which a percentage allowance can be made. Account must also be taken of those WWTWs where the process relies on evaporation ponds, in which case the return to the Water Resource System is effectively zero.

All the WWTWs are supplied with flow meters for the incoming flow. The table below gives an overview of the annual volume of effluent received at the various WWTWs. The monthly flows and rainfall measured at the various WWTWs are also included in Annexure C.

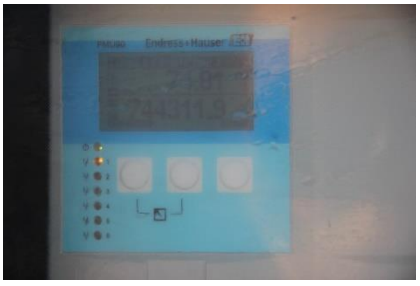

Table 5.2.5.1: Quantity of effluent received at the various WWTWs

WWTW	Record : Prior (Ml/a)				23/24
	19/20	20/21	21/22	22/23	
Stellenbosch WWTW	5 356.068	6 264.677	6 707.930	7 909.000	8 656.913

Pniel WWTW: Endress & Hauser FMU90 (Inflow meter)

Pniel WWTW: Final effluent flow meter (x3) Safmag.

Stellenbosch WWTW: Flow readings for Inflow and outflow

Raithby WWTW: Inflow meter

5.2.6 Total returns to the water resource system

All effluent discharged into the Municipal sewer system is treated at the existing WWTWs and the current effluent re-used practices are as follows:

Table 5.2.6.1 Current effluent re-used practices at the various WWTWs

WWTW	Current effluent re-use practices
Stellenbosch	Wash water at WWTW and some irrigation of WWTW terrain.
Wemmershoek	Irrigation of WWTW terrain
Pniel	Wash water at WWTW
Klapmuts	Wash water at WWTW
Raithby	Wash water at WWTW

There is a need to report on the volume or proportion of treated effluent that is returned from each WWTW to the Water Resource System. These return flows can be significant and can add to the water resources of a catchment and need to be accounted for. In other instances the effluent is not returned and is diverted to oxidation ponds or is re-used on parks, sports fields, etc. All **sewage** discharged into the Municipal sewer systems are treated at the existing WWTWs and the total returns to the water resource system for Stellenbosch Municipality are summarised in the table below.

Table 5.2.6.2: Total returns to the water resource system and treated effluent re-used for irrigation purposes

WWTW	Type of WWTW	Resource Name (River, Dam, Other)	Current returns (23/24)		Current re-use (23/24)	
			Total Returns (Ml/a)	Portion (%) of total influent returned	Total Re-Use (Ml/a)	Portion (%) of total influent re-used
Stellenbosch	Activated Sludge (MBR and Conventional)	Veldwachters River	7 358.376	85%	432.846	5%
Wemmershoek	Activated Sludge	Berg River	1 353.311	90%	75.184	5%
Pniel	Activated Sludge	Dwars River	813.672	95%	0.000	0%
Klapmuts	Activated Sludge	Klapmuts River	532.870	95%	0.000	0%

Table 5.2.6.2: Total returns to the water resource system and treated effluent re-used for irrigation purposes						
WWTW	Type of WWTW	Resource Name (River, Dam, Other)	Current returns (23/24)		Current re-use (23/24)	
			Total Returns (Ml/a)	Portion (%) of total influent returned	Total Re-Use (Ml/a)	Portion (%) of total influent re-used
Raithby	Rotating Biological Contactors	Raithby River, a tributary that flows into the Eerste River	22.636	95%	0.000	0%

Re-use of water is becoming more acceptable and feasible because of increasing water shortages, improved purification technology and decreasing treatment costs. Improvements in membrane technologies and their affordability have made a significant contribution in recent years. At present, up to 14% of water use is reused, mostly through wastewater return flows to rivers from which it is abstracted downstream for indirect re-use. Re-use of return flows could be significantly increased, particularly in coastal cities where wastewater ordinarily drains into the sea.

The direct re-use of treated wastewater can pose a risk to public health and safety; must be managed carefully and be subject to water quality management and control. Advanced treatment and proper monitoring of all processes and quality of potable water produced is essential. Public perceptions and opinions vary on the topic of water re-use, specifically as it relates to direct potable water re-use. Public perceptions are strongly informed by the general awareness of the poor operation, maintenance and performance of municipal wastewater treatment plants at present. This poses a significant challenge to building public acceptance of direct water re-use in the current situation. The performance of municipal wastewater and effluent treatment plants nationwide will have to be improved to meet high standards, resulting in consistently good quality discharges to the environment before direct water re-use can be placed on the national water supply agenda.

5.3 WATER LOSSES

The Infrastructure Leakage Index (ILI) included in the tables below, is the most recent and preferred performance indicator for comparing leakage from one system to another. It is a non-dimensional index representing the ratio of the current real leakage and the “Unavoidable Annual Real Losses”. A high ILI value indicates a poor performance with large potential for improvement while a small ILI value indicates a well-managed system with less scope for improvement.

The parameters used to calculate the ILIs for the various distribution systems are included in the Models in Annexure D. Attaining and ILI = 1 is a theoretical limit which is the minimum water loss in an operational water reticulation system. A value of less than 1 should not occur since this implies that the actual leakage is less than the theoretical minimum level of leakage.

Table 5.3.1: Information included in the Leakage Benchmarking Sheets			
Water Losses Models	Leakage Benchmarking Sheets		
Bulk and water sales data	Summary Sheet	System name and contact details	
Water balance for town		Performance indicators of water loss	
Non-Revenue water (%/month)		Key operating parameters which influence UARL	
		Key components of annual system input volume	
Monthly Peak Factors (Pmf)	Data Entry Sheet	General	
Annual non revenue water (% / year)		System data	
		Unavoidable annual real losses (UARL)	
Water usage per sector (Kl / month)		Annual water balance data	Data period
			System input volume
			Components of authorised consumption
			Components of water losses
		Selected operational	Current annual real losses per connection at current

Table 5.3.1: Information included in the Leakage Benchmarking Sheets			
Water Losses Models	**Leakage Benchmarking Sheets**		
		performance indicators	pressures
			Infrastructure Leakage Index
			Non-Revenue water as a % by volume of system input
		Selected financial performance indicators	Local valuation of real and apparent losses
			Annual cost of running system
			Non-Revenue water as % by value of cost of running system
		Relationship between real losses expressed as % of system input	Real losses curve definition
			Components of water balance in litres / service connection / day (Actual Results)
			Current real losses as % of system input volume
			Potential real losses as % of system input volume
			Real losses as a % of system input volume versus consumption in litres / service connection for different values of Real Losses in Litres / service connection / day

The table below gives a summary of the treatment losses, NRW, water losses and ILIs for the various distribution systems in Stellenbosch Municipality's Management Area.

Table 5.3.2: Treatment Losses, NRW, Water Losses and ILIs for the various water distribution systems

		Percentage	**22.8%**	**21.0%**	**24.2%**	**26.5%**	**24.1%**	**28.1%**

Note: Infrastructure Leakage Index (ILI) for Developed Countries = **1 – 2 Excellent (Category A)**, **2 – 4 Good (Category B)**, **4 – 8 Poor (Category C)** and > **8 – Very Bad (Category D)**

Category A = No specific intervention required.

Category B = No urgent action required although should be monitored carefully.

Category C = Requires attention

Category D = Requires immediate water loss reduction interventions

The table below gives an overview of the System Input Volume, Average Billed Metered Consumption and NRW in litre per connection per day for the various water distribution systems for 2023/2024.

Table 5.3.3: System input volume, average billed metered consumption and NRW in litre per connection per day for the various water distribution systems for 2023/2024.

Water Balance Component	Stellenbosch	Franschhoek	Dwars River	Klapmuts
System Input Volume	1 959	1 359	1 148	787
Average Billed Metered Cons.	1 358	966	679	531
Non-Revenue Water	601	393	469	257

Stellenbosch is the town with the highest system input volume per connection per day, the highest average billed metered consumption per connection per day and the highest NRW per connection per day.

6 WATER RESOURCES

6.1 SOURCES AND VOLUMES

This section is closely related to the water balance, but where the balance deals with total amounts, this section deals with the conditions associated with use, both in terms of quantity and quality. The total water required as identified in the water balance based on the service level targets needs to be compared to permit abstraction and return rights as stipulated in the permits. There is therefore some overlap in reporting requirements.

This part of the WSDP is driven by the National Water Act (Act 36 of 1998) and therefore will require dialogue with the Catchments Management Agency (CMA) (or DWS's Regional Office until the CMA is established) and reference to the Catchments Management Strategy/ies (CMS) when these are in place. It is very important that water demand and wastewater flows within the Catchments be viewed against what the resources can sustainably supply and what the likely environmental impacts will be.

Permits govern abstraction and return rights within a Catchment. The additional flows that might arise from the service level targets may well result in requirements over and above what is stated in the permit. The WSA needs to understand what these are and the implications for permits.

It is important to note that all water used within the WSA area needs to be included, including those resources not managed by the authority (such as boreholes and those operated by other water services providers).

The reporting format in this section does not require a separation into urban and rural areas. With the annual water demand and wastewater flows known, the capacity of sources to meet this demand needs to be assessed. In the case where boreholes are operated independently and water used for human consumption, the WSA should report on these as well.

Reporting requirements in this section refer to water supplied through the municipal system. This includes borehole water supplied for human consumption. Water abstracted from sources needs to be reported in terms of all providers extracting water. There are three main sources of water:

- Abstraction from surface sources within the WSA area of jurisdiction (dams, springs, large rainwater collectors such as natural rock surfaces or streams);
- Abstraction from groundwater sources within the WSA area of jurisdiction (boreholes or dug wells);
- Purchase from external sources (e.g. a Water Board).

The water sources for the towns in Stellenbosch Municipality's Management Area are as follows:

Stellenbosch relies on its own water supply from the Eerste River in the Jonkershoek Valley which is treated at the Idas Valley WTW. During summer when shortfalls occur, water is drawn from the WCWSS, obtained from the Theewaterskloof Dam and treated at Paradyskloof WTW.

Stellenbosch Rural Systems:

- ***Faure / Raithby / Jamestown System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the urban users in Raithby, rural consumers along the pipeline and can also supply water to the De Zalze Estate and Jamestown in Stellenbosch. The system is supplied with bulk potable water by the CCT from their Faure WTW.

- ***Polkadraai System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the rural consumers in the Polkadraai area along the pipeline. Water can also in emergency conditions be supplied from the Faure system to the Polkadraai system. The system is supplied with bulk potable water by the CCT from their Blackheath WTW.
- ***Koelenhof System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the urban users in the Koelenhof rural area. The system is supplied with bulk potable water by the CCT from their Wemmershoek scheme.
- ***Muldersvlei System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the urban users in the Muldersvlei rural are. The system is supplied with bulk potable water by the CCT from their Bloekombos reservoir (supplied from the Wemmershoek pipeline).
- ***Meerlust, Croydon and Helderberg Systems***: These systems supplies potable water to the urban users in these areas. Bulk potable water is supplied by the CCT. The Meerlust area is supplied with bulk water from the Wemmershoek scheme and the Helderberg and Croydon areas with bulk water from the Steenbras dam through the CCT's reticulation network.

Table 6.1.1: Authorised water use for the Stellenbosch System

Source	Registered or Authorised Water Use		Comment
	WARMS or Licence Number	Volume (Ml/a)	
Eerste River (Idas Valley WTW)	22059898 (WARMS)	7 224.000	Own Source
WCWSS (Paradyskloof WTW)	22095527 (WARMS)	3 000.000	Government Scheme
Wemmershoek, Faure and Blackheath (CCT)	Service Level Agreement with CCT Signed 2016	2 348.864	Agreement volume of 6 848 000 m³/a split proportional according to the 23/24 System Input Volume from the CCT for the various areas.
Stellenbosch Central Groundwater	01/G22H/AAA/8652 (Licence)	2 040.905	Production boreholes not all yet fully operational
WCWSS (BRVAS)	Agreement signed with DWS 2023	1 640.000	Government Scheme. Available once BRVAS project is completed and operational.
Total		**16 253.769**	

Franschhoek: The eastern part of Franschhoek is currently supplied with water from the Municipality's own source in the adjacent mountains, the so-called Perdekloof source. The raw water from the Perdekloof source is treated at the Franschhoek WTW (Package plant). The western part of Franschhoek, La Motte and Wemmershoek are supplied with potable water purchased from the CCT, which is supplied from the Wemmershoek WTW.

Table 6.1.2: Authorised water use for the Franschhoek System

Source	Registered Water or Authorised Water Use		Comment
	WARMS or Licence Number	Volume (Ml/a)	
Perdekloof	22059237 (WARMS)	576.648	Small portion of Franschhoek supplied from this source.
Mount Rochelle Fountain	22078305 (WARMS)	220.752	Currently not utilised.
Du Toitskloof River	22059433 (WARMS)	103.680	Currently not utilised.
Wemmershoek (CCT)	Service Level Agreement with CCT Signed 2016	1 890.048	Agreement volume of 6 848 000 m³/a split proportional according to the 23/24 System Input Volume from the CCT for the various areas.
Total		**2 791.128**	

The Dwars River system obtains potable water from the Wemmershoek pipeline, operated by the CCT, which forms part of the WCWSS. The water supplied to the Dwars River system is treated at the Wemmershoek WTW.

Table 6.1.3: Authorised water use for the Dwars River System

Source	Signed Service Level Agreement with CCT	Volume (Ml/a)	Comment
Wemmershoek (CCT)	Agreement Signed 2016	1 486.016	Agreement volume of 6 848 000 m³/a split proportional according to the 23/24 System Input Volume from the CCT for the various areas.
Total		**1 486.016**	

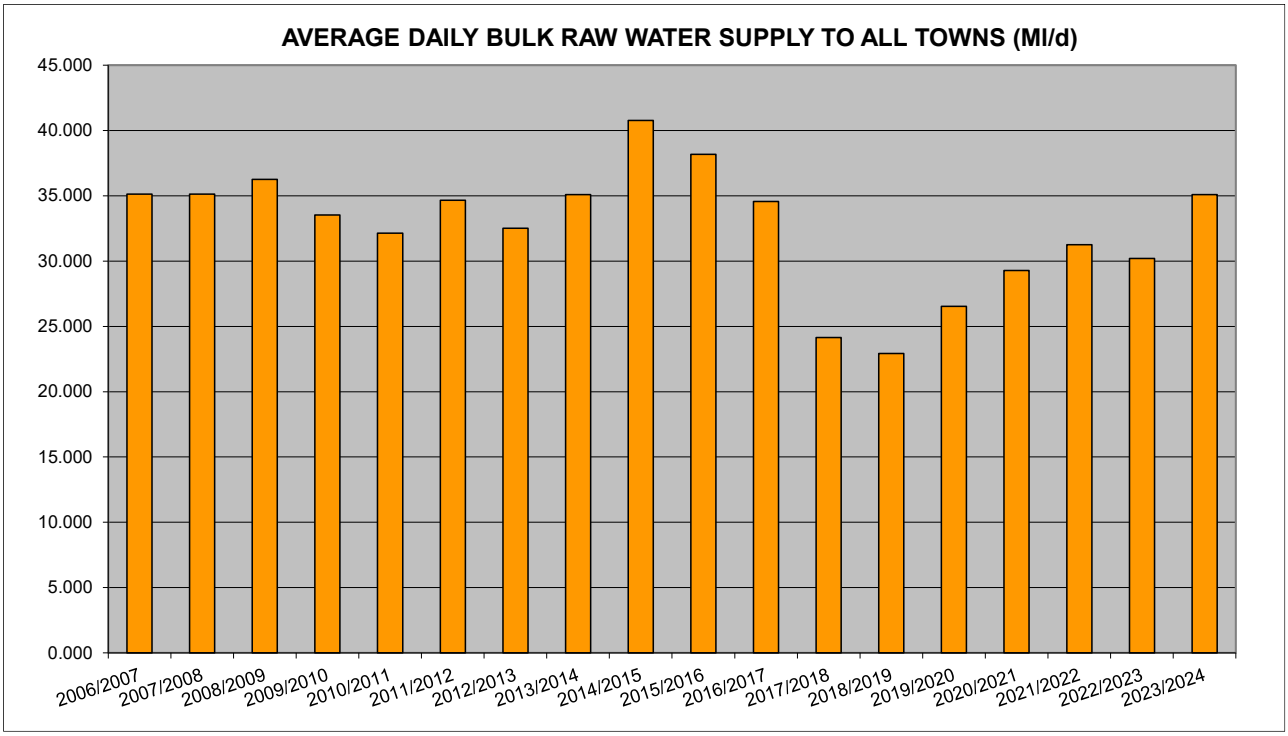
The Klapmuts system obtains potable water from the Wemmershoek pipeline, operated by the CCT, which forms part of the WCWSS. The water supplied to the Klapmuts system is treated at the Wemmershoek WTW.

Table 6.1.4: Authorised water use for the Klapmuts System

Source	Signed Service Level Agreement with CCT	Volume (Ml/a)	Comment
Wemmershoek (CCT)	Agreement Signed 2016	1 123.072	Agreement volume of 6 848 000 m³/a split proportional according to the 23/24 System Input Volume from the CCT for the various areas.
Total		**1 123.072**	

The table below gives an overview of the current water resources, the current volumes abstracted and authorised and whether the abstractions are registered and recorded.

Table 6.1.5: Current water sources and volumes



Current Water Sources							
Source Type	Scheme	Number of Sources	Current 23/24 Abstraction or Returns (Mm³/a)	Licensed Abstraction / Returns (Mm³/a)	Community Water Supply		Assessment Score
					Rural	Urban

Conjunctive use	-	-	-	-	-	-	-

The table below indicates the potential additional future water resources for Stellenbosch Municipality.

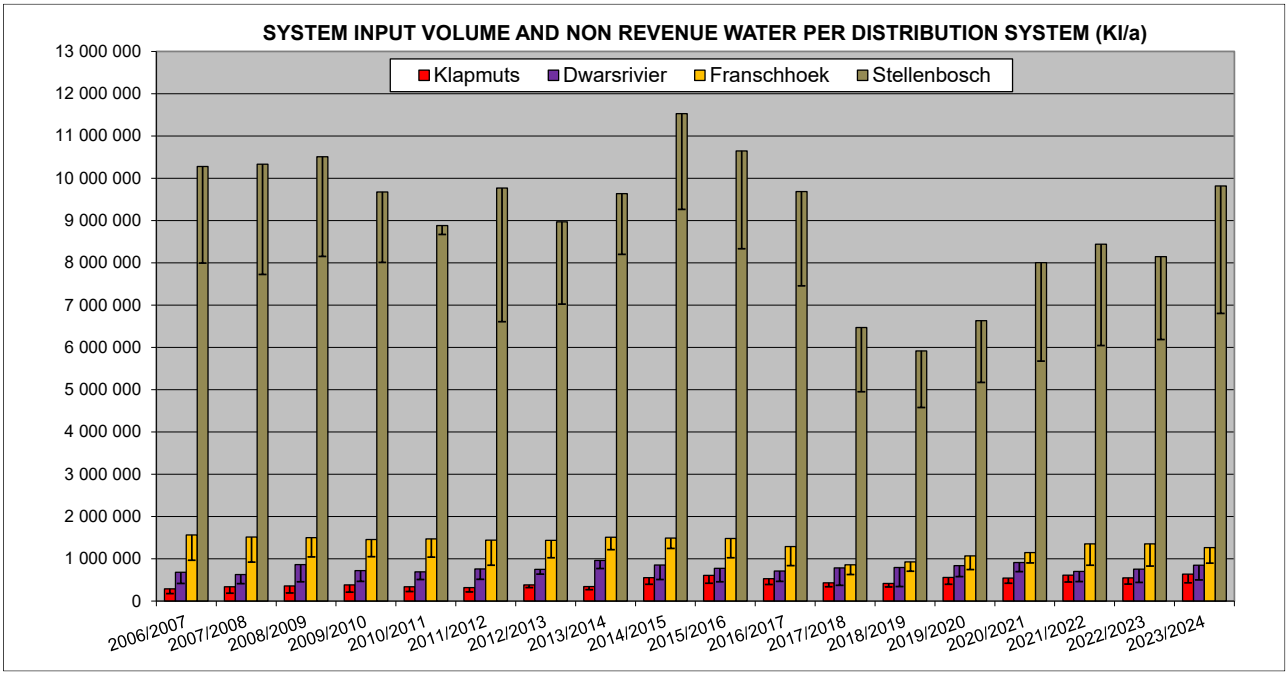

Table 6.1.6: Additional water resources and volumes

Source Type	Schemes	Number of Sources	Potential Volume (Mm^3/a)	Licensed Abstraction (Mm^3/a)
Groundwater	Stellenbosch	To be determined	1.598	WULAs will only be submitted when boreholes are developed.
	Dwars River	To be determined	0.365	
	Franschhoek	To be determined	1.054	
	Klapmuts	To be determined	0.473	
	Meerlust	To be determined	0.024	
	Koelenhof	To be determined	0.151	
Surface Water	-	-	-	-
Wastewater Reclamation	Stellenbosch	1	1.825	Detail investigations required first.
	Dwars River	1	0.365	
	Franschhoek	1	0.730	
	Klapmuts	1	0.255	
External Sources (Bulk Purchase)	Stellenbosch (CCT, Blackheath WTW)	1	1.140	Increased allocation from CCT
	Stellenbosch (WCWSS, Second Phase)	1	2.710	Increased allocation from WCWSS
	Other areas (CCT)	1	3.920	Increased allocation from CCT

The graph below gives an overview of the average daily raw water supply to all the towns in Stellenbosch Municipality. The impact of the drought experienced over the period 2015 to 2018 can be noted on the graph.

The graph below gives an overview of the total annual system input volumes and the NRW for the various water distribution systems in Stellenbosch Municipality's Management Area.

6.2 MONITORING

Stellenbosch Municipality has an established monitoring plan to monitor the volume of water supplied to the various areas by the City of Cape Town and the volume of water abstracted from their own surface and ground water resources. IWA Water Balances figures are also reported to the DWS on a quarterly basis for all the water distribution systems.

6.2.1 Percentage of Water Abstracted Monitored: Surface Water

The table below gives an overview of the WARMS registered volumes of the individual surface water sources and the historical abstraction volumes from these sources for the last six financial years.

Table 6.2.1.1: Quantity of water abstracted: Surface Water

Scheme	Source	WARMS Registration (Ml/a)	Record : Prior (Ml/a)					2023/2024
			2018/2019	2019/2020	2020/2021	2021/2022	2022/2023	
Stellenbosch	Eerste River (RW)	7 224.000	4 026.022	3 638.217	4 836.881	4 632.684	3 889.139	4 333.228
Franschhoek	Perdekloof (SI)	576.648	198.372	228.473	199.107	132.810	220.617	188.309
Total		**7 800.648**	**4 224.394**	**3 866.690**	**5 035.988**	**4 765.494**	**4 109.756**	**4 521.537**
Percentage of all sources			**50.5%**	**39.9%**	**47.1%**	**41.8%**	**37.3%**	**35.3%**

Notes: RW – Raw Water Volume and SI – System Input Volume

The abstraction from all the surface water sources are monitored monthly by Stellenbosch Municipality and is a valuable source of information in terms of the IWA water balances for the various water distribution systems.

6.2.2 Percentage of Water Abstracted Monitored: Groundwater

The table below gives an overview of the overall groundwater licence volume of the production boreholes and the historical abstraction volumes from these boreholes for the last six financial years.

Table 6.2.2.1: Quantity of water abstracted: Groundwater

Scheme	Borehole / Well Number	Licensed abstraction (Ml/a)	Record : Prior (Ml/a)					2023/2024
			2018/2019	2019/2020	2020/2021	2021/2022	2022/2023	
Stellenbosch	Various Boreholes	2 040.905	321.339	190.177	0.000	0.000	0.000	0.000
Total		**2 040.905**	**321.339**	**190.177**	**0.000**	**0.000**	**0.000**	**0.000**
Percentage of all sources			**3.8%**	**2.0%**	**0.0%**	**0.0%**	**0.0%**	**0.0%**

The abstraction from all the boreholes are monitored monthly by Stellenbosch Municipality and is a valuable source of information in terms of the IWA water balances for the various water distribution systems. It also enables Stellenbosch Municipality to operate their groundwater management system efficiently and to prevent any over abstraction of boreholes.

6.2.3 Percentage of Water Abstracted Monitored: External Sources (Bulk Purchase)

Raw water is supplied to the Paradyskloof WTW form the WCWSS and potable water is supplied by the CCT to the Franschhoek, Dwars River, Klapmuts systems and some of the other areas in Stellenbosch Municipality's Management Area to supplement the supply from the Municipality's own local sources. The bulk potable water supplied by the CCT to Stellenbosch Municipality is from their Wemmershoek-, Faure- and Blackheath WTW.

Table 6.2.3.1: Quantity of water abstracted: External Sources (Bulk Purchase)

Scheme	Name	Contracted Supply Volume (Ml/a)	Record : Prior (Ml/a)					2023/2024
			2018/2019	2019/2020	2020/2021	2021/2022	2022/2023	
Stellenbosch	WCWSS (Raw Water)	3 000.000	1 145.346	2 568.874	2 254.120	3 296.201	3 417.667	4 391.814

Total		**9 848.000**	**3 818.896**	**5 625.289**	**5 647.480**	**6 640.276**	**6 912.044**	**8 285.681**
Percentage of all sources			**45.7%**	**58.1%**	**52.9%**	**58.2%**	**62.7%**	**64.7%**

Note: * Agreement volume of 6 848 000 m³/a split proportional according to the 23/24 System Input Volume from the CCT for the various areas.

6.2.4 Surface Water Levels

Table 6.2.4.1: Surface water levels monitored

Scheme	Monitoring Intervals
Stellenbosch (Jonkershoek Weir)	Daily
Franschhoek (Perdekloof Weir)	Weekly

Note: Monitoring Intervals: 1 – Daily, 2 – Weekly, 3 – Monthly, 4 – Annually, 5 - Never

6.2.5 Groundwater Levels

In order to establish the optimum abstraction rates from the production boreholes and to ensure the aquifer is not over-pumped, it is essential that groundwater levels and abstraction be monitored on a regular basis. In addition to the production boreholes, nearby un-used boreholes should also be monitored, as these provide a better indication than the production boreholes on the status of the aquifer.

Table 6.2.5.1: Groundwater levels monitored

Distribution System	Monitoring Intervals
Stellenbosch	Boreholes currently not in use

Note: Monitoring Intervals: 1 – Daily, 2 – Weekly, 3 – Monthly, 4 – Annually, 5 - Never

6.2.6 Water Quality for Formal Schemes

The Compulsory National Standards (Regulations under Section 9 of the Water Services Act) on quality of potable water state that a WSA must include a suitable programme for sampling the quality of potable water provided to consumers within its WSDP. The intention of this regulation is to ensure that WSAs provide potable water that is safe for human consumption, suitable for drinking, for preparation of food, for personal hygiene and not harmful to water supply installations and domestic appliances. Stellenbosch Municipality's Operational and Compliance Water Quality Sampling Programmes and the parameters monitored are included in Table 8.1.7.2 of Topic 8. The Operational and Compliance Wastewater Quality Sampling Programmes and the parameters monitored are included in Table 8.1.9.2 of Topic 8.

The current Water Safety Plan (February 2013) for the water resources and the water distribution systems is outdated and needs to be reviewed and updated. The W_2RAPs for the WWTWs and the sewer drainage areas were drafted in August 2021 and also need to be reviewed and updated.

Water Safety Plans are a form of water quality assurance through a comprehensive risk assessment and risk management approach that encompasses all steps in water supply from catchment to consumer. The multiple barrier principle implies that actions are required at all stages in the process of producing and distributing water in order to protect water quality. This includes source protection, treatment through several different stages and prevention of contamination during distribution to each individual household.

The W_2RAP is an all-inclusive risk analysis tool by which risks associated with the management of collection, treatment and disposal of wastewater are identified and rated (quantified). The W_2RAP is used by Stellenbosch Municipality to manage the identified risks according to its potential impacts on the receiving environment / community / resources.

Stellenbosch Municipality actively implements their Operational and Compliance Water and Effluent Quality Sampling Programmes in order to promptly identify water and effluent quality failures and to react accordingly.

Table 6.2.6.1: Water quality monitored for formal schemes

Scheme	Monitoring Intervals
Stellenbosch / Faure / Blackheath	Hourly, Two Hourly, Six Hourly, Daily, Bi-Weekly
Franschhoek	Bi-Weekly
Dwars River	Bi-Weekly

Stellenbosch	Die Braak BH	Daily when in use
	Van Der Stel Sport Ground BH	Daily when in use
	Cloetesville Sport Ground BH	Daily when in use

Note: Monitoring Intervals: 1 – Daily, 2 – Weekly, 3 – Monthly, 4 – Annually, 5 - Never

6.3 WATER QUALITY

Quality of water returned to the resource is increasingly becoming an issue in South Africa. Water quality is regulated according to permits, licenses and standards and it is very important that these be put in place if not already effective.

The water returned to the resource may be from either point source e.g. WWTWs, the quality of which will be measurable, or diffuse sources e.g. grey water from informal settlements the quality of which will be less easy to measure.

Different types of pollution need to be dealt with in this section, both from “point” (e.g. an industry) and “diffuse” (e.g. an informal settlement or agricultural holding) sources.

Point sources: refer to discharges from identifiable users at a point (generally a pipe discharging to a stream). Often this is associated with industries but also includes WWTWs that may discharge water- containing waste back to a resource. For industries not discharging directly to a resource but to the sewer, the WSA needs to monitor the types of chemicals being disposed of and that these are disposed of to the WWTWs within the parameters laid down in bylaws. In this way, the effluent can be treated effectively with no adverse effects on the WWTWs’ operation. If these sources are polluting directly to a resource because of, for example, poor storm water management, steps need to be taken to ensure that these flows are directed through treatment works.

It is therefore important for the WSA to monitor the types of effluent being disposed of into the sewers as well as the discharges from the WWTWs itself.

Diffuse sources of pollution refer to a number of cases where polluted water is returned to the resource (both surface and groundwater) without being treated. This mainly occurs when:

- There are no, or poorly managed storm water systems which results in run-off and pollution of water sources.
- There are poorly operated and maintained sanitation facilities e.g. blocked sewers, pump failures etc. leading to sewage leaks and pollution of water resources.
- There is runoff from informal settlements (e.g. where standpipes are poorly designed with no drainage system).

- There are inadequate sewage works.
- Sludge from pit latrines is not disposed of adequately. To avoid this, the use of double pits could be explored.
- There is run-off from solid waste sites (e.g. where no leachate collection system exists).
- There is run-off from agricultural areas e.g. feedlots, cultivated lands. The most urgent task to be undertaken is for the WSA to find out where there are problems and prioritise those areas that represent the greatest threat to water quality. The WSA needs to address the above (i.e. both point and diffuse sources of pollution).

Table 6.3.1. Water Quality

Water Quality Component	In Place? Yes/No	Status Quo (%)
Is there a Water Safety Plan in Place?	Yes	40%
Reporting on quality of water taken from source: Urban and Rural	Yes	80%
Quality of water returned to the resource: Urban	Yes	60%
Quality of water returned to the resource: Rural	No	Not Applicable
Is there a pollution contingency measures plan in place?	Yes	60%
Quality of water taken from source: Urban - % monitored by WSA self?	Yes	80%
Quality of water taken from source: Rural - % monitored by WSA self?	No	Not Applicable
Quality of water returned to the source: Urban - % monitored by WSA self?	Yes	60%
Quality of water returned to the source: Rural - % monitored by WSA self?	No	Not Applicable
Are these results available in electronic format?	Yes	80%
% Time within SANS241 standards per year	Yes	80%

Note: Percentage in the above table: None – 0%, Limited – 20%, Partial – 40%, Good – 60% and Excellent – 80%.

WATER SAFETY PLAN AND INCIDENT RESPONSE MANAGEMENT

DWS's 2022 Blue Drop requirements for drinking water quality management were as follows (Indicators for evaluation of blue drop status).

Table 6.3.2: DWS's 2022 Blue Drop Certification Standards and Requirements

Requirements	Sub Requirements
Criteria 1: Capacity Management	
1.a: Registration of Water Treatment Plant	The water treatment facility is registered as per the requirements of Regulation 2834 or as per Blue Drop Standard (Draft Regulation 813). Evidence: 1) Classification Certificate for WTW
1.b: Registration of Process Controllers & Supervisor	Process Controllers and Supervisors are classified as per Reg. 2834 or draft Reg. 813 (Blue Drop Standard). This requirements will apply for all shifts or a specific water supply system. Evidence: 1) Copies of Registration Certificates of Process Controllers and Supervisors. 2) Copies of the classification certificates of all Process Controllers / Operators and Supervisors / Superintendents must be uploaded on the IRIS. 3) Compliance with Reg. 2834 coupled with shift details; WSI must indicate shift patterns or measures in place when a shift does not comply with Regulatory Process Control requirements. 4) WSI must indicate Process Controllers and / or Supervisors that are "shared" across different plants / sites.
1.c: Maintenance Capacity	The water system must be served by a competent maintenance team (internal or outsourced), executing the maintenance work according to an acceptable maintenance plan / schedule. Evidence: 1) The plant and pump stations (both mechanical and electrical). Internal or evidence of outsourced. 2) Term Contract (Outsourced) or Organisational Structure (Internal). 3) Proof of team competency (Qualification & Experience & Trade Test). 4) Provide a site specific operation and maintenance schedule. 5) Logbook with maintenance entries as per maintenance plan.
1.d: Engineering Management Capacity	The WSI must ensure that a competent engineering specialist oversee water treatment and supply operations, maintenance and general asset management. Evidence: 1) Number of Engineering staff available in the WSI taking responsibility for Maintenance Planning and General Asset Management.

Table 6.3.2: DWS's 2022 Blue Drop Certification Standards and Requirements	
Requirements	**Sub Requirements**
1.e: Scientific Capacity	The WSI must ensure that a suitably qualified professional scientist oversee the implementation of the Operational and Compliance monitoring programme (sampling and analyses). Evidence: 1) Number of Scientific Staff appointed for the management of drinking water quality management, incl. implementation of the water safety planning process and monitoring programme, sampling and analyses.
Criteria 2: Drinking Water Quality Risk Management	
2.a: Water Safety Planning	The WSI must has a Water Safety Plan in place which complies to the World Health Organisation's guide for water safety planning, in terms of competencies, comprehensive DWQ risk assessment, control measures, monitoring programmes, etc., providing for a risk management approach to drinking water quality monitoring for the water supply system. A WSI could have an overarching water safety plan, but it shall have reference to all requirements for each water supply system. Evidence: The WSI must provide a water safety plan, adhering to WHO standards: 1)Team Assembled. 2) System detailed in the Plan. 3) Plan reviewed in past 3 years. 4) Detailing system-specific Hazard / Risk Assessment 5) Adequate Control measures identified (Planned for- or implemented). Proof that the Water Safety Plan has been approved by Council).
2.b: Operational Monitoring	Each WTW will have an operational monitoring programme in place which informs the operational treatment efficacy (as per the required frequency) of the treatment facility as per SANS 241. Evidence: Details of Operational Monitoring 1) Proof of Operational Monitoring sites, determinands and frequency. 2) Samples must include i) inflow (raw), ii) pre-filtration, iii) post-filtration, iv) final, v) network. 3) Determinands monitored must at least incl. pH, Turbidity, Free Chlorine (Final). 4) As per Authorization measure abstraction rates (Ml/d).
2.c: Compliance Monitoring	Each WTW will have a compliance monitoring programme in place (implemented), informed by the Water Safety Planning process, and SANS 241 requirements, as per the required frequency, determinands and sampling points. Evidence: Details of Compliance Monitoring Programme: 1) Compliance monitoring sampling sites informed by Water Safety Planning Process. 2) Determinands monitored for informed risk assessment process.
2.d: Laboratory Credibility	All compliance monitoring samples must be analysed at a credible laboratory (either accredited according to SANAS requirements or participating in a Proficiency Testing scheme with acceptable Z-scores) for the required determinands, with an acceptable turnaround time. Evidence: WSI must prove that all compliance samples are analysed at a credible laboratory 1) Certificate of Accreditation for applicable methods or Z-scores results in a recognised Proficiency Testing Scheme. 2) Or proof of intra- and inter-laboratory proficiency (quality assurance as prescribed in Standard Methods).
2.e: Incident Management Protocol	As part of the DWQ Risk Management preparedness the WSI should have an Incident Management Protocol in place and an Incident Register detailing incident, causes, rectification and timeframes. The Treatment works will have a WTW Logbook to record all treatment process related incidents. Evidence: WSI must have an Incident Management Protocol to guide reaction should there be a failure in DWQ; Detailing Communication Processes and Treatment Process protocols 1) A DWQ Incident Register detailing i) Incidents. ii) Causative factors. iii) Rectification. iv) Timeframes. 2) A WTW Logbook detailing all treatment process related incidents.
Criteria 3: Financial Management	
3.a: Water Supply Operations	The WSI must determine the actual operations and maintenance cost of water treatment and supply (reticulation) per water supply scheme and express this in R/m3. (This determination should include energy use for treatment and pumping) Evidence: 1) Municipality / WSI must provide evidence of a proper O&M cost determination for the entire water supply system (treatment works, network, pumpstations) This must at least include the Energy Consumption, Compensation of Employees, Chemical Cost and Maintenance Cost drivers. 2) Provide an operational cost determination per m³ treated.
3.b: Water Treatment and Supply O&M Budget	The WSI must have an annual O&M budget per water supply system, for water treatment and supply / reticulation. Evidence: The WSI must provide proof of the water treatment system Operations & Maintenance Budget per annum (for the audit period) -Including the water treatment works, bulk distribution and reticulation.
3.c: Water Treatment and Supply O&M Expenditure	WSI must provide evidence of the water treatment and supply O&M expenditure per annum (to be measured in relation to the original budget). Evidence: WSI to provide proof of the water treatment system O&M expenditure per annum.
3.d: Supply Chain Management of services and Treatment Products	There must be appropriate supply chain management process in place to ensure continuous availability of treatment chemicals (and related consumables), maintenance and spares. Evidence: WSI must provide proof of approved contracts for outsourced Technical Services (i.e. maintenance, spares, calibration) and supply of chemical and treatment consumables (where applicable).
3.e: Capital Budget and Expenditure	The WSI must provide current (and planned) capital budget and expenditure for refurbishment and/or upgrades of the specific water treatment and supply system. Evidence: In terms of refurbishment or

Table 6.3.2: DWS's 2022 Blue Drop Certification Standards and Requirements	
Requirements	**Sub Requirements**
	upgrades, the WSI must provide the capital budget for treatment and supply system and expenditure to date.
Criteria 4: Technical Management	
4.a: Water Treatment Works Design and Supply Capacity Management	The WSI must be authorised for a Section 21(a) water use, measure operations (volumes treated per day) accordingly and record for planning and audit purposes. It is also required to have a record of the available supply/pumping capacity to convey water to reservoir(s). Evidence: 1) Documented design capacity of the water treatment facility. 2) Documented daily water treatment volumes (over 12 months of assessed period) in Ml/d. 3) WSI is required to provide a motivation / proof of accuracy of meter readings (calibration or verification).
4.b: Process Audit	A water treatment facility must be subjected to an annual condition assessment and/or a Process Audit (conducted by a duly qualified professional person) to inform functionality of the infrastructure. Risk findings must be incorporated in the Water Safety Planning process. Evidence: 1) Condition Assessment report (conducted by a qualified engineering/technical/scientific internal resource). Evidence required of audit findings and recommendations on treatment facility status (Jul '21 to Sept '23). 2) Process Audit report (conducted by a duly qualified independent professional person) to include the (design) capability of the plant to meet compliance standards, as well as actual performance of unit processes (Period: Jul '15 to Sept '23). 3) Evidence/plan of implementation of 1) or 2) audit recommendations during year(s) following Audit Report.
4.c: Water Reticulation Inspection	The WSI shall ensure that the water supply system is subjected to at least an annual inspection to determine asset condition of pump-stations, reservoirs, and the network in general. The results of this inspection must inform the water safety planning process, especially the reservoirs. Evidence: 1) Site inspection and report on water reticulation network (incl. pump station/s and reservoirs). 2) Provide evidence in form of capacity and condition assessment/audit description, findings, and recommendations of system. 3) Report to include a water flow balance that provides an indication of Unaccounted for Water.
4.d: Water Treatment and Supply Asset Management	Water Infrastructure must be included in the WSI Asset Register (as per AGSA requirements). Evidence: 1) Updated Water Treatment and Supply Infrastructure / Asset Register 2) Asset Register must detail relevant equipment and infrastructure, asset description, location, condition, RUL and replacement value. 3) Proof that Asset Register is used to inform Maintenance Plan.
Criteria 5: Drinking Water Quality Compliance	
5.a: Monitoring Data Submission to DWS	A WSI must ensure that all Compliance Monitoring data is submitted on a monthly basis to the Department of Water and Sanitation on the required Regulatory System (IRIS) (12 months). Compliance monitoring must be adhering to the water safety planning informed monitoring programme. Evidence: 1) The WSI should ensure that all DWQ data (compliance incl. risk-based) is submitted to the DWS 2) Data submitted for 12 months of the audit period. 3) All sampling results submitted as per the WSP monitoring programme. 4) Submitted on the IRIS.
5.b: Microbiological Compliance	The Microbiological Quality of water supply must comply with the South African National Standard (SANS241: 2015). Evidence: The Microbiological Quality of water supply must comply with the South African National Standard (SANS241) as per the Excellent Requirements set by the Blue Drop Programme.
5.c: Chemical Compliance	The Chemical Quality of water supply must comply with the South African National Standard (SANS241: 2015), for both Acute and Chronic health determinands. Evidence: 1) The Chemical Quality of water supply must comply with the South African National Standard (SANS241) as per the Excellent Requirements set by the Blue Drop Programme. a) Chemical Acute Health Excellent Compliance (97% for < 100 000 and 99% for > 100 000) and Good Compliance (95% for < 100 000 and 97% for > 100 000). b) Chemical Chronic Health Excellent Compliance (95% for < 100 000 and 97% for > 100 000) and Good Compliance (93% for < 100 000 and 95% for > 100 000).
5.d: Risk-defined Compliance	All Determinands identified in the Risk Assessment Process must be included in the risk defined monitoring programme and must be measured for compliance with SANS 241 limits. Evidence: The Compliance of all Determinands identified during the Risk Assessment Process to be included in the risk-defined monitoring programme, must comply with the requirements set in the SANS 241 (Excellent Compliance 95% for < 100 000 and 97% for > 100 000 and Good Compliance 93% for < 100 000 and 95% for > 100 000)
5.e: Water Treatment Efficiency Index	The compliance of operational determinands as monitored at the final water sampling point must comply with SANS 241 Requirements. Evidence: The compliance of operational determinands as monitored at the Final Water sampling point must comply with the SANS 241 Requirements. (Excellent Compliance 93% for < 100 000 and 95% for > 100 000 and Good Compliance 90% for < 100 000 and 93% for > 100 000)
Criteria 6: Bonus	
6.a: Process Controller Training	Process controllers and supervisory staff must be subjected to relevant training over the past 24 months as from the date of audit. Cross-pollination and in-house training will be acknowledged as non-accredited

Table 6.3.2: DWS's 2022 Blue Drop Certification Standards and Requirements	
Requirements	**Sub Requirements**
	capacity building. Evidence: 1) Proof of Process Controller and Supervisor staff being subjected to relevant training past 24 months. 2) Evidence must include training dates, subject, attendees, trainer – certificates of training will be an advantage. 2) Technical or Process Control related, incl. OHS training. 3) Training can be accredited or 'credible' training. 4) Cross-pollination and in-house training will be acknowledged as non-accredited capacity building.
6.b: Performance Agreement	Institutional arrangement between the WSA and the Water Services Provider, then it is essential that the legislatively required contract (Section 19 of the Water Services Act) stipulate the Service Level Agreements between the two entities. Evidence: 1) A copy of the workplan and Performance Agreements of DWQ Management between the WSA and WSP as per Section 78 arrangements, aligned to Water Treatment Operations Requirements and SANS 241 compliance targets. 2) A copy of the Performance Agreement between the responsible manager (official) which stipulates Drinking Water Quality Management responsibilities and performance expectations related to supply and quality (SANS 241).
6.c: Publication of Drinking Water Results	The WSI takes responsibility to inform the public of quality of drinking water supplied. Evidence 1) Evidence on the various means of drinking water quality information made public to constituencies supplied with drinking water from this specific water supply system. 2) Newspaper publication, Municipal billing, Community Radio, Annual Report, Posters & Pamphlets, Population and promotion of "My Water" or Electronic Webpage. 3) Water Services Institutions must provide evidence of adequate marketing of Blue Drop registered water supply systems.
6.d: Water Demand Management	WSI has a water balance of its water supply system in terms of Section 11 Regulation 509 developed under Section 9 of the Water Services Act. Evidence: Water Conservation and Water Demand Management Plan which provides a strategy and work plan that identify, quantify, monitor and manage leakages and water losses of any kind. The bonus will be maximised should a Water Balance be provided (IWA standard or better).
Criteria 7: Penalties	
7.a: Data Variances and Discrepancies	A penalty will be applied if hardcopy records present differences to what was uploaded onto IRIS or reported to the public. Evidence: A Disqualifying Penalty will apply should the Department find proof during / post assessment that the WSI is guilty of an offence as per Section 82 of the Water Services Act, by only submitting partial or false information in order to present a false impression of DWQ performance and/or compliance.
7.b: Less than 11 Months of Compliance Data	If less than 11 months' data is available to assess compliance. Evidence: A WSI will be penalised if less than 11 months compliance data is uploaded on IRIS.
7.c: Non-Notification of Drinking Water Failure	Should the WSI fail to present evidence of an Adverse Water Quality Alert Notice (incl. Boil Water Notice) issued for significant (sustained) failures exceeding 48hours. Evidence: If any Directive/ non-compliance letter was issued a year prior or during the BD Assessment Period by the Department or Delegated Authority to the WSI for the specific WTW or water supply system, then the WSI should present proof of attempts made to adhere to Directive/ non-compliance letter Requirements.
Criteria 8: Disqualifier (s)	
8: That a WSI will be disqualified from being eligible for Blue Drop status or positive scoring if: 1) There is evidence of falsifying any information related to the Drinking Water Quality Management. 2) A system fails to meet compliance levels in Microbiological and Chemical quality compliance. 3) Less than 9 months of water quality data is available.	

Stellenbosch Municipality's Water Safety Plan is outdated and needs to be reviewed. A qualified, dedicated team needs to be established by Stellenbosch Municipality to compile their Water Safety Plan. A detailed risk assessment needs to be executed and the existing control measures implemented by Stellenbosch Municipality need to be summarised. Improvement / Upgrade Plans also need to be developed with relevant Water and Safety Management Procedures. Each identified improvement needs to be linked to one of the Water Safety Plan Team members to take responsibility for implementation together with an appropriate time frame for implementation of these controls.

The updated Water Safety Plan of Stellenbosch Municipality needs to include the following three key components:

- ***System assessment,*** which determines whether the drinking water supply chain (up to the point of consumption) as a whole can deliver water of a quality which meets national standards.

- Identification of ***control measures*** in the drinking water systems that will collectively control identified risks and ensure that health based targets are met. Appropriate means of ***operational monitoring*** needs to be defined for each control measure identified, that will ensure that any deviation from the required performance to be rapidly detected in a timely manner.

- ***Management*** plans describing actions taken during normal operation or incident conditions and documenting the system assessment (including upgrade and improvement), monitoring and communication plans and supporting programmes.

Many actions are important in ensuring drinking water safety but do not directly affect drinking water quality and are therefore not control measures. These are referred to as supporting programmes and are activities that ensure the operating environment, equipment used and the people themselves do not become an additional source of potential hazards to the drinking water supply. The existing Supporting programmes of Stellenbosch Municipality need to be included in the Water Safety Plan.

Codes of good operating, management and hygienic practice are essential elements of supporting programmes. The codes in place at Stellenbosch Municipality needs to be included in the Water Safety Plan.

An Incident Management Protocol (IMP) needs to guide Stellenbosch Municipality's response to resolution and communication of drinking water quality failures (as defined according to the latest version of SANS 241). The objective of Stellenbosch Municipality's IMP needs to ensure that the failures are dealt with and are managed in an efficient and effective manner, using a consultative and transparent approach. The Water Services Act (No.108 of 1997) states that Water Services Institutions must take reasonable steps in an emergency situation to address incidents and to minimise the health risks.

The goal of Water and Safety Management Procedures is to highlight the procedures / protocols to be implemented and adhered to by Stellenbosch Municipality and needs to form part of Stellenbosch Municipality's Incident Management Protocol.

The Water Safety Plan Team of Stellenbosch Municipality, once established, needs to meet regularly to review all aspects of the Water Safety Plan to ensure that it is still accurate. In addition to the regular three year review, the Water Safety Plan also needs to be reviewed when, for example, a new water source is developed, major treatment improvements are planned and brought into use, or after a major water quality incident.

W_2RAP AND FAILURE RESPONSE MANAGEMENT

DWS's 2025 Green Drop requirements for waste water collection and treatment include the following (Indicators for evaluation of Green drop status).

Table 6.3.3: DWS's 2025 Green Drop requirements for waste water treatment and collection

Key Performance Area	Sub-Requirements
Criteria A: Capacity Management	
A.1: Registration of Wastewater Treatment Plant	a) The wastewater treatment facility is registered as per requirements of Reg. 3630 / 2834
A.2: Registration of Process Controllers and Supervisor	a) Copies of Registration Certificates of Process Controllers and Supervisor(s). b) Copies of the classification certificates of all process controllers/operators and supervisors/superintendents must be uploaded on IRIS.

Table 6.3.3: DWS's 2025 Green Drop requirements for waste water treatment and collection	
	c) Compliance with Reg. 3630 / 2834 (must comply at least 50% in each of the shifts); WSI must indicate shift patterns or measures in place when a shift does not comply with regulatory Process Control requirements. d) WSI must indicate process controllers and/or supervisors that are 'shared' across different plants/sites.
A.3: Maintenance Capacity	a) Evidence of Maintenance Team used for general maintenance work at the plant and pump stations (both mechanical and electrical) - (Internal or evidence of Outsourced Term Contract). b) Information on in-house staff (or organogram) or external contractor/s. c) Provide additional proof of competency of team (e.g. Qualification and Experience and Trade-test). d) Provide a site-specific operation and maintenance schedule (routine / scheduled). e) Contract or Logbook with maintenance entries to serve as evidence of the above aspects.
A.4: Engineering Management Capacity	Number of Engineering Staff available in the Municipality taking responsibility for Maintenance Planning and General Asset Management): a) 1 x Engineering Technician; b) 1 x Engineering Technologist; c) 1 x Engineer, or d) More than one of the above.
A.5: Scientific Capacity: Sampling and Laboratory Information Management (Advanced Systems only)	Number of Scientific Staff appointed for the management of wastewater treatment management, incl. sampling and analyses: a) 1 x Candidate Scientist; b) 1 x Professional Scientist, or c) More than one of the above.
Criteria B: Environmental Management	
B.1: Wastewater Risk Management	a) A Risk Register available on all risks posed by the wastewater collection and treatment processes to the immediate environment. The register must include risks and measures pertaining to unlocking green /brown field developments where bulk infrastructure shortcomings is unable to support development and investment through water efficient or dry sanitation, i.e. off-grit, water efficient sanitation solutions (WESS) and related concepts (Not older than 3 years and dated and signed before end Febr 2025). b) A Wastewater Risk Abatement Plan; is the more advanced standard but will only be accepted if not older than 3 years, and approved by Management. - A practical and site-specific Wastewater Risk Abatement Plan (W_2RAP) is in place which identify and prioritise risks, with measures to mitigate inefficiencies/inadequacies that result in non-compliance – The W_2RAP must include risks and measures pertaining to the entrenchment of WESS concepts as outlined above, to receive a full score. c) Implementation evidence and proof of management commitment. Providing evidence of risk mitigation (identified during the audit period).
B.2: Operational Monitoring	Details of Operational Monitoring: a) Proof of Operational Monitoring sites, determinands and frequency; b) Samples must include: i) inflow, ii) outflow, iii) process flows, iv) sludge; c) Determinands monitored; d) As per Authorisation / as per best practice per technology type; e) Frequency: as per Authorisation /as per best practice.
B.3: Compliance Monitoring (Effluent)	Details of Compliance Monitoring (For ALL Effluent Discharges). a) Sampling Sites as per Authorisation; b) Determinands as per Authorisation (This would include determinands not categorised as Microbiological, Chemical or Physical, e.g. SAR, biomonitoring) ; c) Sampling frequency occurs as per Authorisation Requirements Note1: For zero-effluent treatment systems - still need to monitor for impact on catchment / environment (for both lined and unlined systems). Where oxidation ponds are producing effluent for irrigational purposes then General Limits apply. Note 2: A monitoring programme alone will not be sufficient to obtain full score; Analyses results should proof implementation of the monitoring programme.
B.4: Sludge Classification and Monitoring (Advanced Systems Only)	a) Proof of Sludge Classification b) Provide Sludge Treatment Monitoring Programme c) Provide Sludge Monitoring Results d) Sludge Handling and Management Plan
B.5: Laboratory Credibility	a) Name lab(s) for operational analysis (in-house or on-site) and lab for compliance analysis/checks (in-house or external)

Table 6.3.3: DWS's 2025 Green Drop requirements for waste water treatment and collection	
	b) Certificate of Accreditation for applicable methods c) Or Z-scores results following participation a recognised Proficiency Testing Scheme (–2 ≥ z-score ≥ 2 are unacceptable) d) Or Proof of Intra- and Inter-laboratory proficiency (quality assurance as prescribed in Standard Methods) e) Proof Turn Around time allows for proper process control (less than 5 days)
Criteria C: Financial Management	
C.1: Wastewater Operations Cost Determination	a) WSI must provide evidence of a proper operations cost determination for the entire wastewater system (incl. Pump stations). This must at least incl.: i) Energy Consumption; ii) Compensation of Employees; iii) Chemical cost; iv) Maintenance cost, etc. b) Provide an operational cost determination per m^3 treated. Note: budget / cost excluding interest and redemption on capital
C.2: Energy Demand	WSI is able to provide DWS with proof of Energy Efficiency Management: a) Energy Demand figures: Current and 3-year Projections (Energy Efficiency Management), based upon Specific Power Consumption (SPC, kWh/m^3), and b) Energy unit cost (R/kWh) and energy consumption figures for the specific WWTW (R/m^3).
C.3: Operations and Maintenance Budget	WSI to provide proof of the wastewater system O&M Budget per annum (amended budget).
C.4: Operations and Maintenance Expenditure	WSI to provide proof of the wastewater system O&M Expenditure per annum. Note: budget / cost excluding interest and redemption on capital. (Calculation: Comparing Expenditure / m³ vs Cost Determination / m³
C.5: Supply Chain Management of Services and Treatment Products (Advanced Systems only)	WSI must provide proof of approved contracts for Outsourced services (i.e. Maintenance) and Treatment Chemical Supplies.
Criteria D: Technical Management	
D.1: Wastewater Treatment Works Design Capacity Management	a) Documented design capacity (hydraulic and organic) of the wastewater treatment facility. i) Design capacity as Average Dry Weather Flow (ADWF) and COD load to the plant; and b) Documented daily receiving flows over the 12 months of assessed period (ideally ≤ than design capacity) i) Evidence of daily flows and subsequent calculated averages. Measurement method to be explained. ii) Evidence of peak wet weather flow to plant during rain events (record rain event and flow to plant). iii) Evidence of minimum night flow (minimum monitoring: monthly) iv) WSI is required to provide motivation/proof of accuracy of meter readings c) Monitoring of outflow volumes (available records).
D.2: Process Audit	a) Condition Assessment report (conducted by a technically/scientifically qualified municipal official); evidence required of audit findings and recommendations on treatment facility status (Previous Audit year up until Feb '25) OR The Process Audit (conducted by a duly qualified independent professional person) to include the (design) capability of the plant to meet compliance standards, as well as actual performance of plant (Period: Oct '22 to Feb '25). b) Evidence/plan of implementation of findings during year(s) following Audit Report required.
D.3: Sewer Main Inspection	Site inspection of sewer reticulation network and pump-station/s. Provide evidence in form of capacity and conditional assessment/audit and recommendations of system. Report to include flow balance that provides evidence which % of total sewage is received at treatment plant. Note: both the process audit/Conditional Assessment and sewer network report could serve as baseline to the W_2RAP (may run concurrently with "system description and risk identification / rating") NB! Must report on Functionality of Pump stations in the Sewer Collector System.
D.4: Wastewater Asset Register	Updated sanitation / wastewater Infrastructure Asset Register a) Proof of Asset Register, evidence to be submitted. Asset register to include movable equipment and immovable infrastructure / assets with matching detail. The asset register must detail:

Table 6.3.3: DWS's 2025 Green Drop requirements for waste water treatment and collection	
	i) relevant equipment and infrastructure; ii) indicate asset description; iii) location; iv) condition (remaining useful life); and v) replacement value. b) Proof Asset Register is used to inform Maintenance Plan.
D.5: Bylaws and Enforcement (Local Regulation) (Advanced Systems only)	Proof of the a) Bylaws and b) Enforcement providing for the regulation of the municipal sewer system, incl. the following elements: i) industrial (trade) influent (volumes & quality) discharged into municipal system, ii) package plants, iii) decentralized systems, iv) vacuum tank discharges, v) Spillages into the environment, vi) Storm-water connections to sewer system, and iv) Off-grit, water efficient or dry sanitation, i.e. water efficient sanitation solutions (WESS). Will make up 50% of (a) score. Proof will be Council documents and/or agreements with developers – with alternative solutions (WESS) approved or implemented. For DPW and Private Plants: Copy of municipal bylaws and evidence of compliance to relevant sections.
Criteria E: Effluent and Sludge Quality Compliance	
E.1: Monitoring data submission to DWS	a) 12 months of Compliance Monitoring data submitted to DWS on the IRIS. b) Frequency: Monthly Submission (or as per Authorisation). c) WSA must ensure that 12 months' sets of results are submitted and recorded on the IRIS prior to the assessment. Note: All compliance results' data required. If proven that the system is not generating effluent, and oxidation pond content is strictly used as per Authorisation Conditions, then 12 months' data records not necessary but according to Authorisation requirements.
E.2: Water Use Authorisation	Copy of Water Use Authorisation, detailing Effluent Quality Standards. NOTE: List Standards to comply with (GA or License Conditions).
E.3: Effluent Quality Compliance	a) 90% Microbiological Compliance (e.g. E Coli; Faecal Coliforms) b) 90% Chemical Compliance (e.g. COD, Ammonia, Nitrogen, Nitrate, Nitrite, Chlorine, Ortho-Phosphates, Fluoride, Arsenic, Cadmium, Copper, Manganese, Iron, Selenium, Zinc, Boron, etc.) c) 90% Physical Compliance (e.g. pH, Suspended Solids, Electrical Conductivity, Soap, Oil or Grease, etc) Note: IRIS uses the above to calculate % CRR.
E.4: Sludge Quality Compliance (Advanced Systems Only)	a) Sludge treatment not managed / monitored (Monitoring records must be produced); b) In case of ponds systems, provide schedule for desludging of system.
Criteria F: Green Drop Bonuses	
F.1: Process Control Training	Proof of Process Controller staff being subjected to relevant training the past 24 months. Weighting will be shared where compliance to Reg 3630 in line with training, PC compliance and WWTW registration / classification requirements are proven. PrPC will be recognised under this incentive. Technical or Process Control related to OHS will be recognised, but OSH only will not receive full score.
F.2: Storm Water Management	Proof of a Storm-water management plan detailing how stormwater (or other extraneous flow e.g. groundwater) entry is quantified, managed and monitored to prevent entry to sewer systems. Plan should also include measures to prevent sewage from entering storm water systems. Evidence of implementation required.
F.3 Water Demand Management	Water Demand Management Plan which provides a strategy and/or work plan that identify, quantify, monitor and manage leakages and water losses of any kind that (may) create an artificial water demand due to higher hydraulic loading of wastewater collection and treatment infrastructure. The bonus will be maximised should a wastewater flow balance be provided. No Drop Assessment.
F.4 Capital Projects planned for upgrades or refurbishment of	Proof of approved business plans for utilizing MIG, WSIG or Municipal Capital Budget for upgrades of refurbishment.

Table 6.3.3: DWS's 2025 Green Drop requirements for waste water treatment and collection	
wastewater treatment and collector system	
F.5 Sludge Reuse	Provide proof of plant-specific initiatives that contribute to wastewater resource and climate resilience objectives: energy efficiency, energy generation, beneficial use of sludge, nutrients, etc. A full score will be awarded if the reduced footprint can be demonstrated (projected CO2 equivalents improved by the initiates).
F.6 Additional Impact Monitoring	Incl. Groundwater, up-stream / down-stream monitoring, biomonitoring.
F.7 Water efficient or dry sanitation solutions	Proof of council documents that relate to unlocking green/brown field developments through alternative water efficient or dry sanitation, i.e. water efficient sanitation solutions (WESS) Proof of number of households planned/implemented with WESS, and type of technologies/methods accepted.
Criteria G: Green Drop Penalties	
G.1: Wastewater Treatment Works operating beyond hydraulic design capacity.	a) Design capacity as Average Dry Weather Flow (ADWF) and COD load to the plant and b) Documented daily receiving flows over the 12months of assessed period (ideally ≤ than design capacity). Based on information provided in D.1 (Calculation).
G.2: Any sewer collector pump station dysfunctional causing long term spillage.	Based on information provided in D.3.
Criteria H: Disqualifier	
H.1: Withholding information	Disqualifying Penalty will apply should the Department find proof during / post assessment that the WSI is guilty of an offence as per Section 82 of the Water Services Act, by only submitting partial information in order to present a false impression of WWQ Performance and / or compliance.
H.2: Directive Status	If any Directive was issued over the GD Assessment Period by the Department or Delegated Authority to the WSI for this specific WWTW and/or system, then the WSI should present proof of attempts made to adhere to Directive Requirements.

W_2RAPs were drafted during 2021 for all the WWTWs and sewer drainage networks in Stellenbosch Municipality, which need to be updated. The W_2RAPs include the following sections.

- Introduction
- The W_2RAP Team
- Description of WWTW System
  - Catchment
  - Collection
  - Treatment
  - Management of the Works
- Influent Quantity and Quality
  - Influent Quantity
  - Influent Quality
- Receiving Environment and Final Effluent Quality
- Hazard Assessment
  - Cumulative Risk Rating
  - Weighted Risk Assessment
- Control Measurements
- Monitoring of Control Measurements and Response Protocol

  - Operational Alert Levels
  - Verification of Functioning of W_2RAP
- Incident Management Plan
- Conclusion
- Recommendation
  - Risks to be addressed
  - Way Forward

A detailed risk assessment was executed. A list of potential hazards and hazardous events were compiled and worked through with the W_2RAP Team. The impact of each of the hazards or hazardous events were characterised by assessing the severity of the likely health outcome and the probability of occurrence.

An Improvement / Upgrade Plan was compiled for all the existing significant risks, where the existing controls were not effective or absent. **The Corrective Action / Control Measures were not linked to one of the W_2RAP Team members to take responsibility for implementation together with an appropriate time frame for implementation of these controls, which need to be addressed when the W_2RAPs are updated.**

Stellenbosch Municipality implements the proposed Management Procedures and Incident Response and Emergency Protocols, in which certain reactive procedures are followed when an incident occurs (normally when a malfunction of the treatment processes occur due to power failures, faulty equipment, adverse weather conditions or human error). The Management Procedures and Incident Response and Emergency Protocols forms part of Stellenbosch Municipality's W_2RAPs. The different types of incidents were grouped together under the three Alert Levels in the W_2RAPs.

A set of Compliance Alert Levels, corresponding to the requirements of the various Licences and General Authorisations, is also in place. Authorisations are in place for all the WWTWs.

There are two levels of incident management, firstly when final effluent is discharged that does not meet the requirements of the Water Act, and secondly when an event takes place causing a major pollution event for which emergency response is required. For serious incidents or emergency situations, additional actions and notifications are required, including notification of DWS and the media / public.

The W_2RAP team of Stellenbosch Municipality is committed to meet regularly to review the implementation and all the aspects of the W_2RAP and to determine whether the field assessments need updates or modifications and whether the Incident Response Management Protocol is still adequate.

6.3.1 Reporting on Quality of Water Taken From Source: Urban and Rural

There has to date been no repeated occurrence of water quality issues requiring public notification. The public notifications over the previous number of years were with regard to the drought situation and the water restrictions that were implemented. Should such a problem arise in the future, then Stellenbosch Municipality will inform the users at risk via pamphlets, radio announcements, local newspapers and through direct communication with schools.

A Disaster Management Plan for the Cape Winelands Region is also in place, which confirms the arrangements for managing disaster risk and for preparing for- and responding to disasters within the Cape Winelands Region as required by the Disaster Management Act.

Percentage compliance to Drinking Water Acceptable Limits:

Stellenbosch Municipality monitors the water quality in the distribution networks of all the towns within their Municipal Management Area. The Drinking Water Quality Sampling Programme is actively implemented in order to promptly identify water quality failures and to react accordingly. The water quality results are loaded onto DWS's IRIS via the internet. Once entered the data is automatically compared to SANS241. This real-time system allows for immediate intervention to rectify any problems.

Up to present it was not necessary to take any steps to inform the consumers of any health risk regarding the potable water supplied by Stellenbosch Municipality. Safety Management Procedures are however in place, to inform the Municipality's consumers about any potential health risks regarding the water quality, should it become necessary.

The percentage Microbiological and Chemical Compliance for the various distribution systems, as included in the various Blue Drop and Blue Drop Progress Reports, were as follows.

Table 6.3.1.1: Percentage Microbiological and Chemical Water quality compliance per system as included in the various Blue Drop and Blue Drop Progress Reports

Scheme	2013 Blue Drop Progress Report		2014 Blue Drop Report		2022 Blue Drop Progress Report		2023 Blue Drop Report	
	Micro-biological	Chemical	Micro-biological	Chemical	Micro-biological	Chemical	Micro-biological	Chemical
Blackheath	99.60%	>99.99%	99.7%	99.9%	100.0%	97.2%	98.29%	99.99%
Faure	99.60%	>99.99%	97.6%	99.9%	100.0%	97.6%	99.33%	99.99%
Franschhoek	95.00%	97.90%	86.9%	99.9%	91.3%	96.4%	97.48%	99.99%
Stellenbosch	>99.99%	99.40%	94.6%	99.9%	92.2%	94.8%	99.22%	99.99%
Wemmershoek	99.60%	>99.99%	98.4%	99.9%	97.5%	96.7%	97.87%	99.99%

Stellenbosch Municipality's compliance sample results for the period July to June for the last five financial years are included in Annexure E. The percentage compliance for the various water distribution systems are included in Table 8.1.7.5 of the Future Demand and Functionality Requirements Report.

Number of Monitoring Points for Drinking Water Sufficient:

The current Operational and Compliance Water Quality Sampling Programmes of Stellenbosch Municipality are mostly adequate, with just a small number of additional sampling proposed (See Table 8.1.7.2). The number of microbiological samples taken by Stellenbosch Municipality for all the water distribution systems were also adequate for the 2023/2024 financial year, except for Klapmuts where one additional microbiological sample is required per month, as indicated in Table 8.1.7.3 under Topic 8 of the Future Demand and Functionality Requirements Report. The additional monitoring required by Stellenbosch Municipality for determinands identified during the Blue Drop risk assessment exceeding the SANS241:2015 limits for the 2023/2024 financial year, as can be noted from Table 8.1.7.5 under Topic 8 of the Future Demand and Functionality Requirements Report, were as follows.

- Stellenbosch: Acute Health Microbiological: Additional monthly sampling.
- Stellenbosch: Operational Efficiency: Additional monthly sampling
- Wemmershoek: Acute Health Microbiological: Additional monthly sampling

6.3.2 Quality of Water Returned to the Resource: Urban

Stellenbosch Municipality monitors the quality of the final treated effluent returned to the Water Resource System at all their WWTWs and the sample results for the 2023/2024 financial year are included in Annexure E.

Industrial Consumers: The quality of the industrial effluent discharged into the Municipality's sewer system is monitored monthly by Stellenbosch Municipality. The effluent quality results for the consumers monitored for the last financial year are included in Annexure E.

Percentage compliance to Effluent Release Acceptable Limits:

The effluent quality compliance sample results are loaded onto DWS's IRIS via the internet. The effluent quality compliance sampling results per parameter per WWTW for the period July 2023 to June 2024 are included in Annexure E.

The overall Microbiological, Chemical and Physical compliance percentages of the final effluent samples taken over the last three financial years at the various WWTWs in Stellenbosch Municipality's Management Area are summarised in the tables below. The compliance percentages were calculated against the following compliance limits for the WWTWs.

- Stellenbosch WWTW: Licence 19/G22H/EFG/3844, 18 February 2016.
- Wemmershoek WWTW: Licence 01/G10A/ECGIF/6229, 12 October 2017.
- Raithby WWTW: Used General Authorisation.
- Pniel WWTW: Licence 01/G10C/CFI/12002, 26 June 2022.
- Klapmuts WWTW: Used General Authorisation

Table 6.3.2.1: Percentage microbiological compliance of the compliance samples taken at the various WWTWs for the last three financial years.

WWTW	2021/2022	2022/2023	2023/2024
Stellenbosch 1	9.1	16.7	0.0
Stellenbosch 2	16.7	0.0	0.0
Wemmershoek	15.4	16.7	33.3
Raithby	58.3	45.5	33.3
Pniel	83.3	11.1	0.0
Klapmuts	53.8	33.3	50.0
Total	**39.7**	**21.0**	**22.2**

Table 6.3.2.2: Percentage chemical compliance of the compliance samples taken at the various WWTWs for the last three financial years.

WWTW	2021/2022					2022/2023					2023/2024				
	Ammonia	Nitrates	COD Filtered	Ortho Phosphate	Overall	Ammonia	Nitrates	COD Filtered	Ortho Phosphate	Overall	Ammonia	Nitrates	COD Filtered	Ortho Phosphate	Overall

Klapmuts	100.0	100.0	15.4	**71.8**	100.0	100.0	16.7	**72.2**	100.0	100.0	33.3	**77.8**
All WWTWs	**74.0**	**100.0**	**34.2**	**69.4**	**88.7**	**91.9**	**33.9**	**71.5**	**88.9**	**96.8**	**45.2**	**77.1**

The percentage wastewater quality compliance for the various WWTWs, as included in DWS's 2022 Green Drop Report and DWS's 2023 Green Drop Progress Report, were as follows.

Table 6.3.2.4: Microbiological, Chemical, Physical and Overall compliance percentages, as included in DWS's 2022 Green Drop Report and DWS's 2023 Green Drop Progress Report.

WWTW	2022 Green Drop Report			2023 Green Drop Progress Report (July 2021 – June 2022 data)		
	Microbiological	Chemical	Physical	Microbiological	Chemical	Physical
Stellenbosch	9%	54%	61%	4.5%	38.6%	73.8%
Wemmershoek	0%	31%	54%	23.1%	34.2%	69.2%
Pniel	92%	52%	66%	53.3%	53.8%	74.4%
Klapmuts	54%	80%	69%	60.0%	72.9%	79.5%
Raithby	58%	54%	80%	53.3%	67.5%	87.2%

Number of Monitoring Points for Effluent Release Sufficient:

Stellenbosch Municipality's existing Operational and Compliance Sampling Programmes are included in Table 8.1.9.2 in Topic 8. The Compliance Monitoring Programme includes the monthly sampling of the final effluent at all the WWTWs and analyses of all the main quality criteria as required by the DWS. Results of the samples taken, as part of the implementation of the Compliance Monitoring Programme, are loaded onto DWS's IRIS.

6.3.3 Quality of Water Returned to the Resource: Rural

Stellenbosch Municipality monitors no water returned to the Water Resource system in the rural areas. The Municipal Health Services of the Cape Winelands District Municipality report monthly to the Department of Health on water quality. The EHPs of the Cape Winelands District Municipality take water quality samples in the rural areas of the Cape Winelands Region on request.

6.3.4 Pollution Contingency Measures Plan

It is important to indicate those resources which could potentially become polluted. The specific resource should be indicated, based on detail available to the municipality, for example the number of the borehole/s or the name of the river.

WWTWs and pump stations are also the most notable causes for concern. These elements have to be managed properly to prevent untreated wastewater from becoming a health risk or a pollution risk to the environment. Stellenbosch Municipality could conduct a future study, or appoint a specialist environmental consultant to do so, to determine the status quo of existing wastewater infrastructure and the related risk that it presents to the environment and human health.

Some of the sewer pump stations are provided with emergency storage capacity to prevent spillages during power and pump failures. Some of the pump stations are also provided with backup generators for power failure periods. Mobile generators are also available.

Klapmuts Sewer PS No.3: Generator

Klapmuts Sewer PS No.2: Generator

Lanquedoc Sewer PS: Generator

Wood Mill Sewer PS: Generator

De Boord Sewer PS: Generator

Nuutgevonden Sewer PS: Generator

Vlottenburg Sewer PS: Generator

Jamestown Sewer PS: Generator

Corobrick Sewer PS: Generator

Wastewater treatment has to be managed properly to prevent untreated wastewater from becoming a health risk or a pollution risk to the environment. A Disaster Management Plan for the Cape Winelands District Municipality is also in place to manage potential pollution risks in the Cape Winelands Region.

6.3.5 Quality of Water Taken from Source: Urban – Percentage Monitored by WSA

The raw water quality of the supply from the various resources are monitored by Stellenbosch Municipality on a monthly basis. A full SANS241:2015 analysis is also done annually on the raw water supplied from the different water resources. The potable water quality compliance sample results, as taken over the last five financial years, are included in Annexure E. Stellenbosch Municipality's existing Operational and Compliance Water Quality Sampling Programmes are included in Table 8.1.7.2., which also indicates the raw water quality sampling points. The recommended additional samples to be taken, in order to ensure compliance with SANS241 requirements, are also indicated in the table.

6.3.6 Quality of Water Taken from Source: Rural – Percentage Monitored by WSA

The water quality in the rural areas is monitored by the EHPs of the Cape Winelands District Municipality. Samples are taken on the farms when complaints or requests for water quality sampling are received by the EHPs. To date there is no monitoring undertaken by Stellenbosch Municipality in the rural areas, other than the areas supplied with water from the current supply networks of Stellenbosch Municipality.

The water quality of the rivers in Stellenbosch Municipality's Management Area is regularly monitored by Stellenbosch Municipality and the Cape Winelands District Municipality, specifically during the summer months. The water quality of the drinking water at the schools in the rural areas is also regularly monitored by the EHPs of the Cape Winelands District Municipality.

6.3.7 Quality of Water Returned to the Source: Urban – Percentage Monitored by WSA

Stellenbosch Municipality's Wastewater Quality Sampling Programmes are included under Tables 8.1.9.2. The effluent quality sample results for the 2023/2024 financial year are included in Annexure E.

6.3.8 Quality of Water Returned to the Source: Rural – Percentage Monitored by WSA

The water returned to the source in the rural areas is monitored by the EHPs of the Cape Winelands District Municipality.

6.3.9 Water Quality Results in Electronic Format

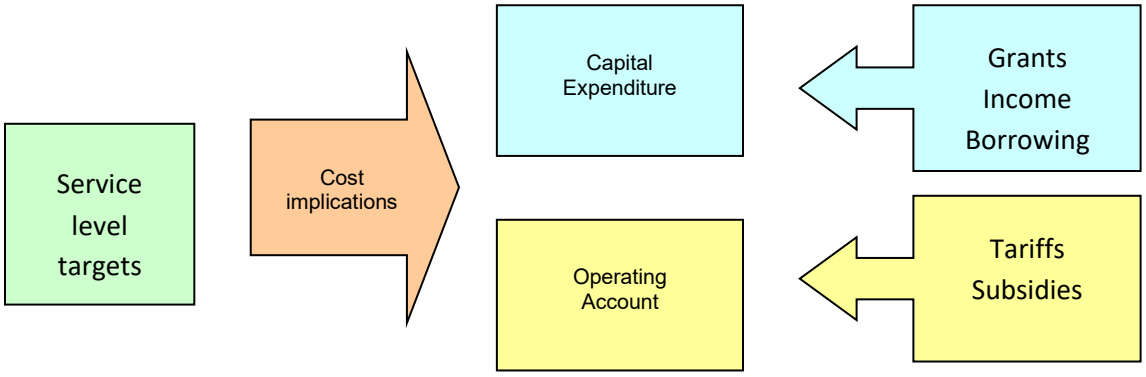
All the water quality sample results are available in electronic format and the results are loaded on a monthly basis onto DWS's IRIS.

6.3.10 Percentage Time (Days) within SANS241 Standards per Year

The percentage compliance with the SANS241:2015 limits for the various schemes are included in Table 8.1.7.5 of the Future Demand and Functionality Requirements Report. The water and effluent quality compliance percentages are also included in Annexure E.

6.4 OPERATION

Table 6.4.1: Registration and recording of raw water abstraction



Scheme	Source	Is the abstraction registered with DWS? (Yes/No)	Is the abstraction recorded? (Yes/No)
Stellenbosch	Eerste River (Idas Valley WTW)	Yes	Yes
	WCWSS (Paradyskloof WTW)	Yes	Yes
	CCT (Blackheath-, Faure-, Wemmershoek WTW)	Yes (SLA with CCT)	Yes
Franschhoek	Perdekloof (Franschhoek WTW)	Yes	Yes
	CCT (Wemmershoek WTW)	Yes (SLA with CCT)	Yes
Dwars River	CCT (Wemmershoek WTW)	Yes (SLA with CCT)	Yes
Klapmuts	CCT (Wemmershoek WTW)	Yes (SLA with CCT)	Yes

Note: Faure / Raithby/ Jamestown system, Polkadraai system, Koelenhof system, Muldersvlei system, Meerlust system, Croydon system and Helderberg system are included under Stellenbosch scheme above.

7. FINANCIAL PROFILE

This part of the planning process is critical to the final WSDP. By identifying the costs associated with service level targets and the sources to meet the costs, the WSA will be able to see how financially viable their plan is.

Finance overview

As mentioned earlier, service level targets are what drive costs. On the one hand there are capital costs which refer to how much it is going to cost to install the infrastructure. The section on capital expenditure requires the costs of infrastructure to be recorded according to a number of different categories. The section on capital income requires that the sources of finance to meet capital expenditure be recorded in terms of subsidies, consumer payments, money from the WSA's current income and amounts to be borrowed.

Once the infrastructure has been built, there are on-going operating costs. If the projected operating costs associated with capital expenditure are not factored in right from the start (i.e. when service levels are being considered), there is a danger that the WSA will not be able to afford the running cost of the services. Detailed operating costs are not required as part of the tables, however information on the operational budget is requested. This information gives an indication of how "healthy" the WSA's finances are.

Income for operating costs comes from user payments (through tariffs) and subsidies (equitable share). The section on operating incomes requires information on current and future tariffs. Future tariffs are important since they provide an indication of the costs to users for the services set out in the targets.

Whilst income and expenditure will be calculated for the different settlement types, the tables require that the amounts are consolidated for the WSA area as a whole.

It also needs to be noted that costs can only be calculated once the necessary water services policies are in place, for example Free Basic Water Policy, Indigent Policy, and policies regarding the use of equitable share and other subsidies.

Currently the Water Sector suffers an unacceptable high level of financial losses, mainly for reasons that could be addressed through proper governance and management. The financial losses are evidenced by:

- Unacceptably high water leakages.
- Failure to meter water supplied and other forms of unaccounted for water.
- Poor infrastructure planning and poor investments.
- Poor operation and maintenance.

- Pollution of the resource leading to unnecessarily high water treatment costs.
- Corruption, tender fraud, maladministration and lack of governance.
- Failure of local government ring-fence the water sector finances and the diversion of funds allocated to water to non-essential purposes.
- Inefficient institutional performance.
- Poor revenue and debt management.
- Inefficient water pricing that results in the under-recovery of costs.
- A misunderstanding of the free basic water policy and the neglect to manage the quantity of water supplied in terms of the policy and the poor maintenance of indigent registers.

Stellenbosch Municipality's 2023/2024 Annual Report list the following Financial Viability Highlights:

- Long-Term Financial Plan: The Municipality has developed a long-term financial planning tool that can be updated regularly for strategic planning.
- Current Ratio: The Municipality maintained a very good current ratio of 2.03:1. This compares well with the norm of 1.5 to 2:1.
- Collection Rate: The Municipality maintained a good collection rate for service debtors of 96%, which is above the norm of 95%. This indicates that the municipality's creditor control and debt collection processes are in place and the revenue is managed effectively.
- Finance Charges: Finance charges represent 2.83% of the total operational expenditure. This compares favourably with the norm of 6% to 8%.
- Liability Management: Capital costs (interest paid and redemption) represent 4.65% of total operating expenditure. This indicates that the municipality can take on additional financing from borrowing to invest in infrastructure projects.
- mSCOA Specimen Financial Statements: The municipality implemented the National Treasury mSCOA specimen annual financial statements preparation template, where the financial statements are compiled utilising the data strings extracted from the financial system.
- Debt Management: The municipality's total debt represents 28.5% of the total operational expenditure. This compares favourably with the norm of 45% and is an indication that the municipality can take on additional financing from borrowings.

7.1 EXPENDITURE

7.1.1 Ratios and Efficacy Indicators

The table below gives an overview of the ratios and efficacy indicators for Stellenbosch Municipality.

Table 7.1.1.1: Water and sanitation ratios and efficacy indicators

Ratios and Efficacy Indicators	2019/2020	2020/2021	2021/2022	2022/2023	2023/2024
Water service O&M cost as a % of Total O&M Budget	These indicators are not yet part of the Municipality's MFMA Schedule A tables. The key financial indicators and ratios included in the 2024/2025 Final Budget are summarised in Table 7.1.1.2 below.				
Water service O&M cost as a % of Total Asset Value (CRC)					
Sanitation service O&M cost as a % of Total O&M Budget					
Sanitation service O&M cost as a % of Total Asset Value (CRC)					
Untreated waste water units released					
Cost to purify water					
Cost to deliver water to consumers					

Table 7.1.1.1: Water and sanitation ratios and efficacy indicators					
Ratios and Efficacy Indicators	**2019/2020**	**2020/2021**	**2021/2022**	**2022/2023**	**2023/2024**
Cost to treat waste water					
Cost to deliver waste water to treatment facility					
Blue Drop cost					
Blue Drop number of WTWs					
Green Drop cost					
Green Drop number of WWTWs					

The table below indicates the key financial indicators and ratios as included in the 2024/2025 MTREF Budget.

Source: Medium Term Revenue and Expenditure Framework for Stellenbosch Municipality 2024/2025: Table SA8 – Performance indicators and benchmarks

Notes:

(1) **Liquidity Ratio**: Measures the municipality's ability to pay its bills and is calculated by dividing the monetary assets (due within one year) by the municipality's current liabilities. A higher ratio is better.

(2) **Cost Coverage**: It explains how many months expenditure can be covered by the cash and other liquid assets available to the Municipality excluding utilisation of grants.

(3) **Outstanding Service Debtors**: Measures how much money is still owed by the community for water, electricity, waste removal and sanitation compared to how much money has been paid for these services. It is calculated by dividing the total outstanding debtors by the total annual revenue. A lower score is better.

(4) **Debt Coverage**: The number of times debt payments can be accommodated within Operating revenue (excluding grants). This in turn represents the ease with which debt payments can be accommodated by the municipality.

(5) **Creditors System Efficiency**: The proportion of creditors paid within terms (i.e. 30 days). This ratio is calculated by outstanding trade creditors divided by credit purchases.

(6) **Capital Charges to Operating Expenditure**: Is calculated by dividing the sum of capital interest and principle paid by the total operating expenditure.

(7) **Employee Costs**: Measures what portion of the revenue was spent on paying employee costs. It is calculated by dividing the total employee cost by the difference between total revenue and capital revenue.

(8) **Repairs and Maintenance**: This represents the proportion of the operating expenditure spent on repairs and maintenance.

The table below list the Operating Ratios for 2023/2024, as included in Stellenbosch Municipality's 2023/2024 Annual Report.

Table 7.1.1.3: 2023/2024 Operating Ratios

Operating Ratio	Expected Norm	2023/2024 Actual	Comment
Employee Cost	35%-40%	28.18%	Below the national norm, representing a positive outcome.
Repairs and Maintenance	15%	3.99%	Below the norm, which indicates that expenditure on repairs and maintenance would have to be increased in future budgets to properly maintain the Council's assets.
Finance Charges	15%	2.83%	Finance charges are 12.71% lower than the norm of 15%, this can be attributed mainly to the municipality's ability to fund its capital programmes to some extent from its resources (CRR) and not external funding.

7.1.2 Water Balance Cost / Revenue

The table below gives an overview of the water balance cost for Stellenbosch Municipality.

Table 7.1.2.1: Operation, function and process water balance cost / revenue

Water Balance Cost / Revenue	2021/2022		2022/2023		2023/2024

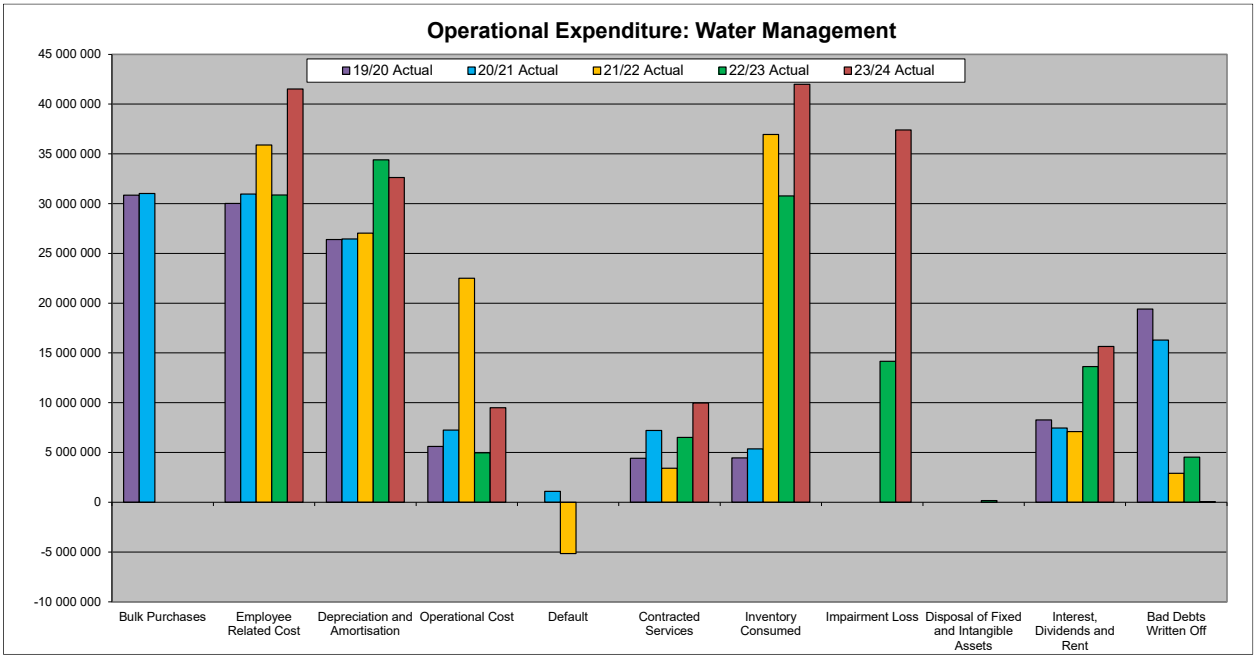
Source: WSDP Performance- and Water Services Audit Report for 2023/2024

Water Management generated operating surpluses for the last five financial years. Waste Water Management also generated surpluses for four of the last five financial years, except for the 2022/2023 financial year. The surpluses are used to subsidise other services that do not generate enough own revenue to sustain themselves.

7.1.3.1 Operating Costs: Water



The table below gives a summary of the O&M expenditure for Water Management for the last five financial years.

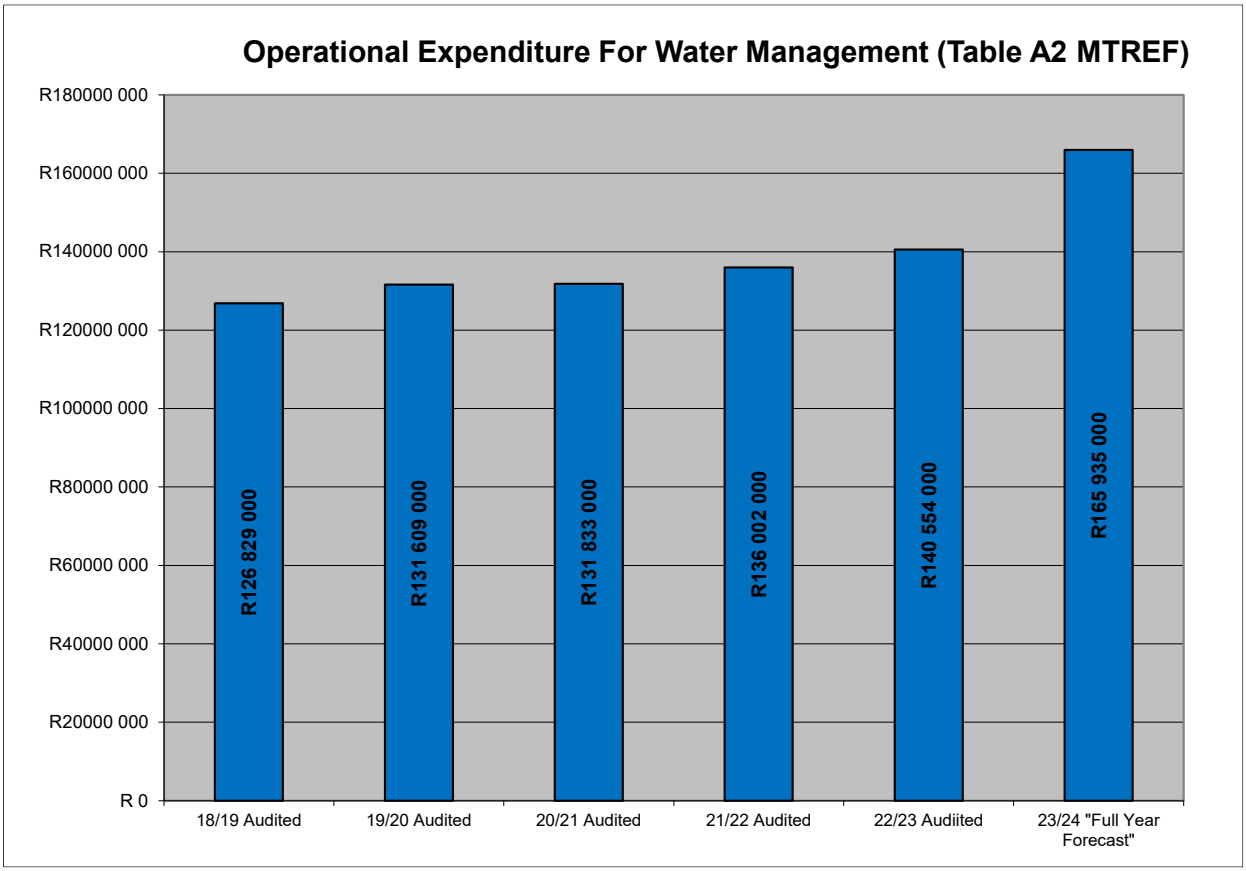


Table 7.1.3.1.1: Detail O&M expenditure for Water Management

7.2 INCOME

7.2.1 Operating Income

7.2.1.1 Operating Income: Subsidies

The main subsidy available for funding the operating costs of services is the equitable share. This is an unconditional grant from national to local government and the amount allocated is based on the levels of poverty within the particular municipal area. The WSA will have to decide how it will spend this subsidy and how much of it is to be spent on water. It is strongly recommended that part of this subsidy be used to cover the running costs of supplying a basic level of supply to poor households. This should be based on the Indigent Policy, which requires that poor households be identified and the conditions of subsidization be clearly spelt out.

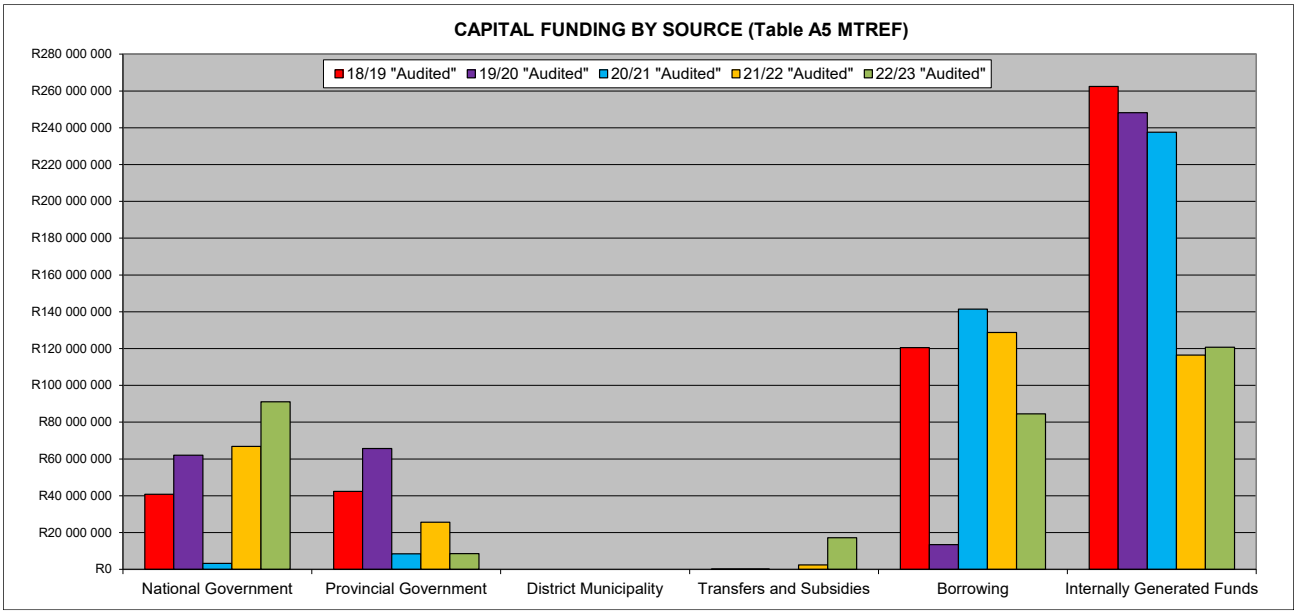
The graphs below give an overview of the O&M income for Waste Water Management for the last five financial years.

7.2.2 Capital Income

Capital expenditure is funded through National Grants, External Borrowing and Internally Generated Revenue. Internally Generated Revenue can only be generated through operating budget surpluses, but this means that Stellenbosch Municipality's customer base must pay for it through property rates and service charges levied.

Grants and donations through government programmes are another important funding source. Government programmes will usually give grants for bulk infrastructure service and internal infrastructure services where the investment in infrastructure is needed to provide basic services to the poor.

External borrowing is the least desirable source of finance to invest in infrastructure services, simply because borrowings need to be repaired at a cost for Stellenbosch Municipality's customer base. A Municipality can become over borrowed and needs to guard against this not to burden their customer base in an unsustainable and non-viable manner.



The total capital requirement for the 2023/2024 financial year was R193.042 million. The funding sources of Stellenbosch Municipality's previous year's capital budgets are summarised in the table below.

Table 7.2.2.1: Sources of funding of Stellenbosch Municipality's previous years' capital budgets

Capital Funding	Record Prior				2023/2024 (Pre-audit outcome)
	2019/2020 Audited outcome	2020/2021 Audited outcome	2021/2022 Audited outcome	2022/2023 Audited outcome	
National Government	R62 049 000	R3 294 000	R66 852 000	R91 031 000	R43 014 000
Provincial Government	R65 677 000	R8 491 000	R25 643 000	R8 543 000	R6 204 000

Source: Medium Term Revenue and Expenditure Framework for Stellenbosch Municipality 2023/2024: Table A5 - Capital Expenditure by Vote, Standard Classification and Funding

The graph below gives an overview of the historical capital budget funding sources of Stellenbosch Municipality for the last five financial years.

It can be noted from the above graph that "Internally Generated Funds" was the biggest funding source of Stellenbosch Municipality's historical capital programme over the last five financial years.

7.2.2.1 Capital Income: Water

The table below gives a summary of the funding sources of the historical water capital infrastructure projects of Stellenbosch Municipality.

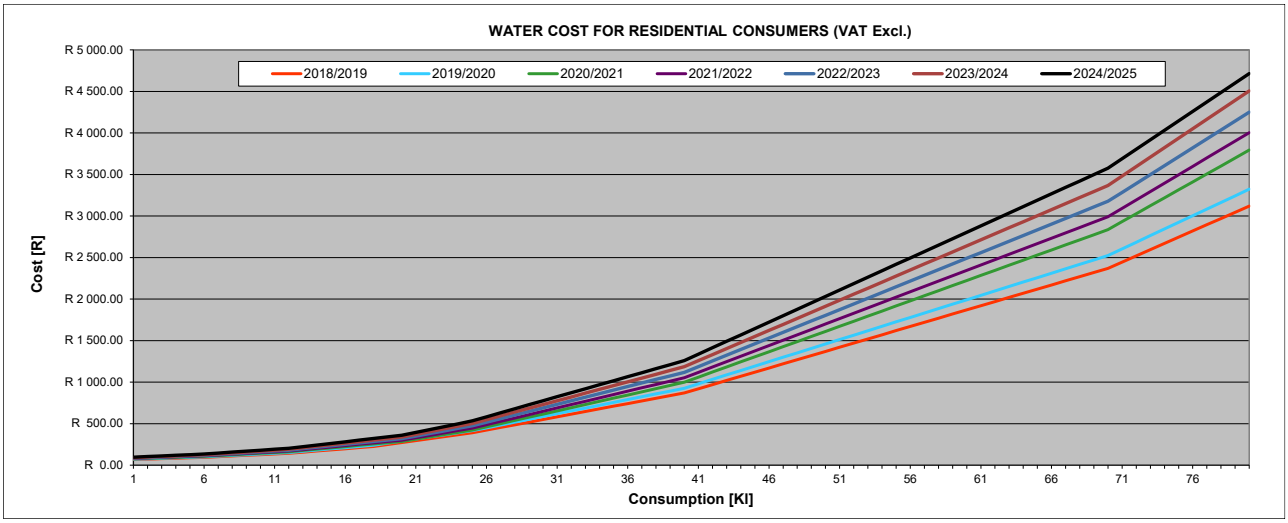
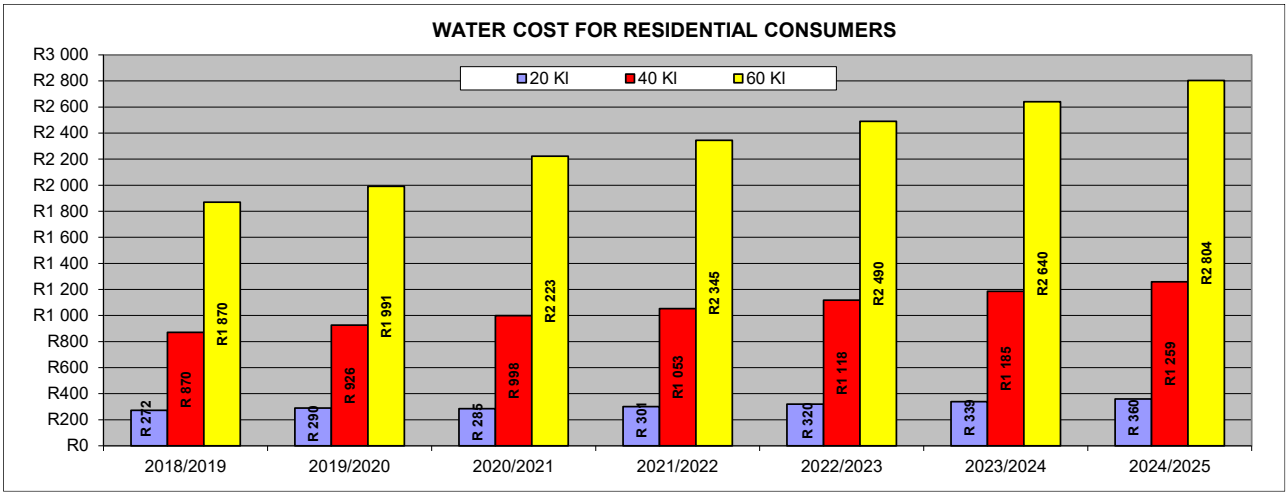
7.3 TARIFF AND CHARGES

The WSA needs to have an income or tariff policy stating from where it will raise recurrent income, how tariffs are to be set for different consumer groups and levels of service, and actual tariff levels. This should include a policy to provide free water for those who cannot afford a basic level of supply.

The tariff set by the WSA must:



- support the viability and sustainability of water services to the poor;
- discourage wasteful or inefficient water use;
- take into account the incremental cost that would be incurred to increase capacity of the water supply infrastructure to meet an incremental growth in demand.



Stellenbosch Municipality's current (2024/2025) water and sewer tariffs are based on the following:

- A seven-block step rising residential water tariff structure, with the first 6 kl/month being free for all indigent registered households (Subsidised).
- A fix tariff per Kl for Commercial, Business and Industrial consumers.

- A fix tariff per Kl for Miscellaneous and All Other users (Schools, Sport Bodies, Churches and Charity Organisations).
- A three block step rising water tariff structure for Municipal usage.
- Water restriction tariffs (10%, 20%, 30% and 40%) are also in place.
- The annual sanitation tariffs are based on either one of the following:
  - The size of the erf for properties utilised for dwelling purposes, all vacant erven and all other developed erven.
  - Levies based on the usage and floor areas of the buildings (Offices, Halls, Shops, Educational and Research buildings, Hospitals, etc.).

The cost residential consumers had to pay for their water in Stellenbosch Municipality's Management Area, for the various financial years, is presented on the graphs below.

The water tariff structures for Stellenbosch Municipality for the 2024/2025 financial year and the previous four financial years are summarised in the table below (Subject to VAT).

Table 7.3.1: Water tariffs

Consumer/Description		Category	20/21	21/22	22/23	23/24	24/25

	m) Dwelling units that are part of buildings described under a) to l) / unit		R2 217-23	R2 350-26	R2 503-03	R2 665-72	R2 878-98
	n) Rooms used for dwelling purposes, forming part of buildings under a) to l) / m^2		R390-11	R413-52	R440-40	R469-03	R506-55

7.4 FREE BASIC SERVICES

The first six (6) kl of water is provided free to all indigent registered residential consumers. Stellenbosch Municipality's tariffs support the viability and sustainability of water supply services to the poor through cross-subsidies where feasible. Free basic water and sanitation services are linked to the Municipality's Indigent Policy and all indigent registered households therefore receive free basic water and sanitation services. This implies that either the equitable share is used to cover this cost, or higher consumption blocks are charged at a rate greater than the cost in order to generate a surplus to cross-subsidise indigent consumers.

The free basic services are funded through the Equitable Share allocation to the Municipality in the Division of Revenue Act. The criteria for indigent or poor households, as included in the 2024/2025 Indigent Policy, is as follows:

Household:

- The head of the household, or his/her spouse(s) who are not alienated from the household, must indicate if said person is:
  - a state official in any capacity; or
  - a director of a company, a member of a Closed Corporation or Trust, or
  - involved in any state tender processes.
- The head of the household must be a South African citizen with valid South African identity documentation and have permanent residency.
- The head of the household should be:
  - the registered owner or part owner of the property; or
  - the registered lessee of a Council housing unit; or
  - the registered lessee of an Organ of State - (as defined in Section 239 of the Constitution) owned housing unit; or
  - in meritorious cases as determined by the Municipality a person, being the head of the household, who is incapable of paying for basic municipal services and who resides in said property/unit.

  The head of the child-headed household shall be deemed to meet these criteria.
- To register as an indigent consumer the head of the household must personally complete and sign the registration form.
- Child-headed households will only be approved based on the following criteria:
  - both parents of the household are deceased, or one parent and/or guardian is deceased, and the other is totally alienated from the household;
  - a minor has assumed the role of caregiver in respect of the other minor(s) in the household. This caregiver is the head of the household and shall be deemed to meet the criteria as per paragraph above;
  - such minors reside permanently on the property;
  - such minors, and exclusively only minors occupy the property as their norma residence;
  - such minors are scholars or unemployed and if income is derived, the household earns less than the qualifying income as envisaged by the defined Indigent Income Threshold;
  - the situation pertaining to the household has been verified by the Municipality; and

  - the situation pertaining to the household will be reviewed when the caregiver as per (ii) above reaches the age 18 years or older.

- Indigent households living in homes for senior citizens shall be eligible to qualify for assistance and support under this Policy, subject to the following rules and procedures:
  - For the purposes of passing/issuing the free basic electricity units to such indigent household, the onus will be on the unit owner or lessee to apply and submit proof that the electricity connection is in the name of the Indigent consumer and not in the name of the organization providing the accommodation.
  - In the event of the unit being occupied by a single individual without any dependents as per the definition of a household above, the level of income to qualify shall be equal to or less than 50% (fifty percent) of the defined Indigent Income Threshold per month.

Qualifying Income:

- The total Gross Household income for a household will be taken into account when considering the application for Indigent support.
- The maximum qualifying income level defined as the Indigent Income Threshold for a household as described in paragraph 5.2 of the Indigent Policy will be equal to or less than R 7 000 per month. Proof must be produced in the form of pay slips, unemployment certificates, income certificates or other acceptable proof of income.
- Should proof of income not be available, income may be declared by means of a sworn statement. Such applications may be verified by means of a full investigation and a socio-economic survey.

The number of indigent households that received free basic water and sanitation services for the last five financial years were as follows:

- 2019/2020: Water 7 012; Sanitation 7 012
- 2020/2021: Water 7 283; Sanitation 7 283
- 2021/2022: Water 4 681; Sanitation 4 681
- 2022/2023: Water 5 744; Sanitation 5 744
- 2023/2024: Water 5 584; Sanitation 5 584

7.5 METERING, BILLING AND INCOME

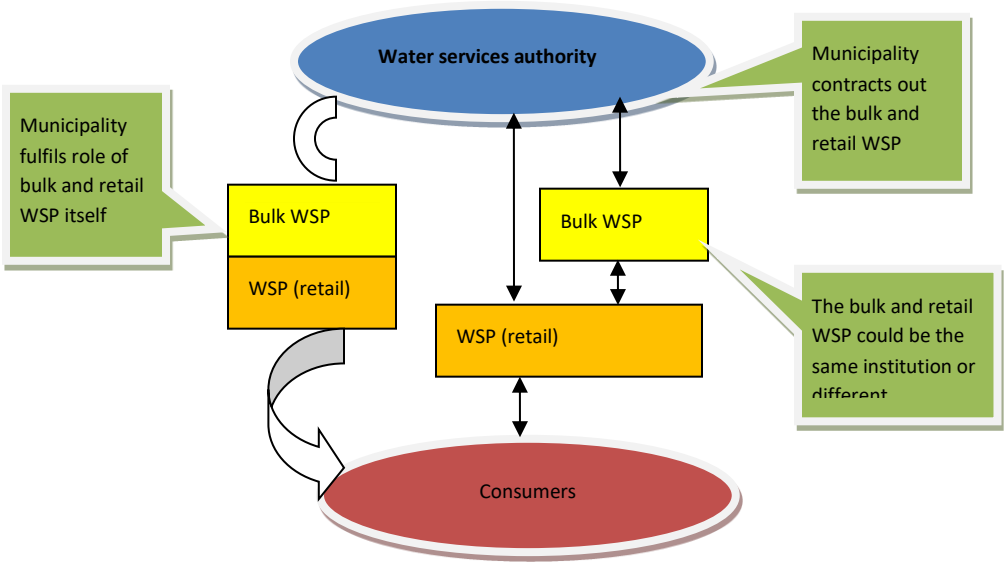
Installing meters and implementing an adequate billing system is central to managing services effectively and building a relationship of understanding and trust between the provider and consumer. The extent of metering and billing throughout the Municipality, as calculated from the February 2023 Swift Analysis, are included in Tables 5.1.1.4.1 and 5.1.1.5.1 under Topic 5. The following categories are included in the two tables.

- Number of Occupied Erven in Treasury Data without a Water Meter;
- Number of occupied erven in treasury data with a water meter, but with zero demand;
- Number of occupied erven in treasury data with a water meter, but with a very low demand (<3 kl/month); and
- Number of informal units.

The above occupied stands need to be investigated by the Municipality's meter readers in order to ensure that all stands are metered and that consumers are billed according to the volume of water used by them.

8. WATER SERVICES INSTITUTIONAL ARRANGEMENTS AND CUSTOMER SERVICES

Institutional Arrangements: In order to address the WSDP goals and service level targets the Municipality needs to ensure that:



- it is able to effectively fulfil the WSA responsibilities as outlined in the Water Services Act (internal management and regulatory arrangements) and
- that efficient and effective water services provider institutional arrangements are in place (bulk WSPs, retail WSPs and support services agents).

The WSA is the Municipality that has been assigned WSA functions. The WSA is accountable and responsible for ensuring that water services are provided to consumers. However, this does not mean that it has to provide the services itself. The Municipality or other WSPs can provide the services. If the WSA decides to appoint a WSP to fulfil the water services provision function, it will enter into a municipal services partnership through signing a contract with a bulk and / or retail WSP.

Whilst the Water Service Act does not require the WSDP to contain details about the Municipality's capacity to fulfil WSA functions, various components within the WSDP are dependent upon these functions being effectively fulfilled.

Water services provider (WSP) institutional arrangements

WSP institutional arrangements refer to the bulk and retail WSP functions. The figure below illustrates the municipality fulfilling both the bulk and retail WSP functions (on the left hand side) and municipal service partnerships (MSPs) with bulk and retail WSPs (on the right hand side).

Note: There are many different options in establishing WSP institutional arrangements. For example the Municipality could contract out the bulk WSP function and fulfil the retail WSP function itself. In addition the Municipality could act as WSP for some areas and contract other WSPs for other areas. These arrangements will depend on specific context of the WSA area of jurisdiction.

If the WSA decides to fulfil the water services provision function itself, it may fulfil the function through an integral unit or it may corporatise the function through creating a municipal company. It may also decide to outsource parts of the water services provider function, for example meter reading, billing, etc. through service contracts. In this case the WSA remains the WSP with the assistance of service contracts.

Retail water services providers

The retail WSP function includes the following:

- Daily operations and repairs
- Preventative and major maintenance
- Customer relations, health and hygiene awareness and communication
- Revenue collection and related financial management
- Reporting and providing information on the provision of services
- General administration of the water services

A WSP may be contracted to fulfil some or all of these functions. There are a number of different types of WSPs which could fulfil the WSP retail functions, including district and local municipalities, a water board (they are typically associated with bulk water supply, but in some areas also provide retail services), private companies, and community based organisations (CBOs), such as a village water committee.

Some WSPs may require access to support, for example a community based water services provider or other small water services providers. The WSA may provide the support itself, or it may contract a support services agent (SSA) to provide support such as institutional and social development (ISD) mentoring, maintenance support or sanitation promotion.

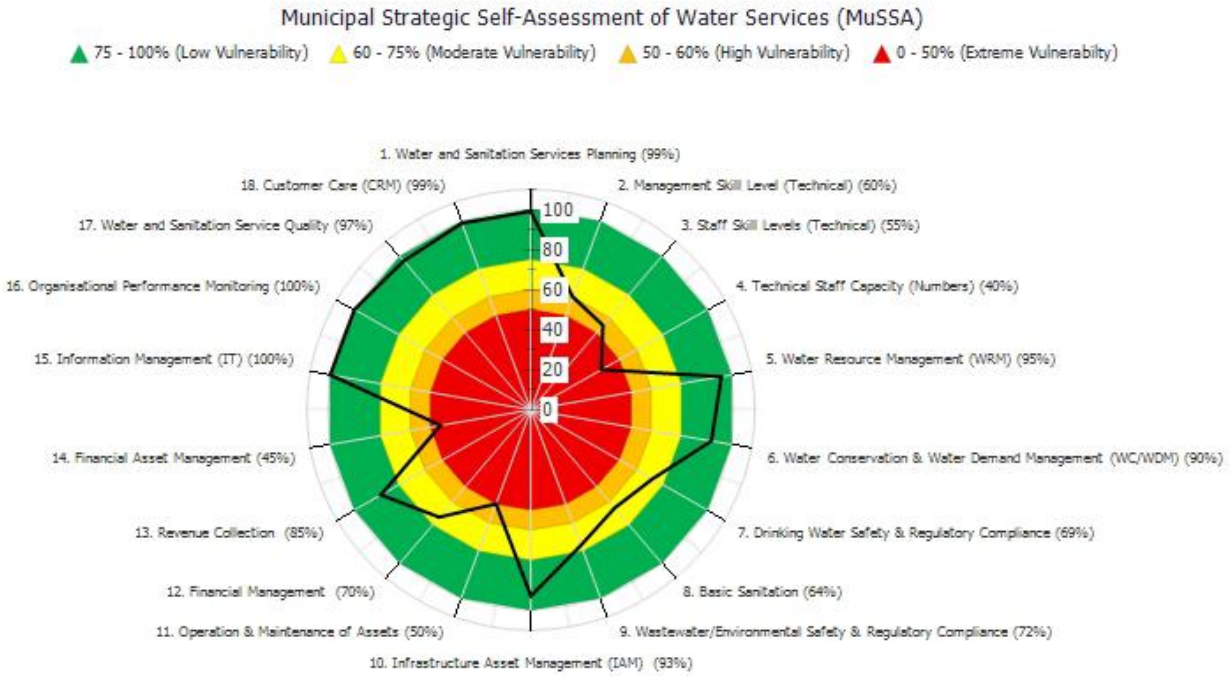
The WSP institutional arrangements will depend on a range of issues such as:

- The particular settlement type (as different institutions are suited to different contexts);
- Location and accessibility of the community to be served;
- Capacity of the municipality to provide services itself;
- Capacity of the municipality to monitor and regulate WSPs should it decide to contract WSPs;
- Suitability of other WSPs to provide the services (cost, acceptability to the community/ies concerned, etc).

Customer Services: Consumer's experience of the delivery of water services is not restricted to what level of service they receive but includes the quality of service rendered. If consumers are satisfied with the quality of service, they are more likely to prepare to pay for the services they receive.

On the water supply side, quality of service includes water quality, service continuity, complaint response time, meter coverage, billing, and access to pay points. On the sanitation side, quality of service is about the quality of infrastructure provided (basic sanitation) and support for operation and maintenance and also about response times to complaints.

Monitoring is necessary to collect sufficient and accurate data to inform decision making, and reduce and manage risks. Therefore, the ultimate goal is to provide information needed for planning, decision making and operational water management.



Stellenbosch Municipality is the WSA and Water Services Provider for the various towns in Stellenbosch Municipality's Management Area. Raw water is supplied from the WCWSS to the Paradyskloof WTW and bulk potable water is also supplied by the CCT to the greater Stellenbosch system, the Franschhoek system, the Klapmuts system and the Dwars River system. The areas in Stellenbosch Municipality supplied with potable water by the CCT from their WTWs are as follows:

- Wemmershoek WTW: Portion of Franschhoek, La Motte, Wemmershoek, Pniel, Boschendal, Johannesdal, Kylemore, Lanquedoc, Klapmuts, Koelenhof, Elsenburg, Devon Valley and Mudersvlei.
- Blackheath WTW: Polkadraai, Spier and Vlottenburg.
- Faure WTW: Faure, Jamestown, De Zalze, Raithby and Lynedoch.

8.1 MUNICIPAL STRATEGIC SELF-ASSESSMENT (MuSSA)

Overseen by the DWS the MuSSA conveys the overall business health of municipal water business and serves as a key source of information around municipal performance. The MuSSA also identifies key municipal vulnerabilities that are strategically important to DWS, the Department of Cooperative Government (DCoG), National Treasury, the planning Commission/Office of the Presidency, the South African Local Government Association (SALGA) and the municipalities themselves. The MuSSA team continues to engage (1) DWS directorates and their associated programmes (e.g. Water Services Development Plan, Water Services Regulation), and (2) other sector departments and their associated programmes (e.g. LGTAS, MISA) to minimize duplication and ensure alignment. Through the tracking of current and likely future performance, the key areas of vulnerability identified, allow municipalities to effectively plan and direct appropriate resources that will also enable DWS and the sector to provide support that is more effective.

The Spider Diagram below effectively indicates the vulnerability levels of Stellenbosch Municipality across the eighteen key service areas, as identified through the Municipal Strategic Self-Assessment of Water Services process (2023).

Stellenbosch Municipality's Vulnerability Index for 2023 was indicated as 0.44 "Moderate Vulnerability". The areas of concern evident from the 2021 assessment are Operation & Maintenance of Assets (50.0%), Financial Management (45.0%), Staff Skill Levels (Technical) (55.0%) and Technical Staff Capacity (Numbers) (40.0%).

CONTEXT INFORMATION

The table below gives an overview of the context information as completed during the MuSSA of Stellenbosch Municipality.

Table 8.1.1: MuSSA context information

Questions	MuSSA (2023)
Municipality name	Stellenbosch
Date of completion	30 November 2023
Municipality type	B4
Water service provider type	Internal (i.e. municipality)
Wastewater service provider type	Internal (i.e. municipality)
Water system maintenance	Internal (i.e. municipality)
Wastewater system maintenance	Combination of internal and external
Bulk water provision	Combination of internal and external
The key staff (i.e. managerial) turnover in your WSA.	Moderate: 10 - 25% (i.e. occasionally lose staff)
Your WSA has developed and implemented a scarce skills policy.	Yes, developed and partially implemented.
Your WSA actively provides required drinking water related data to the Regulator (e.g. Blue Drop participation)	Yes, strongly agree
Regular drinking-water quality monitoring and management (including boreholes) is performed for all communities / towns in the WSA.	Almost all (i.e. >95% of WSA population)
WTWs operational capacity as a function of total design capacity (Combine for all WTWs within your WSA).	<90%
Your WSA actively provides required wastewater related data to the Regulator (e.g. Green Drop participation)	Yes, strongly agree
Regular wastewater quality monitoring and management is performed for all wastewater systems in the WSA.	Almost all (i.e. >95%)
WWTWs operational flow capacity as a function of total design capacity (Combine for all WWTWs within your WSA).	<90%
WWTWs operational COD load as a function of total design load (Combine for all WWTWs within your WSA).	<90%
Your WSA actively provides required WC and WDM related data to the Regulator (e.g. No Drop participation)	Yes, strongly agree
Your municipality has a water resilience policy in place, which includes optimisation of existing water resources, diversifying supply to increase water security, and optimisation of the "water mix"	Yes, strongly agree
Your municipality has a policy and procedures in place to encourage rainwater harvesting	In process
Your municipality has desalination facilities for augmenting drinking-water supply	In process (e.g. developing, feasibility studies)
Your municipality recovers and reuses treated wastewater either directly (e.g. for potable purposes) or indirectly (e.g. for irrigation, feed to industry, aquifer recharge)	In process (e.g. developing, feasibility studies)
Your municipality recovers and reuses stormwater either directly (e.g. for potable purposes) or indirectly (e.g. recharging river for ecological functioning, nature based systems) (NOTE: This does not aim to measure inflow to dams at catchment level, but rather aims to define the extent of stormwater capture/reuse in the urban context).	In process (e.g. developing, feasibility studies)
Advanced water treatment technologies (e.g. membrane based) and wastewater treatment/recovery technologies (e.g. reuse) implemented at your municipality are staffed by appropriately qualified personnel	Almost all (i.e. >95%)

WSDP: ADMINISTRATION, INFORMATION AND COMPREHENSIVE OVERVIEW
TOPIC 8: WATER SERVICES INSTITUTIONAL ARRANGEMENTS AND CUSTOMER SERVICES

Table 8.1.1: MuSSA context information	
Questions	**MuSSA (2023)**
Your WSA actively promotes improved hygiene practices through campaigns in communities (e.g. had washing education, safe and improved sanitation).	Partially in place, but not ideal
Indicate the proportion of the population serviced via on-site sanitation (e.g. using appropriate technologies as defined by the National Norms and Standards for Sanitation Services (Sep 2017))	>50%
Indicate the proportion of the population not serviced (i.e. backlog, and potentially implying open defecation)	> 0% - 10%
Indicate the proportion of drinking-water sources at risk from on-site sanitation (e.g. VIPs could pollute groundwater source)	No, no sources (0%) are at risk
Indicate the proportion of on-site sanitation systems (e.g. VIPs, septic tanks) that are appropriately sealed/enclosed and/or fully/partially lined with minimal environmental impact (e.g. no overflow/seepage)	Almost all (i.e. >95%)
Indicate the estimated proportion of wastewater not delivered for treatment (to all WWTWs) (e.g. lost through old, leaking sewer pipes)	<1%
Indicate the estimated proportion of faecal sludge/supernatant emptied from all on-site sanitation systems (e.g. septic tanks, VIPs) that is not delivered for treatment (e.g. honeysucker does not deliver to the WWTW, but rather dumps into environment)	<1%
You have classified all of your treated sludge (from WWTWs and on-site sanitation systems (e.g. VIPs, septic tanks)	Yes, all sludges classified (i.e. close to 100%)
You are disposing/reusing all of your all your sludge (from both WWTWs and on-site sanitation systems (e.g. VIPs, septic tanks)) in accordance with licence conditions/WRC guidelines	Yes, all sludges reused/disposed appropriately (i.e. close to 100%)
Your municipality is adhering to its mandated responsibility as WSA and proactively managing water and sanitation services on farms/rural areas within its area of jurisdiction (as per National Norms and Standards for Domestic Water and Sanitation Services (Sep 2017))	Yes, strongly agree
Council has functional Oversight Committees and Ward Committees, as appropriate (DM would be served via LM Ward Committees)	Yes, strongly agree (i.e. Oversight and Ward Committees established and functioning)
Council has effective systems of internal control and functional governance structures (internal audit unit, audit committee, risk committee, IT governance)	Yes, strongly agree (i.e. internal audit unit established and posts filled, governance structures in place, frequent meetings held and risk assessments conducted, audit plan developed and quarterly reports submitted to council)
Forensic investigations are undertaken as and when necessary to ensure adherence to governance requirements (i.e. either internally initiated by the municipality or externally initiated by, for example, Public Protector, Auditor General)	Yes, strongly agree
Your municipality has policies, procedures and systems in place that negate the impact of vandalism / sabotage of municipal water and sanitation infrastructure on services delivery	Yes, strongly agree
Your municipality has ongoing and appropriate public participation, is transparent in its decision making, and is accountable to its constituency (fiscal and social).	Yes, strongly agree
Your municipality have a co-operation agreement in place (technical, financial, twinning, peer learning, etc) with an international municipality or other international institution?	Don't know
Your municipality receives international financial aid (grants/loans)?	No, disagree
Those of your 18 MuSSA Business Aspects which reflect Extreme and / or Highly Vulnerable, are included within your WSAs Corporate Risk Register.	Yes, strongly agree
Your MuSSA was completed with appropriate inputs from senior officials within Technical Services, Finance and Human Resources (as a minimum these three departments should participate).	Only Technical Services HOD
Names, designation and contact details (phone, email) of all MuSSA participants.	Paul Joubert, Senior Manager Water and Waste Water Services, +27 21 808 8240, paul.joubert@stellenbosch.gov.za; Monique Steyl, Finance Dept. +27 21 808 8512, Monique.steyl@stellenbosch.gov.za

8.1.1 Water and Sanitation Services Planning

Table 8.1.1.1: Water and Sanitation Services Planning

Water and Sanitation Services Planning – Low Vulnerability 99%						
Your appropriate water and sanitation services planning (e.g. WSDP) and associated master planning processes include and are aligned with appropriate Water and Sewage Master Plans, Spatial Development Framework, Water Safety Plans and Wastewater Risk Abatement Plans (W_2RAPs) and are aligned to your IDP and associated SDBIP targets.						
Yes, appropriate water services plans are developed and include all required plans and alignment (i.e. close to 100%)	Yes, appropriate water services plans are developed and include all required plans and alignment (i.e. > 95%)	Yes, appropriate water services plans are developed and include all required plans and alignment (i.e. > 75%)	Yes, appropriate water services plans are developed and include all required plans and alignment (i.e. > 50%)	Plans still in development	Plan development not yet initiated	Don't know
You are implementing an up-to-date and adopted municipal water and sanitation services plan (e.g. WSDP).						
Yes, municipal water and sanitation services plans up-to-date, adopted and implemented.	Municipal water and sanitation services plans adopted and implemented, but out-of-date (i.e. requires revision)	Municipal water and sanitation services plans adopted but not yet implemented	Municipal water and sanitation services plans not adopted but implemented	Municipal water and sanitation services plans neither adopted nor implemented		Don't know
Your current project list addresses existing needs / shortcomings identified through the WSDP and associated master planning process.						
Yes, all projects are identified via the planning process (i.e. close to 100%)	Almost all (i.e. >95% of projects)	Most projects (i.e. >75%)	Some projects (i.e. >50%)	<50% of projects	None (i.e. 0%)	Don't know
Project progress is monitored, tracked and reported to municipal top management / council and the Regulator (through the annual water and sanitation services report).						
Yes, strongly agree (both to municipal top management / Council and Regulator)	Only to municipal top management/council	Only to Regulator	No, disagree	Don't know		
Projects identified through your various planning processes have been implemented in the last 3 years.						
Yes, all projects identified via planning have been implemented (i.e. 100%)	Almost all implemented (i.e. >95%)	Most implemented (i.e. >75%)	Some implemented (i.e. >50%)	<50% implemented	None implemented (i.e. 0%)	Don't know

Stellenbosch Municipality's Water and Sewer Master Plan process entails the establishment of computer models for the water systems and the sewer systems in Stellenbosch Municipality, the linking of these models to the stand and water meter databases of the treasury financial system, evaluation and master planning of the networks and the posting of all the information to IMQS. The Water and Sewer Master Plans lists the analyses and findings of the study on Stellenbosch Municipality's water distribution and sewer drainage systems. The existing Water and Sewer Master Plans of Stellenbosch Municipality were updated during 2023/2024 and 2024/2025 and were incorporated into the WSDP. All forward planning for water and sanitation services and water and sewerage infrastructure is guided by the Water and Sewer Master Plans.

W_2RAPs are in place for all the WWTWs and sewer drainage networks (August 2021). Detail WWTW Process Audits were also compiled during June 2021. A Water Safety Plan was also previously drafted (February 2013), which requires updating. The Municipality annually compile the WSDP Performance- and Water Services Audit Report, as required by the Water Services Act and the DWS.

8.1.2 Management Skill Level (Technical)

Table 8.1.2.1: Management Skill Level						
Management Skill Level (Technical) – Moderate Vulnerability 60%						
Your council approved technical management organisational organogram meets your business requirements, and key posts are filled (e.g. Technical Director, Water Services Manager, and Sanitation Services Manager).						
Yes, and all posts filled (i.e. close to 100%)	Yes, and almost all posts filled (i.e. >95%)	Yes, and most posts filled (i.e. >75%)	Yes, but only some posts filled (i.e. >50%)	Yes, but <50% of posts filled	No, does not meet business requirements	Don't know
You have sufficient technical management and technical support staff.						
Yes, 100% as per approved organogram	Yes, strongly agree (i.e. >95% as per approved organogram)	Mostly agree (i.e. >75% as per approved organogram)	Agree somewhat (i.e. >50% as per approved organogram)	<50% as per approved organogram	None (i.e. 0% as per approved organogram)	Don't know
Technical management and technical support staff have the correct skills / qualifications and experience as per Job Description requirements (e.g. if Job Description requires Pr Eng, Pr Tech or CPM, the staff have these qualifications).						
Yes, all (i.e. close to 100%)	Almost all (i.e. >95%)	Most (i.e. >75%)	Some (i.e. >50%)	<50%	None (i.e. 0%)	Don't know
Managers and technical support staff regularly attend appropriate water and sanitation services skills development / training to support professionalisation.						
Quarterly (or more frequent) skills development/ training	Bi-annual skills development/ training	Annual skills development/ training	Less frequent skills development/ training (i.e. >1 year)	No skills development/ training	Don't know	
Key technical managers (e.g. Section 56 and other Senior Management) have signed and monitored Performance Agreements.						
Yes, all (i.e. close to 100%)	Almost all (i.e. >95%)	Most (i.e. >75%)	Some (i.e. >50%)	<50%	None (i.e. 0%)	Don't know

Mr Preshane Chandaka is the Director for Infrastructure Services, which include the following functions:

- Manages Civil Engineering Services including water, sewerage, streets, storm water and traffic engineering;
- Manages Electrical Engineering Services; and
- Manages Solid Waste Services, including waste collection, disposal facilities, waste minimisation, awareness and education, waste diversion, street sweeping, community projects, area cleaning and waste to energy.

8.1.3 Staff Skill Level (Technical)

Table 8.1.3.1: Staff Skill Level							
Staff Skill Levels (Technical) – High Vulnerability 55%							
WTWs are operated by staff with the correct skills / qualifications and experience (as per Regulation 2834).							
Yes, all (i.e. close to 100%)	Almost all (i.e. >95%)	Most (i.e. >75%)	Some (i.e. >50%)	<50%	None (i.e. 0%)	Don't know	Not applicable
WWTWs are operated by staff with the correct skills / qualifications and experience (as per Regulation 2834).							
Yes, all (i.e. 100%)	Almost all (i.e. >95%)	Most (i.e. >75%)	Some (i.e. >50%)	<50%	None (i.e. 0%)	Don't know	Not applicable
Water system plumbers, millwrights, mechanics and electricians have the required skills / qualifications and experience (including contractors / outsourced resources).							
Yes, all (i.e. close to 100%)	Almost all (i.e. >95%)	Most (i.e. >75%)	Some (i.e. >50%)	<50%	None (i.e. 0%)	Don't know	

Table 8.1.3.1: Staff Skill Level						
Staff Skill Levels (Technical) – High Vulnerability 55%						
Sewage system plumbers, millwrights, mechanics and electricians have the required skills/qualifications and experience (including contractors / outsourced resources).						
Yes, all (i.e. close to 100%)	Almost all (i.e. >95%)	Most (i.e. >75%)	Some (i.e. >50%)	<50%	None (i.e. 0%)	Don't know
Staff regularly attend appropriate water services skills development / training (including safety) (e.g. ESETA courses).						
Quarterly (or more frequent) skills development/ training	Bi-annual skills development/ training	Annual skills development/ training	Less frequent skills development/ training (i.e. >1 year)	No skills development/ training	Don't know	

The Water Services Section is headed by the Senior Manager: Water and Waste Water Services (Mr P Joubert).

At a technical, operations and management level, municipal staff is continuously exposed to training opportunities, skills development and capacity building in an effort to create a more efficient overall service to the users, within budget constraints. Submissions were also made to the DWS for the classification and registration of the Process Controllers and Supervisors at the various plants according to the new Regulation 3630 requirements.

A skills audit is conducted during each year which leads to various training programmes in order to wipe out skills shortages and to provide employees with the necessary capacity.

WTWs: Stellenbosch Municipality owns and manages the following water distribution systems and WTWs:

- Stellenbosch system, with supply from the Idas Valley WTW and the Paradyskloof WTW.
- Franschhoek System, with supply from the Wemmershoek pipeline, operated by the CCT, and the Franschhoek WTW.
- The Dwars River and Klapmuts Systems obtain potable water from the Wemmershoek pipeline, operated by the CCT. The water is treated at the Wemmershoek WTW.

The various rural systems are supplied as follows:

- Faure / Raithby / Jamestown System: The system is supplied with bulk potable water by the CCT from their Faure WTW.
- Polkedraai System: The is supplied with bulk potable water by the CCT from their Blackheath WTW.
- Koelenhof System: The system, is supplied with bulk potable water by the CCT from their Wemmershoek scheme.
- Muldersvlei System: The system is supplied with bulk potable water by the CCT from their Bloekombos reservoir (supplied from the Wemmershoek pipeline).
- Meerlust, Croydon and Helderberg Systems: The Meerlust area is supplied with bulk water from the Wemmershoek scheme and the Helderberg and Croydon areas with bulk water from the Steenbras dam through the CCT's reticulation network.

The current classification of the WTWs, according to Section 26 of the National Water Act (Act No.36 of 1998), is summarised in the table below. The required number of qualified personnel at the WTWs according to Regulation 3630 (June 2023) for water treatment personnel is shown in the table below, together with number of operational and supervisory personnel currently employed and their classifications.

Table 8.1.3.2: Classification of the WTWs and the required and current number of Process Controllers and Supervisors employed at the WTWs and their Classifications

WTW			Process Controllers and Supervisors		
WTW	**Class**	**Shifts**	**Requirements according to Regulation 3630**	**Currently Employed**	**Class**
Idas Valley	C	06:00 – 18:00 18:00 – 06:00	Class III Process Controller per shift	Jacobus Kosie Jacobs	III
				Apiwe Ndendela	Unknown
				Elton John Daniels	II
				Daniel May Hendricks	I
				Bennie Williams	II
				Gerhard John Windwaai	II
				Sekgaodi Jackson August	I
				Eugene Marco Williams	II
				Raymond Charles Crowley	II
			Class V Process Controller for Supervision		
			The minimum requirement for a Class C WTW is one Class III Process Controller per shift, plus one on standby. For the Idas Valley WTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. The existing Class II Process Controllers need to receive the required training to be classified as a Class III Process Controllers in order to ensure compliance.		
Paradyskloof	C	06:00 – 18:00 18:00 – 06:00	Class III Process Controller per shift	Willie van Niekerk	II
				Petrus Ndleleni	IV
				Sandile Peter	V
				Vusumzi Bhaduza	III
				Valerie Mapaseka	IV
				Marcell Geduld	III
				Zimasu Sibali	Not yet classified
			Class V Process Controller for Supervision		
			The minimum requirement for a Class C WTW is one Class III Process Controller per shift, plus one on standby. For the Paradyskloof WTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. The current number of Process Controllers at the plant is adequate.		
Franschhoek	Unknown	No permanent PC	Unknown	Unknown	Unknown
			Unknown	Unknown	Unknown

Operational and Maintenance support personnel must be available at all times, but may be in-house or outsourced (Electrician, fitter and instrumentation technician). The Supervisor for Class C – E works does not have to be at the works at all the times, but must be available at all times.

The Municipality regularly review their Organogram in order to ensure that the number of Process Controllers per WTW is in-line with DWS's requirements for Process Controllers per Class of plant. Submissions for the re-classification of Process Controllers, after specific training courses were completed, are also regularly loaded onto the IRIS.

WWTWs: Stellenbosch Municipality owns and manages the following WWTWs and sewer drainage systems.

- Stellenbosch WWTW and sewer drainage system
- Wemmershoek WWTW and sewer drainage system
- Pniel WWTW and sewer drainage system
- Klapmuts WWTW and sewer drainage system
- Raithby WWTW and sewer drainage system

Current authorisations for the Stellenbosch Municipality's WWTWs are as follows:

Table 8.1.3.3: Authorisations for the WWTWs

WWTW	Authorisations
Stellenbosch WWTW	Licence 19/G22H/EFG/3844, 18 February 2016.
Wemmershoek WWTW	Licence 01/G10A/ECGIF/6229, 12 October 2017.
Pniel WWTW	Licence 01/G10C/CF/12002, 26 June 2022.
Klapmuts WWTW	General Authorisation
Raithby WWTW	General Authorisation, 4 May 1999.

The current classification of the WWTWs, according to Section 26 of the National Water Act (Act No.36 of 1998), for which Stellenbosch Municipality is responsible is summarised in the table below. The required number of qualified personnel at the WWTWs according to Regulation 3630 (June 2023) for wastewater treatment personnel is shown in the table below, together with number of operational and supervisory personnel currently employed and their classifications.

Table 8.1.3.4: Classification of the WWTWs and the required and current number of Process Controllers and Supervisors employed at the WWTWs and their Classifications

WWTW			Process Controllers and Supervisors		
WWTW	**Class**	**Shifts**	**Requirements according to Regulation 3630**	**Currently Employed**	**Class**
Stellenbosch	A	06:00 – 18:00 18:00 – 06:00	Class IV Process Controller per shift	B Botha	V
				T Mzili	IV
				F Williams	IV
				C Adams	IV
				R Faulding	V
				E Olshon	IV
				R Chabalala	III
				J Kaap	III
				T Makuzeni	III
				A Sitwayi	0 (Trainee)
				R Goeieman	0 (Trainee)
				E Wenn	0 (Trainee)
				V Khohliso	TBC
				K September	TBC
				D Jacobs	TBC
				M Luphalule	TBC
			Class V Process Controller for Supervision	J Beukes	VI
			The minimum requirement for a Class A WWTW is one Class IV Process Controller per shift, plus one on standby. For the Stellenbosch WWTW, with two shifts, there should therefore be three Process Controllers with minimum		

Table 8.1.3.4: Classification of the WWTWs and the required and current number of Process Controllers and Supervisors employed at the WWTWs and their Classifications

WWTW			Process Controllers and Supervisors		
WWTW	**Class**	**Shifts**	**Requirements according to Regulation 3630**	**Currently Employed**	**Class**
			Class IV classifications. Current number and Class of Process Controllers are adequate for the plant.		
Wemmershoek	C	06:00 – 18:00 18:00 – 06:00	Class III Process Controller per shift	B Botha	V
				H Benjamin	IV
				N Johannes	III
				A Madiya	III
				W Barron	0 (Trainee)
				B Cameron	0 (Trainee)
				N van Wyk	0 (Trainee)
			Class V Process Controller for Supervision	J Beukes	VI
			The minimum requirement for a Class C WWTW is one Class III Process Controller per shift, plus one on standby. For the Wemmershoek WWTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. Current number and Class of Process Controllers are adequate for the plant.		
Pniel	C	07:30 – 16:15	Class III Process Controller per shift	B Botha	V
				C Hendricks	III
				H Johannes	0 (Trainee)
			Class V Process Controller for Supervision	J Beukes	VI
			The minimum requirement for a Class C WWTW is one Class III Process Controller per shift, plus one on standby. For the Pniel WWTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. One additional Class III Process Controller needs to be appointed for the Pniel WWTW.		
Klapmuts	C	06:00 – 18:00 18:00 – 06:00	Class III Process Controller per shift	B Botha	V
				A April	III
				M Dampies	III
				J Manual	III
				W Nzakuzaku	III
				T Daniels	0 (Trainee)
				F Juries	0 (Trainee)
				C Adams	0 (Trainee)
			Class V Process Controller for Supervision	J Beukes	VI
			The minimum requirement for a Class C WWTW is one Class III Process Controller per shift, plus one on standby. For the Klapmuts WWTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. Current number and Class of Process Controllers are adequate for the plant.		
Raithby	D	No permanent PC on site	Class II Process Controller per shift	B Botha	V
				J Kaap	III
			Class V Process Controller for Supervision	J Beukes	VI
			The minimum requirement for a Class D WWTW is one Class II Process Controller per shift, plus one on standby. For the Raithby WWTW, with one shift, there should therefore be two Process Controllers with minimum Class II classifications. Current number and Class of Process Controllers are adequate for the plant.		

Operational and Maintenance support personnel must be available at all times, but may be in-house or outsourced (Electrician, fitter and instrumentation technician). The Supervisor for Class C – E works does not have to be at the works at all the times, but must be available at all times.

The Municipality regularly review their Organogram in order to ensure that the number of Process Controllers per WWTW is in-line with DWS's requirements for Process Controllers per Class of plant. Submissions for the re-classification of Process Controllers, after specific training courses were completed, are also regularly loaded onto the IRIS.

The Maintenance Team mainly performs their own repair and preventative maintenance work to the equipment and infrastructure of the Municipality, except when specialised repair work is required, in which case the work is sub-contracted to approved sub-contractors on the municipal database.

8.1.4 Technical Staff Capacity (Numbers)

Table 8.1.4.1: Technical Staff Capacity

Technical Staff Capacity (Numbers) – Extreme Vulnerability 40%						
Your council approved technical staff organisational organogram meets your business requirements, and posts are filled (i.e. Superintendent of WTWs / WWTWs and below).						
Yes, and all posts filled (i.e. 100%) as per the approved organogram	Strongly agree, and most posts filled (i.e. >95%) as per the approved organogram	Yes, and most posts filled (i.e. >75%) as per the approved organogram	Yes, but only some posts filled (i.e. >50%) as per the approved organogram	Yes, but <50% of posts filled as per the approved organogram	No, does not meet requirements	Don't know
WTWs are operated by the appropriate number of staff (as per Regulation 2834).						
Yes, 100% as per requirements	Strongly agree (i.e. >95% as per requirements)	Mostly agree (i.e. >75% as per requirements)	Agree somewhat (i.e. >50% as per requirements)	<50% as per requirements	None (i.e. 0% as per requirements)	Don't know	Not applicable
WWTWs are operated by the appropriate number of staff (as per Regulation 2834).						
Yes, 100% as per requirements	Strongly agree (i.e. >95% as per requirements)	Mostly agree (i.e. >75% as per requirements)	Agree somewhat (i.e. >50% as per requirements)	<50% as per requirements	None (i.e. 0% as per requirements)	Don't know	Not applicable
You have sufficient water and sewerage/sanitation network operations and repair staff/plumbers including contractors / outsourced resources (i.e. you have the appropriate number of staff).						
Yes, close to 100% as per functional requirements	Strongly agree (i.e. >95% as per functional requirements)	Mostly agree (i.e. >75% as per functional requirements)	Agree somewhat (i.e. >50% as per functional requirements)	<50% as per functional requirements	None (i.e. 0% as per functional requirements)	Don't know
An active mentoring/shadowing programme is in place where experienced staff train younger, inexperienced municipal staff.						
Yes, strongly agree	In place, with occasional non-optimal performance	In place, but not ideal	No, disagree	Don't know		

The table below gives an overview of the number of water and sanitation services personnel and the vacancy rates for the last three financial years.

Table 8.1.4.2: Number of employees in the Department: Water and Wastewater Services

Job Level	Number of Funded Posts			Number of Employees			Number of Vacancies against Posts			Percentage Vacancy Rate		
	21/22	22/23	23/24	21/22	22/23	23/24	21/22	22/23	23/24	21/22	22/23	23/24
18 – 22	1	1	1	0	1	1	1	0	0	100.0%	0.0%	0.0%
14 – 17	4	7	9	3	3	4	1	4	5	25.0%	57.1%	55.6%
9 – 13	37	44	45	35	32	33	2	12	12	5.4%	27.3%	26.7%

Table 8.1.4.2: Number of employees in the Department: Water and Wastewater Services												
Job Level	Number of Funded Posts			Number of Employees			Number of Vacancies against Posts			Percentage Vacancy Rate		
	21/22	22/23	23/24	21/22	22/23	23/24	21/22	22/23	23/24	21/22	22/23	23/24
4 – 8	59	62	78	55	59	74	4	3	4	6.8%	4.8%	5.1%
3 – 0	115	111	84	111	102	81	4	9	3	3.5%	8.1%	3.6%
Total	**213**	**225**	**217**	**204**	**197**	**193**	**12**	**28**	**24**	**5.6%**	**12.4%**	**11.1%**

The number of Water and Wastewater Services posts on the approved Organogram is 414. The current number of Water and Wastewater Services employees is 193, which indicates a vacancy rate of 53.4% against the approved posts. The vacancy rates against the posts on the Organogram for Job Level T18-T22 is 0%, T14 – T17 it is 69%, T9 – T13 it is 42%, T4 – T8 it is 58% and for T3 – T0 it is 51%.

Stellenbosch Municipality is currently effectively managing their water and sanitation services. Special focus is however required to ensure adequate rehabilitation and maintenance of the existing water and sewerage infrastructure, with adequate operational personnel.

Tables 8.1.3.2 and 8.1.3.4 indicate the required number of process controllers per Class of WTWs and WWTWs, as well as the personnel currently employed at the WTWs and WWTWs and their classifications.

8.1.5 Water Resource Management (WRM)

Table 8.1.5.1: Water Resource Management								
Water Resource Management (WRM) – Low Vulnerability 95.0%								
The recommendations and actions from the Reconciliation Strategies (Large Systems / All Towns) have been incorporated into your WSDP, master planning and IDP processes.								
Yes, strongly agree	In process	No, disagree	Don't know	Not applicable				
The metered quantity of water available from the resources is sufficient for your future WSA needs (at the stipulated level of abstraction and assurance of supply).								
No shortage (i.e. sufficient water)	1 - 10% shortage	11-20% shortage	21-30% shortage	31-40% shortage	41-50% shortage	>50% shortage	Don't know	Not applicable
The metered quantity of water available from the resources is sufficient for your future WSA needs (at the stipulated level of abstraction and assurance of supply and considering possible climate change impacts) (i.e. no shortage in 10 years).								
No shortage (i.e. sufficient water)	1 - 10% shortage	11-20% shortage	21-30% shortage	31-40% shortage	41-50% shortage	>50% shortage	Don't know	Not applicable
The source water quality is regularly tested and is currently acceptable for its purpose.								
Yes, strongly agree (i.e. all sources (close to 100%) by water volume are acceptable)	Mostly agree (i.e. >75% of sources by water volume are acceptable)	Agree somewhat (i.e. >50% of sources by water volume are acceptable)	<50% of sources by water volume acceptable	None (i.e. 0% of sources by water volume are acceptable)	Don't know	Not applicable		
The source water quality is regularly tested and the trend indicates a deteriorating quality.								
Yes, all sources (100%) by water volume are deteriorating	>75% of sources by water volume are deteriorating	>50% of sources by water volume are deteriorating	>25% of sources by water volume are deteriorating	< 25% of sources by water volume are deteriorating	No, no sources (0%) are deteriorating	Don't know	Not applicable	

See Topic 6 for more information on the water resource management of the municipality.

8.1.6 Water Conservation and Water Demand Management (WC/WDM)

Table 8.1.6.1: Water Conservation and Water Demand Management						
Water Conservation and Water Demand Management (WC/WDM) – Low Vulnerability 90%						
Your WSA has developed a council approved WC/WDM Strategy, which includes a standard water balance (e.g. modified IWA).						
WC/WDM Strategy and water balance developed	Only WC/WDM Strategy developed	Only water balance developed	None developed	Don't know		
Please indicate your percentage Non-Revenue Water (NRW) as per the modified IWA water balance.						
Less than 15%	Less than 20%	Less than 30%	Less than 40%	Less than 50%	50% or more	Don't know
System input volumes (bulk) to the WSA are accurately monitored using calibrated bulk meters (e.g. check metering).						
Yes, all (i.e. close to 100%)	Almost all (i.e. >95%)	Most (i.e. >75%)	Some (i.e. >50%)	<50%	None (i.e. 0%)	Don't know
Please indicate what percentage of all connections are metered and billed (residential and non-residential (commercial, industrial, etc.)) on a monthly basis.						
>98%	75% - 98%	50% - 75%	<50%	< 25%	No metering	Don't know
Your WSA is implementing appropriate intervention programmes to reduce NRW (e.g. minimisation of night flows through pressure management, removal of unlawful connections, leak detection and repairs, consumer education / awareness).						
Yes, strongly agree (i.e. 100% implementation)	Agree (i.e. >95% implementation)	Mostly agree (i.e. >75% implementation)	Agree somewhat (i.e. >50% implementation)	<50% implementation	No implementation (i.e. 0%)	Don't know

Stellenbosch Municipality also received their 2023 No Drop Score, as calculated through the 2023 Assessment done by the DWS. The 2023 No Drop assessments were performed using a reduced set of No Drop Criteria. These criteria were selected to assess a WSA's understanding of their WC/WDM status, the plans, strategies, budgets, and implementation of remedial projects.

Below is a brief description of the Criteria used for the 2023 assessment.

Table 8.1.6.2: Description of No Drop Criteria	
Criteria 1	WC/WDM status quo, plans and strategies, budgets, and implementation of projects (Water Resource Diagram, Water Balance, Council approved WC/WDM strategies and budgets)
Criteria 2	Asset management as it relates to meter replacement. Monitoring, analysis, and action of high loss District Metered Areas (DMAs) in metropolitan municipalities
Criteria 3	Technical skills of WC/WDM team
Criteria 5	Compliance and Performance based on the water loss and efficiency Key Performance Indicators (KPI) and year on year improvement there-of

The purpose of the 2023 No Drop Assessments was twofold:

- To complete the consultative assessment of the 144 WSAs as per the No Drop Requirements based on the 2021/22 financial year.
- To update the water balance and water loss benchmarking for the 2022/23 financial year. This is reported on in the Status of Water Loss, Water Use Efficiency and Non-Revenue Water in South African Municipalities (2012/13 to 2022/23).

The No Drop results for Stellenbosch Municipality are presented in the table below.

Table 8.1.6.3: No Drop Performance of the Municipality (DWS's 2023 No Drop Report)		
No Drop Score (2021/2022)		**57%**
Criteria	**Weight**	**Score**
1: WC/WDM Strategy, Planning and Implementation	45%	55% (Average)
2: Asset Management	10%	40% (Poor)
3: Technical Skills	10%	20% (Critical)
5: Compliance and Performance	35%	46% (Poor)
Weighted Sub-Total		**47%**
Bonus		10%
Score		**57% (Average)**
Penalty 1: No evidence of approved budget		0.0%
Penalty 2: Section 82 of the Water Servies Act		0.0%
Criteria 1 Sub-Items: WC/WDM Strategy, Planning and Implementation		
Item		**Score (Max = 1)**
1.1: Water Resources		1.0 (Excellent)
1.2: Water Balance		0.8 (Good)
1.2: WC/WDM Strategy and Business Plan		0.0 (Critical)
Penalty 1: No evidence of approved budget		0.0
Criteria 5 Sub-Items: Compliance and Performance		
Item		**Score (Max = 1)**
5.1: Reticulation Leak Repair		0.3 (Poor)
5.2: Physical Water Losses		0.4 (Poor)
5.3: Commercial Water Losses		0.5 (Average)
5.4: Non-Revenue Water		0.4 (Poor)
5.5: Water Use Efficiency		0.7 (Average)
Water Balance Integrity		**High (Excellent)**

Regulatory Impression: The score of 57% indicates an average performance for Stellenbosch Municipality.

- There is ample room for improvement. Stellenbosch Municipality has demonstrated some understanding of its water use situation and WC/WDM Strategy.
- The IWA water balance did not include all the required components and/or did not cover the supply area. The integrity of the water balance was considered to be high.
- Proof of some consumer meter maintenance and replacements was provided, but an insufficient number of interventions were implemented during the 2021/22 audit period.
- There are staff at the WSA responsible for water loss management, but there were shortcomings in the team and/or the related documentation.
- Leak repairs were proven, but an insufficient number of repairs were completed in the 48-hour response time.
- The regulator calculated the key performance indicators for physical water losses (ILI), commercial water losses, NRW, water use efficiencies based on the water balance.

See Topic 5 for more information on the WC/WDM of the municipality.

8.1.7 Drinking Water Safety and Regulatory Compliance

Table 8.1.7.1: Drinking Water Safety and Regulatory Compliance						
Drinking Water Safety and Regulatory Compliance – Moderate Vulnerability 69.0%						
Please indicate your microbiological drinking- water quality compliance for E.Coli (or faecal coliforms) for the communities you are monitoring for the last 12 months.						
99% - 100%	97% - <99%	95% - <97%	< 95%	Don't know		
ALL your supply schemes, WTWs, process controllers, monitoring programmes, sample points, laboratories, results, procedures, protocols, etc. are managed with a suitable Water Safety Planning framework.						
Yes, strongly agree (i.e. close to 100% covered)	Strongly agree (i.e. >95% covered)	Mostly agree (i.e. >75% covered)	Agree somewhat (i.e. >50% covered)	<50% covered	None covered (i.e. 0%)	Don't know
Council have been made aware of high risk / critical water safety plan related issues (including those identified via the Blue Drop Certification programme) that require budget and actioning, and these issues have been actioned (where applicable).						
Yes, strongly agree (i.e. all (close to 100%) tabled)	Strongly agree (i.e. >95% tabled)	Mostly agree (i.e. >75% tabled)	Agree somewhat (i.e. >50% tabled)	<50% tabled	Issues noted but none tabled (i.e. 0%)	Not applicable (no issues requiring council resolution exist)	Don't know
Sufficient funds have been made available to address all these identified water safety related issues.						
Yes, strongly agree (i.e. 100% of required funds)	Strongly agree (i.e. >95% of required funds)	Mostly agree (i.e. >75% of required funds)	Agree somewhat (i.e. >50% of required funds)	<50% of required funds	Issues noted but no funds (i.e. 0%)	Not applicable (no issues requiring funding exist)	Don't know
Required corrective actions/remedial measures to address all these identified water safety related issues have been successfully implemented.						
Yes, strongly agree (i.e. 100% implementation)	Strongly agree (i.e. >95% implementation)	Mostly agree (i.e. >75% implementation)	Agree somewhat (i.e. >50% implementation)	<50% implementation	Issues noted but no implementation (i.e. 0%)	Not applicable (no issues requiring corrective actions exist)	Don't know

Drinking Water Quality Monitoring Programme:

The current and proposed operational and compliance water quality sampling programmes of Stellenbosch Municipality for the various water distribution systems are summarised in the table below.

Table 8.1.7.2: Current and proposed water quality parameters sampled by Stellenbosch Municipality: Routine monitoring of Process Indicators				
Current / Proposed	**Sampling Point**	**Frequency of sampling**	**Samples taken by**	**Current and Proposed Parameters to be sampled**
Stellenbosch / Faure / Blackheath				
Idas Valley WTW				
Current	Raw Water Idas Valley Dam	Monthly	External Lab	Sodium, Calcium, Magnesium, Sulphate, Alkalinity, EC, pH, Turbidity, Colour, Aluminium, Iron
		Annually	External Lab	Full SANS
	Raw Water Jonkershoek Weir	Monthly	External Lab	Sodium, Calcium, Magnesium, Sulphate, Alkalinity, EC, pH, Turbidity, Colour, Aluminium, Iron
		Annually	External Lab	Full SANS
	Raw Water WTW: Towers 1-3	Six Hourly	PC	Colour
		Daily	PC	pH, Turbidity, Colour
	Filters 1-17 Outlet	Daily	PC	pH, Turbidity, Colour
	Lime Stabiliser Inlet: Stab 1-3	Daily	PC	pH, Turbidity, Colour
	Lime Stabiliser Outlet: Stab 1-3	Daily	PC	pH, Turbidity, Colour
	Final Water	Daily (06:00)	In-Line	pH, Turbidity
		Two Hourly	PC	Free Chlorine

Table 8.1.7.2: Current and proposed water quality parameters sampled by Stellenbosch Municipality: Routine monitoring of Process Indicators

Current / Proposed	Sampling Point	Frequency of sampling	Samples taken by	Current and Proposed Parameters to be sampled
		Six Hourly	PC	Colour
Proposed	Raw Water Idas Valley Dam	Monthly	External Lab	As currently implemented
		Annually	External Lab	As currently implemented
	Raw Water Jonkershoek Weir	Monthly	External Lab	As currently implemented

		Annually	External Lab	Full SANS
	Distribution System	Bi-Weekly	External Lab	Sodium, Calcium, Magnesium, Sulphate, Alkalinity, EC, pH, Turbidity, Colour, Aluminium, Iron, HPC, Total Coliforms, E.Coli
		Annually	External Lab	Full SANS
Proposed	Intake Franschhoek Pass	Monthly	External Lab	As currently implemented
		Annually	External Lab	As currently implemented
	Franschhoek WTW Raw Water	Daily	PC	pH, EC, Turbidity
	Franschhoek WTW Final Water	Once per Shift	PC	pH, Turbidity, Free Chlorine
		Daily	PC	EC
		Bi-Weekly	External Lab	As currently implemented
		Annually	External Lab	As currently implemented
	Distribution System	Bi-Weekly	External Lab	As currently implemented, but Disinfectant residuals also to be sampled.
		Annually	External Lab	As currently implemented

Monitoring is the act of conducting a planned series of observations or measurements of operational and / or critical limits to assess whether the components of the water supply are operating properly. The first process is checking the water quality during the operational processes including abstraction, treatment and distribution.

The second process is checking that the water delivered complies with the quality standards as set by government regulations.

A significant limitation of an approach that focuses on compliance monitoring only is that it promotes reactive management, rather than proactive preventative management, as corrective actions are initiated only after drinking water quality monitoring indicates that guideline values have been exceeded.

Other limitations of a compliance monitoring approach to protecting public health include that:

- It is neither technically nor economically feasible to monitor every possible chemical, physical and microbiological parameter. Furthermore, indicator organisms such as E.Coli do not always correlate well with risks for viruses and protozoa, and
- Contamination can occur between sampling events and be missed by the monitoring programme.

The objectives of operational monitoring are for Stellenbosch. Municipality to monitor each control measure in a timely manner to enable effective system management and to ensure that health-based targets are achieved. It also ensures that all the risks identified during the risk assessment process are adequately monitored and that the drinking water quality requirements as set out in SANS:241 are fully complied with. Appropriate data capturing and record keeping systems are in place to satisfy the requirements of the Water Services Act.

The parameters selected by Stellenbosch Municipality for operational monitoring

- reflect the effectiveness of each control measure;
- provide a timely indication of performance;
- are readily measured; and
- provide opportunity for an appropriate response.

The water quality results from operational monitoring are used as a trigger for immediate short – term corrective action to operational procedures, to improve drinking water quality. Stellenbosch Municipality's Compliance Sampling Programme for the water distribution networks is summarised in the table below.

Table 8.1.7.3: Existing Compliance Sampling Programme implemented by Stellenbosch Municipality for their water distribution networks

Distribution System	Sampling Points (WBSM)	Frequency of sampling	Analyses performed on the samples
Stellenbosch	ST-001, ST-004, ST-010 Uniepark Reservoir 19 Omega Str., ST-009 Uniepark Reservoir #1 ST-011 Idasvalley Reservoir #1, Idas Valley Kahler St, Church ST-012 Idas Valley Reservoir #2, Dahlia Str. Klapmuts	KL-005 Klapmuts Primary School		

Note: To be confirmed.

Drinking Water Sample Analysis (Credibility): Operational samples are taken by the Process Controllers at the various WTWs. The accreditation certificates of the external laboratories, who is responsible for compliance sampling within Stellenbosch Municipality, are summarised below:

- Compliance Testing for Stellenbosch Municipality: Enviro Metsi, Accreditation Number T0375 for Chemical and Microbiological Analysis.

Stellenbosch Municipality's own internal laboratory is not yet participating in the SABS Proficiency Testing Scheme.

The water quality compliance sample results are loaded onto the IRIS, which indicate the compliance performance for the month for each of the distribution systems, with specific indication of samples that does not comply. The 2023/2024 water quality compliance sample results are included in Annexure E.

Blue Drop Status: The DWS completed the Blue Drop process for the WSAs in 2023. Blue drop status is awarded to those towns that comply with 95% criteria on drinking water quality management. The blue drop performance of Stellenbosch Municipality was summarised as follows in the DWS's 2023 Blue Drop Report.

Table 8.1.7.4: Blue Drop Performance of the Municipality (DWS's 2023 Blue Drop Report)	
Municipal Blue Drop Score	**2011 – 95.74%, 2012 – 95.56%, 2014 – 80.12% and 2023 – 84.65%**
Introductions: Stellenbosch Local Municipality supplies approximately 126 795 people with potable water through a total of 5 water supply systems and one water service provider. The municipality is responsible for operating and maintaining the water supply network, treatment systems and distribution of 2 systems: Franschhoek and Stellenbosch CBD. The Stellenbosch CBD system is supplied by 2 WTWs (Idas Valley WTW and Paradyskloof WTW), which are operated and maintained by the Stellenbosch LM. The two water supply systems withdraw water from dams and a fountain in the Berg-Olifants catchment area.	

Table 8.1.7.4: Blue Drop Performance of the Municipality (DWS's 2023 Blue Drop Report)

The Water Service Provider (WSP), City of Cape Town, supplies treated water to three of the municipality's systems for distribution, namely: Blackheath, Faure and Wemmershoek. In the distribution and delivery systems, Stellenbosch LM contributes a total SIV of 22 907 kl/d and City of Cape Town 8 933 kl/d (1 675 kl/d via Blackheath WTW; 1 990 kl/d via Faure WTW and 5 268 kl/d via Wemmershoek WTW), accounting for 100% (31 840 kl/d) distributed by Stellenbosch LM.

Regulatory Impression: The Stellenbosch Local Municipality team exhibited a positive attitude towards the Blue Drop assessment process and recognized the value of the assessments in assisting them with improving the management of their water supply systems and optimisation of their operational efficiency. Unfortunately, the position of Manager for Water was vacant at the time of the assessments and the team was not well prepared in terms of uploading documentation on IRIS in advance of the main audit. The audit team acknowledges the involvement and support of the Senior Manager for Water & Wastewater Services, as well as the Manager for Wastewater in rectifying the situation, so that a meaningful assessment can be conducted. The Blue Drop scores for the systems supplied by the City of Cape Town, namely, Blackheath, Faure and Wemmershoek, are consistent with those in 2014, with Wemmershoek showing an improvement. Regrettably, the Blue Drop scores for Franschhoek and Stellenbosch CBD have decreased since the last Blue Drop audit in 2014. The main reasons for this deterioration are the lack of implementation of a coordinated water safety planning process with the associated compliance monitoring programmes, no evidence of operational monitoring programmes and actual operational monitoring and no process audits informing the risk management process. However, despite the deterioration in these scores, the WSA should be lauded for supplying drinking water of excellent quality to its consumers. Overall, both chemical and microbiological compliance is excellent, although the audit team noted a relatively poor microbiological compliance in the Blackheath distribution system managed by the Stellenbosch LM.

Despite not attaining Blue Drop status, the Stellenbosch team should be commended for their actions in several key areas. Design capacities of the WTWs, water balances for all the supply systems and daily flow measurement data are available for the full 12 months of the assessment period. However, flow meters are not calibrated, and the team is encouraged to ensure the meters are calibrated regularly to ensure accuracy of flow measurements. Process controllers for all the WTWs are compliant with the Blue Drop requirements. The WSA employs a full contingent of engineering staff and a professional scientist.

There are, however, several areas identified for improvements. The team is encouraged to focus on enhancing their management processes and procedures to ensure compliance with relevant norms and regulations. Supervisors need to be employed, trained, and registered to ensure compliance with Blue Drop requirements. The WSA has a full multi-disciplinary maintenance team, but a coordinated maintenance programme (preferably informed by a comprehensive asset register) should be developed, implemented and the maintenance records should be formalised to ensure longevity of equipment and infrastructure, as well as reducing the risk of equipment failure. The Stellenbosch Municipality's team is encouraged to review the WaSP that was completed in 2020 and focus on the implementation of a risk-management process supported by associated compliance and operational monitoring programmes. Comprehensive process audits are essential for efficient operation and risk mitigation. The findings and recommendations of the process audits should be integrated into the Water Safety Planning process. Regular inspections and condition assessment of all water reticulation systems need to be undertaken, the findings need to be formally reported and recommendations should be implemented. For the Franschhoek and Idas Valley WTWs the WSA needs to obtain water use authorisations for raw water abstraction. The WSA should review its existing Incident Management Protocols and maintain incident registers and logbooks. The WSA should also improve its supply chain management procedures.

The audit team firmly believes that the Stellenbosch team has the necessary managerial and technical competence to strive for Blue Drop status during the next Blue Drop audit cycle. This will be achieved by focusing on the abovementioned areas of improvement.

Several capital projects are planned for the Stellenbosch CBD WSS to improve asset condition and operational efficiency:
Stellenbosch CBD:

- R1,193,075 Refurbishment - Idas Valley Water Treatment Works
- R500,000 Bulk Water Supply Pipeline and Reservoir – Jamestown
- R11,851,547 New Reservoir – Rosendal.

Blue Drop Findings:

- While process controllers for all Stellenbosch LM's WTW's comply with Blue Drop requirements, supervisors do not comply with regulatory requirements. The WTWs are not officially registered on IRIS in terms of Regulation 2834.
- Although the WSA provided proof of a full maintenance team, there is no evidence of coordinated maintenance plans and maintenance logbooks.
- The WSA employs qualified engineering staff and a professional scientist.
- Water Safety plans were compiled in 2020 but have not been implemented and have not been reviewed. There is no proof of a risk-based compliance monitoring programme.
- There is no evidence of compliant operational monitoring programmes and no proof that operational monitoring is taking place.
- The WSA uses an external laboratory which is fully accredited.
- Incident Management Protocols were compiled in 2020 but have not been formally implemented and reviewed. There is no evidence of any incident registers or logbooks.
- Partial system-specific operational cost determinations are done, including costs of raw water and employee remunerations, but excluding costs for electricity, chemicals, and maintenance.
- Global water specific operational budgets and expenditure systems for water treatment and supply are in place but can be further refined to allow more accurate financial planning and control.
- Supply chain management is lacking. Approved contracts for chemicals and treatment consumables are in place, but there are no service agreements for spares, maintenance, or calibration of flow meters.

Table 8.1.7.4: Blue Drop Performance of the Municipality (DWS's 2023 Blue Drop Report)

- Water use authorisations are only available for the Paradyskloof WTW.
- Design capacities for all WTWs are available and WTWs are operating within their design capacities. While daily flow measurements are taken on all WTWs, flow meters need to be calibrated. Water balances are available for all water supply systems.
- The WSA has not conducted any process audits. Condition assessments by internal staff are available for the Franschhoek and Stellenbosch CBD WTWs; however, findings and recommendations have not been implemented and incorporated in the Water Safety planning and risk management process.
- The WSA does not undertake regular inspections of the reticulation systems for any of the water supply systems.
- Although an asset register is in place, it needs to be expanded to inform maintenance plans and schedules.
- Microbiological and chemical compliance is excellent for all systems, except for the Blackheath distribution system managed by Stellenbosch LM, which has a relatively poor microbiological compliance. While chemical monitoring compliance is adequate for Franschhoek and Stellenbosch CBD, there is room for improvement.

Technical Site Assessment:

The **Paradyskloof WTW** was inspected to determine the condition and functionality of infrastructure, to assess operational performance on site and to verify the Blue Drop audit findings. The WTW received a technical site score of 71% with a VROOM estimated cost of R1 406 900 required to restore the system to full functionality. The WTW is relatively new, and the infrastructure is generally in very good condition and well maintained. A serious concern is that free chlorine is not measured in the final treated water. The WSA relies on intermittent E.coli count measurements in various reservoirs to determine microbiological quality compliance. This is a major risk and the WSA should address this urgently. Refer to the Blue Drop Watch Report 2023 for more detail.

Performance Area		Blackheath (CCT)	Faure (CCT)	Fransch-hoek	Stellenbosch CBD	Wemmershoek (CCT)

8.1.8 Basic Sanitation

Table 8.1.8.1: Basic Sanitation

Basic Sanitation – Moderate Vulnerability 64.0%

You have formal housing areas that are not fully serviced with sanitation infrastructure.

No, all formal areas are fully serviced (i.e. no bucket sanitation service)	Yes, but these are new households that will be serviced within 2 years	Yes, still trying to meet formal backlog but >90% are serviced	Yes, still trying to meet formal backlog with 80 - 90% serviced	Yes, still trying to meet formal backlog with 60 - 80% serviced	Yes, still trying to meet formal backlog with <60% serviced (e.g. occurrence of bucket systems, existence of open defecation)	Don't know

You have informal housing or rural areas that are not fully serviced with sanitation infrastructure.

No, all informal and rural areas are fully serviced	We have no informal areas and rural areas are serviced	Yes, but these are new households that will be serviced within 2 years	Yes, still trying to meet informal or rural backlog with >90% serviced	Yes, still trying to meet informal or rural backlog but 80- 90% are serviced	Yes, still trying to meet informal or rural backlog with 60 - 80% serviced	Yes, still trying to meet informal or rural backlog with <60% serviced (e.g. occurrence of bucket systems, existence of open defecation)	Don't know

You have a detailed plan and programme to provide safe sanitation to all households (including health and hygiene education and user awareness including Water, Sanitation and Health (WASH) aspects).

Yes, strongly agree (i.e. close to 100% implementation)	Strongly agree (i.e. >95% implementation)	Mostly agree (i.e. >75% implementation)	Agree somewhat (i.e. >50% implementation)	<50% implementation	No implementation (i.e. 0%)	Don't know	Not applicable

Your sanitation budget is appropriate for required sanitation programmes (implementation and O&M).

Yes, strongly agree (i.e. close to 100% of required funds)	Mostly agree (i.e. >95% of required funds)	Some shortfall (i.e. >75% of required funds)	Disagree, significant shortfall (50-75% of required funds)	Serious underfunding (<50% of required funds)	No funds (i.e. 0%)	Don't know	Not applicable

You are servicing your basic sanitation facilities (e.g. pit latrines) as per safe sanitation requirements (healthy, environmentally safe, structurally sound, regularly maintained, following faecal sludge management best practices).

Yes, close to 100% as per requirements	Strongly agree (i.e. >95% as per requirements)	Mostly agree (i.e. >75% as per requirements)	Agree somewhat (i.e. >50% as per requirements)	No, we only manage to service <50% of the sanitation infrastructure	No, we have serious shortfalls in the servicing of sanitation infrastructure (i.e.<20 %)	Don't know	Not applicable

See Topic 2 for more information on the Service Levels of the municipality.

8.1.9 Waste Water / Environmental Safety and Regulatory Compliance

Table 8.1.9.1: Waste Water / Environmental Safety and Regulatory Compliance

Wastewater / Environmental Safety and Regulatory Compliance – Moderate Vulnerability 72.0%							
Please indicate your treated wastewater effluent compliance for COD for your (or your service provider's) WWTWs for the last 12 months.							
>95%	90% - 95%	80% - <90%	<80%	Don't know			
ALL your WWTWs, process controllers, monitoring programmes, sample points, laboratories, results, procedures, protocols, etc. are managed with a suitable waste water risk abatement framework.							
Yes, strongly agree (i.e. close to 100% covered)	Agree (i.e. >95% covered)	Mostly agree (i.e. >75% covered)	Agree somewhat (i.e. >50% covered)	< 50% covered	None covered (i.e. 0%)	Don't know	
Council have been made aware of all W_2RAP related issues (e.g. pollution incidents, Green Drop deficiencies) that require budget and actioning, and these issues have been actioned (where applicable).							
Yes, strongly agree (i.e. all (close to 100%) tabled)	Agree (i.e. >95% covered)	Mostly agree (i.e. >75% tabled)	Agree somewhat (i.e. >50% tabled)	< 50% tabled	Issues noted but none tabled (i.e. 0%)	Not applicable (no issues requiring council resolution exist)	Don't know
Sufficient funds have been made available to address all identified wastewater and environmental safety related issues.							
Yes, strongly agree (i.e. 100% of required funds)	Agree (i.e. >95% covered)	Mostly agree (i.e. >75% of required funds)	Agree somewhat (i.e. >50% of required funds)	< 50% of required funds	Issues noted but no funds (i.e. 0%)	Not applicable (no issues requiring funding exist)	Don't know
Required corrective actions/remedial measures to address all identified wastewater and environmental safety related issues have been successfully implemented.							
Yes, strongly agree (i.e. 100% implementation)	Agree (i.e. >95% covered)	Mostly agree (i.e. >75% implementation)	Agree somewhat (i.e. >50% implementation)	<50% implementation	Issues noted but no implementation (i.e. 0%)	Not applicable (no issues requiring corrective actions exist)	Don't know

Waste Water Monitoring Programme: Sampling is done on a frequent basis by the Process Controllers at the various WWTWs, Stellenbosch Municipality's own Internal Laboratory and an accredited external Laboratory, according to comprehensive operational and compliance monitoring programmes. The table below provides an overview of Stellenbosch Municipality's Operational and Compliance Wastewater Quality Monitoring Programmes.

Table 8.1.9.2: Operational and Compliance Wastewater Quality Monitoring Programmes

Sampling Point	Frequency of sampling	Samples taken by	Determinants sampled
Stellenbosch WWTW			
Raw Sewage	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Volatile Suspended Solids, VSS/TSS (Calc, %), Chemical Oxygen Demand (Unfiltered), Ammonia, Total Phosphate, Total Kjeldahl Nitrogen, Total Alkalinity.
MBR Bioreactor A: Zone No.1 – No.3	Daily	PC (In-Line)	DO
MBR Bioreactor B: Zone No.1 – No.3	Daily	PC (In-Line)	DO
MBR Trains No.1 – No.6	Daily	PC (In-Line)	Turbidity
ASP Bio Reactor (No.1 - No.3)	Daily	PC (In-Line)	DO
Bioreactor: MBR Aerobic	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Volatile Suspended Solids, VSS/TSS (Calc, %), Settled Sludge Volume (30 min), Sludge Volume Index, Chemical

Table 8.1.9.2: Operational and Compliance Wastewater Quality Monitoring Programmes			
Sampling Point	**Frequency of sampling**	**Samples taken by**	**Determinants sampled**
			Oxygen Demand (Unfiltered), Ammonia, Nitrate, Orthophosphate, Total Alkalinity.
Bioreactor: ASP Aerobic	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Volatile Suspended Solids, VSS/TSS (Calc, %), Settled Sludge Volume (30 min), Sludge Volume Index, Chemical Oxygen Demand (Unfiltered), Ammonia, Nitrate, Orthophosphate, Total Alkalinity.
RAS No.1 (MBR)	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Volatile Suspended Solids, VSS/TSS (Calc, %)
RAS No.2 (ASP)	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Volatile Suspended Solids, VSS/TSS (Calc, %)
Final Effluent Permeate	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Chemical Oxygen Demand (Unfiltered), Chemical Oxygen Demand (Filtered), Ammonia, Nitrate, Orthophosphate, E.Coli
Final Effluent FE2	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Chemical Oxygen Demand (Unfiltered), Chemical Oxygen Demand (Filtered), Ammonia, Nitrate, Orthophosphate, Free Chlorine, E.Coli
Final Effluent FE2 Channel	Weekly	Internal Lab	E.Coli
Upstream	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Chemical Oxygen Demand (Unfiltered), Ammonia, Nitrate, Orthophosphate, E.Coli.
Downstream	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Chemical Oxygen Demand (Unfiltered), Ammonia, Nitrate, Orthophosphate, E.Coli.
Pniel WWTW			
Raw Sewage	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Volatile Suspended Solids, VSS/TSS (Calc, %), Chemical Oxygen Demand (Unfiltered), Ammonia, Total Phosphate, Total Kjeldahl Nitrogen, Total Alkalinity.
Bioreactor: Aerobic	Daily	PC (In-Line)	DO (No.1 - No.6), Total Solids
	Dailly	PC	Sludge Settling Volumes (30 minutes and 60 minutes)
	Weekly	Internal Lab	pH, Temperature, Electrical Conductivity, Total Dissolved Solids, Total Suspended Solids, Volatile Suspended Solids, VSS/TSS (Calc, %), Settled Sludge Volume (30 min), Sludge Volume Index, Chemical Oxygen Demand (Unfiltered), Ammonia, Nitrate, Orthophosphate, Total Alkalinity.

The Compliance Monitoring Programme consists of monthly sampling of final effluent at the various WWTWs and analyses of all the main quality criteria. Results of the samples taken are loaded onto DWS's IRIS. Monthly monitoring and inspection reports are also compiled by Stellenbosch Municipality's own Laboratory. The Municipality takes immediate action to rectify problems and / or improve operational aspects as and when may be required. For serious failures an Incident Response Management Protocol is followed to ensure rapid remedying of the problems, which includes notification to the DWS as may be necessary.

Waste Water Sample Analysis (Credibility): Compliance Waste Water Samples of Stellenbosch Municipality are analysed by an accredited external laboratory. Once the analyses of the wastewater samples received at the laboratory are completed the results are given through to Stellenbosch Municipality. Any final effluent samples that do not comply with the target values (corresponding either to the Licence Limits or General Authorisation Limits) are reported.

Stellenbosch Municipality's own internal laboratory is not yet participating in the SABS Proficiency Testing Scheme.

The final effluent quality compliance sample results are loaded onto the IRIS, which indicate the compliance performance for the month for each of the WWTWs, which specific indication of samples that does not comply. The 2023/2024 final effluent quality compliance sample results are included in Annexure E for each of the WWTWs.

DWS's Green Drop Process

The DWS completed the new Green Drop assessment for the WSAs in 2021 and the results were received early in 2022. Green drop status is awarded to those WSAs that comply with 90% criteria on key selected indicators on wastewater quality management. The green drop performance of Stellenbosch Municipality is summarised as follows in the DWS's 2022 Green Drop Report.

Table 8.1.9.3: Green Drop Performance of the Stellenbosch Municipality (DWS's 2022 Green Drop Report)	
Average Green Drop Score	**2009 – 53%, 2011 – 71%, 2013 – 40%, 2021 – 84%**

Regulator's Comment: Stellenbosch Local municipality has delivered a sterling performance during the 2021 audit cycle, as is evident from an 84% Green Drop score. This marks a progressive upwards movement from the 2013 baseline score of 40%. The Regulator noted the change being brought about by a highly committed and qualified team, coupled by systematic improvements made over several years since the last Green Drop assessments. Four (4) of the 5 systems have scored >80%, and all 5 systems reside in medium- and low risk CRR positions.

An outstanding feature by Stellenbosch has been the persistent refurbishments and amendments to the Stellenbosch WWTW (the largest size plant). Senior management commitment and attention to their staff's needs seems to make a markable difference and is evident in terms of financial and technical support to the staff and systems. Nevertheless, further improvements can be made to move the municipality to Green Drop Certification status in 2023, if they are addressed. These include but are not limited to finalisation of pending authorisations for the works that are still outstanding, implementing plans for using the generated and classified sludge to the benefit of the municipality.

Linking process audits/conditional assessment findings of the works to the respective W_2RAPs and provide practical implementation plan of all the risks identified.

Stellenbosch is appraised for its high standard and modern equipped laboratory that is used for inhouse operational monitoring and river health monitoring. The laboratory renders a professional scientific service to all WWTWs of the municipality. Furthermore, the municipality has a fully-fledged pollution control unit department that focuses on all the industrial discharges and thereby enforcing bylaws. Stellenbosch sets an example for professionalisation of wastewater services and the Regulator is pleased to acknowledge Stellenbosch for its service and performance, notably in the office and in the field, as can been seen by the 84% Green Drop score and 80% TSA score for the Stellenbosch system. Well done.

Green Drop findings:

1. More than 90% has been achieved against KPAs A and B for all systems, except Raithby.
2. Pniel exceeds its design capacity, all other WWTWs are well below.
3. Work is required to classify and allocate Process Controllers to specific systems, or define their allocations across different systems.
4. Zero out of 5 WWTWs complied with all effluent quality categories (i.e., Microbiological, Chemical and Physical) – this was the single reason for not achieving Green Drop excellence status. The good microbiological compliance by Pniel is acknowledged.
5. Energy efficiency management is not practiced; hence, recommendations were made to tap in with existing initiatives by SALGA, DMRE, GIZ and WISA.
6. Most of the licenses/permits are outdated and engagement with DWS must be intensified to resolve this before the next audit.
7. Wemmershoek WWTW is currently undergoing planned upgrades and it is expected to resolve the effluent compliance issues.
8. No plants in the high or critical risk positions.
9. Bonusses have been maximised by offering additional evidence, only one penalty applied for the Pniel system.
10. Budget had been secured for capital projects for replacement, upgrades, and addition of new unit process at some of the WWTWs and associated infrastructure:
    - R989,000: Stellenbosch WWTW upgrades through internal funding and capital replacement reserves.
    - R90,000,000: Wemmershoek WWTW upgrades through internal funding and capital replacement reserves.
    - R47,000,000: Pniel WWTW upgrades through internal funding and capital replacement reserves.
    - R16,000,000: Klapmuts WWTW upgrades through internal funding and capital replacement reserves.
    - R5,000,000: Raithby WWTW upgrades through internal funding and capital replacement reserves.

The Stellenbosch WWTW was inspected to verify the Green Drop Audit Findings: Technical Site Assessment Score 80%

- The plant's installed and design capacity is 35 Ml/day and consist of: 27 Ml/d MBR (submerged membrane bioreactor) plant (new plant commissioned in 2019) and 8 Ml/d conventional activated sludge plant (old plant but recently refurbished and amended configuration).

Table 8.1.9.3: Green Drop Performance of the Stellenbosch Municipality (DWS's 2022 Green Drop Report)

- A combined inlet works (mechanical screens, vortex degritters and flow measurement) provides preliminary treatment for both parts of the works (new and old). There is no primary settlement, but there are fine screens for the new works to protect the submerged membranes. The final effluent streams are again blended, and disinfection is via UV.
- The flow to the plant is only 16 Ml/d which has decreased since the recent water restrictions and COVID (less students at Stellenbosch university). The works appear to be in very good condition and despite a few minor teething problems, appears to be well operated.
- The discharge requirements are 'special limits' which is currently under dispute with DWS, in particular the UV disinfection, noting that the receiving river is under general limit conditions.
- Good quality sludge was produced, as product of aerobic digestion and belt presses. The sludge is taken to the landfill site which will have to be reviewed in future under new legislation.
- The MBR plant and aerobic digestion is (inherently) power intensive and the works SPC and energy efficiency could potentially be further optimized.
- The works has a Dissolved Air Flotation unit that is currently not utilised.

Stellenbosch Municipality also received their 2023 Green Drop Risk Ratings, as calculated from the 2023 assessment done by the DWS.

Table 8.1.9.5: Green Drop Risk Rating of Stellenbosch Municipality (DWS's 2023 Green Drop Progress Report)

Municipal CRR% 2023 (%CRR/CRRmax)	84.1%

Introduction:

Stellenbosch Local Municipality is responsible for the management and operation of the five (5) WWTWs using various technologies and various sizes from the Activated Sludge plant at Stellenbosch (20 400 kl/day) to the 150 kl/day Rotating Biological Contactors at Raithby.

Regulator's Comments: Stellenbosch Local Municipality failed to provide any information at all to the regulator to verify the accuracy of the information on the IRIS and to allow the review of the CRR scores. This dismal performance is of great concern to the regulator as the WWTWs are all high-risk sites due to the high CRR scores. There is a significant lack of correct design capacity information for all sites which has impacted on the successful registration of these sites on the IRIS. No information on the operational flow is available for any of the sites and this represents a critical risk as a lack of flow measurement information impacts on the CRR score significantly. The WSA must confirm the operational capacity of all works with accurate flow records. In addition, the WSA must ensure that inflow meters are installed and that daily flow readings are recorded. Annual flow meter calibration should also be performed to ensure that the operational capacity of the works does not exceed its design capacity.

The final effluent quality at all sites is of concern. Most concerning is the effluent quality from the Stellenbosch and Wemmershoek WWTWs as the effluent from both these sites fails to meet the discharge limits for most of the required parameters including very poor microbiological quality. This presents a significant risk to downstream users. No information on sludge quality is available. The poor effluent quality is a reflection on the lack of skilled operational and maintenance staff at these sites and presents a critical risk for SLM. These positions should be prioritized as effective operation cannot take place without competent staff to operate and maintain the treatment works. The lack of registered skilled process controllers and supervisors at many of the sites is concerning. On a positive note, the availability of a qualified supervisor and sufficient process control staff at Stellenbosch WWTW is to be commended. The WSA should ensure that the other sites area also provided with competent and qualified supervisors and process control staff to ensure effective operation and management of the treatment works including Klapmuts, Pniel, Raithby and Wemmershoek. No information on the maintenance team is available, which is a critical risk to the effective management of a WWTWs. The lack of a maintenance team with required competencies presents a high risk of as this will negatively impact on functionality of the WWTWs.

No information was provided by the WSA for Wastewater Risk Abatement Planning (W_2RAP) and no GDIP or Corrective Action Plan (CAP) documentation was provided. No descriptions of current projects or future capital projects are available as the WSA did not provide any evidence for the GD PAT via the municipal information spreadsheet (MIS) or on the IRIS system. The WSA is encouraged to develop or review and implement the risk-based methodology of the W_2RAP as this ensure minimizing the overall risk rating and improvement in effluent quality compliance. The WSA must also develop and implement a GDIP plan which identifies the shortcomings for all Green Drop criteria and allocates responsibility, budget and time frames to address the gaps. Overall, the lack of interest exhibited by the SLM during the GD PAT does not inspire confidence in the ability of the WSA to manage these treatment works effectively, and it is hoped that the WSA will engage with the Regulator in future to ensure effective wastewater management.

8.1.10 Infrastructure Asset Management (IAM)

Table 8.1.10.1: Infrastructure Asset Management					
Infrastructure Asset Management (IAM) – Low Vulnerability 93.0%					
You have an appropriate and up-to-date water and sanitation services technical Asset Register (includes asset name, location, condition, extent, remaining useful life, performance and risk). NOTE: This does not only refer to GRAP17 asset register requirements.					
Yes, strongly agree (e.g. advanced asset register)	Yes, agree (e.g. basic asset register - i.e. not all aspects included)	Not ideal (e.g. outdated asset register)	No, disagree (i.e. no asset register)	Don't know	
You have developed an appropriate Infrastructure Asset Management (IAM) Plan for your WSA.					
Yes, strongly agree	In place, with occasional non-optimal performance	Partially in place, but not ideal	No, disagree	Don't know	
You are implementing the IAM outcomes.					
Yes, strongly agree (i.e. 100% implementation)	Agree (i.e. >95% implementation)	Mostly agree (i.e. >75% implementation)	Agree somewhat (i.e. >50% implementation)	< 50% implementation	No implementation (i.e. 0%)	Don't know
Budget allocated to implement IAM outcomes is sufficient and is being effectively spent.						
Yes, strongly agree (i.e. 100%)	Agree (i.e. >95%)	Mostly agree (i.e. >75%)	Agree somewhat (i.e. >50%)	< 50%	No (i.e. 0%)	Don't know
You conduct annual technical assessments of your water and wastewater related systems (including sources, WTWs, WWTWs, pump stations, network, etc.) and implement required follow-up actions.						
Yes, all systems (i.e. 100%)	Almost all systems (i.e. >95%)	Most systems (i.e. >75%)	Some systems (i.e. > 50%)	< 50% systems	No systems (i.e. 0%)	Don't know	Not applicable

A 2025/2026 Asset Management Policy is in place. The objectives of the Asset Management Policy are as follows:

- Specifying Council's practice regarding accounting for assets.
- Ensuring consistency in accounting treatment.
- To assist officials in understanding their legal and managerial responsibilities with regard to key asset functions such as:
  - Safeguarding of assets;
  - Maintaining assets;
  - Establishing and maintaining a management, accounting and information system;
  - That accounts for the assets of the municipality;
  - Asset valuation principles in accordance with GRAP;
  - Establishing and maintaining systems of internal control over assets;
  - Establishing and maintaining asset registers; and
  - Clarifying responsibilities and accountabilities for the asset management process.

The current water and sewerage infrastructure assets, as included in the latest Asset Register of Stellenbosch Municipality (June 2024), are summarised under Section 3.1.1 of Topic 3.

8.1.11 Operation and Maintenance of Assets

Table 8.1.11.1: Operation and Maintenance of Assets					
Operation and Maintenance of Assets – High Vulnerability 50.0%					
Appropriate maintenance facility(ies) that is (are) secure and stocked with essential equipment (e.g. spare parts), plant and tools is (are) available.					
Yes, strongly agree	In place, with occasional non-optimal performance	Partially in place, but not ideal	No, disagree	Don't know	
Appropriate water and sanitation services infrastructure / equipment planned / preventative maintenance schedules are developed.					
Yes, strongly agree	In place, with occasional non-optimal performance	Partially in place, but not ideal	No, disagree	Don't know	
Appropriate planned / preventative maintenance is performed at all WTWs and associated reservoirs, pump stations and distribution networks.					
Yes, all (i.e. 100%)	Most (i.e. >75%)	Some (i.e. > 50%)	< 50%	None (i.e. 0%)	Don't know
Appropriate planned / preventative maintenance is performed at all WWTWs and associated collection systems and pump stations.					
Yes, all (i.e. 100%)	Most (i.e. >75%)	Some (i.e. > 50%)	< 50%	None (i.e. 0%)	Don't know
Please indicate your infrastructure repairs and maintenance costs as a function of total operating expenditure (%).					
<5%	5% - <10%	10% - <15%	15% - <12%	20% or more	Don't know

See Topic 4 for more information on the Water Services Operation and Maintenance of the municipality.

8.1.12 Financial Management

Table 8.1.12.1: Financial Management					
Financial Management – Moderate Vulnerability 70.0%					
Financial controls - Please state the audit opinion with regard to your last audit report on the financial statements.					
Clean audit outcome (i.e. unqualified with no findings)	Financially unqualified audit opinion (with findings)	Qualified audit opinion	Disclaimer of audit opinion	Adverse audit opinion	Don't know
Cash flow status – Please state your Cash / Cost Coverage Ratio (excluding Unspent Conditional Grants)					
> 90 days	60 - 90 days	30 - 60 days	< 30 days	Don't know	
Your actual operating expenditure closely reflects your budgeted operating expenditure (i.e. Operating Expenditure Budget Implementation Indicator).					
95% - 100%	90% - <95%	85% - <90%	80% - <85%	<80%	Don't know
Your actual revenue closely reflects your budgeted operating revenue (i.e. Operating Revenue Budget Implementation Indicator).					
95% - 100%	90% - <95%	85% - <90%	80% - <85%	<80%	Don't know
Liabilities (Creditors) - Money is owed by your municipality to major / critical service providers (e.g. ESKOM, Water Board, largest contractors, etc.) for more than 30 days from receipt of invoice (NOTE: Ignore disputed invoices).					
Never	Once per year	Twice per year	Once per quarter	More frequently than quarterly	Don't know

See Topic 7 for more information on the financial management of the municipality.

8.1.13 Revenue Collection

Table 8.1.13.1: Revenue Collection					
Revenue Collection - Low Vulnerability 85.0%					
Please indicate the frequency of actual consumer meter readings.					
Actual meter reading on a monthly basis	Actual meter reading at least every 2nd month	Meter reading at least on a quarterly basis	Meter reading less frequently than quarterly	Don't know	
Net Surplus / Deficit – Please state your net surplus / deficit from water services activities for the last 12 months (NOTE: This question tests whether your WSA currently has fully cost reflective Water and Sanitation Tariffs, which take into account cost of maintenance and renewal of purification plants and networks and the cost of new infrastructure).					
Surplus (i.e. >0%)	Breakeven (i.e. = 0%)	Net deficit (i.e. <0%)	Don't know		
Revenue collections - Please state the revenue collection rate in respect to Water and Sanitation Services (%).					
<50%	50% - <70%	70% - <80%	80% - <95%	95% or more	Don't know
Revenue Growth – Please state your Water and Sanitation Services revenue growth for the last financial year (%).					
>CPI	Equals CPI	<CPI, but >0%	Negative growth (-ve)	Don't know	
Grant dependency – Actual-operating revenue less operational grants / subsidies (e.g. equitable share) sufficiently covers actual operating expenditure.					
Yes, all (i.e. 100%)	Most (i.e. >75%)	Some (i.e. > 50%)	< 50%	None (i.e. 0%)	Don't know

See Topic 7 for more information on the revenue collection of the municipality

8.1.14 Financial Asset Management

Table 8.1.14.1: Financial Asset Management						
Financial Asset Management – Extreme Vulnerability 45.0%						
Capital Expenditure (Municipal). Please state your municipal Capital Expenditure as a percentage of Total Expenditure (i.e. Total Operating Expenditure + Capital Expenditure).						
<5%	5% - <10%	10% - <15%	15% - <20%	20% or more	Don't know	
Capital Expenditure (Water Services). Please state your Capital Expenditure on Water and Sanitation Services as a percentage of Total Capital Expenditure (Capital Expenditure (Municipal)).						
<25%	25% - <50%	50% - <75%	75% or more	Don't know		
Asset Renewal. Please state your Asset Renewal investment as percentage of Depreciation Costs.						
100%	>90%	>75%	>50%	<50%	None (i.e. 0%)	Don't know
Repairs and Maintenance. Please state your Repairs and Maintenance expenditure as a percentage of Property, Plant and Equipment, Investment Property (Carrying Value).						
<5%	5% - <8%	8% - <10%	10% or more	Don't know		
Grant funding of capital expenditure – Please state your reliance on grant funding.						
>90%	> 75%	>50%	<50%	Don't know		

See Topic 3, Section 3.1.1. for more information on the financial asset management of the municipality.

8.1.15 Information Management (IT)

Table 8.1.15.1: Information Management					
Information Management (IT) – Low Vulnerability 100.0%					
You have a developed, approved and implemented IT Master Systems Plan (e.g. covering 3-5 years) that addresses your IT business requirements.					
Yes, developed, approved and being implemented	Developed and approved, but not yet implemented	Developed but not yet approved or implemented	In development	No, disagree	Don't know
You have a developed, approved and implemented ICT Technology Master Plan that addresses your current and future IT infrastructure requirements.					
Yes, developed, approved and being implemented	Developed and approved, but not yet implemented	Developed but not yet approved or implemented	In development	No, disagree	Don't know
You have IT systems that support your full range of water and sanitation services business requirements (e.g. billing, GIS, customer care, O&M, asset management).					
Yes, strongly agree (i.e. 100% of required systems)	Mostly agree (i.e. >75% of required systems)	Agree somewhat (i.e. >50% of required systems)	< 50% of required systems	None (i.e. 0% of required systems)	Don't know
ICT service continuity – Adequate IT security exists with off-site back-ups / archiving of operation critical applications, databases, data, etc. routinely performed in terms of an IT disaster Recovery Plan.					
Yes, strongly agree (i.e. All (close to 100%) in place)	Mostly agree (i.e. >75% in place)	Agree somewhat (i.e. >50% in place)	< 50% in place	Nothing in place (i.e. 0%)	Don't know
You have sufficient budget and staff to keep key IT systems table and up-to-date as per IT policies and procedures.					
Yes, strongly agree (i.e. 100%)	Mostly agree (i.e. >75%)	Agree somewhat (i.e. >50%)	< 50%	No (i.e. 0%)	Don't know

Information and Communication Technology (ICT) Systems and Services are playing an ever-increasing role as a strategic enabler of organisational transformation and service delivery in the public sector. There is also a growing acknowledgement at the corporate governance level that ICT services and systems form an integral part of the municipal service delivery value chain.

The continuous alignment of ICT services and systems with the strategic goals and objectives of the municipality, as well as statements of direction from the National Government and the Western Cape Provincial Government, impose major challenges on the Department: ICT and its resources. Stellenbosch Municipality's vital ICT-related services include the following (5th Generation IDP 2022 – 2027, 2nd Review May 2024):

- Provisioning of Municipal Financial Management and Payroll Management software applications;
- Hosting of the municipal website;
- E-mail and internet services;
- Data storage;
- Data recovery;
- ICT planning;
- Provisioning of the network, wireless networks, and telephony services;
- End-user support for the ICT environment;
- Disaster Recovery Management;
- Business Continuity;
- ICT Risk Management;

- ICT contract management; and
- Public Wi-Fi.

8.1.16 Organisational Performance Monitoring

Table 8.1.16.1: Organisational Performance Monitoring					
Organisational Performance Monitoring – Low Vulnerability 100.0%					
Appropriate plans, policies and procedures to address Disaster Management / emergencies and other issues (safety, public participation, communication, etc.) are developed and implemented. NOTE: Although Disaster Management is a district function, LMs need to ensure they are aware of their associated roles and responsibilities and have developed a Disaster Management Framework.					
Yes, developed and implemented	Developed but not yet implemented	In development	No, disagree	Don't know	
An organisational performance management system is developed and implemented (i.e. effectively measure, monitor and track water and sanitation services performance indicators).					
Yes, developed and implemented	Developed but not yet implemented	In development	No, disagree	Don't know	
A municipal risk management framework is developed and implemented and includes monitoring and tracking of water and sanitation related risks.					
Yes, developed and implemented and includes water and sanitation related risks	Yes, developed and implemented but does not include water and sanitation related risks	Developed but not yet implemented	In development	No, disagree	Don't know
Effective administration support is available to technical staff to assist with processing work orders, providing order numbers, handling correspondence, etc.					
Yes, strongly agree (i.e. close to 100% effective)	Mostly agree (i.e. >75% effective)	Agree somewhat (i.e. >50% effective)	< 50% effective	No, completely ineffective (i.e. 0%)	Don't know
"Access to Basic Water and Sanitation Services" progress reports are frequently produced and presented to council for discussion, action and follow-up.					
At least quarterly	At least bi-annually	At least annually	Less frequently (i.e. > 1 year)	No, never	Don't know

The IDP is the Municipality's single most strategic document that drives and directs all implementation and related processes. The Municipality's budget is developed based on the priorities, programmes and projects of the IDP, after which a Service Delivery Budget Implementation Plan (SDBIP) is developed, to ensure that the organisation actually delivers on the IDP targets.

The SDBIP is the process plan and performance indicator / evaluation for the execution of the budget. The SDBIP is being used as a management, implementation and monitoring tool that assists and guide the Executive Mayor, Councillors, Municipal Manager, Senior Managers and the community. The plan serves as an input to the performance agreements of the Municipal Manager and Directors. It also forms the basis for the monthly, quarterly, mid-year and the annual assessment report and performance assessments of the Municipal Manager and Directors.

The water and sanitation KPIs, as included in the 2023/2024 WSDP Performance- and Water Services Audit Report, and the performance with regard to these KPIs are summarised in the table below.

Table 8.1.16.2: 2023/2024 Water and Sanitation KPIs and the performance

Ref	KPI	Unit of Measurement	Annual Target	Actual
D1828	Spend the Department: Water and Wastewater Services approved Capital Budget.	Percentage of approved Capital Budget of the Department: Water and Wastewater Services actually spent by 30 June.	90%	97.06%
D1838	Update of Infrastructure Asset Register.	Number of updates to the Infrastructure Asset Register submitted to the Portfolio Committee as a preventative maintenance tool by 31 March.	1	0
D1839	Submit the Water Services Tariffs to the Directorate: Financial Services.	Number of Water Services Tariffs submitted to the Directorate: Financial Services by 31 January.	1	1
D1840	Submission of a revised the Water Resources Master Plan to the Director: Infrastructure Services.	Number of revised Water Resources Master Plans submitted to the Director: Infrastructure Services by 30 June.	1	0
D2175	Submission of the revised Wastewater Master Plan to the Municipal Manager.	Number of revised Wastewater Master Plans submitted to the Municipal Manager by 30 June.	1	1
D2180	Wastewater quality measured i.t.o. the Department of Water and Sanitation's License Conditions for physical and micro parameters.	Percentage of wastewater quality compliance as per the analysis certificate, measured quarterly.	70%	48.67%
D2190	Water quality measured quarterly i.t.o. the SANS 241 physical and micro parameters.	Percentage of water quality level as per the analysis certificate, measured quarterly.	90%	95.25%
D2191	Limit unaccounted water to less than 25%.	Percentage of average unaccounted water, measured by 30 June.	25%	7.83%
D1799	Spend the Section: Wastewater Treatment approved Capital Budget.	Percentage of approved Capital Budget of the Section: Wastewater Treatment actually spent by 30 June.	90%	42%
D1846	Spend the Section: Water Treatment approved Capital Budget.	Percentage of approved Capital Budget of the Section: Water Treatment actually spent by 30 June.	90%	60%
D1847	Submit an Annual Water Services Audit Report to the Portfolio Committee: Infrastructure Services.	Number of Annual Water Services Audit Reports submitted to the Portfolio Committee: Infrastructure Services by 30 June.	1	1
D2126	Update Water Use Licensees (WULA).	Number of Water Use Licenses (WULA) updated by 30 June.	3	3
D1811	Spend the Section: Water and Wastewater Network Operations approved Capital Budget.	Percentage of approved Capital Budget of the Section: Water and Wastewater Network Operations actually spent by 30 June.	90%	78%
D1812	Implement Water Demand Management measures.	Number of Water Demand Management measures implemented by 30 June.	200	427
D3329	Implementation of the pipe replacement programme.	Number of metres of pipe replaced in the pipe replacement programme, measured per quarter.	1 000	2 734
D1814	Repair burst pipes within 5 hours from receiving the complaint.	Percentage of burst pipes repaired within 5 hours from receiving the complaint.	80%	200%
D1815	Implementation of the indigent household water leak repair programme.	Percentage implemented of the indigent household water leak repair programme.	80%	80%
D1816	Unblock municipal sewer blockages within 5 hours from receiving the complaint.	Percentage of sewer blockages unblocked within 5 hours from receiving the complaint.	80%	83.75%

8.1.17 Water and Sanitation Service Quality

Table 8.1.17.1: Water and Sanitation Service Quality

Water and Sanitation Service Quality – Low Vulnerability 97.0%						
Critical business databases and documents (e.g. as-built drawings, records, manuals, agreements, billing/revenue collection, project and scheme management data, etc.) are current, maintained and stored in secure locations (on-site and off-site, both paper and electronic).						
Yes, strongly agree (i.e. 100% in place)	Agree (i.e. >95% in place)	Mostly agree (i.e. >75% in place)	Agree somewhat (i.e. >50% in place)	< 50% in place	Nothing in place (i.e. 0%)	Don't know
Customers have a functional, reliable and safe water supply system with sufficient quantity and flow, good quality and minimal interruptions.						
Yes, all have a functional, reliable and safe service (i.e. close to 100%)	At least 90% have a functional, reliable and safe service	Most have a functional, reliable and safe service (i.e. >75%)	Some have a functional, reliable and safe service (i.e. > 50%)	< 50% of customers have a functional, reliable and safe service	None have a functional, reliable and safe service (i.e. 0%)	Don't know
All consumers served experience interruptions of less than 48 hours (at any given time) and a cumulative interruption time during the year of less than 15 days.						
Yes, all (i.e. close to 100%)	>90% of households	>75% of households	>50% of households	<50% of households	None (i.e. 0%)	Don't know
Households in your WSA experience water pressure problems (i.e. meet requirements as per National Norms and Standards for Domestic Water (Sep 2017) (not to be confused with interruption to supply).						
Yes, no households experience pressure problems (i.e. close to 100% do not experience pressure problems)	>90% of households do not experience pressure problems	>75% of households do not experience pressure problems	>50% of households do not experience pressure problems	<50% of households do not experience pressure problems	All households (i.e. 100%) experience pressure problems	Don't know
Customers have a functional, reliable, dignified and safe sanitation system with no blockages resulting in overflows that impact on the environment, including effective collection and treatment of faecal sludge.						
Yes, all customers have a functional, reliable, dignified and safe service with no impact on the environment (i.e. close to 100%)	> 98% of all customers have a functional, reliable, dignified and safe service with minimal impact on environmental health	Almost all have a functional, reliable, dignified and safe service (i.e. >90%)	Most have a functional, reliable, dignified and safe service (i.e. >75%)	Some have a functional, reliable, dignified and safe service (i.e. > 50%)	< 50% of customers have a functional, reliable, dignified and safe service	None have a functional, reliable, dignified and safe service (i.e. 0%)	Don't know

Stellenbosch Municipality is currently effectively managing its water and sanitation services. Disruptions to water supply and sanitation services at the consumer's end are minimal. Standby pumps and motors and backup generators are available at most of the pump stations and additional standby pumps and motors are also kept in storage by Stellenbosch Municipality in order to minimise the risk of interruption in water supply from pump stations and possible sewage spillages at the sewer pump stations.

8.1.18 Customer Care (CRM)

Table 8.1.18.1: Customer Care

Customer Care (CRM) – Low Vulnerability 99.0%				
A functional customer service system manned by appropriate customer services representatives and using a complaints register, is in place to address complaints and appropriately inform customers of service interruptions, contamination of water, boil water alert, etc.				
Yes, strongly agree	In place, with occasional non-optimal performance	Partially in place, but not ideal	No, disagree	Don't know
Regular municipal wide customer satisfaction surveys are conducted to determine customer satisfaction levels and inform the Customer Care Management Plan.				

Table 8.1.18.1: Customer Care						
Customer Care (CRM) – Low Vulnerability 99.0%						
Annual customer satisfaction surveys	Biennial (i.e. every 2nd year) customer satisfaction surveys	Less frequent customer satisfaction surveys (i.e. > 2 years)	No customer satisfaction surveys	Don't know		
Please indicate what percentage of the reported water related complaints/callouts are acknowledged, including consumer response, within 24 hours.						
All (i.e. close to 100%)	Almost all (i.e. >95%)	Most (i.e. >75%)	Some (i.e. > 50%)	< 50%	None (i.e. 0%)	Don't know
Please indicate what percentage of the reported wastewater/sanitation related complaints/callouts are acknowledged, including consumer response, within 24 hours.						
All (i.e. close to 100%)	Almost all (i.e. >95%)	Most (i.e. >75%)	Some (i.e. > 50%)	< 50%	None (i.e. 0%)	Don't know
A comprehensive customer awareness programme (informing customers of water and wastewater system O&M activities, water quality, resource protection / pollution, reporting incidents / security concerns, etc.) is in place and implemented.						
Yes, strongly agree	In place, with occasional non-optimal performance	Partially in place, but not ideal	No, disagree (i.e. no awareness programme)	Don't know		

A comprehensive Customer Services and Complaints system is in place at Stellenbosch Municipality and the Municipality has maintained a high and a very consistent level of service to its urban water consumers. A Customer Care Service Charter is also in place, with the following mission and values.

Our Mission is:

To deliver services in an enabling environment through sustainable, cost-effective and accountable services for our community, which further enshrines the values and spirit of Batho Pele.

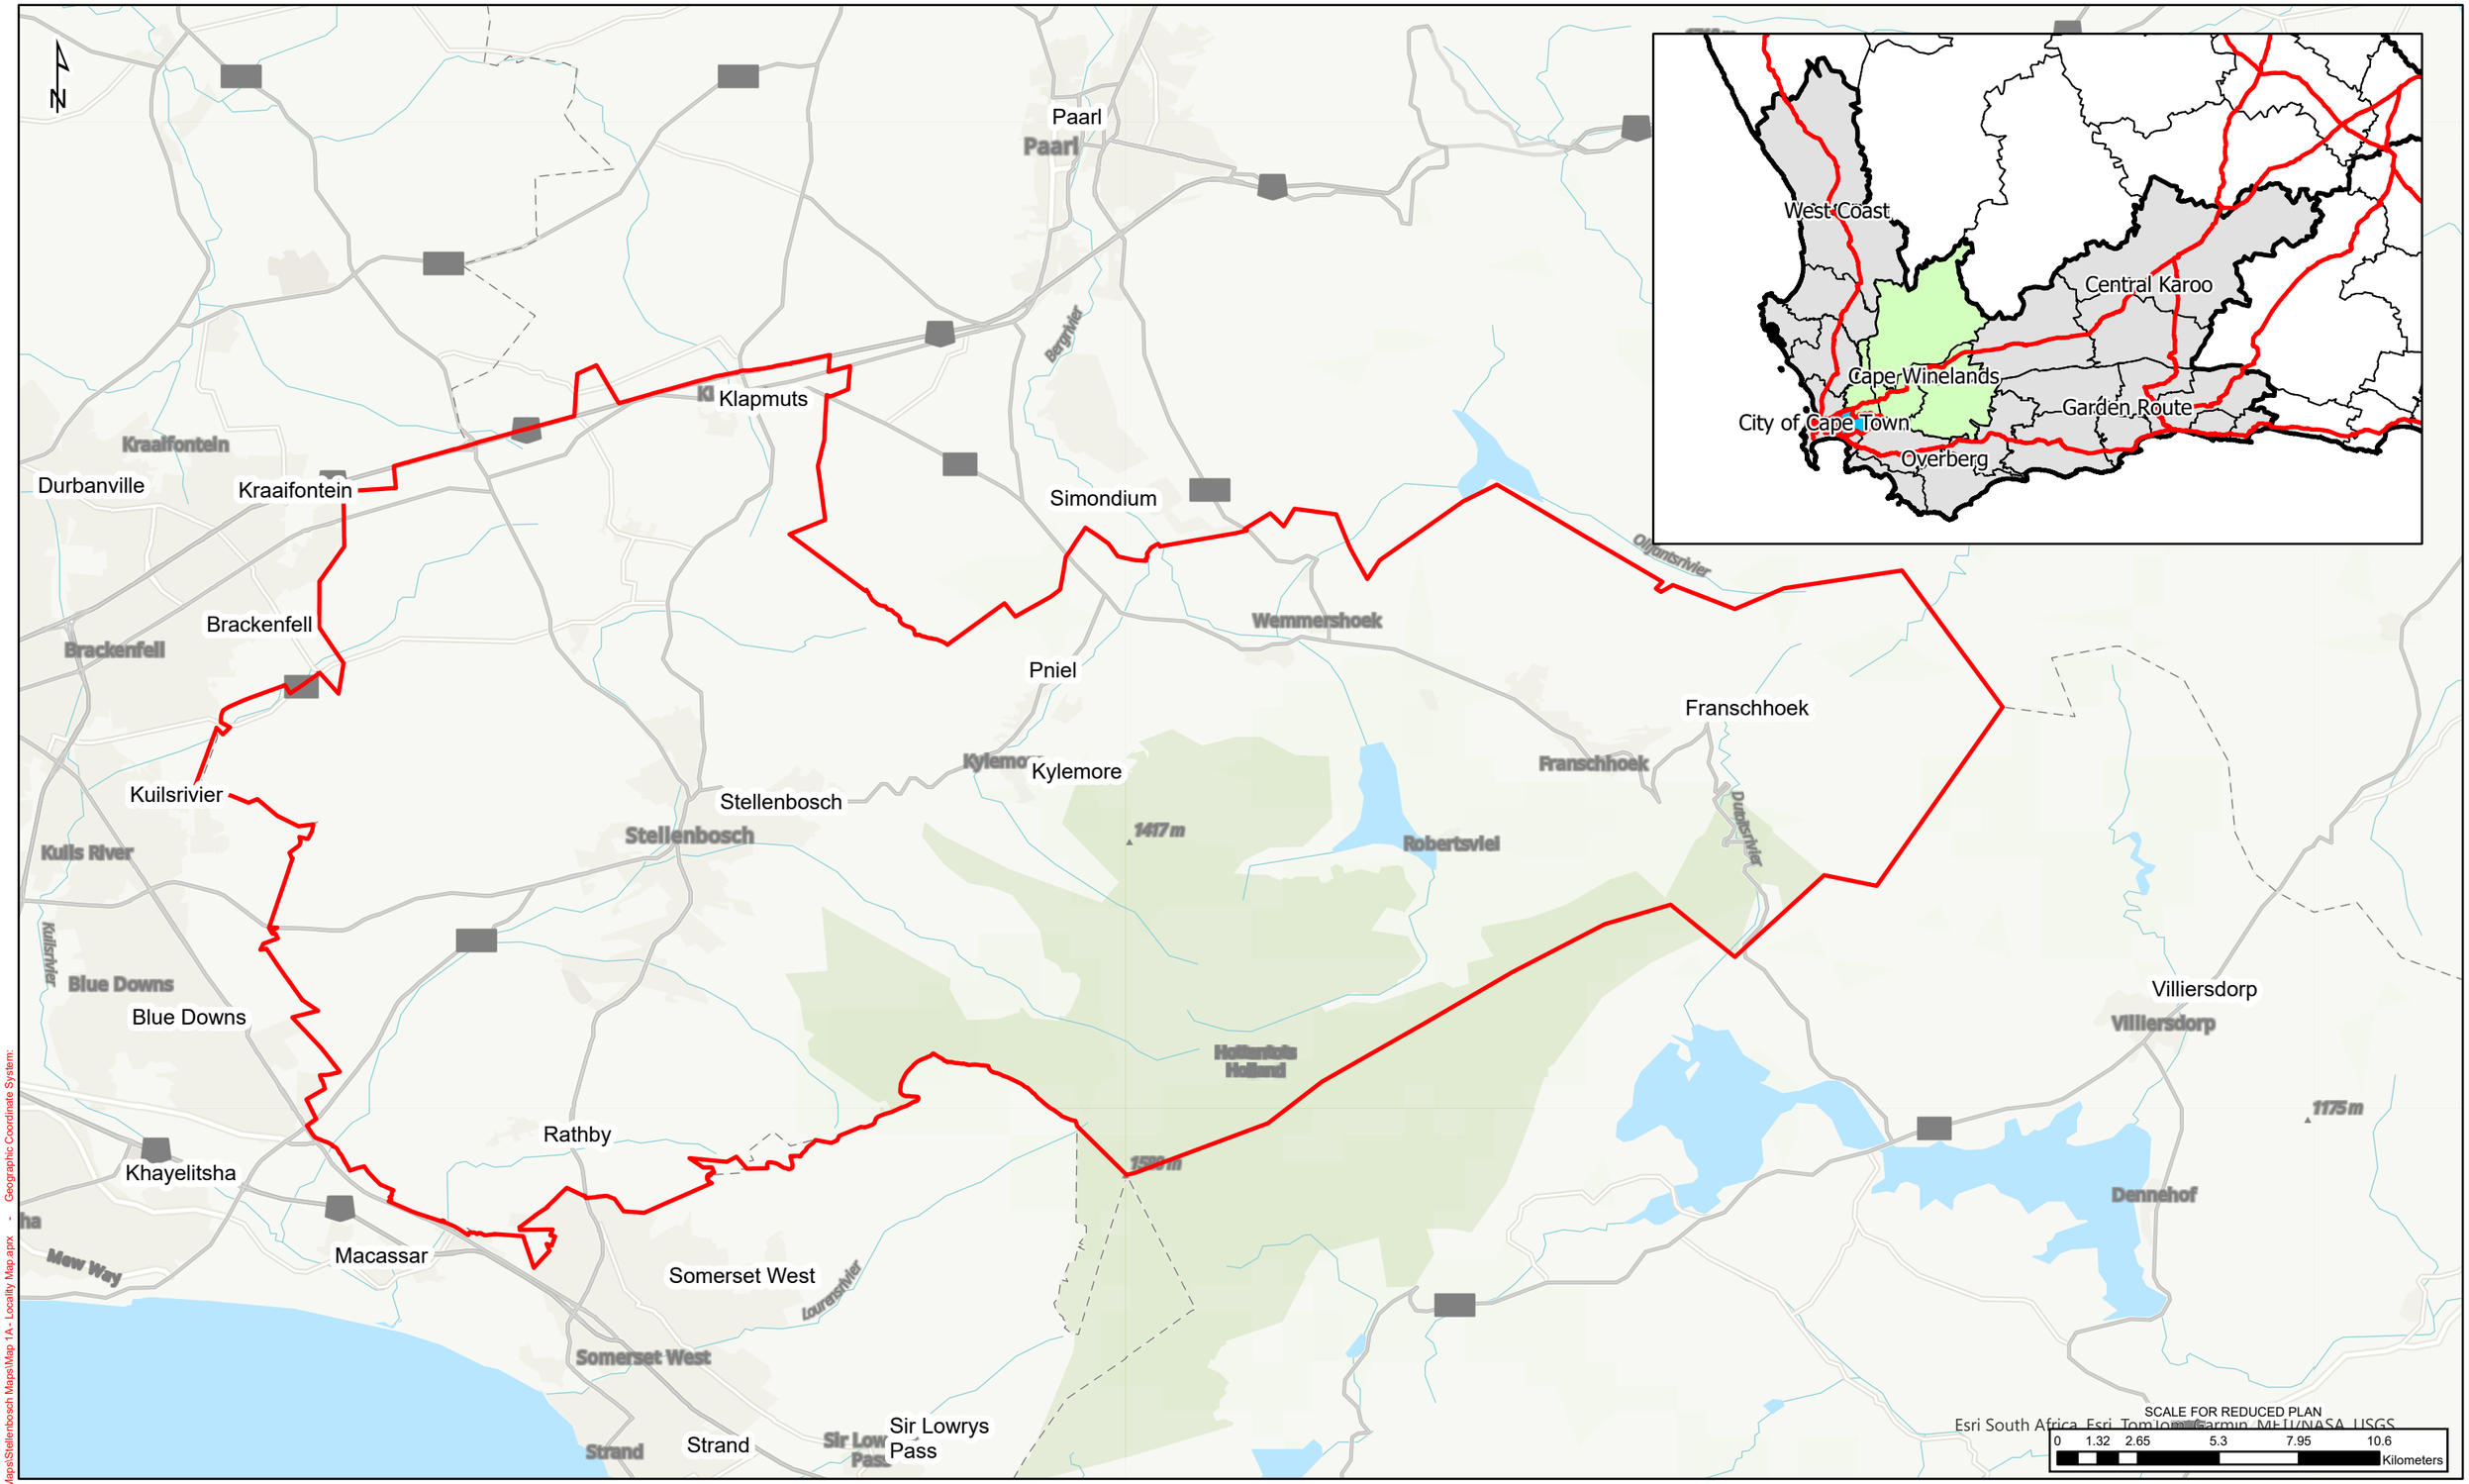
Our Values are:

Integrity: As servants of the public, we undertake to perform the functions and operations of the Municipality in an honest and ethical manner.

Accountability: As responsible public servants, we pledge to perform our duties in a manner that is open to oversight and public scrutiny. This commitment is shaped by our understanding to give an account of our actions to individuals, groups and organisations.

Transformation: We will tirelessly work at transforming our municipality, communities and broader society as custodians of hope through unlocking the endless possibilities our valley holds treasure. This commitment is shaped by our understanding of the historical, spatial, social and economic inequalities in our valley.

Innovation: We will continuously review our systems, procedures and processes to make them more responsive to customer needs. In partnership with out stakeholders we will seek innovative solutions to complex problems. We will encourage and reward initiatives which show creativity and ingenuity.



Stellenbosch Municipality and its staff endeavour to meet and adhere to the following service standards for water and sanitation services as far as practically possible.

Table 8.1.18.2: Water and Sanitation Service standards (Customer Care Service Charter)		
Section	**Query**	**Reaction Time**
Water Network	Burst water mains	1 Day
	No water	1 Day
	Water leak	1 Day
	Fire hydrant	1 Day
	Water network – valve	1 Day

Table 8.1.18.2: Water and Sanitation Service standards (Customer Care Service Charter)		
Section	**Query**	**Reaction Time**
	Water network – stopcock	1 Day
	Water network – leak	1 Day
	Hydrant cover missing	1 Day
	Water connection	1 Day
	Illegal water connection	1 Day
	Water meter faulty	1 Day
	Smart meter faulty	1 Day
	Rehabilitate area after repairs	1 Day
	Low water pressure	1 Day
	Maintain reservoir sites	1 Day
	High consumption	1 Day
Sewer Network	Blockage	1 Day
	Sewer manhole cover missing	1 Day
	Sewer spillage	1 Day
	Sewer connection	1 Day
	Ablution maintenance	1 Day
	Illegal sewer connection	1 Day
	Vector control	1 Day
Wastewater	Spillage	1 Day
	Quality	1 Day
	Pump stations not operational	1 Day
	Empty septic tanks	1 Day
	River pollution	1 Day
Pollution	Pollution control – river pollution	1 Day
	Industrial effluent not compliant	1 Day
	Illegal dumping of effluent	1 Day
Water Treatment	Water quality	1 Day
	Turbidity / Colour	8 Hours
	Taste / Odour	8 Hours
	Augmentation (Boreholes)	1 Day

ANNEXURE D (Infrastructure Leakage Indexes)

Municipal Scorecard for assessing the potential for WC/WDM efforts in Stellenbosch Municipality

ILI for Stellenbosch

ILI for Franschhoek

ILI for Dwars River

ILI for Klapmuts

MUNICIPAL SCORECARD FOR ASSESSING THE POTENTIAL FOR WC/WDM EFFORTS IN MUNICIPALITIES: STELLENBOSCH

1. Development of Standard Water Balance	WSA has developed reliable water balance and results indicate UAW/NRW at less than 20%	4
	WSA has developed reliable water balance and results indicate UAW/NRW at 20% to 40%	3
	WSA has developed reliable water balance and results indicate UAW/NRW at more than 40%	2
	WSA has no water balance. Is currently developing one	1
	WSA has no water balance	0
2. Pressurised Supply to all consumers 100% of time	WSA maintains a pressurised supply to all areas within the water distribution network all of the time at a minimum of 20m pressure	4
	WSA maintains a pressurised supply to all areas within the water distribution network however pressure drops below 10m in certain areas	3
	Small isolated sections of the network experience intermittent supply	2
	Many sections of the network experience intermittent supply	1
	The entire network experiences intermittent supply	0
3. Residential Metering System	More than 98% of all connections are metered and billed.	4
	75% to 98% of all connections are metered and billed	3
	50 - 75% of connections are metered and billed	2
	Less than 50% of connections are metered and billed	1
	No metering takes place	0
4. Non Residential Metering System (Commercial, Industrial and Institutional)	More than 98% of all non-residential connections, including fire supply connections, are metered and billed based on metered use	4
	75% to 98% of all non-residential connections, including fire supply connections, are metered and billed based on metered use	3
	50 - 75% of non-residential connections, including fire supply connections, are metered and billed based on metered	2
	Less than 50% of non-residential connections, including fire supply connections, are metered and billed based on metered use	1
	No non—residential metering takes place	0
5. Effective Billing System including Informative Billing	WSA produces informative billing to all customers based on meter readings	4
	WSA produces informative billing to most customers based on meter readings	3
	WSA produces informative billing to only some customers based on meter readings	2
	WSA has an uninformative billing system in place	1
	WSA has no billing	0
6. Network (Leakage) Complaints System	Efficient reporting system in place (90% of reported leaks are repaired within 24 hours)	4
	Efficient reporting system in place (90% of reported leaks are repaired within 48 hours)	3
	Leakage reporting system in place response times need to be improved	2
	Leakage reporting system in place but few if any field response teams to undertake repairs	1
	No leakage reporting system in place and no plans to create one	0
7. Billing and Metering Complaints System	Efficient reporting system for metering and billing problems in place (90% dealt with within14 days)	4
	Efficient reporting system for metering and billing problems in place (90% dealt with within one month)	3
	Metering and billing problem reporting system in place response times need to be improved	2
	Metering and billing problem reporting system in place but very poor response time with many problems never resolved	1
	No Metering and billing problem reporting system in place	0
8. Asset Register for Water Reticulation System	WSA has a comprehensive and accurate asset register in place which is available digitally	4
	WSA has a partially completed accurate asset register in place	3
	WSA has a poor asset register in place	2
	SA is in the process of developing an asset register	1
	WSA has no asset register in place and no immediate intention of generating an asset register	0
9. Asset Management - Capital Works	2% or more of the value of the water network is invested annually into new capital works related to the existing	4
	1% - 2% of the value of the water network is invested annually into new capital works related to the existing infrastructure	3
	Less than 1% of the value of the water network is invested annually into new capital works related to the existing infrastructure	2
	No estimate of asset value of water supply system is available but WSA feels that sufficient budget is spent on new	1
	No estimate of asset value of water supply system is available and WSA feels that insufficient budget is spent on new Capital Works	0
10. Asset Management - Operations and Maintenance	2% or more of the value of the water network is invested annually into the maintenance of the existing infrastructure	4
	1% - 2% of the value of the water network is invested annually into the maintenance of the existing infrastructure	3
	Less than 1% of the value of the water network is invested annually into the maintenance of the existing infrastructure	2
	No estimate of asset value of water supply system is available but WSA feels that sufficient budget is spent on operations and maintenance	1
	No estimate of asset value of water supply system is available and WSA feels that insufficient budget is spent on operations and maintenance	0
11. Dedicated WDM support	Efficient WDM Section in place with sufficient resources	4
	WDM section in place requires some resources and capacity building	3
	WDM section in place. Major resources and capacity building required	2
	No WDM section currently in place, intention to create WDM section	1
	No WDM Section and no intention to create WDM section	0
12. Active Leakage Control	Active leakage detection and repair undertaken continuously with average sweep time of 12 months or less	4
	Active leakage detection and repair undertaken continuously with average sweep time of 48 months	3
	Active leakage detection and repair is undertaken on an add-hoc basis	2
	No active leakage detection is currently undertaken however the WSA intends to initiate such measures	1
	No active leakage detection is undertaken and the WSA has no intention to conduct such measures	0
13. Effective Sectorisation	Reticulation network has been sectorised and is checked regularly to maintain discrete zones	4
	Reticulation network has been sectorised but is not checked regularly to ensure discrete zones	3
	Only portions of the reticulation network have been sectorised	2
	Few if any zones have been created but plans are in place to sectorise the system	1
	No sectorisation has been undertaken and no plans are in place to implement such measures	0
14. Effective Bulk Meter Management	All bulk water sources to the WSA are metered by the WSA using some form of check metering (either permanent or temporary)	4
	All bulk water sources to the WSA are metered by the Bulk water supplier or by the WSA	3
	Few bulk meters are operational	2
	No Bulk metering in place, however, WSA has plans to install bulk meters	1
	No Bulk metering in place and no plans for such meters have been made	0
15. Effective Zone Meter Management and Assessment of Minimum Night Flows	All inlet points to discrete zones are metered and accurate with Minimum Night Flows logged and analysed on a regular basis	4
	All inlet points to discrete zones are metered and accurate but no Minimum Night Flow analyses are undertaken	3
	All inlet points to discrete zones are metered but many are broken or considered to be inaccurate	2
	Zone inputs are currently not metered although the WSA has planned to install meters on all zone inlets	1
	No accurate zone metering is in place and there are no plans to introduce such measures	0
16. Pressure Management and Maintenance of Pressure Reducing Valves	Reticulation is comprehensively sectorised into pressure zones which are all discrete. All PRV's are maintained under maintenance schedule	4
	Reticulation is comprehensively sectorised into pressure zones which are all discrete. PRV's are only maintained when problems become apparent.	3
	Reticulation is sectorised in pressure zones but the zones are not verified and little or no maintenance is undertaken on the PRVs	2
	WSA intends to introduce pressure zones and the use of PRVs to manage system pressures.	1
	No Discrete pressure zones and no PRV maintenance	0
17. As-Built Drawings of Bulk and Reticulation Infrastructure	Accurate as-built drawings for all reticulation are available digitally	4
	As-build drawings available digitally for the majority of the network and available in hardcopy for the remainder of the network	3
	A mixture of digital and hard copy as-built drawings available for the majority of the network but many problems are known to exist with the quality of the data.	2
	Only some hard copy as-built drawings are available for portions of the network	1
	No as-built drawings available	0

MUNICIPAL SCORECARD FOR ASSESSING THE POTENTIAL FOR WC/WDM EFFORTS IN MUNICIPALITIES: STELLENBOSCH

18. Schematic Layout of Water Infrastructure	An up-to date and detailed schematic of the whole bulk reticulation network is available showing all bulk mains, pumps, reservoirs, meters and control valves.	4
	A detailed schematic of the bulk reticulation network is available but is known to be outdated and/or inaccurate.	3
	Only a rough schematic of the bulk reticulation network is available which is known to be inaccurate and/or outdated	2
	No schematic of the bulk reticulation is available although the WSA is planning to develop such a schematic.	1
	No schematic of the bulk reticulation is available and the WSA has no plans to develop such a schematic.	0
19. Regulations and Bylaws	Regulations and Bylaws are in place which address WDM issues and some form of enforcement is undertaken	4
	Regulations and Bylaws are in place which address WDM issues but are not enforced	3
	Regulations and Bylaws are in place but do not address WDM issues	2
	There are no Bylaws in place but WSA is intending to introduce such measures	1
	There are no Bylaws in place and WSA has no plans to introduce them	0
20. Tariffs	WSA has rising block tariffs in place that encourage water use efficiency	4
	WSA has rising block tariffs in place but they do not encourage water use efficiency sufficiently	3
	WSA has single water tariff in place	2
	WSA has a declining block tariff in place	1
	WSA does not know what tariff structure is in place	0
21. Technical Support to Customers	The WSA actively engages with customers and offers technical support on WDM to both domestic as well as commercial/industrial customers	4
	The WSA offers technical support on WDM to large consumers on a pro-active basis	3
	The WSA only offers technical support on WDM on a reactive basis	2
	The WSA currently offers no technical support but plans to introduce a support mechanism	1
	The WSA has no plans to offer technical support on WDM measures to any customers	0
22. Removal of Unlawful Connections	The WSA actively monitors and removes all unlawful connections	4
	The WSA selectively monitors and removes unlawful connections	3
	The WSA monitors unlawful connections but has no policy for removal	2
	The WSA plans to introduce measures to tackle unlawful connections	1
	The WSA has no plans to deal with illegal connections	0
23. Community Awareness and Education Programmes	WSA is actively involved in conducting workshops on water conservation within the communities with a dedicated team	4
	WSA is involved in conducting workshops on water conservation within the communities however no dedicated team exists	3
	WSA has very little involvement with workshops on water conservation within the communities	2
	WSA currently does not conduct workshops on water conservation within the communities, however these interventions are proposed	1
	WSA currently does not conduct workshops on water conservation within the communities	0
24. Schools Awareness and Education Programmes	WSA is actively involved in conducting workshops on water conservation within the schools with a dedicated team	4
	WSA is involved in conducting workshops on water conservation within the schools however no dedicated team exists	3
	WSA has very little involvement with workshops on water conservation within the schools	2
	WSA currently does not conduct workshops on water conservation within the schools, however these interventions are proposed	1
	WSA currently does not conduct workshops on water conservation within the schools	0
25. Retrofitting	WSA has undertaken detailed plumbing repairs in public buildings and inside properties of indigent users.	4
	WSA has undertaken limited plumbing repairs in public buildings and inside properties of indigent users.	3
	WSA has undertaken limited plumbing repairs in public buildings, but not inside properties of indigent users.	2
	WSA has not undertaken internal plumbing repair in public buildings or inside properties of indigent users.	1

SUMMARY SHEET FOR LEAKAGE BENCHMARKING IN SOUTH AFRICA

P08356

S1. SYSTEM NAME AND CONTACT DETAILS

Name of Water Undertaking		Stellenbosch Municipality
Name of Water Supply System		Stellenbosch (Other areas around Stellenbosch included)
Contact Details:	Name	Mr P Joubert
	Address	Town House Complex
		Plein Street, Stellenbosch
		7600
	Telephone	+27(21) 808 8240
	Fax	
	E-mail	paul.joubert@stellenbosch.gov.za

S2. Performance Indicators of Water Loss

Viewpoint	Level	Parameter	Typical Range Excellent	Good	Poor	Actual PI	Units
Operations management of distribution system at current pressure	**Basic**	% of year system is pressurised	100	100	<100	100	%
		Current Annual Real Losses (CARL) (when system is pressurised - see note 2)	30 to 100	100 to 200	>200	416	Litres/connection/day
	Detailed	Unavoidable Annual Real Losses (UARL) (see note 3)	n/a	n/a	n/a	63	Litres/connection/day
		Consumption	n/a	n/a	n/a	1291	Litres/connection/day
		Infrastructure Leakage Index (ILI) (= CARL/UARL : see note 4)	1	2	>3.0	6.6	non dimensional
Financial management aspects of water losses	**Basic**	Volume of non-revenue water as a% of system input volume (see note 5)	<10%	20%	30%	31	%
	Detailed	Value of non-revenue water as a % of annual cost of running the system (see note 6)	<5%	10%	15%	11	%

Notes:

Note1: taken from data in "AQUA" article, December 1999 or estimated by WRP

Note 2: takes account of % of time system is pressurised, but not system pressure, density of connections or customet meter location

Note 3: takes account of density of connections and customer meter location at current pressure

Note 4: measures overall efficiency of management of distribution system at current operating pressure

Note 5: strongly influenced by average consumption per service connection

Note 6: Allows different values of Rand/m3 for different components of non-revenue water

S3. Key Operating Parameters which influence Unavoidable Annual Real Losses (UARL)

Variable	Typical Range Low	Medium	High	Actual PI	Units
Average Operating Pressure	30	45	100	49	Metres
Density of connections	20	45	120	36	per km of mains

4. Key Components of Annual System Input Volume

Component	m3/year	m3/connection/day	% of System Input Volume
Water Exported		not applicable	
Authorised Consumption excluding exports	7118096	1.29	72.5
Apparent Losses	404803	0.07	4.1
Actual Consumption excluding exports	7522899	1.36	76.6
Real Losses	2293886	0.42	23.4
System Input Volume	9816785	1.78	100.0

DATA ENTRY SHEET FOR LEAKAGE BENCHMARKING IN SOUTH AFRICA

Note: Note: An example has been included to assist you in completing this data sheet. The example input data can be seen in the pale blue shaded areas. Your input data should appear in the pale yellow shaded areas. The light green shaded areas are protected calculation fields and nothing can be entered in these fields.
Use the units as shown. If you have to use other units; you have to change the appropriate cells.

D1. GENERAL

Name of Water Undertaking		Stellenbosch Municipality
Name of Water Supply System		Stellenbosch (Other areas around Stellenbosch included)
Contact Details:	**Name**	Mr P Joubert
	Address	Town House Complex
		Plein Street, Stellenbosch
		7600
	Telephone	+27(21) 808 8240
	Fax	
	E-mail	paul.joubert@stellenbosch.gov.za

D2. SYSTEM DATA

Input Description	Variable	Example Data	Actual Data	Units	
Length of Mains (Transmission + Distribution)	Lm	1500	422	km	
Number of Service Connections	Ns	60000	15100	Number	See Notes 1 & 2
Density of Service Connections (per km of mains)	Ns/Lm	40	36	Per km	
Percentage of time system is pressurised during year	T	100	100	%	See Note 3
Average operating pressure when system pressurised	P	45	49	metres	See Note 4
Population served by the supply system	Pop	100000	121363	Number	

Note 1: The number of service connections is not always the same as the number of meters or billed accounts. For South African conditions, however, you can use the total of the number of metered accounts plus the estimated number of unmetered connections

Note 2: In South Africa customer meters are usually located close to the street/stand boundary. If this is not the case for your system, then add a note here.

Consumer Units from Treasury for 2023/2024 = 13 729 formal and 503 communal taps in informal areas and 868 waterborne toilets in informal areas = 15 100

Note 3: Use T in % eg. If T = 80%, use 80 and not 0.8

Note 4: If you do not have an accurate figure, please make a best estimate and provide brief details of how you derived it.

Estimated from Water Master Plans: Average of Residual and Static Pressures for different zones.

D3. UNAVOIDABLE ANNUAL REAL LOSSES (UARL)

Details	Calculation	Example Result	Actual Data	Units
On mains	18 x Lm x P x 365 x T/10^8	443	134	10^3 m^3/yr
On Service Connections	0.8 x Ns x P x 365 x T/10^8	788	214	10^3 m^3/yr
Total Volume of UARL		**1232**	**348**	10^3 m^3/yr

UARL in litres/service conn./day when the system is pressurised	Annual Volume of UARL x 10^6 / (Ns x 365 x T/100)	**56**	**63**	Litres/ conn./day

D4. ANNUAL WATER BALANCE DATA

D4a. Data Period

		Example Data	Actual Data
12-MONTH PERIOD FOR WHICH DATA APPLIES	**Start Date**	April 1, 1998	July 1, 2023
	End Date	March 31, 1999	June 30, 2024

D4b. System Input Volume

Water Supplied	**Example Data**					**Actual Data**				
	Metered 10^3 m^3/yr	**Correction to Source Meter data**		**Unmetered 10^3 m^3/yr**	**Total 10^3 m^3/yr**	**Metered 10^3 m^3/yr**	**Correction to Source Meter data**		**Unmetered 10^3 m^3/yr**	**Total 10^3 m^3/yr**
		+/- %	**10^3 m^3/yr**				**+/- %**	**10^3 m^3/yr**		
From Own Sources:	36000	2.00%	720		36720	8481				8481
From Other Suppliers:	1000			280	1280	1335				1335
Total:	37000		720	280	38000	**9817**				**9817**

D4c. Components of Authorised Consumption

Components of Authorised Consumption	**Example Data**					**Actual Data**				
	Billed Metered 10^3 m^3/yr	**Billed Unmetered 10^3 m^3/yr**	**Unbilled Metered 10^3 m^3/yr**	**Unbilled Unmetered 10^3 m^3/yr**	**Total 10^3 m^3/yr**	**Billed Metered 10^3 m^3/yr**	**Billed Unmetered 10^3 m^3/yr**	**Unbilled Metered 10^3 m^3/yr**	**Unbilled Unmetered 10^3 m^3/yr**	**Total 10^3 m^3/yr**

TOTALS:	33940	1100	10	200	35250	**6804**		**295**	**20**	**7118**

D4d. Components of Water Losses

Details	**Example Result**	**Actual Result**	**Units**
Water Losses = System Input – Authorised Consumption	2750	2699	10^3 m^3/yr
Percentage of Total Losses estimated to represent the Apparent Losses	20	15	%
Apparent Losses	550	405	10^3 m^3/yr

Annual Real Losses (ARL) = Water Losses – Apparent Losses	**2200**	**2294**	10^3 m^3/yr

D5. SELECTED OPERATIONAL PERFORMANCE INDICATORS

D5a. Current Annual Real Losses per Connection (CARL) at Current Pressures

Details	Calculation	Example Result	Actual Result	Units
CARL is expressed in Litres/service connection/day, when system is pressurised	ARL x 10^6 / (Ns x T/100 x 365)	**100**	**416**	Litres /conn./day
Consumption in litres/conn/day		**1610**	**1291**	Litres /conn./day

D5b. Infrastructure Leakage Index (ILI)

Details	Calculation	Example Result	Actual Result
ILI is the ratio of Current Annual Real Losses (CARL) to Unavoidable Annual Real Losses	CARL / UARL	**1.79**	**6.59**

D5c. Non-Revenue Water as a % by Volume of System Input

Description of Unbilled Items	Example Result			Actual Result		
	Volume 10^3 m^3/yr	System Input 10^3 m^3/yr	% of System Input	Volume 10^3 m^3/yr	System Input 10^3 m^3/yr	% of System Input
Unbilled Consumption	210	38000	0.55	314	9817	3.20
Apparent Losses:	550	38000	1.45	405	9817	4.12
Real Losses:	2200	38000	5.79	2294	9817	23.37
Total Unbilled:	**2960**	**38000**	**7.79**	**3013**	**9817**	**30.69**

D6. SELECTED FINANCIAL PERFORMANCE INDICATORS

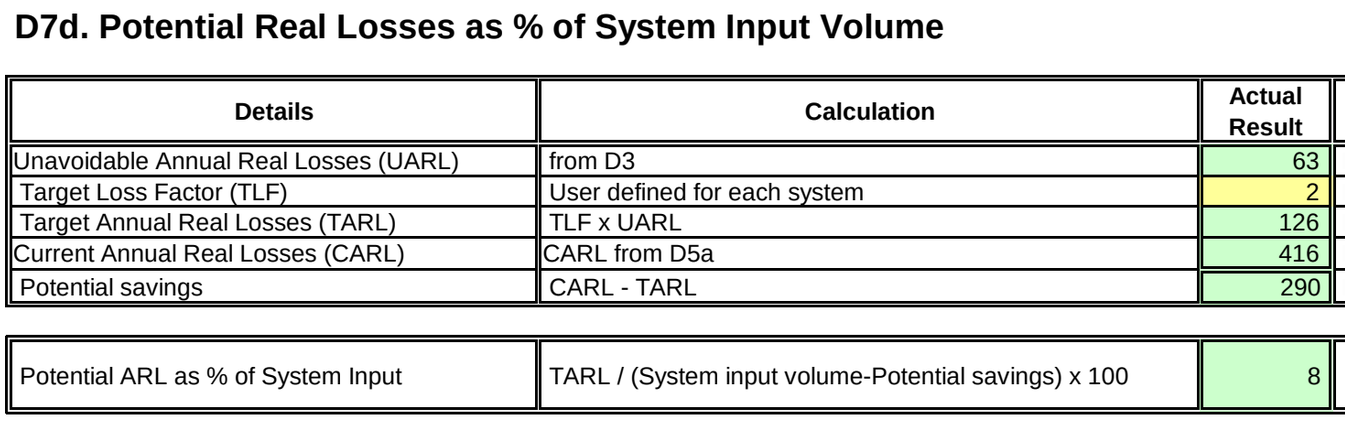
D6a. Local Valuation of Real and Apparent Losses

Details	Example Result	Actual Result	Units
Unit Value of Real Losses (eg bulk purchase price)	0.15	1.50	R /m^3
Unit Value of Apparent Losses (eg selling price)	2.70	18.42	R /m^3

D6b. Annual Cost of Running System

Details	Example Cost	Actual Cost	Units
Annual Cost of running system in 1000's of Rand per year	45000	147440	10^3 R/year

D6c. Non-Revenue Water as % by Value of Cost of Running System



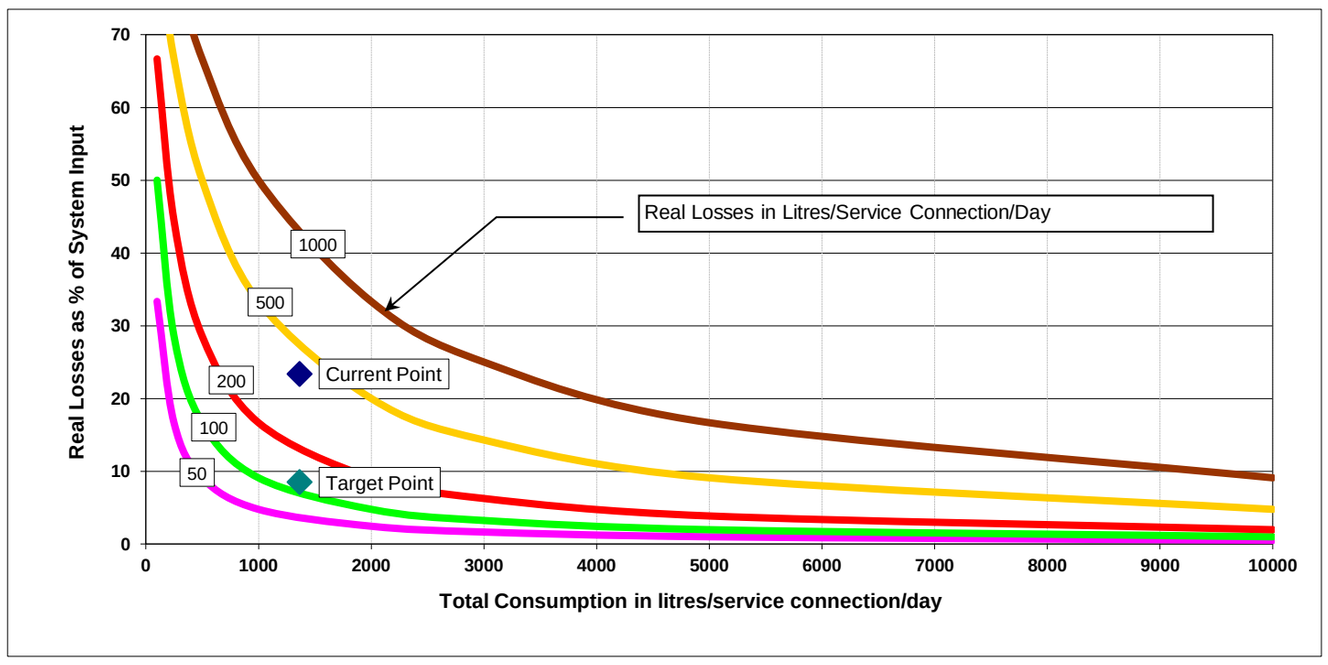
Description of Unbilled Items	Example Result				Actual Result			
	Volume 10^3 m^3/yr	Unit Value R /m^3	Value 10^3 R/year	% of Annual Running Costs Costs	Volume 10^3 m^3/yr	Unit Value (R /m^3)	Value 10^3 R/year	% of Annual Running Costs Costs
Unbilled Consumption	210	2.70	567	1.26	314	18.42	5786	3.92
Apparent Losses:	550	2.70	1485	3.30	405	18.42	7456	5.06
Real Losses:	2200	0.15	330	0.73	2294	1.50	3441	2.33
Total Unbilled:	2960		**2382**	**5.29**	3013		16684	**11.32**

D7. RELATIONSHIP BETWEEN REAL LOSSES EXPRESSED AS % OF SYSTEM INPUT

D7a. Real losses curve definition

Curve Definition					
Consumption litres/serv conn/day	Real losses in litres/service connection/day				
	50	100	200	500	1000
100	33.3	50.0	66.7	83.3	90.9
250	16.7	28.6	44.4	66.7	80.0
500	9.1	16.7	28.6	50.0	66.7
1000	4.8	9.1	16.7	33.3	50.0
2000	2.4	4.8	9.1	20.0	33.3
3000	1.6	3.2	6.3	14.3	25.0
5000	1.0	2.0	3.8	9.1	16.7
10000	0.5	1.0	2.0	4.8	9.1

D7b. Components of water balance in litres/service connection/day (Actual Results)



D7c. Current Real Losses as % of System Input Volume

Details	Calculation	Actual Result	Units
System Input Volume	from D7b	1 781	Litres/conn/day
Total Consumption	from D7b	1 365	Litres/conn/day
Annual Real Losses	from D7b	416	Litres/conn/day
ARL as % of System Input	ARL / System input volume x 100	23	%

D7d. Potential Real Losses as % of System Input Volume

Details	Calculation	Actual Result	Units
Unavoidable Annual Real Losses (UARL)	from D3	63	Litres/conn/day
Target Loss Factor (TLF)	User defined for each system	2	Dimensionless
Target Annual Real Losses (TARL)	TLF x UARL	126	Litres/conn/day
Current Annual Real Losses (CARL)	CARL from D5a	416	Litres/conn/day
Potential savings	CARL - TARL	290	Litres/conn/day
Potential ARL as % of System Input	TARL / (System input volume-Potential savings) x 100	8	%

D7e. Real Losses as a % of System Input Volume versus Consumption in litres/service connectio for different values of Real Losses in litres/service connection/day

SUMMARY SHEET FOR LEAKAGE BENCHMARKING IN SOUTH AFRICA

Name of Water Undertaking		Stellenbosch Municipality
Name of Water Supply System		Dwarsrivier
Contact Details:	Name	Mr P Joubert
	Address	Town House Complex
		Plein Street, Stellenbosch
		7600
	Telephone	+27(21) 808 8240
	Fax	
	E-mail	paul.joubert@stellenbosch.gov.za

S2. Performance Indicators of Water Loss

Viewpoint	Level	Parameter	Typical Range Excellent	Good	Poor	Actual PI	Units
Operations management of distribution system at current pressure	**Basic**	% of year system is pressurised	100	100	<100	100	%
		Current Annual Real Losses (CARL) (when system is pressurised - see note 2)	30 to 100	100 to 200	>200	365	Litres/connection/day
	Detailed	Unavoidable Annual Real Losses (UARL) (see note 3)	n/a	n/a	n/a	50	Litres/connection/day
		Consumption	n/a	n/a	n/a	712	Litres/connection/day
		Infrastructure Leakage Index (ILI) (= CARL/UARL : see note 4)	1	2	>3.0	7.3	non dimensional
Financial management aspects of water losses	**Basic**	Volume of non-revenue water as a% of system input volume (see note 5)	<10%	20%	30%	41	%
	Detailed	Value of non-revenue water as a % of annual cost of running the system (see note 6)	<5%	10%	15%	14	%

Notes:

Note1: taken from data in "AQUA" article, December 1999 or estimated by WRP

Note 2: takes account of % of time system is pressurised, but not system pressure, density of connections or customet meter location

Note 3: takes account of density of connections and customer meter location at current pressure

Note 4: measures overall efficiency of management of distribution system at current operating pressure

Note 5: strongly influenced by average consumption per service connection

Note 6: Allows different values of Rand/m3 for different components of non-revenue water

S3. Key Operating Parameters which influence Unavoidable Annual Real Losses (UARL)

Variable	Typical Range Low	Medium	High	Actual PI	Units
Average Operating Pressure	30	45	100	44	Metres
Density of connections	20	45	120	53	per km of mains

4. Key Components of Annual System Input Volume

Component	m3/year	m3/connection/day	% of System Input Volume
Water Exported		not applicable	
Authorised Consumption excluding exports	527892	0.71	62.4
Apparent Losses	47812	0.06	5.6
Actual Consumption excluding exports	575704	0.78	68.0
Real Losses	270932	0.37	32.0
System Input Volume	846636	1.14	100.0

DATA ENTRY SHEET FOR LEAKAGE BENCHMARKING IN SOUTH AFRICA

Note: Note: An example has been included to assist you in completing this data sheet. The example input data can be seen in the pale blue shaded areas. Your input data should appear in the pale yellow shaded areas. The light green shaded areas are protected calculation fields and nothing can be entered in these fields.
Use the units as shown. If you have to use other units; you have to change the appropriate cells.

D1. GENERAL

Name of Water Undertaking	Stellenbosch Municipality	
Name of Water Supply System	Dwarsrivier	
Contact Details:	**Name**	Mr P Joubert
	Address	Town House Complex
		Plein Street, Stellenbosch
		7600
	Telephone	+27(21) 808 8240

	E-mail	paul.joubert@stellenbosch.gov.za

D2. SYSTEM DATA

Input Description	Variable	Example Data	Actual Data	Units	
Length of Mains (Transmission + Distribution)	Lm	1500	38	km	
Number of Service Connections	Ns	60000	2031	Number	See Notes 1 & 2
Density of Service Connections (per km of mains)	Ns/Lm	40	53	Per km	
Percentage of time system is pressurised during year	T	100	100	%	See Note 3
Average operating pressure when system pressurised	P	45	44	metres	See Note 4
Population served by the supply system	Pop	100000	16395	Number	

Note 1: The number of service connections is not always the same as the number of meters or billed accounts. For South African conditions, however, you can use the total of the number of metered accounts plus the estimated number of unmetered connections

Note 2: In South Africa customer meters are usually located close to the street/stand boundary. If this is not the case for your system, then add a note here.

Consumer Units from Treasury for 2023/2024 = 2021 formal and 10 communal taps in informal areas = 2031 (No waterborne toilets in informal areas)

Note 3: Use T in % eg. If T = 80%, use 80 and not 0.8

Note 4: If you do not have an accurate figure, please make a best estimate and provide brief details of how you derived it.

Estimated from Water Master Plans: Average of Residual and Static Pressures for the various zones

D3. UNAVOIDABLE ANNUAL REAL LOSSES (UARL)

Details	Calculation	Example Result	Actual Data	Units
On mains	$18 \times Lm \times P \times 365 \times T/10^8$	443	11	10^3 m^3/yr
On Service Connections	$0.8 \times Ns \times P \times 365 \times T/10^8$	788	26	10^3 m^3/yr
Total Volume of UARL		**1232**	**37**	10^3 m^3/yr

UARL in litres/service conn./day when the system is pressurised	Annual Volume of UARL x 10^6 / (Ns x 365 x T/100)	**56**	**50**	Litres/ conn./day

D4. ANNUAL WATER BALANCE DATA

D4a. Data Period

		Example Data	Actual Data
12-MONTH PERIOD FOR WHICH DATA APPLIES	**Start Date**	April 1, 1998	July 1, 2023

TOTALS:	33940	1100	10	200	35250	**898**		**38**	**3**	**938**

D4d. Components of Water Losses

Details	Example Result	Actual Result	Units
Water Losses = System Input – Authorised Consumption	2750	325	10^3 m^3/yr
Percentage of Total Losses estimated to represent the Apparent Losses	20	15	%
Apparent Losses	550	49	10^3 m^3/yr

Annual Real Losses (ARL) = Water Losses – Apparent Losses	**2200**	**276**	10^3 m^3/yr

D5. SELECTED OPERATIONAL PERFORMANCE INDICATORS

D5a. Current Annual Real Losses per Connection (CARL) at Current Pressures

Details	Calculation	Example Result	Actual Result	Units
CARL is expressed in Litres/service connection/day, when system is pressurised	ARL x 10^6 / (Ns x T/100 x 365)	**100**	**264**	Litres /conn./day
Consumption in litres/conn/day		**1610**	**897**	Litres /conn./day

D5b. Infrastructure Leakage Index (ILI)

Details	Calculation	Example Result	Actual Result
ILI is the ratio of Current Annual Real Losses (CARL) to Unavoidable Annual Real Losses	CARL / UARL	**1.79**	**4.71**

D5c. Non-Revenue Water as a % by Volume of System Input

Description of Unbilled Items	Example Result			Actual Result		
	Volume 10^3 m^3/yr	System Input 10^3 m^3/yr	% of System Input	Volume 10^3 m^3/yr	System Input 10^3 m^3/yr	% of System Input
Unbilled Consumption	210	38000	0.55	40	1263	3.20
Apparent Losses:	550	38000	1.45	49	1263	3.86
Real Losses:	2200	38000	5.79	276	1263	21.86
Total Unbilled:	**2960**	**38000**	**7.79**	**365**	**1263**	**28.92**

D6. SELECTED FINANCIAL PERFORMANCE INDICATORS

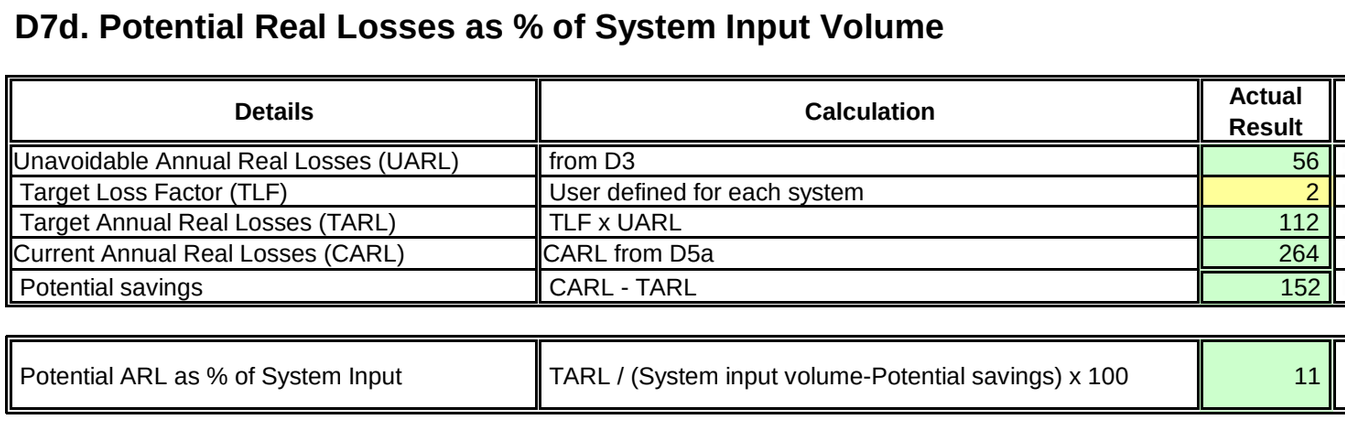
D6a. Local Valuation of Real and Apparent Losses

Details	Example Result	Actual Result	Units
Unit Value of Real Losses (eg bulk purchase price)	0.15	1.50	R /m^3
Unit Value of Apparent Losses (eg selling price)	2.70	18.42	R /m^3

D6b. Annual Cost of Running System

Details	Example Cost	Actual Cost	Units
Annual Cost of running system in 1000's of Rand per year	45000	18972	10^3 R/year

D6c. Non-Revenue Water as % by Value of Cost of Running System



Description of Unbilled Items	Example Result				Actual Result			
	Volume 10^3 m^3/yr	Unit Value R /m^3	Value 10^3 R/year	% of Annual Running Costs Costs	Volume 10^3 m^3/yr	Unit Value (R /m^3)	Value 10^3 R/year	% of Annual Running Costs Costs
Unbilled Consumption	210	2.70	567	1.26	40	18.42	745	3.92
Apparent Losses:	550	2.70	1485	3.30	49	18.42	898	4.73
Real Losses:	2200	0.15	330	0.73	276	1.50	414	2.18
Total Unbilled:	2960		**2382**	**5.29**	365		2056	**10.84**

D7. RELATIONSHIP BETWEEN REAL LOSSES EXPRESSED AS % OF SYSTEM INPUT

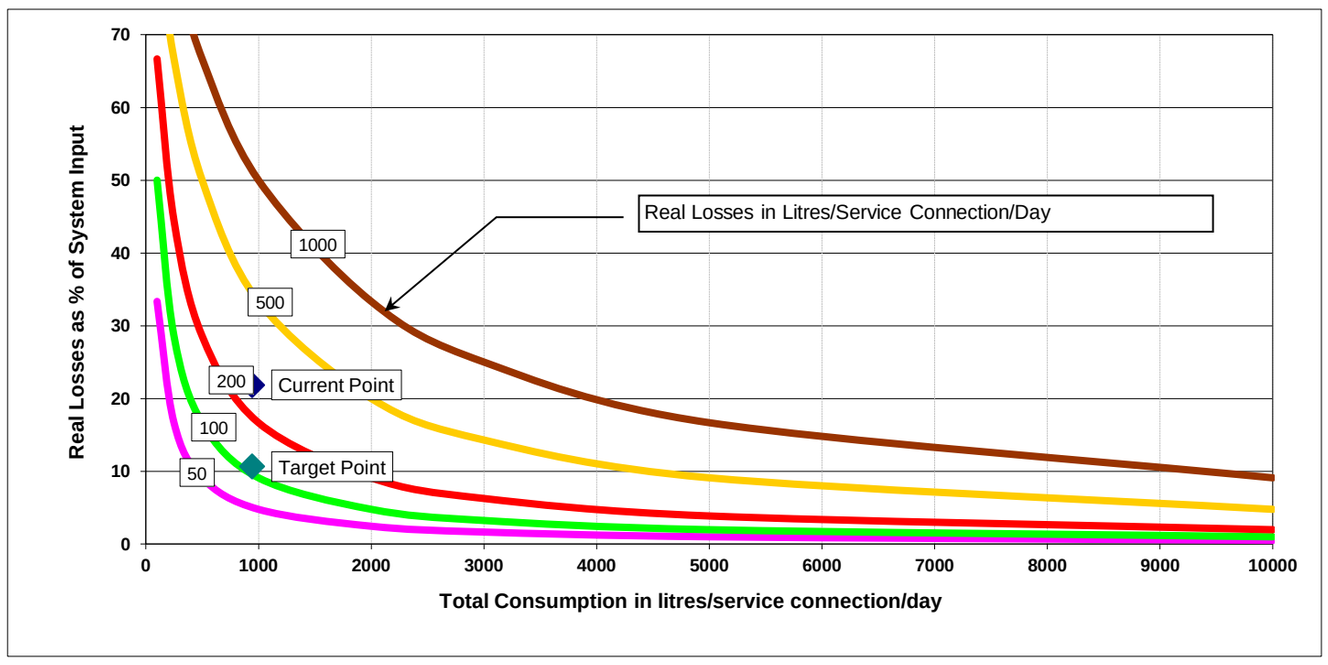
D7a. Real losses curve definition

Curve Definition					
Consumption litres/serv conn/day	Real losses in litres/service connection/day				
	50	100	200	500	1000
100	33.3	50.0	66.7	83.3	90.9
250	16.7	28.6	44.4	66.7	80.0
500	9.1	16.7	28.6	50.0	66.7
1000	4.8	9.1	16.7	33.3	50.0
2000	2.4	4.8	9.1	20.0	33.3
3000	1.6	3.2	6.3	14.3	25.0
5000	1.0	2.0	3.8	9.1	16.7
10000	0.5	1.0	2.0	4.8	9.1

D7b. Components of water balance in litres/service connection/day (Actual Results)

D7c. Current Real Losses as % of System Input Volume

Details	Calculation	Actual Result	Units
System Input Volume	from D7b	1 208	Litres/conn/day
Total Consumption	from D7b	944	Litres/conn/day
Annual Real Losses	from D7b	264	Litres/conn/day



ARL as % of System Input	ARL / System input volume x 100	22	%

D7d. Potential Real Losses as % of System Input Volume

Details	Calculation	Actual Result	Units
Unavoidable Annual Real Losses (UARL)	from D3	56	Litres/conn/day
Target Loss Factor (TLF)	User defined for each system	2	Dimensionless
Target Annual Real Losses (TARL)	TLF x UARL	112	Litres/conn/day
Current Annual Real Losses (CARL)	CARL from D5a	264	Litres/conn/day
Potential savings	CARL - TARL	152	Litres/conn/day

Potential ARL as % of System Input	TARL / (System input volume-Potential savings) x 100	11	%

D7e. Real Losses as a % of System Input Volume versus Consumption in litres/service connectio for different values of Real Losses in litres/service connection/day

SUMMARY SHEET FOR LEAKAGE BENCHMARKING IN SOUTH AFRICA

P08356

S1. SYSTEM NAME AND CONTACT DETAILS

Name of Water Undertaking		Stellenbosch Municipality
Name of Water Supply System		Klapmuts
Contact Details:	Name	Mr P Joubert
	Address	Town House Complex
		Plein Street, Stellenbosch
		7600
	Telephone	+27(21) 808 8240
	Fax	
	E-mail	paul.joubert@stellenbosch.gov.za

S2. Performance Indicators of Water Loss

Viewpoint	Level	Parameter	Typical Range Excellent	Good	Poor	Actual PI	Units
Operations management of distribution system at current pressure	**Basic**	% of year system is pressurised	100	100	<100	100	%
		Current Annual Real Losses (CARL) (when system is pressurised - see note 2)	30 to 100	100 to 200	>200	186	Litres/connection/day
	Detailed	Unavoidable Annual Real Losses (UARL) (see note 3)	n/a	n/a	n/a	48	Litres/connection/day
		Consumption	n/a	n/a	n/a	527	Litres/connection/day
		Infrastructure Leakage Index (ILI) (= CARL/UARL : see note 4)	1	2	>3.0	3.8	non dimensional
Financial management aspects of water losses	**Basic**	Volume of non-revenue water as a% of system input volume (see note 5)	<10%	20%	30%	33	%
	Detailed	Value of non-revenue water as a % of annual cost of running the system (see note 6)	<5%	10%	15%	12	%

Notes:

Note1: taken from data in "AQUA" article, December 1999 or estimated by WRP

Note 2: takes account of % of time system is pressurised, but not system pressure, density of connections or customet meter location

Note 3: takes account of density of connections and customer meter location at current pressure

Note 4: measures overall efficiency of management of distribution system at current operating pressure

Note 5: strongly influenced by average consumption per service connection

Note 6: Allows different values of Rand/m3 for different components of non-revenue water

S3. Key Operating Parameters which influence Unavoidable Annual Real Losses (UARL)

Variable	Typical Range Low	Medium	High	Actual PI	Units
Average Operating Pressure	30	45	100	47	Metres
Density of connections	20	45	120	79	per km of mains

4. Key Components of Annual System Input Volume

Component	m3/year	m3/connection/day	% of System Input Volume
Water Exported		not applicable	
Authorised Consumption excluding exports	449703	0.53	70.6
Apparent Losses	28085	0.03	4.4
Actual Consumption excluding exports	477788	0.56	75.0
Real Losses	159151	0.19	25.0
System Input Volume	636939	0.75	100.0

DATA ENTRY SHEET FOR LEAKAGE BENCHMARKING IN SOUTH AFRICA

Note: Note: An example has been included to assist you in completing this data sheet. The example input data can be seen in the pale blue shaded areas. Your input data should appear in the pale yellow shaded areas. The light green shaded areas are protected calculation fields and nothing can be entered in these fields.
Use the units as shown. If you have to use other units; you have to change the appropriate cells.

D1. GENERAL

Name of Water Undertaking	Stellenbosch Municipality	
Name of Water Supply System	Klapmuts	
Contact Details:	**Name**	Mr P Joubert
	Address	Town House Complex
		Plein Street, Stellenbosch
		7600
	Telephone	+27(21) 808 8240
	Fax	
	E-mail	paul.joubert@stellenbosch.gov.za

D2. SYSTEM DATA

Input Description	Variable	Example Data	Actual Data	Units	
Length of Mains (Transmission + Distribution)	Lm	1500	30	km	
Number of Service Connections	Ns	60000	2339	Number	See Notes 1 & 2
Density of Service Connections (per km of mains)	Ns/Lm	40	79	Per km	
Percentage of time system is pressurised during year	T	100	100	%	See Note 3
Average operating pressure when system pressurised	P	45	47	metres	See Note 4
Population served by the supply system	Pop	100000	15500	Number	

Note 1: The number of service connections is not always the same as the number of meters or billed accounts. For South African conditions, however, you can use the total of the number of metered accounts plus the estimated number of unmetered connections

Note 2: In South Africa customer meters are usually located close to the street/stand boundary. If this is not the case for your system, then add a note here.

Consumer Units from Treasury for 2023/2024 = 2216 formal and 33 communal taps in informal areas and 90 Waterborne toilets in informal areas = 2 339

Note 3: Use T in % eg. If T = 80%, use 80 and not 0.8

Note 4: If you do not have an accurate figure, please make a best estimate and provide brief details of how you derived it.

Estimated from Water Master Plans: Average between residual and static pressures.

D3. UNAVOIDABLE ANNUAL REAL LOSSES (UARL)

Details	Calculation	Example Result	Actual Data	Units
On mains	18 x Lm x P x 365 x T/10^8	443	9	10^3 m^3/yr
On Service Connections	0.8 x Ns x P x 365 x T/10^8	788	32	10^3 m^3/yr
Total Volume of UARL		**1232**	**41**	10^3 m^3/yr

UARL in litres/service conn./day when the system is pressurised	Annual Volume of UARL x 10^6 / (Ns x 365 x T/100)	**56**	**48**	Litres/ conn./day

D4. ANNUAL WATER BALANCE DATA

D4a. Data Period

12-MONTH PERIOD FOR WHICH DATA APPLIES		Example Data	Actual Data
	Start Date	April 1, 1998	July 1, 2023
	End Date	March 31, 1999	June 30, 2024

D4b. System Input Volume

Water Supplied	Example Data					Actual Data				
	Metered 10^3 m^3/yr	Correction to Source Meter data		Unmetered 10^3 m^3/yr	Total 10^3 m^3/yr	Metered 10^3 m^3/yr	Correction to Source Meter data		Unmetered 10^3 m^3/yr	Total 10^3 m^3/yr
		+/- %	10^3 m^3/yr				+/- %	10^3 m^3/yr		
From Own Sources:	36000	2.00%	720		36720					
From Other Suppliers:	1000			280	1280	637				637

D4d. Components of Water Losses

Details	Example Result	Actual Result	Units
Water Losses = System Input – Authorised Consumption	2750	187	10^3 m^3/yr
Percentage of Total Losses estimated to represent the Apparent Losses	20	15	%
Apparent Losses	550	28	10^3 m^3/yr

Annual Real Losses (ARL) = Water Losses – Apparent Losses	**2200**	**159**	10^3 m^3/yr

D5. SELECTED OPERATIONAL PERFORMANCE INDICATORS

D5a. Current Annual Real Losses per Connection (CARL) at Current Pressures

Details	Calculation	Example Result	Actual Result	Units
CARL is expressed in Litres/service connection/day, when system is pressurised	ARL x 10^6 / (Ns x T/100 x 365)	**100**	**186**	Litres /conn./day
Consumption in litres/conn/day		**1610**	**527**	Litres /conn./day

D5b. Infrastructure Leakage Index (ILI)

Details	Calculation	Example Result	Actual Result
ILI is the ratio of Current Annual Real Losses (CARL) to Unavoidable Annual Real Losses	CARL / UARL	**1.79**	**3.84**

D5c. Non-Revenue Water as a % by Volume of System Input

Description of Unbilled Items	Example Result			Actual Result		
	Volume 10^3 m^3/yr	System Input 10^3 m^3/yr	% of System Input	Volume 10^3 m^3/yr	System Input 10^3 m^3/yr	% of System Input
Unbilled Consumption	210	38000	0.55	20	637	3.20
Apparent Losses:	550	38000	1.45	28	637	4.41
Real Losses:	2200	38000	5.79	159	637	24.99
Total Unbilled:	**2960**	**38000**	**7.79**	**208**	**637**	**32.60**

D6. SELECTED FINANCIAL PERFORMANCE INDICATORS

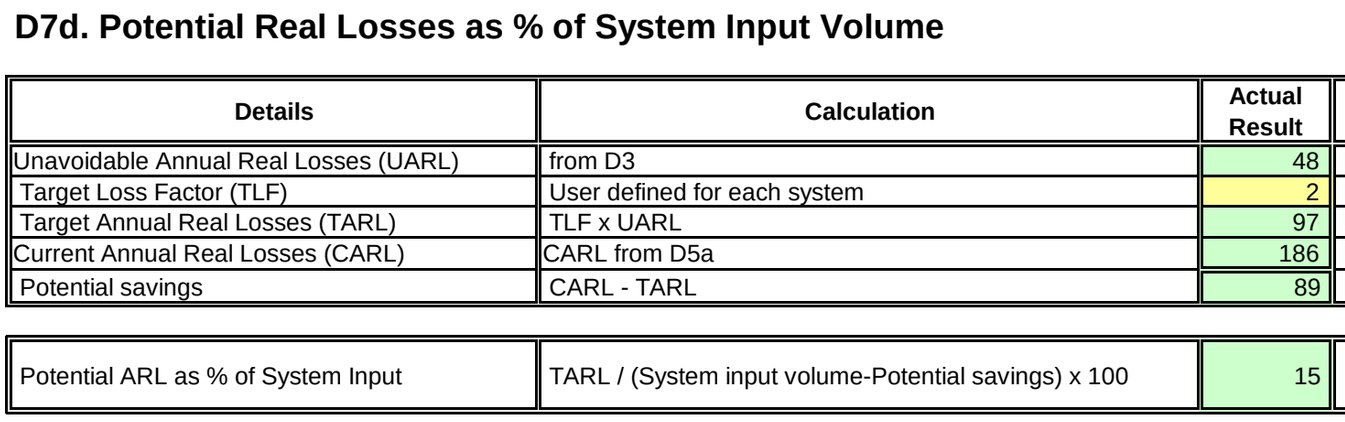
D6a. Local Valuation of Real and Apparent Losses

Details	Example Result	Actual Result	Units
Unit Value of Real Losses (eg bulk purchase price)	0.15	1.50	R /m^3
Unit Value of Apparent Losses (eg selling price)	2.70	18.42	R /m^3

D6b. Annual Cost of Running System

Details	Example Cost	Actual Cost	Units
Annual Cost of running system in 1000's of Rand per year	45000	9566	10^3 R/year

D6c. Non-Revenue Water as % by Value of Cost of Running System



Description of Unbilled Items	Example Result				Actual Result			
	Volume 10^3 m^3/yr	Unit Value R /m^3	Value 10^3 R/year	% of Annual Running Costs Costs	Volume 10^3 m^3/yr	Unit Value (R /m^3)	Value 10^3 R/year	% of Annual Running Costs Costs
Unbilled Consumption	210	2.70	567	1.26	20	18.42	375	3.92
Apparent Losses:	550	2.70	1485	3.30	28	18.42	517	5.41
Real Losses:	2200	0.15	330	0.73	159	1.50	239	2.50
Total Unbilled:	2960		**2382**	**5.29**	208		1131	**11.83**

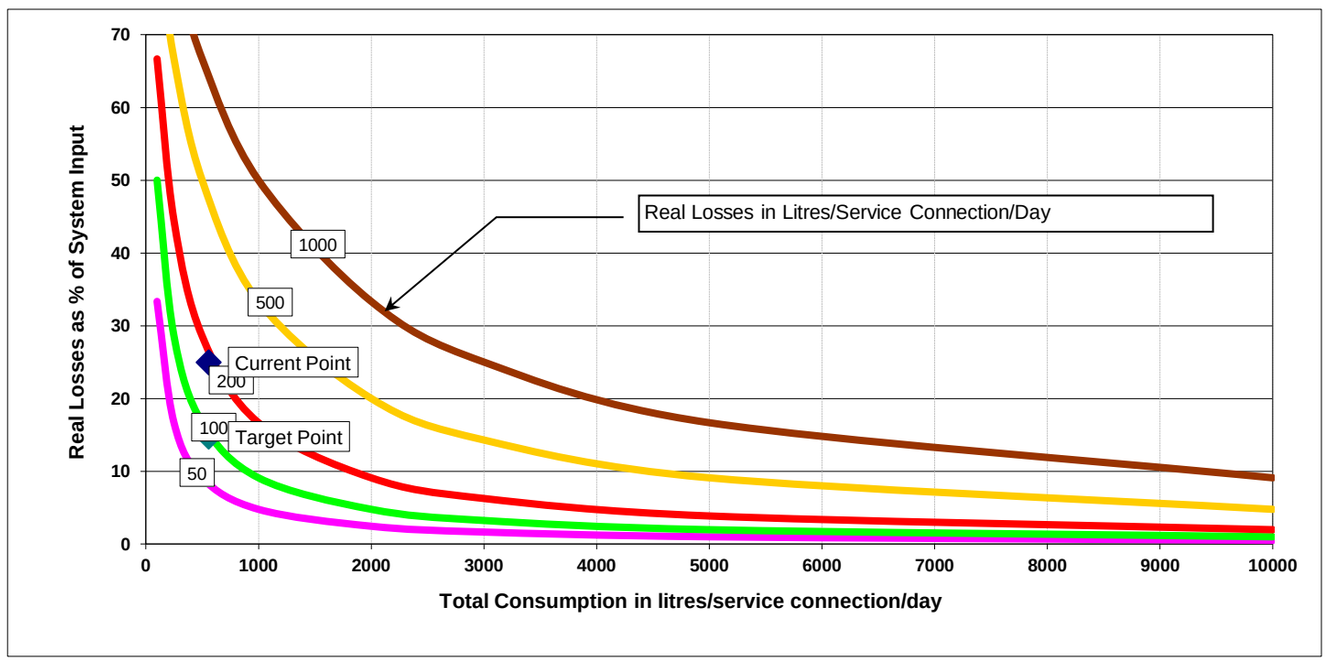
D7. RELATIONSHIP BETWEEN REAL LOSSES EXPRESSED AS % OF SYSTEM INPUT

D7a. Real losses curve definition

Curve Definition					
Consumption litres/serv conn/day	Real losses in litres/service connection/day				
	50	100	200	500	1000
100	33.3	50.0	66.7	83.3	90.9
250	16.7	28.6	44.4	66.7	80.0
500	9.1	16.7	28.6	50.0	66.7
1000	4.8	9.1	16.7	33.3	50.0
2000	2.4	4.8	9.1	20.0	33.3
3000	1.6	3.2	6.3	14.3	25.0
5000	1.0	2.0	3.8	9.1	16.7
10000	0.5	1.0	2.0	4.8	9.1

D7b. Components of water balance in litres/service connection/day (Actual Results)

D7c. Current Real Losses as % of System Input Volume



Details	Calculation	Actual Result	Units
System Input Volume	from D7b	746	Litres/conn/day
Total Consumption	from D7b	560	Litres/conn/day
Annual Real Losses	from D7b	186	Litres/conn/day

ARL as % of System Input	ARL / System input volume x 100	25	%

D7d. Potential Real Losses as % of System Input Volume

Details	Calculation	Actual Result	Units
Unavoidable Annual Real Losses (UARL)	from D3	48	Litres/conn/day
Target Loss Factor (TLF)	User defined for each system	2	Dimensionless
Target Annual Real Losses (TARL)	TLF x UARL	97	Litres/conn/day
Current Annual Real Losses (CARL)	CARL from D5a	186	Litres/conn/day
Potential savings	CARL - TARL	89	Litres/conn/day
Potential ARL as % of System Input	TARL / (System input volume-Potential savings) x 100	15	%

D7e. Real Losses as a % of System Input Volume versus Consumption in litres/service connectio for different values of Real Losses in litres/service connection/day

Photos

PHOTOS KLAPMUTS	
Photo Number	**Description**
Klapmuts WWTW	
KM1	Attendance Register at Security. No operational sampling currently done at plant. No re-use of final effluent.
KM2	Daily Logbook with entries for Inflow, Outflow, Water Usage at plant and non-functional components
KM3	Inlet works. Mechanical screen was removed. Hand raked bypass screen is in place. Flow was going through channel without screen during site visit.
KM4	Inlet works: Huber compactor currently not in use, because mechanical screen was removed.
KM5	Inlet works: Skip for the removal of screenings and grit
KM6, KM8, KM9	Inlet works: Two vortex grit removal tanks with jet lift pumps and grit classifier (Pista)
KM7	Inlet works: Blower and Paddle Drive controls.
KM10	Inlet works: Probe for flow meter above Parshall flume.
KM11	Inlet works: Endress & Hauser FMU90 flow meter for incoming flow (Operational).
KM12	MLE Reactor: Anoxic basin with single 7kW mixer.
KM13, KM14	MLE Reactor: Three Aeration basins with three 30kW single speed aerators.
KM15	Sludge Holding Tank. Whole WWTW site is overgrown with grass, inadequate maintenance of terrain.
KM16	Sludge Holding Tank. Grass to be removed from tank.
KM17	Sludge Holding Tank. Two pumps are working.
KM18	SST No.1: RAS PS. Two (duty/standby) submersible pumps. Both working.
KM19-KM21	SST No.1: Scum and floating sludge layer on surface. The overflow from the SST is not clear and free of scum.
KM22 – KM24	SST No.2: Not operational for the last three weeks, because valve of RAS PS is not working.
KM25	SST No.2: RAS level indicator.
KM26	SST No.2: RAS PS. Two (duty/standby) submersible pumps. One of the pumps is not working.
KM27	MLE Reactor: Two (duty/standby) axial flow pumps to recycle the nitrates back to the anoxic basin (a-cycle). One motor was removed, only one operational.
KM28	MLE Reactor: Two (duty/standby) submersible waste sludge pumps to pump WAS to sludge holding tank. Both submersible pumps not working.
KM29	MLE Reactor: DO and TU meters are not working.
KM30	Pond for storage of sludge if Chlorine Contact Channels are cleaned (Backup pond)
KM31	Chlorine disinfection building. Currently no disinfection, due to chlorine shortage.
KM32 – KM34	Chlorine dosing equipment.
KM35	Safety signage at chlorine building.
KM36	Chlorine electronic scales and dosing regulator
KM37	MCC for chlorine dosing and Chlorine Gas Leak Detector
KM38, KM39	Chlorine Safety Equipment. BA sets
KM40	Chlorine Contact Channel
KM41	Additional Chlorine Tablet Disinfection, not operational. Currently no disinfection.
KM42, KM43	Final effluent flow meter (Endress & Hauser FMU90) with probe (Operational).
KM44	Final effluent maturation pond, full of scum on surface.
KM45	Final effluent PS building, no door.
KM46 - KM48	Final effluent PS for Belt Press. Only one motor and pump operational. One pump was removed.
KM49	Sludge Lagoon, overgrown with grass
KM50	Final effluent discharge from maturation pond
KM51, KM52	Belt Press building with silo for discharge.
KM53 – KM56, KM61	Bellmer WinkelPresse Belt Press Type N6 1S. Currently not operational, belt is loose.
KM57 - KM59	MCC for Belt Press.
KM60	Belt Press: Sludge and Poly flow meters
KM62	Belt Press: Two water pumps for belt press. Both operational
KM63	Belt Press: Two poly dosing pumps. Both operational.

PHOTOS	
KM64, KM65	Belt Press: Poly dosing tank
Klapmuts Sewerage Infrastructure	
KM66, KM68, KM69	Klapmuts sewer PS No.3. Fenced and locked, with 24hour on-site security. Electrical fence not operational.
KM67	Klapmuts sewer PS No.3. Backup generator
KM70 – KM72	Klapmuts sewer PS No.1. Fenced and locked, with 24hour on-site security. Electrical fence not operational.
KM73, KM78	Klapmuts sewer PS No.2. Fenced and locked, with 24hour on-site security. Electrical fence not operational.
KM74 - KM76	Klapmuts sewer PS No.2. Mechanical screen not operational.
KM77	Klapmuts sewer PS No.2. Backup generator
Klapmuts Water Infrastructure	
KM79- KM80	Klapmuts Lower Reservoir 7.000Ml: Fenced, Covers locked and airvents covered (Security on site)
No Access	Klapmuts Upper Reservoir 1.200Ml
KM81- KM83	Klapmuts Old Reservoir 1.200Ml: Fenced, Covers locked and airvents covered (Security on site)
KM84-KM94	Klapmuts PS (x3): Fenced and locked. Motor No.1: Motorelli, 75kW; Pump No.1 Grundfos, Type NK: 80-250/270; Motor No.2: Motorelli 45kW; Pump No.2: KSB, Type WKLn 100/4; Motor No.3: Western Electric, 45kW; Pump No.3: KSB, Type WKLn 100/4. Q = 243.7 m^3/h
KM95	Klapmuts PS: Control Panel
KM96-KM97	Klapmuts PS: Chlorine Dosing Room – one tank in use. Room used by security guard on site.
GREATER FRANSCHHOEK	
Photo Number	**Description**
Wemmershoek WWTW	
GF1	Overview of two SBRs. No operational sampling currently done at plant. No re-use of final effluent. Lighting at site is not operational, only at Belt press building (Safety and Security Risk). No final effluent flow meter. Geyser for Office building not working.
GF2	Daily Logbook. No flow recording on control sheets. Flow register through Telemetry system.
GF3	Inlet works:
GF4	Inlet works: Two mechanical screens are not operational. Service water pumps for water at inlet works not operational.
GF5	Inlet works: Huber compactor is operational.
GF6	Inlet works: Two vortex degritters, both operational.
GF7	Inlet works: Two mechanical fine screens, both operational.
GF8	Inlet works: Grit removed to skip
GF9, GF10	Inlet works: Endress & Hauser FMU90 flow meter for incoming flow (Operational).
GF11, GF12	Inlet works: Raw feed tank with pumps. Level sensors of raw feed tank are faulty. One of the three submersible pumps is faulty.
GF13, GF14	Two SBRs. SBR No.2 valve malfunctioning, especially in the mornings.
GF15, GF16	MCC for SBRs
GF17	Generator Room with backup generator for load shedding periods.
GF18, GF19	Four blowers for SBRs. One of the blowers is not working.
GF20	Compressor
GF21	Sludge Holding Tank
GF22 – GF24	Chlorine contact channels.
GF25	Service water PS building
GF26 – GF34	Two irrigation pumps, currently not in use. Motor No.1 Motorelli, 37kW; Pump No.1 KSB Type WKLn 65/3; Motor No.2 Motorelli, 37kW; Pump No.2 KSB Type WKLn 65/3
GF35, GF36	Flow meter for irrigation pumps. Endress & Hauser Promag W.
GF37	Two linear screen and Belt wash pumps. Not operational (Alignment).
GF38	Two chlorine motive water pumps
GF39	Two service water pumps. One not working.
GF40	Compressor not operational for linear screen and belt wash pumps.
GF41, GF42	Chlorine building, with MCC for service water pumps in the other room. Door to be replaced.
GF43	Chlorine dosing: Manual dosing regulator and auto V-notch controller.

PHOTOS	
GF44	Chlorine gas leak detector
GF45	Chlorine cylinder electronic scales.
GF46	No BA sets or other chlorine safety equipment.
GF47	Chlorine cylinders
GF48	Vacuum Regulator for first chlorine cylinder
GF49	Vacuum Regulator for second chlorine cylinder not operational. Only one cylinder can be used.
GF50	Extraction fan is not operational.
GF51	Chlorine building. Door to be replaced.
GF52	Emergency shower, no water and not operational.
GF53, GF54	Silo for belt press, with three screw pumps. Dried sludge is push out when full, no control valve. Level sensor also faulty.
GF55 – GF60	Two Bellmer WinkelPresse Belt Presses Type N6 1S. Belt press stand during load shedding periods, not connected to backup generator.
GF61	Belt Presses: Poly dosing point
GF62	Belt Presses: Poly dosing tank
GF63	MCC for belt presses
GF64, GF67	Washwater and Poly dosing flow meters for both belt presses.
GF65	Belt Presses: Four poly dosing pumps, all operational.
GF66	Belt Presses: Four washwater pumps, all operational.
GF67 – GF72	Scada system for management of WWTW
GF73	Electrical fence not operational, was vandalized. 24 Hour security at plant.
Franschhoek Sewerage Infrastructure	
GF140 – GF141	La Motte sewer PS. Locked and fenced. (Fence requires refurbishment).
GF142	La Motte sewer PS. MCC for PS
Franschhoek WTW	
GF122	Franschhoek WTW
Franschhoek Water Infrastructure	
GF74 - GF81	Wemmershoek Booster PS (x2): Fenced and locked. Motor No.1: WEG, 50kW; Pump No.1 KSB, Type ETA: 150-50; Motor No.2: WEG 50kW; Pump No.2: KSB, Type ETA 150-50.
GF82 - GF84	Wemmershoek Package Plant: Not in use
GF85 - GF86	Wemmershoek Reservoir 0.500Ml. Fenced, covers in place, not locked and airvents covered.
GF87 - GF94	La Motte Booster PS (x2): Fenced and locked. Motor No.1: WEG, 220kW; Pump No.1 KSB, Type WKLn 150/4; Motor No.2: WEG 220kW; Pump No.2: KSB, Type WKLn 150/4.
GF95 - GF96	La Motte Booster PS: MCC for PS
GF97 - GF99	La Motte Reservoir 0.500Ml: Not fenced, covers not locked, airvents covered.
GF100 - GF101	Groendal Reservoir 0.700Ml: Fenced, covers locked and airvents covered.
GF102 – GF103	Franschhoek PS (x2) and Langrug PS (x2): Located in same building. Fenced and locked.
GF104 – GF109	Langrug PS (Groendal): Motor No.1, Motorelli 22kW; Pump No.1, Type KSB WKLn 80/5; Motor No.2, WEG 22kW; Pump No.2, Type KSB WKLn 80/5.
GF110 – GF117	Franschhoek PS (Groendal): Motor No.1, ACTOM 90kW; Pump No.1, Type KSB ETA 125-50/2; Motor No.2, ACTOM 90kW; Pump No.2, Type ETA 125-50/2.
No Access due to safety concerns	Langrug Old Reservoir 0.500Ml, Langrug New Reservoir 1.000Ml,
No Access	Franschhoek Reservoir 5.000Ml
GF118- GF121	Franschhoek Estate Lower Reservoir 2.000Ml. Not fenced, covers locked and airvents covered. Chlorine tablets dosing.
GF123-GF124	Franschhoek Estate Upper Reservoir 0.200Ml (Private, no access)
GF125 - GF127	Bagatelle Reservoir 0.700Ml. Fenced, covers not locked and airvents covered.
GF128 - GF132	Bagatelle PS (x2): Fenced and locked. Motor and Pump No.1: Pentax, Type CM40-250B. Q = 160 – 650 l/min. Motor and Pump No.2 (Jockey) Unknown
GF133 – GF138	Shepperdson Booster PS: Vandalised (Dysfunctional), not in use.
GF139	Southern Booster PS – Not sure if used – SBM to confirm status

SB133	Scada for sludge cake and silo.
SB134	Scada overview of three belt presses.
SB135	Scada overview of UV and Wash water
SB136	Scada of SSTs and UV disinfection
SB137	Daily recording sheet for inlet works equipment, running hours.
SB138, SB139	MBR and ASP Daily Readings. Flow meter readings for inflow and outflow.
SB140	Inlet works: Three front-raked screens. Only one operational.
SB141	Inlet works: Two duty/standby wash compactors with skips. One not operational for the last three weeks, with screenings being dumped next to the inlet works. Seepage pump not operational due to blockages from broken wash compactor.
SB142 – SB144	Inlet works: All three belt screens are operational.
SB145	Inlet works: All sluice gates are operational.
SB146	Inlet works: Odour treatment system (Bio-trickling fitler with a nutrient addition tank and metering pump tank and recirculation pump). Odour system not operational for the last two years.
SB147	Inlet works: Three Vortex degritters with jet pumps. One of the degritters is not operational.
SB148, SB149	Inlet works: Two duty/standby grit classifiers with skips.
SB150	Inlet works.
SB151	MCC for inlet works.
SB152, SB154	Aerobic digestor with four aerators.
SB153	Aerobic digestor with two floating aerators.
SB155, SB156	Belt Presses: Three Bellmer Winkelpresse Belt Presses Type N6 4S
SB157	Belt Presses: Two sludge pumps, only one operational. Needs to be operated manually.
SB158	Belt Presses: Poly tank
SB159	Belt Presses: Three poly dosing pumps, all operational.
SB160	Belt Presses: Three sludge pumps, all operational
SB161	Storage of lime and poly.
SB162	Reactor flow splitter (70 MBR / 30 ASP) with modulating sluice gates
SB163, SB164	Four rotating brush fine screens (1.5mm or smaller) to protect the membranes in the MBR. (Screens No.1 and No.4 are not working). Common conveyor and wash press.

PHOTOS	
SB165	Anaerobic zone with six mixers (all operational) and Anoxic zone with six mixers (two not working)
SB166	ASP Reactor with anaerobic and anoxic zones, all mixers are working.
SB167	R-Recycle PS, all pumps operational.
SB168, SB169	SST No.3. No scum sump. Scum plates removed at various sections.
SB170 – SB172	SST No.1. Scum plates removed at various sections.
SB173	SST No.2 not operational due to leakage through floor. Bridge wheel was removed.
SB174 – SB176	Aeration zone. One of the five aerators is not operational.
SB177	Maturation Pond, overgrown with grass and reeds.
SB178	Waste sump with two pumps, both operational.
SB179, SB180	MBR: Two aeration zones, with fine bubble diffused aeration
SB181	MBR: Valve broken off, to be repaired. The shaft of one of the actuators is broken.
SB182, SB183	Membranes of MBR
SB184	MBR: De-aeration zone with two vertical axial downflow agitators.
SB185	MBR: Hach inline sampler, not in use.
SB186, SB187	MCC for MBR.
SB188	MCC for ASP.
SB189	MCC for UV system.
SB190	MCC for blowers.
SB191	MBR: Sodium hypochlorite dosing (Organic cleaning of membranes twice weekly).
SB192	MBR: Citric acid dosing (Inorganic cleaning of membranes once weekly)
SB193	Storage of citric acid
SB194	Standard operating procedure for citric acid and chemical make-up.
SB195	UV System, with two bypass lines at the back. UV system is not operational due to broken sensor. Never worked.
SB196	Two duty/standby membrane tank drainage pumps.
SB197, SB198	Six membrane pumps. No.2 and No.4 not working.
SB199	Three wash water pumps, all operational
SB200	Four turbo compressors for aeration.
SB201	Four rotary lobe type blowers.
SB202 – SB205	Laboratory with sampling equipment.
SB206	Generator building.
Stellenbosch Sewerage Infrastructure

SBRWS30	Longlands Reservoir 10.000Ml: New Reservoir being constructed (Details to be confirmed)
SBRWS31	De Zalze PS Building: Fenced and locked
SBRWS32-SBRWS39	De Zalze PS: Motor No.1: WE, 55kW; Pump No.1 KSB, Type WKLn 100/6; Motor No.2: WE 55kW; Pump No.2: KSB, Type WKLn 100/6 (Leaking).
SBRWS40	De Zalze PS MCC
No Access (Private)	Longlands Reservoir 0.500Ml, Longlands Booster PS, Digteby Reservoir, Digteby Booster PS

PHOTOS	
Does not exist	Hands Booster PS
STELLENBOSCH RURAL-MULDERSVLEI AND KOELENHOF	
Photo Number	**Description**
SBRWS41	Koelenhof PS Building. Fenced and Locked
SBRWS42-SBRWS48	Koelenhof PS (x2): Motor No.1: EBERLE, 75kW; Pump No.1 FPS, Type SF 80 250 CI-CI-MS; Motor No.2: EBERLE 75kW; Pump No.2: M&B Normaflow, Type NF 80 250 (Leaking).
SBRWS49	Koelenhof PS MMC
SBRWS50-SBRWS51	Water Meter for off-take from Koelenhof
SBRWS52-SBRWS55	Koelenhof Reservoir: Fenced, Covers locked and airvents covered (Chamber full of water)
No Access (Private)	Elsenburg Reservoir
No Access (Private)	Elsenburg PS
SBRWS57-SBRWS58	Elsenburg Old PS: Dysfunctional (vandalised and not in use)
SBRWS59	Devon Valley and Sonop PS: Fenced and locked.
SBRWS60-SBRWS73	Devon Valley PS (x2): Motor No.1: BMM, 30kW; Pump No.1 KSB, Type WKLn 50/6 (Leaking); Motor No.2: Motorelli, Unknown kW; Pump No.2: KSB, Type WKLn 50/6 Sonop PS (x2): Motor No.3: EML, 55kW; Pump No.3 Rapid-Allweiler, Type L 63-3ST6761/B7/P6; Motor No.4: EML, 55kW; Pump No.4 Rapid-Allweiler, Type L 63-3ST6761/B7/P6
No Access	Devon Valley Reservoir 0.077Ml
No Access	Sonop Reservoir 3.500Ml

ANNEXURE C

STELLENBOSCH MUNICIPALITY

WATER SERVICES DEVELOPMENT PLAN FOR 2022-2027

FUTURE DEMAND AND FUNCTIONALITY REQUIREMENTS

FINAL

27 MAY 2026

WATER SERVICES DEVELOPMENT PLAN FOR 2022-2027

FUTURE DEMAND AND FUNCTIONALITY REQUIREMENTS

INDEX

DESCRIPTION **PAGE NO**

LIST OF TABLES ..... **vi**

ABBREVIATIONS AND DEFINITIONS ..... **ix**

1. SETTLEMENT DEMOGRAPHICS AND PUBLIC AMENITIES **1.1**

1.1 SETTLEMENTS DEMOGRAPHICS 1.1
1.2 PUBLIC AMENITIES 1.15
1.3 SOCIO ECONOMIC BACKGROUND 1.15
1.3.1 Population and Households 1.15
1.3.2 Population Growth Rates 1.16
1.3.3 Age and Gender Profile 1.16
1.3.4 Employment Profile 1.16
1.3.5 Household Income 1.17

2. SERVICE LEVELS PROFILE **2.1**

2.1 RESIDENTIAL WATER PROFILE 2.12
2.2 RESIDENTIAL SANITATION PROFILE 2.12
2.3 PUBLIC AMENITIES 2.15
2.3.1 Water Services 2.15
2.3.2 Sanitation Services 2.17

3. WATER SERVICES ASSET MANAGEMENT **3.1**

3.1 GENERAL INFORMATION 3.1
3.1.1 Asset Management Plan 3.1
3.1.2 Disaster Management Plan 3.2
3.1.3 Untreated Effluent Management Plan 3.3
3.2 FUTURE WATER AND SEWERAGE INFRASTRUCTURE REQUIREMENTS 3.3
3.2.1 Groundwater infrastructure (Boreholes) 3.3
3.2.2 Surface water infrastructure (Abstraction Points) 3.4
3.2.3 Bulk water pipeline and reticulation network infrastructure 3.5
3.2.4 Water Treatment Works infrastructure 3.11
3.2.5 Water pump stations 3.14
3.2.6 Reservoir infrastructure 3.15
3.2.7 Bulk sewer pipeline infrastructure and sewer drainage network infrastructure 3.16

3.2.8 Sewer pump stations 3.21
3.2.9 Waste Water Treatment Works 3.23
3.3 WATER AND SANITATION SCHEMES 3.27
3.3.1 Water Schemes 3.27
3.3.2 Sanitation Schemes 3.27

4. WATER SERVICES OPERATION AND MAINTENANCE 4.1

4.1 OPERATION AND MAINTENANCE PLAN 4.2
4.1.1 Groundwater infrastructure 4.3
4.1.2 Surface water infrastructure 4.6
4.1.3 Bulk and water reticulation networks and fittings 4.7
4.1.4 Water Treatment Works 4.9
4.1.5 Water Pump Stations 4.14
4.1.6 Reservoirs 4.16
4.1.7 Remote Monitoring and Control Systems 4.18
4.1.8 Sewer Pump Stations 4.20
4.1.9 Bulk and sewer drainage networks 4.22
4.1.10 Waste Water Treatment Works 4.23

5. CONSERVATION AND DEMAND MANAGEMENT 5.1

5.1 WATER RESOURCE MANAGEMENT 5.15
5.1.1 Reducing Unaccounted Water and Water Inefficiencies 5.15
5.1.1.1 Night flow metering 5.15
5.1.1.2 Day flow metering 5.16
5.1.1.3 Reticulation leaks 5.17
5.1.1.4 Illegal connections 5.19
5.1.1.5 Un-metered connections 5.19
5.1.2 Leak and Meter Repair Programmes 5.19
5.1.2.1 Leak Repair Assistance Programmes 5.19
5.1.2.2. Retro-fitting of water efficient toilets 5.21
5.1.2.3 Meter repair programme 5.22
5.1.3 Consumer / End-use Demand Management: Public Information and Education Programmes 5.22
5.1.3.1 Schools targeted by Education Programmes 5.23
5.1.3.2 Consumers targeted by Public Information Programmes 5.23
5.1.4 Conjunctive use of Surface- and Groundwater 5.24
5.1.5 Working for Water 5.24
5.1.6 Water Resource Management Projects 5.25
5.2 WATER BALANCE 5.25
5.2.1 Water Balance for Stellenbosch 5.27

5.2.2 Water Balance for Franschhoek 5.27
5.2.3 Water Balance for Dwars River 5.28
5.2.4 Water Balance for Klapmuts 5.28
5.3 WATER LOSSES 5.28

6. WATER RESOURCES 6.1

6.1 SOURCES AND VOLUMES 6.2
6.2 MONITORING 6.6
6.2.1 Percentage of Water Abstracted Monitored: Surface Water 6.6
6.2.2 Percentage of Water Abstracted Monitored: Groundwater 6.7
6.2.3 Percentage of Water Abstracted Monitored: External Sources (Bulk Purchase) 6.7
6.2.4 Surface Water Levels 6.7
6.2.5 Groundwater Water Levels 6.8
6.2.6 Water Quality for Formal Schemes 6.8
6.2.7 Water Quality for Rudimentary Schemes 6.8
6.2.8 Borehole Abstraction 6.8
6.3 WATER QUALITY 6.9
6.3.1 Reporting on Quality of Water taken from Source: Urban and Rural 6.16
6.3.2 Quality of Water Returned to the Resource: Urban 6.19
6.3.3 Quality of Water Returned to the Resource: Rural 6.24
6.3.4 Pollution Contingency Measures Plan 6.25
6.3.5 Quality of Water taken from Source: Urban – Percentage Monitored by WSA 6.25
6.3.6 Quality of Water taken from Source: Rural – Percentage Monitored by WSA 6.25
6.3.7 Quality of Water Returned to the Source: Urban – Percentage Monitored by WSA 6.25
6.3.8 Quality of Water Returned to the Source: Rural – Percentage Monitored by WSA 6.26
6.3.9 Water quality results available in electronic format 6.27
6.3.10 Percentage Time (Days) within SANS241 Standards per Year 6.27
6.4 OPERATION 6.27

7. FINANCIAL PROFILE 7.1

7.1 EXPENDITURE 7.2
7.1.1 Ratios and Efficacy Indicators 7.2
7.1.2 Water Balance Cost / Revenue 7.3
7.1.3 Operating Cost 7.4
7.1.3.1 Operating Cost: Water 7.5
7.1.3.2 Operating Cost: Sanitation 7.5
7.1.4 Capital Expenditure 7.7
7.1.4.1 Capital Expenditure: Water 7.9
7.1.4.2 Capital Expenditure: Sanitation 7.11

7.2 INCOME 7.12
7.2.1 Operating Income 7.12
7.2.1.1 Operating Income: Subsidies 7.13
7.2.1.2 Operating Income: Water 7.14
7.2.1.3 Operating Income: Sanitation 7.14
7.2.2 Capital Income 7.15
7.2.2.1 Capital Income: Water 7.15
7.2.2.2 Capital Income: Sanitation 7.16
7.3 TARIFF AND CHARGES 7.17
7.4 FREE BASIC SERVICES 7.20
7.5 METERING, BILLING AND INCOME 7.21

8. WATER SERVICES INSTIUTIONAL ARRANGEMENTS AND CUSTOMER SERVICES 8.1

8.1 MUNICIPAL STRATEGIC SELF-ASSESSMENT (MuSSA) 8.1
8.1.1 Water and Sanitation Services Planning 8.1
8.1.2 Management Skill Level (Technical) 8.1
8.1.3 Staff Skill Level (Technical) 8.3
8.1.4 Technical Staff Capacity (Numbers) 8.4
8.1.5 Water Resource Management (WRM) 8.5
8.1.6 Water Conservation and Water Demand Management (WC/WDM) 8.5
8.1.7 Drinking Water Safety and Regulatory Compliance 8.5
8.1.8 Basic Sanitation 8.10
8.1.9 Waste Water / Environmental Safety and Regulatory Compliance 8.10
8.1.10 Infrastructure Asset Management (IAM) 8.12
8.1.11 Operation and Maintenance of Assets 8.12
8.1.12 Financial Management 8.12
8.1.13 Revenue Collection 8.12
8.1.14 Financial Asset Management 8.12
8.1.15 Information Management (IT) 8.12
8.1.16 Organisational Performance Monitoring 8.13
8.1.17 Water and Sanitation Service Quality 8.14
8.1.18 Customer Care (CRM) 8.15

9. EXISTING NEEDS PERSPECTIVE, WATER MASTER PLAN PERSPECTIVE AND OVERALL TOPIC STRATEGIES 9.1

9.1 Existing Needs Perspective 9.1
9.2 Water Master Plan Perspective 9.5
9.3 Overall Topic Strategies 9.7

ANNEXURES

ANNEXURE A (Water and Sewer Master Plans)

Water and Sewerage

Figure SS 4.1 (a): Potential Future Land Developments – Stellenbosch
Figure SS 4.1 (b): Potential Future Land Developments – Dwars River
Figure SS 4.1 (c): Potential Future Land Developments – Franschhoek
Figure SS 4.1 (d): Potential Future Land Developments – Klapmuts
Figure SS 4.1 (e): Potential Future Land Developments – Faure, Raithby, Helderberg and Croydon
Figure SS 4.1 (f): Potential Future Land Developments – Polkadraai

AADD	Average Annual Daily Demand
AC	Asbestos Cement
ADWF	Annual Dry Weather Flow
AIDS	Acquired Immune Deficiency Syndrome
AMP	Asset Management Plan
AMR	Automatic Meter Reading
BA	Basic Assessment
BD	Blue Drop
BDRR	Blue Drop Risk Rating
BH	Borehole
BNR	Biological Nutrient Removal
BRVAS	Berg River Voëlvlei Augmentation Scheme
CAFES	Conserving, Adequate, Fair, Enforceable and Simple
CBA	Critical Biodiversity Areas
CBD	Central Business District
CCT	City of Cape Town
CMA	Catchment Management Agency
COD	Chemical Oxygen Demand
COVID-19	Coronavirus disease
CRC	Current Replacement Cost
CRM	Customer Care Management
CRR	Cumulative Risk Ratio
DC	District Council
DM	District Municipality
DO	Dissolved Oxygen
DoH	Department of Health
DORA	Division of Revenue Act
DWS	Department of Water and Sanitation
EC	Electrical Conductivity
EHP	Environmental Health Practitioner
EMF	Environmental Management Framework
EPWP	Expanded Public Works Programme
ESA	Environmental Sensitive Area
GD	Green Drop
GIS	Geographic Information Systems
GPS	Global Positioning System
HH	Household
HIV	Human Immunodeficiency Virus
HTH	High Test Hypochlorite
IAMP	Infrastructure Asset Management Plan
IBT	Inclining Block Tariff
ICT	Information and Communication Technology
IDP	Integrated Development Plan
ILI	Infrastructure Leakage Index
IMP	Incident Management Protocol
IMQS	Infrastructure Management Query System
IRIS	Integrated Regulatory Information System
ISO	International Standards Organisation

IT	Information Technology
IUDG	Integrated Urban Development Grant
IWA	International Water Association
Kl	Kilolitre
KPI	Key Performance Indicator
l/c/d	Litre per Capita per Day
LED	Local Economic Development
LM	Local Municipality
LOFLOS	Low Flow on Site
l/s	Litre per Second
m	Metre
m³/a	Cubic Metre per Annum
MBR	Membrane Biological Reactor
MFMA	Municipal Finance Management Act
MIG	Municipal Infrastructure Grant
Ml	Mega Litre
Ml/a	Mega Litre per Annum
Ml/d	Mega Litre per Day
MLSS	Mixed Liquor Suspended Solids
MNF	Minimum Night Flow
mSCOA	Municipal Standard Chart of Accounts
MTREF	Medium-Term Revenue Expenditure Framework
MuSSA	Municipal Strategic Self-Assessment
NGO	Non-Government Organisation
NMT	Non-Motorised Transport
NRW	Non-Revenue Water
NSSS	Non-sewered Sanitation Systems
NWRS	National Water Resource Strategy
NTU	Nephelometric Turbidity Unit
NU	Non-urban
NWA	National Water Act
PRP	Pipe Replacement Potential
PRV	Pressure Reducing Valve
PS	Pump Station
RAS	Return Activated Sludge
RM	Rand Million
RR	Risk Ratio
RUL	Remaining Useful Life
SABS	South African Bureau Standard
SANS	South African National Standard
SAR	Sodium Absorption Ratio
SCADA	Supervisory Control and Data Acquisition
SDBIP	Service Delivery and Budget Implementation Plan
SDF	Spatial Development Framework
SEMF	Stellenbosch Environmental Management Framework
SFWS	Strategic Framework for Water Services
SIV	System Input Volume

SMP	Sewer Master Plan
SOP	Standard Operating Procedure
SST	Secondary Settling Tank
STED	Septic Tank Effluent Drainage
TB	Tuberculosis
TKN	Total Kjeldahl Nitrogen
TSS	Total Suspended Solids
UAW	Unaccounted for Water
UPS	Universal Power Supply
UV	Ultra Violet
VAT	Value Added Tax
VIP	Ventilated Improved Pit
VMLSS	Volatile fraction of MLSS
WARMS	Water Authorisation Registration and Management System
WC	Water Conservation
WC/WDM	Water Conservation / Water Demand Management
WCWSS	Western Cape Water Supply Scheme
WDM	Water Demand Management
WESS	Water Efficient Sanitation Solutions
WHO	World Health Organisation
WMP	Water Master Plan
WRM	Water Resource Management
WSA	Water Services Authority
WSDP	Water Services Development Plan
WSI	Water Services Institution
WSIG	Water Services Infrastructure Grant
WSP	Water Services Provider
WTW	Water Treatment Works
WULA	Water Use License Application
W_2RAP	Waste Water Risk Abatement Plan
WWTW	Waste Water Treatment Works

1. SETTLEMENT DEMOGRAPHICS AND PUBLIC AMENITIES

Table 1.1: Master Plan for settlement demographics and public amenities		
Section	**Master Plan**	**Yes / No**
Settlements Summary (Population, Households, Household size, Settlements)	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Settlement Group (Rural / Urban)	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Settlement Type	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Amenities Summary	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes

1.1 SETTLEMENT DEMOGRAPHICS

Stellenbosch and Klapmuts are the settlements where significant development over the short to medium term is foreseen. The potential of Klapmuts for economic development and associated housing is particularly significant, located as it is on the metropolitan area's major freight route. Over the longer term, the Muldersvlei / Koelenhof and Vlottenburg / Lynedoch areas can potentially develop into significant settlements. Although considerably smaller than Stellenbosch and Klapmuts, these expanded settlements are nevertheless envisaged as balanced, inclusive communities. Over the longer term, these expanded settlements are foreseen to fulfil a role in containing the sprawl of Stellenbosch town, threatening valuable nature and agricultural areas. Importantly, they should not grow significantly unless parallel public transport arrangements can be provided.

The remainder of settlements are not proposed for major growth, primarily because they are not associated with movement routes and other opportunity than can support substantial livelihood opportunity for all community groups. The focus in these settlements should be on on-going improvements to livelihood opportunity for residents, and the management of services and places. The largest of these settlements is Franschhoek, a significant tourism destination.

The Engineering Services Department supports the focus on Stellenbosch and Klapmuts as priority development areas as appropriate bulk service networks exist which could be expanded upon. The secondary investment areas identified along Baden Powell Drive and the R304 will require significant bulk infrastructure development. Extensive development is not supported in these areas until sufficient capital funding is available to fund the required infrastructure.

Engineering Services also support the principle that development in these secondary areas should only be supported once appropriate public transport services are available.

Stellenbosch Municipality's Amended Spatial Development Framework, 27 June 2023, list the following spatial and non-spatial proposals for the various areas within the Municipal Area.

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.

Stellenbosch Municipality			
Type of Action	**SDF Element**	**Spatial Proposals**	**Related Non-Spatial Proposals**
Protective Actions	CBAs, ESA's, Protected areas	• Work to extend, integrate, restore, and protect a system of protected areas that transect the municipality and includes low-to-high elevation, terrestrial, freshwater, wetlands, rivers, and other ecosystem types, as well as the full range of climate, soil, and geological conditions. • Maintain Core (and to an extent Buffer) areas largely as "no-go" areas from a development perspective, only permitting non-consumptive activities (for example, passive outdoor recreation and tourism, traditional ceremonies, research and environmental education). • Where value-adding development is required (for example for temporary accommodation), preference should be given to currently disturbed areas as development footprints.	• Provide active support for Stewardship Programmes, Land-care Programmes, and the establishment of Conservancies and Special Management which protects and expands biodiversity and nature areas. • Implement institutional / management actions contained in the SEMF.
	Water courses	• Improve public continuity, access, and space along all river corridors (including the Kromrivier, Plankenbrug, Eerste River, and Blaauklippen River). • No development should be permitted on river banks below the 1:100 flood-lines.	• Work to clean polluted rivers (particularly the Plankenbrug).
	Agricultural land	• High potential agricultural land must be excluded from non-agricultural development. • Subdivision of agricultural land or changes in land-use must not lead to the creation of uneconomical or sub-economical agricultural units. • Building structures associated with agriculture, dwelling units to support rural tourism, and ancillary rural activities that serves to diversify farm income, are permitted and should adhere to the guidelines contained in the SEMF and "Western Cape Land Use Planning: Rural Guidelines". • Actively engage the CCT and DM related to land use applications which threaten agricultural land located on the border with these municipalities.	• Support the expansion and diversification of sustainable agriculture production and food security.
	Urban edge	• Prohibit the ad-hoc further outward expansion of urban settlements through maintaining tight urban edges.	
	Scenic landscapes, scenic routes, and special places of arrival	• Protect critical scenic routes and landscapes (as identified in surveys). • Maintain a clear distinction between urban development and nature/ agricultural areas at the entrances to settlements.	
	Historically and culturally significant precincts and places	• Maintain the integrity of historically and culturally significant precincts and places (as indicated in completed surveys). • Work to grow the extent of historically and culturally significant precincts and places in daily use and accessible to the public (through appropriate re-design and use of disused places).	• Consider the transfer of government owned historically and culturally significant precincts and places to entities geared to manage them sustainably. • Actively support community involvement in cultural and tourism activities celebrating history

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.

			and culture.
	Settlement hierarchy	• Maintain the existing hierarchy of larger urban towns and small rural settlements (with Stellenbosch and Klapmuts prioritised for further development over the short to medium term).	
Change Actions	Informal settlements to be upgraded	• Progressively upgrade existing informal settlements, focusing on basic services and community facilities. • Actively support development in areas between informal settlements and established areas.	• Utilise government land assets to enable integration. • between informal settlements and established areas.
	Areas for residential densification and infill	• Actively support residential densification and infill development within urban areas (with due consideration to the valued qualities of specific areas).	• Utilise government land assets to enable residential densification and infill development.
	Areas for mixed land use and improved economic opportunity	• Actively support the regional locational advantages of Klapmuts to support economic development, job creation, and associated housing. • Actively support mixed land use in settlement centres. • Ensure adequate provision for small and emerging entrepreneurs at good locations in all settlements. • Actively improve public space in town centres (specifically Stellenbosch and Franschhoek).	• Support private sector led institutional arrangements assist with urban management in town centres.
	Improved access and mobility	• Distinguish between the roles fulfilled by different routes and ensure that design changes and management measures applicable to routes support these roles. • Promote public and NMT (e.g. through densification, the re-design of existing routes, and development of new routes).	• Ensure that the design of all roads provide for appropriate NMT movement. • Pro-actively, and in partnership with key corporations/ institutions, introduce transport demand management measures favouring public transport and NMT.
	Community/ Institutional use	• Cluster community facilities together with commercial, transport, informal sector and other activities so as to maximise convenience, safety and socio-economic potential. • Institutional buildings (accommodating community activities, educational and health services, and entrepreneurial development and skills training) should be located at points of highest access in urban settlements.	• Retain and expand University of Stellenbosch functions and other large education institutions within Stellenbosch town as far as possible (unless there are place-specific reasons for favoring an alternative location).
	Improved landscaping and public amenity	• Actively improve landscaping and public amenity at places of high people concentrations (e.g. community facilities and high streets).	• Actively involve local communities in the development and management of public amenities.
New Development Actions	Significant new mixed use development	• Actively support the Adam Tas Corridor within Stellenbosch town for new mixed use development. • Support the development of a “innovation precinct” or “smart city” in Klapmuts South.	• Support private sector led institutional arrangements to enable joint planning and redevelopment. • Support redevelopment by making available government land assets.
	Significant new industrial development	• Actively support the development of Klapmuts North for industries and employment generating enterprises related to manufacturing, logistics, and warehousing.	• Support private sector led institutional arrangements to enable joint planning and development.

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.			
	Significant new residential development	• Explore the feasibility and pre-conditions of Muldersvlei/ Koelenhof and Vlottenburg/Lynedoch to be developed as more significant, inclusive settlements over the longer term (subject to the availability of public transport).	• Support private sector led institutional arrangements to enable joint planning and development.
	Significant change to access and mobility provision	• Explore the feasibility of changing/ complementing the rail service along the Baden Powell Drive-Adam Tas-R304 corridor to a system providing a more frequent, flexible service better integrated into the urban realm. Alternatively, a regular bus service should be explored serving the same route.	• Support private sector led institutional arrangements to enable joint planning and unlocking of the opportunity.
Stellenbosch Town			
Type of Action	**SDF Element**	**Spatial Proposals**	**Related Non-Spatial Proposals**
Protective Actions	CBAs, ESA's, Protected areas	• Maintain and improve the nature areas surrounding Stellenbosch town. • Work to increasingly connect and integrate nature areas, also with the urban green areas, to form an integrated green web or framework across the town and its hinterland area.	• Implement management actions contained in the SEMF.
	Water courses	• Improve public continuity, access, and space along the Kromrivier, Plankenbrug, Eerste River, and Blaauklippen River corridors.	• Improve water quality in the Plankenbrug River (through infrastructure improvements in Kayamandi).
	Agricultural land	• Retain and improve the relationship between Stellenbosch town and surrounding agricultural land.	
	Urban edge	• As a general principle, contain the footprint of Stellenbosch town as far as possible within the existing urban edge (while enabling logical, small extensions).	
	Scenic landscapes, scenic routes, and special places of arrival	• Retain the strong sense of transition between agriculture and human settlement at the entrances to the town.	
	Historically and culturally significant precincts and places	• Maintain the integrity of historically and culturally significant precincts and places (as indicated in completed surveys). • Improve public space and movement routes within historically and culturally significant precincts, with a focus on pedestrianism. • Work to grow the extent of historically and culturally significant precincts and places in daily use and accessible to the public (through appropriate re-design and use of specifically disused industrial buildings along the Adam Tas Corridor). • Define and hold the northern and eastern edges of Kayamandi. • Support land use change along George Blake Road to enable the integration of Kayamandi with the Adam Tas Corridor and Stellenbosch central area.	
Change Actions	Informal settlements to be upgraded	• Support land use change along George Blake Road to enable the integration of Kayamandi with the Adam Tas Corridor and Stellenbosch central area.	• Utilise government land assets to enable integration between informal settlements and established areas.
	Areas for residential densification and infill	• Pro-actively support higher density infill residential opportunity in the town centre, areas immediately surrounding it, and along major routes (with consideration of historic areas and structures).	• Utilise government land assets to enable residential densification and infill development.
	Areas for mixed land use and improved	• Retain and actively support mixed use redevelopment and building within the town	• Support private sector led institutional

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.			
	economic opportunity	centre and surrounding areas, comprising living space above active street fronts. • Actively support pedestrianism and improved public space within the old town centre.	arrangements assist with urban management in the town centre.
	Improved access and mobility	• Pro-actively improve conditions for walking and NMT within Stellenbosch town. • Improve access to the Techno Park, specifically from the north-west.	• Pro-actively, and in partnership with key corporations/institutions, introduce transport mode demand measurements favouring public and NMT. • Ensure that the design of all roads within and surrounding the town provides for appropriate NMT movement.
	Community/ Institutional use	• Cluster community facilities together with commercial, transport, informal sector and other activities so as to maximise convenience, safety and socio-economic potential. • Retain, as far as is possible, University and other educational uses within Stellenbosch town.	• Actively support the shared use of community facilities.
	Improved landscaping and public amenity	• As far as possible, focus investment in parks, open space, and social facilities accessible by public and NMT, in this way also increasing the surveillance of these facilities	• Actively involve local communities in the development and management of public amenities.
New Development Actions	Significant new mixed use development	• Develop the Adam Tas Corridor as a mixed-use, high density urban district, with strong internal and external public and NMT connections.	• Support private sector led institutional arrangements to enable joint planning and redevelopment. • Support redevelopment by making available government land assets.
	Significant new residential development	• Support inclusive infill development on vacant public land within Cloetesville, Idas Valley, Central Stellenbosch, and Jamestown. • Support infill development on private land within Stellenbosch town in a manner which serves to compact the town, expand residential opportunity, and rationalize the edges between built and unbuilt areas.	
	Significant change to access and mobility provision	• Explore the feasibility of changing/ complementing the rail service along the Baden Powell Drive-Adam Tas-R304 corridor to a system providing a more frequent, flexible service better integrated into the urban realm. • Alternatively, a regular bus service should be explored serving the same route.	• Support private sector led institutional arrangements to enable joint planning and unlocking of the opportunity.
Klapmuts			
Type of Action	**SDF Element**	**Spatial Proposals**	**Related Non-Spatial Proposals**
Protective Actions	CBAs, ESA's, Protected areas	• Maintain and improve the nature areas surrounding Klapmuts. • Work to increasingly connect and integrate nature areas, also with the urban green areas, to form an integrated green web or framework across the municipal area.	• Implement management actions contained in the EMF.
	Water courses	• Improve public continuity, access, and space along the stream corridors.	
	Agricultural land	• Retain and improve the relationship between Klapmuts and surrounding agricultural land.	
	Urban edge	• As a general principle, contain the footprint of Klapmuts as far as possible within the	

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.			
		existing urban edge.	
	Scenic landscapes, scenic routes, and special places of arrival	• Retain the strong sense of transition between agriculture and human settlement at the entrances to the town.	
	Historically and culturally significant precincts and places	• Maintain the integrity of historically and culturally significant precincts and places (as indicated in completed surveys).	
Change Actions	Informal settlements to be upgraded	• Prioritise informal settlements for upgrading and service provision.	• Utilise government land assets to enable integration between informal settlements and established areas.
	Areas for residential densification and infill	• Pro-actively support higher density infill residential opportunity in Klapmuts South.	• Utilise government land assets to enable residential densification and infill development.
	Areas for mixed land use and improved economic opportunity	• Retain and actively support mixed use redevelopment and building within the town centre and surrounding areas, comprising living space above active street fronts.	• Assist development opportunity for small/ emerging entrepreneurs.
	Improved access and mobility	• Pro-actively improve conditions for walking and NMT within Klapmuts. • Prioritise NMT connections between Klapmuts North and South (in parallel with the development of Farm 736/RE).	• Pro-actively, and in partnership with key corporations/ institutions, introduce transport mode demand measurements favouring public and NMT. • Ensure that the design of all roads within and surrounding the town provides for appropriate NMT movement.
	Community/ Institutional use	• Cluster community facilities together with commercial, transport, informal sector and other activities so as to maximise convenience, safety and socio-economic potential.	• Actively support the shared use of community facility
	Improved landscaping and public amenity	• As far as possible, focus investment in parks, open space, and social facilities accessible by public and NMT, in this way also increasing the surveillance of these facilities.	• Actively involve local communities in the development and management of public amenities.
New Development Actions	Significant new mixed use development	• Support the development of Farm 736/RE in Klapmuts North to unlock the development potential of Klapmuts (with an emphasis on job creation). • Support the development of a “innovation precinct” or “smart city” in Klapmuts South.	• Support private sector led institutional arrangements to enable joint planning and development.
	Significant new residential development	• Ensure that housing in Klapmuts South provides for a range of income groups.	
	Significant change to access and mobility provision	• Improve linkages between Klapmuts North and South, specifically along Groenfonten Road and a possible NMT crossing over the N1. • Explore the feasibility of changing/ complementing the rail service along the Baden Powell Drive-Adam Tas-R304 corridor to a system providing a more frequent, flexible service better integrated into the urban realm. Alternatively, a regular bus service should be explored serving the same route.	• Support private sector led institutional arrangements to enable joint planning and unlocking of the opportunity.
Franschhoek			
Type of Action	**SDF Element**	**Spatial Proposals**	**Related Non-Spatial Proposals**
Protective Actions	CBAs, ESA’s, Protected areas	• Maintain and improve the nature areas surrounding Franschhoek. • Work to increasingly connect and integrate nature areas, also with the urban green	• Implement management actions contained in the EMF.

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.

		areas, to form an integrated green web or framework across the municipal area.	
	Water courses	• Improve public continuity, access, and space along the stream corridors.	
	Agricultural land	• Retain and improve the relationship between Franschhoek and surrounding agricultural land.	
	Urban edge	• As a general principle, contain the footprint of Franschhoek as far as possible within the existing urban edge.	
	Scenic landscapes, scenic routes, and special places of arrival	• Retain the strong sense of transition between agriculture and human settlement at the entrances to the town.	
	Historically and culturally significant precincts and places	• Maintain the integrity of historically and culturally significant precincts and places (as indicated in completed surveys).	
Change Actions	Informal settlements to be upgraded	• Prioritise informal settlements for upgrading and service provision.	• Utilise government land assets to enable integration between informal settlements and established areas
	Areas for residential densification and infill	• Focus infill development on the largely undeveloped part within the urban edge (between the northwestern and south-eastern parts of the settlement). • Ensure that residential development provides for a range of housing types and income groups. • Ensure that future development is woven into the urban fabric of the existing town. • Actively undertake in-situ upgrading initiatives in Langrug.	• Utilise government land assets to enable residential densification and infill development.
	Areas for mixed land use and improved economic opportunity	• Focus new mixed use development as far as possible along Main Road. • Actively support pedestrianism and improved public space within the old town centre.	• Assist development opportunity for small/ emerging entrepreneurs. • Support private sector led institutional arrangements assist with urban management in the town centre.
	Improved access and mobility	• Pro-actively improve conditions for walking and NMT within Franschhoek. • Explore improved movement linkages between the north-western and south-eastern parts of the settlement.	• Ensure that the design of all roads within and surrounding the town provides for appropriate NMT movement.
	Community/ Institutional use	• Cluster community facilities together with commercial, transport, informal sector and other activities so as to maximise convenience, safety and socio-economic potential.	• Actively support the shared use of community facilities.
	Improved landscaping and public amenity	• As far as possible, focus investment in parks, open space, and social facilities accessible by public and NMT, in this way also increasing the surveillance of these facilities.	• Actively involve local communities in the development and management of public amenities.
New Development Actions	Significant new mixed use development		
	Significant new industrial development		
	Significant new residential development		
	Significant change to access and mobility provision		

La Motte and Wemmershoek

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.

Type of Action	SDF Element	Spatial Proposals	Related Non-Spatial Proposals
Protective Actions	CBAs, ESA's, Protected areas	• Maintain and improve the nature areas surrounding La Motte and Wemmershoek. • Work to increasingly connect and integrate nature areas, also with urban green areas, to form an integrated green web or framework across the municipal area.	• Implement management actions contained in the EMF.
	Water courses	• Improve public continuity, access, and space along the stream corridors.	
	Agricultural land	• Retain and improve the relationship between La Motte, Wemmershoek, and surrounding agricultural land.	
	Urban edge	• As a general principle, contain the footprint of La Motte and Wemmershoek as far as possible within the existing urban edges.	
	Scenic landscapes, scenic routes, and special places of arrival	• Retain the strong sense of transition between agriculture and human settlement at the entrances to the settlements.	
	Historically and culturally significant precincts and places	• Maintain the integrity of historically and culturally significant precincts and places (as indicated in completed surveys).	
Change Actions	Informal settlements to be upgraded	• Accommodate inhabitants of informal structures in planning for the settlements.	
	Areas for residential densification and infill	• Consider underutilsed open space within the settlements for infill development.	• Utilise government land assets to enable residential densification and infill development.
	Areas for mixed land use and improved economic opportunity	• Focus new mixed use development in La Motte on Farms 1653, 1339, 1/1158 and RE/1158 and around the intersection of the Robertsvlei Road and the R45. • Focus new mixed use development in Wemmershoek on the sawmill site.	• Assist development opportunity for small/ emerging entrepreneurs.
	Improved access and mobility	• Pro-actively improve conditions for walking and NMT between La Motte, Wemmershoek, the R45, and Franschhoek.	• Ensure that the design of all roads within and surrounding the settlements provides for appropriate NMT movement.
	Community/ Institutional use	• Cluster community facilities together with commercial, transport, informal sector and other activities so as to maximise convenience, safety and socio-economic potential	• Actively support the shared use of community facilities.
	Improved landscaping and public amenity	• As far as possible, focus investment in parks, open space, and social facilities accessible by public and NMT, in this way also increasing the surveillance of these facilities.	• Actively involve local communities in the development and management of public amenities.
New Development Actions	Significant new mixed use development		
	Significant new residential development		
	Significant change to access and mobility provision		
Dwars River Valley			
Type of Action	**SDF Element**	**Spatial Proposals**	**Related Non-Spatial Proposals**
Protective Actions	CBAs, ESA's, Protected areas	• Maintain and improve the nature areas surrounding settlements of the Dwars River Valley. • Work to increasingly connect and integrate nature areas, also with urban green areas, to form an integrated green web or framework across the municipal area.	• Implement management actions contained in the EMF.

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.			
	Water courses	• Improve public continuity, access, and space along the stream corridors.	• Ensure that river rehabilitation activities takes place.
	Agricultural land	• Retain and improve the relationship between settlements of the Dwars River Valley and surrounding agricultural land.	• Protect small scale agricultural opportunity and initiatives to transfer associated skills to the youth.
	Urban edge	• As a general principle, contain the footprint of settlements of the Dwars River Valley within existing urban edge.	
	Scenic landscapes, scenic routes, and special places of arrival	• Retain the strong sense of transition between agriculture and human settlement at the entrances to the settlements.	
	Historically and culturally significant precincts and places	• Maintain the integrity of historically and culturally significant precincts and places (as indicated in completed surveys).	
Change Actions	Informal settlements to be upgraded	• Accommodate inhabitants of informal structures in planning for the settlements.	
	Areas for residential densification and infill	• Ensure that residential development provides for a range of housing types and income groups. • Ensure that future development is woven into the urban fabric of existing settlements. • Consider underutilsed open space within the settlements for infill development that will enhance socio-economic potential of those who currently reside in these towns.	• Utilise government land assets to enable residential densification and infill development.
	Areas for mixed land use and improved economic opportunity	• Focus addressing service needs in cluster developments, in this way improving mixed use and enhancing economic opportunities. • Focus key protects on current mixed-use developments, while ensure future pockets of growth are integrated into the current and new developments.	• Assist development opportunity for small/ emerging entrepreneurs.
	Improved access and mobility	• Pro-actively improve conditions for walking and NMT within and between settlements of the Dwars River Valley.	• Ensure that the design of all roads within and surrounding settlements provides for appropriate NMT movement.
	Community/ Institutional use	• Cluster community facilities together with commercial, transport, informal sector and other activities so as to maximise convenience, safety and socio-economic potential.	• Actively support the shared use of community facilities.
	Improved landscaping and public amenity	• As far as possible, focus investment in parks, open space, and social facilities accessible by public and NMT, in this way also increasing the surveillance of these facilities.	• Actively involve local communities in the development and management of public amenities.
New Development Actions	Significant new mixed use development		
	Significant new residential development		
	Significant change to access and mobility provision		
Koelenhof and Muldersvlei			
Type of Action	**SDF Element**	**Spatial Proposals**	**Related Non-Spatial Proposals**
Protective Actions	CBAs, ESA's, Protected areas	• Maintain and improve the nature areas surrounding small settlements along the R304. • Work to increasingly connect and integrate nature areas, also with the urban green areas, to form an integrated green web or framework across the municipal area.	• Implement management actions contained in the EMF.

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.

	Water courses	• Improve public continuity, access, and space along stream corridors.	
	Agricultural land	• Retain and improve the relationship between small settlements along the R304 and surrounding agricultural land.	
	Urban edge	• As a general principle, contain the footprints of small settlements along the R304 as far as possible within the existing urban edge.	
	Scenic landscapes, scenic routes, and special places of arrival	• Retain the strong sense of transition between agriculture and human settlement at the entrances to small settlements along the R304.	
	Historically and culturally significant precincts and places	• Maintain the integrity of historically and culturally significant precincts and places (as indicated in completed surveys).	
Change Actions	Informal settlements to be upgraded	• Accommodate inhabitants of informal structures in planning for the settlements.	
	Areas for residential densification and infill	• Ensure that residential development provides for a range of housing types and income groups. • Ensure that future development is woven into the urban fabric of existing settlements. • Consider underutilsed open space within the settlements for infill development that will enhance socio-economic potential of those who currently reside in these towns.	• Utilise government land assets to enable residential densification and infill development.
	Areas for mixed land use and improved economic opportunity	• Focus addressing service needs in cluster developments, in this way improving mixed use and enhancing economic opportunities.	
	Improved access and mobility	• Pro-actively improve conditions for walking and NMT within and between small settlements along the R304.	• Ensure that the design of all roads within and surrounding settlements provides for appropriate NMT movement.
	Community/ Institutional use	• Cluster community facilities together with commercial, transport, informal sector and other activities so as to maximise convenience, safety and socio-economic potential.	• Actively support the shared use of community facilities.
	Improved landscaping and public amenity	• As far as possible, focus investment in parks, open space, and social facilities accessible by public and NMT, in this way also increasing the surveillance of these facilities.	• Actively involve local communities in the development and management of public amenities.
New Development Actions	Significant new mixed use development	• Over the longer term, Muldersvlei and Koelenhof along the R304 corridor could possibly accommodate more growth, and be established as inclusive settlements offering a range of opportunities. However, these settlements are not prioritized for development at this stage. • Explore the feasibility of changing/ complementing the rail service along the Baden Powell Drive-Adam Tas-R304 corridor to a system providing a more frequent, flexible service better integrated into the urban realm. Alternatively, a regular bus service should be explored serving the same route. • Explore the development of De Novo as an emerging farmer incubator. As far as possible, focus investment in parks, open space, and social facilities accessible by public and NMT, in this way also increasing the surveillance of these facilities.	• Support private sector led institutional arrangements to enable joint planning and development.
	Significant new residential development		
	Significant change to access and mobility provision		

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.

Vlottenburg, Spier and Lynedoch

Type of Action	SDF Element	Spatial Proposals	Related Non-Spatial Proposals
Protective Actions	CBAs, ESA's, Protected areas	• Maintain and improve the nature areas surrounding small settlements along Baden Powell Drive. • Work to increasingly connect and integrate nature areas, also with the urban green areas, to form an integrated green web or framework across the municipal area.	• Implement management actions contained in the EMF.
	Water courses	• Improve public continuity, access, and space along the stream corridors.	
	Agricultural land	• Retain and improve the relationship between small settlements along Baden Powell Drive and surrounding agricultural land.	
	Urban edge	• As a general principle, contain the footprint of small settlements along Baden Powell Drive as far as possible within the existing urban edge.	
	Scenic landscapes, scenic routes, and special places of arrival	• Retain the strong sense of transition between agriculture and human settlement at the entrances to the small settlements along Baden Powell Drive.	
	Historically and culturally significant precincts and places	• Maintain the integrity of historically and culturally significant precincts and places (as indicated in completed surveys).	
Change Actions	Informal settlements to be upgraded	• Prioritise informal settlements for upgrading and service provision.	
	Areas for residential densification and infill	• Focus infill development on undeveloped land within the urban edge.	
	Areas for mixed land use and improved economic opportunity	• Maintain the scale of mixed used and economic opportunity areas to reflect the current role of settlements.	
	Improved access and mobility	• Pro-actively improve conditions for walking and NMT within and between small settlements along Baden Powell Drive.	• Ensure that the design of all roads within and surrounding the settlements provides for appropriate NMT movement.
	Community/ Institutional use	• Cluster community facilities together with commercial, transport, informal sector and other activities so as to maximise convenience, safety and socio-economic potential. • Maintain Lynedoch as a focus for education and training (with various focus areas and levels" of education).	• Actively support the shared use of community facilities.
	Improved landscaping and public amenity	• As far as possible, focus investment in parks, open space, and social facilities accessible by public and NMT, in this way also increasing the surveillance of these facilities.	• Actively involve local communities in the development and management of public amenities.
New Development Actions	Significant new mixed use development	• Over the longer term, Vlottenburg, Spier, and Lynedoch along the Baden Powell-Adam Tas-R304 corridor could possibly accommodate more growth and be established as inclusive settlements offering a range of opportunities. However, these settlements are not prioritized for development at this stage. • Explore the feasibility of changing/ complementing the rail service along the Baden Powell Drive-Adam Tas-R304 corridor to a system providing a more frequent, flexible service better integrated into the urban realm. Alternatively, a regular bus service should be explored serving the same route.	• Support private sector led institutional arrangements to enable joint planning and development.
	Significant new residential development		
	Significant change to access and mobility provision		

Table 1.1.1: Plan elements and Proposals for the Stellenbosch Municipality, as included in the SDF.			
Raithby			
Type of Action	**SDF Element**	**Spatial Proposals**	**Related Non-Spatial Proposals**
Protective Actions	CBAs, ESA's, Protected areas	• Maintain and improve the nature areas surrounding Raithby. • Work to increasingly connect and integrate nature areas, also with settlement green areas, to form an integrated green web or framework across the area.	• Implement management actions contained in the EMF.
	Water courses	• Retain and improve the relationship between Raithby and surrounding agricultural land.	
	Agricultural land	• As a general principle, contain the footprint of Raithby as far as possible within the existing urban edge.	
	Urban edge	• Retain the strong sense of transition between agriculture and human settlement at the entrances to the Raithby.	
	Scenic landscapes, scenic routes, and special places of arrival	• Maintain the integrity of historically and culturally significant precincts and places (as indicated in completed surveys).	
	Historically and culturally significant precincts and places	• Maintain the Cape Mission Village structure, form, and character of Raithby.	• Actively support local community initiatives to celebrate/ expose locally significant historically and culturally significant precincts and places.
Change Actions	Informal settlements to be upgraded		
	Areas for residential densification and infill	• Focus infill development on undeveloped land within the urban edge of Raithby.	
	Areas for mixed land use and improved economic opportunity		
	Improved access and mobility	• Pro-actively improve conditions for walking and NMT within Raithby.	• Ensure that the design of all roads within and surrounding the settlement provides for appropriate NMT movement.
	Community/ Institutional use	• Cluster community facilities together with commercial, transport, informal sector and other activities so as to maximise convenience, safety and socio-economic potential.	• Actively support the shared use of community facilities.
	Improved landscaping and public amenity	• As far as possible, focus investment in parks, open space, and social facilities accessible by public and NMT, in this way also increasing the surveillance of these facilities.	• Actively involve local communities in the development and management of public amenities.
New Development Actions	Significant new mixed use development	• No significant new development is envisaged in Raithby village.	
	Significant new residential development		
	Significant change to access and mobility provision		

The **objective of Stellenbosch Municipality's Housing Pipeline** is to place more emphasis on the following housing types of programmes:

- Social housing (the National Minister of Human Settlements approved Stellenbosch as a restructuring town and restructuring zones in November 2016;
- Provision of serviced sites;
- Access to affordable housing (GAP housing);
- Upgrading of informal settlements; and
- Mixed-use housing (which includes formalised homeownership, especially employer housing).

The estimated cost of this programme will be approximately R10 billion over 15 years.

- Upgrading of informal settlements (La Rochelle, Klapmuts, Langrug, and Franschhoek);
- Access to basic services (ABS);
- Jamestown, Farm 527 (Phases 2, 3, and 4);
- Upgrading of Zone O, Kayamandi;
- Enumeration of people on farms and backyarders;
- Erf 64, Kylemore;
- Erf 7001, Cloetesville (known as "Soek-mekaar");
- Upgrade of the Kayamandi CBD;
- Adam Tas Corridor Precinct 10 (Northern Extension); and
- Social Housing.

Upgrading of Informal Settlements: The Municipality manages and coordinates the upgrading of informal settlements through the following broad objectives:

- In-situ upgrading of informal settlements;
- Upgrade informal settlements through the provision of basic services;
- Develop emergency housing sites geared to accommodate evictees;
- Enumerate / undertake demographic surveys of identified informal settlements;
- Facilitate tenure security in informal settlements;
- Assist in short-term job creation through linkages with the Expanded Public Works Programme (EPWP) and longer-term job creation through upgrading programmes;
- Facilitate capacity-building and training for residents and stakeholders through direct service provision and partnerships with outside agencies; and
- Manage the provision of services and development programmes to informal settlements.

Informal Backyard Dwellings: The municipality, through the Housing Pipeline, is actively attempting to address the needs and plight of backyard dwellers within the municipal area. Currently, it is required to be registered on the Housing Demand Database, and hopefully, this will result in a permanent dwelling in one of the Council's housing projects. This process is long and tedious, and the chance of actually obtaining a formal house is very slim. Therefore, the Council is actively researching ways in which the service (and basic services) to backyard dwellers can be improved through its various housing programmes, especially Social Housing (affordable rental).

Social Housing: Stellenbosch Municipality was approved as a Restructuring Town in March 2017 by the National Minister of Human Settlements. This approval included the confirmation of the various Restructuring Zones within the municipality, and the latter culminated in a Council decision instructing the administration to attract social housing institutions (SHIs) and / or other development agencies (ODAs) to effect the municipality's social housing programme.

This programme aims to ensure improved quality of life for communities through a rental housing programme. This process of integration speaks to the importance of:

- Economic sustainability: affordability, access to economic opportunities, and promoting job creation via the multiplier effect associated with building medium-density housing stock, etc.;
- Social sustainability: social integration between various income groups, access to educational, recreational, and health facilities, etc.; and
- Ecological sustainability: conservation of scarce resources.

The aim and objective of Social Housing is to offer safe and affordable rental units for families with monthly incomes ranging from R1 850 to R22 000.

Stellenbosch Municipality's housing pipeline and existing housing projects, as summarised in the Priority Housing Projects and Upgrading of Informal Settlements Implementation Plan is summarised in the table below (2025/2026 IDP).

Table 1.1.2: Priority Housing Projects and Upgrading of Informal Settlements in Stellenbosch Municipality.

Key Activity/ Project/ Programme/ Initiative	Description of Unit of Measurement	Project Phase	Number of Housing Opportunities	5-year target 2022 - 2027
Construction of Longlands, Vlottenburg (144 Serviced sites)	Percentage of the Longlands, Vlottenburg Capital Budget actually spent by 30 June	Construction	144	90%
Rectification of Cloetesville: The Steps / Orlean Lounge Houses	Percentage of Cloetesville: The Steps / Orlean Lounge Houses rectification capital budget actually spent by 30 June	Construction	161	90%
Upgrading of Zone O in Kayamandi	Percentage of the Zone O (in Kayamandi) capital budget actually spent by 30 June	Construction will be dealt with in phases	711	90%
Development of the Kayamandi Town Centre	Percentage of the Kayamandi Town Centre development capital budget actually spent by 30 June	Implementation	±1 854	90%
Development of Erf 64 Kylemore	Percentage of the Erf 64 Kylemore development capital budget actually spent by 30 June	Implementation	±171	90%
Development of Erf 2183, La Rochelle, Klapmuts	Percentage of Erf 2183, La Rochelle, Klapmuts development capital budget actually spent by 30 June	Planning (service sites)	±100	N/A
Development of the Stellenbosch Extension	Percentage of Stellenbosch extension, development Capital Budget actually spent by 30 June	Planning (Mix-used development)	± 5 000 - 6 000	90%
To obtain development rights on Erf 7001, Cloetesville to establish GAP housing	Percentage of the Erf 7001, Cloetesville annual capital budget actually spent by 30 June	Planning	360 GAP housing	90%
Finalise the sub-division plan for Jamestown (Phase 2 and 3)	Percentage of the Jamestown, Phase 2 and 3 annual capital budget actually spent by 30 June	Planning	±2 000 housing opportunities (to be determined per phase)	90%
Obtain development rights for mixed-use development for Jamestown Phase 4	Percentage of the Jamestown, Phase 4 annual capital budget actually spent by 30 June	Planning		90%
Submit status reports on Social Housing (affordable rental accommodation) on Farm 81/2 and 81/9, Stellenbosch to the Executive Mayor	Number of quarterly status reports on Social Housing submitted to the Executive Mayor	Planning (SHIs and / or ODAs attract)	±250	20
Submission of Land Use Rights	Number of Land Use Rights Applications	Planning	± 5 000 - 6 000	1

Table 1.1.2: Priority Housing Projects and Upgrading of Informal Settlements in Stellenbosch Municipality.				
Key Activity/ Project/ Programme/ Initiative	**Description of Unit of Measurement**	**Project Phase**	**Number of Housing Opportunities**	**5-year target 2022 - 2027**
Application for the Northern Extension to the Municipal Planning Terminal (MPT)	for the Northern Extension submitted to MPT by 30 June	(Mix-used development)		
Submission of Land Use Rights Applications for the Kayamandi Town Centre to the MPT.	Number of Land Use Rights Applications for the Kayamandi Town Centre submitted to MPT by 30 June	Planning (Mix-used development)	±1 854	1
To obtain development rights for Erf 64 Kylemore	Percentage of the Erf 64 Kylemore annual capital budget actually spent by 30 June	Planning	±171	90%
To obtain development rights La Motte: Farm 1339, Farm 1158 and Farm 1158/1	Percentage of the La Motte: Farm 1339, Farm 1158 and Farm 1158/1 annual capital budget actually spent by 30 June	Planning (Mix-used development)	±1 100	90%
To obtain development rights Erf 2183, La Rochelle, Klapmuts	Percentage of the Erf 2183, La Rochelle, Klapmuts annual capital budget actually spent by 30 June	Planning (service sites)	±100	N/A

1.2 PUBLIC AMENITIES

All schools, tertiary- and health facilities in the urban areas of Stellenbosch Municipality's Management Area are supplied with adequate water and sanitation services (Water connection inside the erven and a sewer connection to the waterborne sewer system or serviced with septic or conservancy tanks). **The water and sanitation service levels of the educational and health facilities in the rural areas need to be verified.**

1.3 SOCIO ECONOMIC BACKGROUND

The 2023/2024 Annual Report list the following challenge within the Section: Economic Development and Tourism during 2023/24.

- Human resources are insufficient to drive an effective economic development and tourism programme.

1.3.1 Population and Households

The table below gives a summary of the projected population for the various schemes in Stellenbosch Municipality's Management Area.

Table 1.3.1.1: Projected future population							
Scheme	**Projected Population 2023/2024**	**Future Estimated Growth (%/a)**	**Projected Population**				
			2028	**2033**	**2038**	**2043**	**2048**
Stellenbosch	121 363	3.5%	144 141	171 194	203 325	241 487	286 810
Franschhoek	28 044	5.0%	35 792	45 681	58 302	74 409	94 967
Dwars River	16 395	3.0%	19 006	22 033	25 543	29 611	34 327
Klapmuts	15 500	6.0%	20 742	27 758	37 147	49 710	66 524
Raithby	1 152	2.0%	1 271	1 404	1 550	1 711	1 889
Farms	45 973	1.5%	49 526	53 353	57 477	61 919	66 704
TOTALS	**228 427**	**3.30%**	**270 478**	**321 423**	**383 344**	**458 847**	**551 221**

The population are likely to be influenced by economic opportunities and job creation.

The table below gives an indication of the estimated future number of households per scheme, as calculated from the projected future population figures.

Table 1.3.1.2: Estimated number of permanent future households

Scheme	Projected Number of HH 2023/2024	Estimated Persons / Household	Estimated future number of permanent households				
			2028	2033	2038	2043	2048
Stellenbosch	36 767	3.30	43 668	51 864	61 598	73 159	86 890
Franschhoek	9 216	3.04	11 763	15 012	19 160	24 454	31 210
Dwars River	3 771	4.35	4 372	5 068	5 875	6 811	7 896
Klapmuts	3 942	3.93	5 275	7 059	9 447	12 642	16 918
Raithby	275	4.18	304	335	370	409	452
Farms	10 521	4.37	11 335	12 211	13 154	14 171	15 266
TOTALS	**64 492**	**3.59**	**76 717**	**91 549**	**109 604**	**131 646**	**158 632**

1.3.2 Population Growth Rates

The historical population growth rates between 2001 and 2011 were used to estimate the future projected population growth rates for the various towns. The 2022 population Census data is not yet available per Community Profile and the data is not accurate. The 2023/2024 population was estimated by applying an annual growth rate of 3.30% to the 2011 Census population figure. The future estimated annual population growth percentages were agreed with the Municipality during January 2014 for each of the towns. The current population figures and the annual population growth percentages used in the WSDP Report are aligned with the figures used in DWS's GeoDatabase.

1.3.3 Age and Gender Profile

The table below indicates the population composition per age cohorts. These groupings are also expressed as a dependency ratio, which in turn indicates who are part of the workforce (Age 15 – 64) and those, who are depending on them (children and senior citizens). A higher dependency ratio implies greater pressure on social systems and the delivery of basic services.

Table 1.3.3.1: Age Cohorts, 2021 - 2025

Year	Children 0 – 14 Years	Working Age 15 - 64 Years	Aged 65+	Dependency Ratio
2022	43 801	144 203	11 321	38.2
2024	45 272	150 716	11 932	38.0
2026	46 765	156 091	12 600	38.0
Growth	1.7%	2.0%	2.7%	

Source: 2022 Socio-Economic Profile Stellenbosch Municipality

Between 2022 and 2026, the largest population growth was recorded in the 65+ age category of 2.7 percent. This reflects possible improvements in life expectancy (an ageing population) or that more people are choosing the Stellenbosch municipal area as a retirement destination. Notable growth is also expected in the working age cohort, which results in an overall decrease in the dependency ratio towards 2026.

1.3.4 Employment Profile

Unemployment leads to poverty which impacts negatively on the Municipality's income as it reduces the ability of people to pay for services and people become dependent on indigent grants which the Municipality has to finance through its equitable share as well as other grants provided by other government agents.

Stellenbosch Municipality is conscious of the challenges of poverty in the area and strives to contribute towards the alleviation thereof by means of e.g. the Indigent Policy, Labour intensive projects, LED projects and the use of their Supply Chain Management Policy as an instrument to enforce the maximum use of local labour.

A critical aspect of infrastructure development is the obligation and commitment to create jobs. Direct job creation takes place through the development, operation and management of water infrastructure, which indirect job creation flows from the associated water supplies to economic activities such as mining, manufacturing, power generation and agriculture.

Investment in infrastructure development could create employment for local workers and provide skills development and work experience at a number of levels, from the highly technical jobs to manual labour, particularly where labour-intensive construction methods are used. The operation and management of water infrastructure also offers opportunities for job creation.

It is therefore important for Stellenbosch Municipality to focus on labour intensive construction methods (EPWP projects) when implementing new projects. This process involves attacking poverty through job creation in the delivery of sustainable services. The Guidelines for the Implementation of Labour Intensive Infrastructure Projects under the Expanded Public Works Programme is available to assist Municipalities.

1.3.5 Household Income

Low household income in poverty areas is aggravated by poor quality of basic services, long walking distances to health and welfare facilities and long distances to the main employment opportunities. In recognition of the urgency to address poverty in the area, Stellenbosch Municipality adopted various measures of assistance to indigents such as incentives in respect of assessment rates and basic services and the provision of housing. Participation from other spheres of government and NGOs are also encouraged in order to meet with the demand.

The key element of the WSDP is the assessment of affordability of the service to consumers. In order to adequately understand affordability, typical monthly bills need to be assessed against what people are earning. This needs to be looked at in terms of how the Equitable Share will be allocated and the Indigent Policy of the municipality. It should be noted that the overall total municipal bill, which includes all municipal services and rates (i.e. not just water and sanitation) for low income earners, should not be greater than about ten (10) percent of income.

Stellenbosch Municipality needs to collaborate with the private sector and local non-profit organizations to provide needed skills at all levels, commission a skills audit and gap assessment and a skills development exercise focusing on specific priorities. The projects should focus on socio-economic upliftment, as part of Stellenbosch Municipality's strategy to bring about poverty alleviation through job creation whilst enhancing the prospects of reducing outstanding municipal consumer debt. The main objectives of these projects should be as follows:

- Create employment
- Reduce poverty
- Reduce outstanding municipal debts
- Transfer / develop skills
- Create facilities, build infrastructure and improve service delivery
- Draw people into the economy (opening bank accounts)
- Build pride of ownership in the community
- Involve communities in developing their areas

Stellenbosch Municipality's free basic services and Indigent Policy caters for a proportion of the population not being able to afford water and sanitation services. The proportion of the population who cannot afford water and sanitation is also examined each year during the budgeting and tariff setting process and tariffs are adjusted accordingly. Households that cannot afford to pay can register as Indigent.

Certain initiatives from the Stellenbosch Municipality aim to create job opportunities by means of:

- Labour intensive public work programmes;
- Procurement Policy in which preference is given to local contractors and contractors who employ local labour.

Labour Intensive methods must be used as far as possible for the following water services activities:

- Bulk and internal water reticulation networks
- Bulk and internal sewer drainage networks
- Provision of basic services on farms.

2. SERVICE LEVELS PROFILE

The Strategic Framework for Water Services (SFWS) places an appropriate focus on the imperative of ensuring universal access by households to at least a basic water supply and sanitation service. However, the provision of effective and efficient water services to meet the economic demand of all consumers (domestic and non-domestic) is equally important.

One of the visions of the Sector is that all people living in South Africa have access to adequate, safe, appropriate and affordable water and sanitation services, use water wisely and practise safe sanitation. One of the goals of the Sector is that water and sanitation services are provided (SFWS):

- Equitably (adequate services are provided fairly to all people);
- Affordably (no one is excluded from access to basic services because of their cost);
- Effectively (the job is done well);
- Efficiently (resources are not wasted);
- Sustainably (services are financially, environmentally, institutionally and socially sustainable; and
- Gender sensitively (taking into account the different needs and responsibilities of women and men with regard to water services and sanitation).

Basic services (the first step). As a priority it is the responsibility of Stellenbosch Municipality to make sure that adequate and appropriate investments are made to ensure the progressive realisation of the right of all people in its area of jurisdiction to receive at least a basic level of water and sanitation services. The grants provided by national government in the form of the municipal infrastructure grant (MIG) will be adequate to ensure universal provision of at least a basic water supply facility and a basic sanitation facility within a reasonable period of time. This is called a universal service obligation and is the most important policy priority.

Whilst the provision of basic water services is the most important and immediate priority, WSAs are expected to provide intermediate and higher levels of services (for example, water on-site) wherever it is practical and provided it is financially viable and sustainable to do so.

PLANNING FOR BASIC LEVELS OF SERVICE

The primary constitutional obligation resting on WSAs is the provision of at least a basic level of services to all people living within their area of jurisdiction. The WSDP must show how the WSA plans to meet this universal service obligation.

PLANNING FOR HIGHER LEVELS OF SERVICE

Notwithstanding the primary constitutional obligation of basic services provision set out above (the first step), Stellenbosch Municipality is expected to plan to move households up the water services ladder by providing higher levels of service wherever these are practical, financially viable and sustainable.

Key issues to be taken into account when formulating a service level policy are as follows:

Socio-economic issues:

- The extent of cross-subsidization to support the provision of free or low cost services to poor and indigent members of the community is dependent on the make-up of the community in terms of the percentages of households that can afford to pay as well as the extent of commercial and industrial development.

- Population growth often tends to be greater in terms of the poorer members of society than the wealthier. Hence the future economic profile may tend towards a greater proportion of residents requiring subsidized services. This could be reversed in societies with high economic growth level.

- The health profile of communities is usually a result of a range of issues, including water supply, sanitation and health awareness. Experience has indicated that all three of these issues must be addressed in order to have a marked impact on the water and sanitation related health profile of a community.

- The implementation of water and sanitation projects can themselves make an impact on the employment and income profile of a community. The approach taken will govern the extent to which employment on the projects is facilitated, and whether the employment is short or long term.

Technical issues:

- The different options for water supply and sanitation systems have significantly different capital costs and operating costs. The local authority or WSP must ensure that these costs are affordable in terms of tariffs and subsidization possibilities.

- The different service level options usually have different water supply needs. Generally higher levels of service imply the need to supply more water per household and to a higher level of reticulation. It is critical to ensure that the water source is adequate and that the abstraction and reticulation systems are adequate and will not be subject to major leaks to ensure an ongoing reliable water supply.

- The risk of pollution of groundwater and surface water resources will be different for the different sanitation technology options. The risk of pollution from any particular system will also vary depending on the level operation and of the maintenance system. Hence a poorly operated and maintained waterborne sanitation system may have a significantly higher pollution risk than VIP sanitation systems, whereas a well operated and maintained waterborne sanitation system may result in a very low risk of pollution.

- The size and density of a settlement may be an important factor in the selection of technical options. The risks of pollution from dense settlements will usually be greater than from less dense settlements. It is also less costly to provide higher levels of services to more dense settlements than to disperse settlements.

- Different service levels have different operational demands, with off-site sanitation options placing more demands on the WSA and on-site options placing higher demands on households.

- Experience with existing water and sanitation services may influence choices for new systems. It must be remembered that a negative experience associated with a particular system need not necessarily be as a result of a technological fault. Adequate human resource capacity and technical skills in operating these systems are also very relevant to their sustainable and affordable operation.

Water resources:

- South Africa is a water-scarce country with limited water resources. Opting for higher levels of service that require significantly more water at each household may not be compatible with the available resources. In the Western Cape in particular, rainfall occurs during periods of lowest demand for water (winter) and considerations such as storage (surface and aquifer) become important in order to store surplus winter water for the summer.

- Other water resources options that may be considered include demand management, aquifer recharge and water re-use at a local level and desalination of sea-water or of treated effluent. Groundwater sources must be carefully managed to ensure that abstraction does not exceed recharge potential and that the impact of abstraction on the surface water flow is monitored.

- The option of groundwater mining (i.e. pumping more than the annual recharge) should be avoided at all costs.

- Options of dual reticulation could be considered where fresh water supplies are limited. The second reticulation system may carry re-used water or saline groundwater and used for toilet flushing, gardens and laundry.

Water conservation / water demand management

From an urban water demand management perspective, there are many options which can be considered for implementation. Private initiatives include:

- Rainwater tanks. In the Western Cape, this option is not well suited for garden watering purposes as the available storage is limited.

- Private well-points and boreholes. This is only suited to those users able to afford the high installation costs, and where groundwater is accessible.

- Grey-water systems. These are also private initiatives and are relatively expensive. There may be associated health concerns, particularly if systems are not properly maintained.

- Retro-fitting of existing plumbing fittings with water efficient alternatives. Also dependent on the willingness of the users to pay for this privately.

Options for consideration by WSAs include:

- Pressure reduction interventions in conveyance networks to reduce leaks during periods of high pressure (common at night when demand is low).

- Dual reticulation systems where the second reticulation system carries treated effluent or saline groundwater for use in toilet flushing, gardens and laundry. May only be affordable to install in new developments.

- Irrigation exchange. This involves the exchange of treated effluent with equal volumes of fresh raw water used for irrigation. There may social, religious and market related objections to this.

- Retro-fitting of plumbing fittings in existing municipal owned premises and promulgation of by-laws to enforce use of water efficient fittings only in new private developments. These include waterless urinals, removal of automatic flush urinals, use of dual flush toilets and low consumption shower heads.

- Adequately stepped tariff structures, particularly in the high consumption range, where water remains cheap to those who are able to afford it.

- Public awareness and education programmes.

The WC/WDM strategy of the WSA should be assessed and the relevant sections that may influence the choice of water and sanitation systems be taken into account.

Water service infrastructure

- The availability of water supplies with sufficient capacity within close proximity may significantly reduce the costs of providing a higher level of water and sanitation services to communities. The development of local infrastructure such as boreholes remain options well suited to the more remote areas.

- The availability of sewers and sewage treatment works within close proximity will significantly reduce the capital costs of providing a higher level of sanitation service, and reduce the incremental operational costs associated with the scheme. The availability of adequate resources to operate and maintain such systems is important.

- The existing services provided to one section of a community may often govern the choice of service levels to be provided to other sections of the community. However the sustainability, cost effectiveness and level of subsidization of the existing system should also be taken into consideration.

Water services institutional profile:

- Any new sanitation scheme requires ongoing care, maintenance and management. These services must usually be undertaken by the Water Services Provider (WSP). The requirements for these services depend on the type of sanitation system installed. The capacity of the WSP to be able to undertake these tasks, and the additional training requirements, must be considered when formulating a service delivery policy for sanitation services.

Customer service profile:

- Aspirations, concerns and past complaints of residents should be considered when formulating a sanitation service delivery policy.

- The associated awareness of health and hygiene education programmes should be based on the current level of knowledge of residents, and be formulated in consultation with community representatives.

Financial profile:

- Financial considerations are one of the most important aspects that should be taken into account when considering a services delivery policy. Considerations include aspects of affordability, providing services to the poor, and the need to create jobs.

- Previous income and sales information may be relevant in the formulation of a way forward. It should be recognized that it takes considerable time to change from a low payment rate to an intermediate or high level of payment of tariffs.

Water and Sanitation Services on Privately Owned Land Policy (November 2023)

The roles and responsibilities of the WSA are as follows:

- The role of the WSAs is to comply with the regulatory and support mandates of DWS over provision of water services and resources to residents living on privately owned land.
- WSAs must integrate this policy with their respective local mandates in terms of the Strategic Framework for Water Services.
- WSAs must ensure Water Service Providers perform their responsibilities, which include Operation, maintenance and capital development of water and sanitation services infrastructure outside the boundary and / or within the servitude / of the end user.
- WSAs must identify, register and regulate Water Service Intermediaries / Providers according to their policies, bylaws, national norms and standards.

The roles and responsibilities of the Private Landowner / Water Services Intermediary are as follows:

- Private landowners must provide basic water services to their employees (and the families of employees) living on their land.
- WSAs must ensure that this policy is implemented and must identify, register and regulate water services intermediaries according to their bylaws and national norms and standards.
- Landowners must make an appropriate contribution to the capital cost of basic services.
- While water and sanitation assets, which WSAs install, remain under the ownership of the State, landowners will however have economic rights to the infrastructure once they become intermediaries, and those economic rights will be linked to a contract term.
- Operations and maintenance (and capital development of water and sanitation services on privately owned land) remain the responsibility of property owners.
- The private landowner is encouraged to enter into a contract with the WSA and perform the duties of a Water Services Provider as stipulate din Section 25(1) and (2) of the Water Services Act.
- Private Landowners / Water Services Intermediaries / Water Services Providers should:
  - Support the regulatory and support mandates of DWS over the water services and resources provided to residents living on privately owned land.
  - Integrate and implement this policy in terms of their planning and implementation to ensure compliance with all relevant legislation concerning provision of water services on private land; and to
  - Ensure that this policy is communicated to any person, party or organization affiliated to the “private land” sector.
  - The employers is responsible for providing water and sanitation services to their labourers / employees as per Section 8(1) of the Occupational Health and Safety Act (Act 85 of 1993).

National Sanitation Policy, 2016.

Problem Statement: The ineffectual interpretation and implementation of the Section 78 of the Municipal Systems Act (No. 32 of 2000) process has contributed to municipalities primarily keeping the sanitation provision function in-house, even when the capacity to do so adequately was lacking. They are not appropriately implementing Section 78 provisions. WSAs are not responding to key responsibilities assigned to them in legislation and the SFWS.

Where a WSA has contracted a WSP to provide sanitation services, the responsibility of the two parties is not always clear in the contracts. There is a need for effective contract regulation.

A WSA have the following responsibility:

- Implementation of the Municipal Systems Act (Act 32 of 2000) and Water Services Act (Act 108 of 1997) provisions.
- Prepare sanitation plans such as WSDPs etc., aligned to national sanitation planning.
- Ensure the realisation of the right to access to sanitation services, particularly basic sanitation services, subject to available resources. This includes people living on privately-owned land, in recognised permanent informal settlements and vulnerable groups and others who are provided services by Water Services Intermediaries. Wherever practical and sustainable, Water Services Authorities are expected to plan for and provide higher levels of service.
- Ensure the provision of effective, efficient and sustainable sanitation services. The provision of sanitation services also includes communication activities related to, amongst other things, Hygiene Education, end-user education and the wise use of water.
- Develop an asset management strategy, a maintenance and rehabilitation plan and a register of sanitation services assets and must then put in place a system to manage these assets.
- Provide information concerning the provision of sanitation services as reasonably requested by the Provincial or National governments, end-users and / or organisations.
- Develop an appropriate institutional structure to adequately respond to key WSA functions and responsibilities.
- Account, as per the Municipal Finance Management Act (No. 56 of 2003), to the province and National Treasury for resource allocation (financial, human etc.).
- Provide sanitation hygiene and end user education.

WSAs have a right but not an obligation to accept industrial, agricultural and mining wastewater within their area of jurisdiction.

WSDP: FUTURE DEMAND AND FUNCTIONALITY REQUIREMENTS
TOPIC 2: SERVICE LEVELS PROFILE

WSAs must adhere to the following requirements in a transparent manner and in close contact with end-users:

- Sanitation services must be designed, planned and implemented to consider operations and maintenance requirements and to reduce the environmental impact of unmanaged grey-water, human excreta and wastewater disposal.

- Sanitation services must be appropriate and minimise impact on and use of water resources. WSA should strive for systems which utilise minimal water resources.

- Sanitation technologies which consider settlement types.

- Geo-hydrological testing before use of on-site groundwater sources or on-site sanitation services. Exceptional situations may require independent review and advice.

- Technology choices must be appropriate and affordable.

- Roles and responsibility for payments for operations and maintenance must be clear.

- Only appropriate sanitation technologies must be adopted.

- The quality of all building materials used for construction must be durable and fully compliant with the requirements, norms and standards

- Local availability of materials and skills must be part of the choice of technology or construction method. The design of sanitation services facilities must maximise the use of local resources.

- Sanitation technology selection should include resources to develop the necessary local institutional capacity to manage the day to day and future operational needs. In some circumstances there may be considerable merit in engaging a sanitation services provider to carry out certain functions on behalf of a local authority. Government does encourage local authorities to consider various options in this regard.

- Social and cultural practices and preferences should be considered in the selection of appropriate sanitation technology.

WSA must have the billing systems in place to raise sufficient revenue for sanitation services.

WSA must ensure sufficient funds are transferred for a WSP to perform the agreed functions.

WSA must regulate all aspects of sanitation services provision locally.

The WSA is accountable to its citizens.

Sanitation services planning by WSAs should be in conjunction with municipal Environmental Health Practitioners, as well as other stakeholders and departments involved in the sector.

Water Service Level Policy

A separate water service level policy is not in place, but the water service levels to be provided by the Municipality to the consumers in their Management Area are, however, included in the Water Services By-law. All water services provided by Stellenbosch Municipality to consumers within the Municipal Management Area are linked to the Municipality's Tariff Policy and poor households are incorporated through Stellenbosch Municipality's Indigent Policy.

Sanitation Service Level Policy

A separate sanitation service level policy is not in place, but the sanitation service levels to be provided by the Municipality to the consumers in their Management Area are, however, included in the Water Services By-law. All sanitation services provided by Stellenbosch Municipality to consumers within the Municipal Management Area are linked to the Municipality's Tariff Policy and poor households are incorporated through Stellenbosch Municipality's Indigent Policy.

The large number of residents in the lowest income groups (living in informal areas) places a major challenge on Stellenbosch Municipality to provide suitable housing. Stellenbosch Municipality works towards providing all households in the towns with a water connection inside the erven and connecting all households to a waterborne sanitation system. It is however important to consider the Municipality's capacity (financial and institutional) to operate and maintain complex sewage systems if opting for higher service levels and in particular waterborne sanitation.

Table 2.1: Master Plan for service levels

Section	Master Plan	Yes / No
Direct Backlog Water	Is there a Master Plan that addresses this problem?	Yes

	Does this Plan address this problem 100%?	Yes

The National Norms and Standards for Domestic Water and Sanitation Services, as published in the Government Gazette No.41100 of 8 September 2017, make provision for the following norms and standards for levels of water supply and sanitation services:

Table 2.2: Norms and standards for levels of water supply services

Full level of service: People access and pay for more than 90 l/c/d at high pressure.	Interim **Full**	**Full provision**: People access a minimum of 50 l/c/d of SANS241 quality water on demand at the boundary of the yard, metered and tariffed.
Middle level of service: People access and pay for 51-90 l/c/d at medium pressure.	Interim **Upper**	**Upper provision**: People access a maximum of 90 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered and tariffed.
	Interim **Intermediate**	Intermediate provision: People access more than 50 l/c/d but less than 90 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered and tariffed.
Minimum level of service: People access 25-50 l/c/d at low to medium pressure, use of more than 25 l/c/d is paid for.	Interim **Basic Plus**	**Basic Plus provision**: People access more than 25 l/c/d but less than 50 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered and tariffed.
	Interim **Basic**	**Basic provision**: People access a minimum of 25 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered and tariffed.
	Interim **Free Basic**	**Free basic provision**: People access a minimum of 25 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered.
	Intermittent	**Intermittent provision**: People access a minimum of 1500 l/household/week of acceptable quality water on a weekly basis within 100m, which is metered.
Bulk service: Source of potable water to be provided to people, which is metered in all circumstances.		
No service / provision = backlog: People access water from insecure or unimproved sources, or sources that are too distant, too time consuming or are of poor quality.		

Interim provision: People access a minimum of 25 l/c/d of acceptable quality water within 24 hours of disruption, normal service to be restored within 7 days.

Proper disposal, clean platform, vector and rodent control, resource use and health protection.

Table 2.3: Norms and standards for levels of sanitation services

Hygiene promotion; Prevention of pollution; Re-use / recycle; Operation and Maintenance; Metering and tariffing; Solid Waste Management; Asset Management

Full level: Full concern for human health, environment and sustainability of interconnected systems.	**Full services**	**In-house facility**: Storm water, wastewater/excreta, greywater, solid waste are collected and managed to achieve maximum benefits from treatment and re-use of water and nutrients.
		In-house facility: Access to a pleasant, safe, reliable and properly maintained facility for 24 hours a day, with control of nutrients in human excreta, wastewater and greywater.
Basic level: Remove excreta from the environment through treatment, pathogen reduction, resource recovery and nutrient reuse.	**Free basic services**	**Toilet with functional hand washing facility in the yard**: Access to a pleasant, safe and reliable facility for 24 hours a day, including privacy, personal safety and shelter through a subsidy for free. Maintenance of the facility is for free and is the responsibility of services provider.
	Basic services	**Toilet with functional hand washing facility in the yard**. Access to a pleasant, safe and reliable facility for 24 hours a day, including privacy, personal safety and shelter through a capital subsidy. Maintenance of the facilities is not for free and is the responsibility of the household / owner.
Interim level: Blocking the spread of faecal-oral diseases through proper excreta containment at a fixed point.	**Excreta containment**	**Household, shared or communal toilets with functional hand washing facilities**: Access to safe, reliable and properly maintained toilet and hand washing facility, free of charge, within 200m of the dwelling, which at a minimum safely contains human excreta. Maintenance is the responsibility of the services provider. To be phased out by 2030.
No service / provision = backlog: People practice open defecation or access an unimproved sanitation facility, such as pit toilets and bucket toilets. To be completely eliminated by 2030.		

Emergency level: People access pleasant, safe, reliable and properly maintained improved toilets and hand washing facility on the premises in close proximity to the temporary dwelling within 24 hours and for duration of event.

The Revised Compulsory National Water and Sanitation Standards, as published in the Government Gazette No.52814 of 6 June 2025, make provision for the following standards for basic water and sanitation supply services.

Table 2.4: Basic water and sanitation supply services

Basic water supply services

- A WSA is responsible for the provision of basic water supply services to all consumers or potential consumers in its jurisdictional area inclusive of people residing on privately owned land as guided by the Water and Sanitation Services Policy on Privately Owned Land (2023).
- The minimum standard for basic water services must consist of:
  - Within two years of promulgation of these regulations an access or delivery point which must be at least at the end boundary of the yard (user connection point) of the existing settlement.
  - A minimum quantity of drinking water of 6 kl/household per month -
    - at a minimum flow rate of not less than 10 litres per minute.
    - with an effectiveness such that water is made available for at least 358 days per year.
    - not interrupted for longer than 48 consecutive hours.
    - at no cost to indigent households, upon depletion of the initial 6 kl per month allocation, qualifying indigent household will be subject to usage restrictions and will be responsible for payment based on the adopted tariff policy for any additional water consumed.
  - Water provided which complies with the requirements of SANS 241.
- Maintenance of the infrastructure up to the user connection is the responsibility of the Water Services Institution and the maintenance of the infrastructure within the boundary of the property is the responsibility of the owner.
- All new users applications for water connections must be completed within 21 calendar days by a WSA in areas where the infrastructure allows or exist.
- All user connections for water supply must be metered or measured, controlled and tariffed by the relevant Water Services Institution.
- A Water Services Institution must replace stolen meters and or repair or replace damaged meters within 30 days of it being reported or detected.
- Water meters must be managed and replaced within their asset lifespan.
- The Water Services Institution must ensure the provision of appropriate education in respect of safe, effective and efficient water use, hygiene and groundwater use management.
- Within two years after promulgation of these Regulations, WSA must submit plans to the Department, using the WSDP platform as part of their WSDP on how they are going to upgrade all consumers in formal settlements to basic services (yard connection; user connection point).

Basic sanitation supply services

- A WSA is responsible for the provision of basic sanitation services to all consumers or potential consumers in its jurisdictional area inclusive of people residing on privately owned land as guided by the Water and Sanitation Services Policy on Privately Owned Land (2023).
- The standard for basic sanitation services must include the provision of a toilet with functional hand washing facility in the yard, which is safe, reliable for 24 hours a day, environmentally sound, easy to keep clean, provides privacy and protection against the weather, well ventilated, keeps smells to a minimum and prevents the entry and exit of flies and other disease-carrying pests, providing for an effective and acceptable sanitation technology.
- A WSA must ensure that human excreta and wastewater is safely contained at all times, throughout the sanitation service chain.
- Faecal sludge management must be an integral part of the sanitation service.
- Each household must have uninterrupted access to an adequate, appropriate sanitation facility.
- Hygiene and user education must be an integral part of sanitation service. Households should be supported with knowledge and any other relevant resources to take responsibility for the correct and consistent use of the sanitation service, including but not limited to the toilet facility.
- In providing basic sanitation service, a WSA must consider the following requirements:
  - The need for everyone, including persons with a disability to have a reasonable quality of life.
  - Water efficient sanitation solutions.
  - Groundwater pollution risks in accordance with the Protocol to manage the potential groundwater contamination from on-site sanitation (2003).
  - Water use authorisation in terms of the NWA.
  - Surface water pollution risks and the management thereof.
  - Population density.
  - Economies of scale.
- Subject to the above, a WSA must consider-
  - In high and medium density formal settlements:

Table 2.4: Basic water and sanitation supply services

Basic water supply services

- waterborne sewered sanitation provided that the wastewater treatment system and works have adequate capacity and is performing to acceptable standards under the National Water Act (read with regulation 10); or
- alternative water efficient sanitation solutions instead of waterborne sewered systems in areas of dense formal and medium settlement where there is resource scarcity and or inadequate capacity or functionality in the sewer system and or the wastewater treatment works.

➢ In low density or sparsely populated settlements: water efficient sanitation solutions.

- Water efficient sanitation solutions, as described above, must be shown to include off-grid, on-site sanitation options such as Non-sewered Sanitation Systems (NSSS) as well as Decentralised Wastewater Treatment Systems (DWWTS).
- A WSA may not unreasonably decline a property development to have a water efficient sanitation solution that is not connected to the central system where development will manage the system as a Water Services Intermediary and where the water uses of the system is authorised under the National Water Act.
- Whenever a Water Services Institution is providing new innovative non-sewered sanitation systems, such must be guided by the requirements of SANS 30500 for Non-Sewered Sanitation Systems or the "SANS 24521:2020 Guidelines for the management of basic on-site domestic wastewater services", whichever is applicable.
- WSA must monitor and regulate safe emptying, transportation, treatment and disposal of faecal sludge to faecal sludge treatment facilities or any other authorised facility.
- Faecal sludge treatment plants must be guided by ISO 31800 for prefabricated units or similar standards for non-prefabricated faecal sludge treatment units.
- WSA must have community participation procedures of informing communities about the emptying processes, routes and health risks.
- Within two years after promulgation of these Regulations, the WSA must submit plans as part of their WSDP, using the WSDP platform, on measures to eradicate unimproved pit toilets and open defaecation in human settlements.

The Revised Compulsory National Water and Sanitation Standards, as published in the Government Gazette No.52814 of 6 June 2025, also make provision for the following standards for interim water and sanitation supply services.

Table 2.5: Interim water and sanitation supply services

Interim water supply services

- A WSA must take reasonable measures to provide interim water supply services in informal settlements.
- Upon realisation of a new informal settlement, the WSA must provide interim water supply services within 90 days of becoming aware thereof.
- A WSA is responsible for the capital, operation, maintenance and refurbishment actions and cost pertaining to interim water services.
- Where an informal settlement is formalised, a WSA must ensure access to basic water services.
- The minimum standard for interim water services must consist of:
  - ➢ An access or delivery point which must be a communal standpipe, within a reasonable walking distance of no more than 200m from the furthest household.
  - ➢ A minimum quantity of drinking water of 6 kl/household per month -
    - at a minimum flow rate of not less than 10 litres per minute.
    - with an effectiveness such that water is made available for at least 358 days per year.
    - not interrupted for longer than 48 consecutive hours.
  - ➢ Water provided which complies with the requirements of SANS 241.
- All areas supplied with interim water supply services must have zonal meters and measured by the relevant Water Services Institution.
- Whenever interim water supply services are provided through water tankers, it must not exceed 12 consecutive months and WSAs need to keep accurate records as specified in Regulation 4(3)(c).

Interim sanitation supply services

- A WSA is responsible for the capital, operation, maintenance and refurbishment actions and cost pertaining to interim sanitation services including the management of faecal sludge in the entire sanitation service chain.
- A WSA must take reasonable measures to provide appropriate interim sanitation services in informal settlements and during a disaster.
- Upon realisation of a new informal settlement, the WSA must provide interim sanitation services within 90 days.
- Interim sanitation services must provide at least the following:
  - ➢ Communal and shared facilities in accordance with the following:
    - Communal toilet: Toilet seat – 1 seat per 10 households; Urinal units – 1 unit per 20 households; Hand washing – 1 basin

Table 2.5: Interim water and sanitation supply services

Interim water supply services

per 10 households.
  - Shared toilets: Toilet seat – 1 unit per 4 households; Urinal units – 1 unit per 10 households; Hand washing – 1 basin per 4 households.
  - The WSA must put measures in place to keep the toilets hygienic.
  - The toilets must be separated according to gender to meet the needs for women, girls and persons with disability.
  - All portable and mobile toilets must be emptied at least twice a week to appropriate licensed facilities for treatment.
- If the sanitation facility is communal, the maximum walking distance should be 100m, wherever possible.
- Parents and care givers must be provided with information by the Water Services Institution regarding safe disposal of infant's faeces, laundering practices and use of nappies, potties or scoops for effectively managing safe disposal.
- A WSA through its Environmental Health Practitioners are responsible for promoting hygiene and user education for ensuring an environmentally safe approach to sanitation and for monitoring the impact of sanitation processes on the environment.

2.1 RESIDENTIAL WATER PROFILE

All the formal households in the urban areas of Stellenbosch Municipality's Management Area are provided with water connections inside the erven. Standpipes are provided in the informal areas as a temporary emergency service. The current water service levels are included under Section 2.1 of the Administration, Information and Comprehensive Overview Report.

Communal standpipes represent probably the weakest part of a network's water supply services. Standpipes must be constructed in ways that can withstand excessive use and should not be neglected in terms of operation and maintenance. Malfunctioning standpipes may adversely affect the health of its already vulnerable and poor users. Communal standpipes are also used by poor households who normally don't pay for water. Poor people are the ones that suffer the most from water-related diseases due to:

- Poor quality and maintenance of standpipes and their surroundings. Standpipes are often leaking and poor drainage around standpipes results in standing pools of water and muddy soil.
- Standpipes are not protected and animals lick the taps.
- When people have to walk long distances to fetch water, it is used sparingly and not enough water is used for hygiene.
- Even if water is clean when it leaves the standpipe tap, it is often contaminated by dirty containers used for carrying and storage.

Stellenbosch Municipality is committed to support the private landowners as far as possible with regard to addressing the basic water services backlog that might still exist on the farms in the rural areas once the 2022 Census data becomes available for the farms and the locations of households without basic water services are known. Water Service Levels in the WSDP for the farms are based on the 2011 Census data, because the 2022 Census Community Profiles per subplace are not yet available.

The Cape Winelands District Municipality takes various water quality samples on the farms in the rural areas of Stellenbosch Municipality's Management Area and the water quality information needs to be shared with the private landowners and any Water Services Intermediaries, also the risks associated with storage of water in open reservoirs or tanks and where no filtration or disinfection takes place.

2.2 RESIDENTIAL SANITATION PROFILE

All the formal households in the urban areas of Stellenbosch Municipality's Management Area are provided with a waterborne sanitation connection points inside the erven. Areas without waterborne sewer systems are required to make use of conservancy tanks. Communal ablution facilities are provided in the informal areas as a temporary emergency service. The current sanitation service levels are included under Section 2.2 of the Administration, Information and Comprehensive Overview Report

Stellenbosch Municipality is faced with various challenges with regard to the provision of services on private owned land in a financial sustainable manner (enabling the on-going operation of services and adequate maintenance and rehabilitation of the assets), which include the following:

Free basic water policy:

- The provision of the infrastructure (facilities) necessary to provide access to water to all households in a sustainable and economically viable manner.
- The development of subsidy mechanisms which benefit those who most need it.

Free basic sanitation policy:

- Provision of the most viable sanitation facility to the poor household.
- Health and hygiene promotion must be provided in a co-ordinated manner and must be properly managed and adequately funded if free basic sanitation is to become a reality. This requires close collaboration between the EHPs of the Cape Winelands District Municipality responsible for environmental health and Stellenbosch Municipality.
- Subsidising the operating and maintenance costs. If the basic service is to be provided free to the poor then Stellenbosch Municipality must ensure that the costs of providing the service are covered by the local government equitable share and / or through cross-subsidies within Stellenbosch Municipality's Management Area.

The ownership of water services assets may be in the hands of the person owning the land where an "on-site" water or sanitation facility is provided to a household. There is no legal impediment to the use of government grants to fund infrastructure for a poor household on private land not owned by that household, provided that the intermediary (the private land owner) makes a financial contribution (This is because the intermediary becomes the owner of the infrastructure once it is installed). Government is looking at specific policies with regard to the appropriate level of contribution.

The following types of sanitation technology options will be investigated by Stellenbosch Municipality when they develop their sanitation service level policy.

- VIP latrines and approved Eco-San dry, on-site sanitation systems;
- Low flow on site (LOFLOS) systems;
- Septic tanks;
- Conservancy tanks;
- LOFLOS or septic tanks with solids-free sewers also referred to as septic tank effluent drainage (STED) systems; or
- Full water-borne sanitation.

Stellenbosch Municipality needs to put the following measures in place with regard to water and sanitation services in their Management Area:

- A Water and Sanitation Service Level Policy needs to be compiled, which is aligned with the requirements of the National Sanitation Policy (2016), Water and Sanitation Services on Privately Owned Land Policy (November 2023) and the Compulsory National Water and Sanitation Services Standards, 2024 (Gazette No.52814, 6 June 2025).
- Stellenbosch Municipality must comply with the regulatory and support mandates of DWS over provision of water services and resources to residents living on privately owned land.

- Stellenbosch Municipality must ensure that the "Water and Sanitation Services on Privately Owned Land Policy" is implemented and must identify, register and regulate Water Service Intermediaries / Providers according to their policies, bylaws, national norms and standards.

- Stellenbosch Municipality must make provision for private landowners to enter into a contract with them to perform the duties of a Water Services Provider as stipulated in Section 25(1) and (2) of the Water Services Act.

- Stellenbosch Municipality must comply with the Basic water and sanitation supply services requirements as included in Table 2.4 and the Interim water and sanitation supply services requirements as included in Table 2.5 (Compulsory National Water and Sanitation Services Standards, 2024, Gazette No.52814, 6 June 2025).

- Stellenbosch Municipality must ensure the realisation of the right to access to water and sanitation services, particularly basic water and sanitation services, subject to available resources. This includes people living on privately-owned land, in recognised permanent informal settlements and vulnerable groups and others who are provided services by Water Services Intermediaries. Wherever practical and sustainable, WSAs are expected to plan for and provide higher levels of service.

- Stellenbosch Municipality must ensure the provision of effective, efficient and sustainable water and sanitation services. The provision of sanitation services also includes communication activities related to, amongst other things, hygiene education, end-user education and the wise use of water.

- Provide information concerning the provision of water and sanitation services as reasonably requested by the Provincial and National governments, end-users and / or organisations.

- Provide sanitation hygiene and end user education.

- Stellenbosch Municipality must adhere to the sanitation requirements listed on page 2.7 in a transparent manner and in close contact with end-users.

- The billing system must make provision for the sufficient raising of revenue for water and sanitation services. Stellenbosch Municipality must ensure sufficient funds are transferred for a WSP to perform the agreed functions when it becomes applicable.

- Stellenbosch Municipality must regulate all aspects of water and sanitation services provision locally and is accountable to their citizens.

- The provision or distribution of bucket toilets to communities in both formal and informal settlements are prohibited.

- Stellenbosch Municipality is prohibited from approving bulk user connections to existing water and wastewater systems without having the necessary capacity to service such user connections. This means that a municipality may not approve new / additional bulk user connections to an existing water or wastewater treatment system unless that system has the capacity to deal with the additional load (ability to operate according to technical specifications).

- Stellenbosch Municipality may not approve any new developments that will connect to an existing wastewater treatment system unless such a system has the capacity to deal with the load from the development.

- Stellenbosch Municipality must only accept the quantity and quality of industrial wastewater or any other substance into a sewerage system that the sewage treatment works linked to that system is capable of purifying or treating to ensure that any discharge to a water resource complies with the required authorisation and standard prescribed under the National Water Act.

- Stellenbosch Municipality shall prescribe pre-treatment of any effluent to the required standard its wastewater treatment systems can process prior to it being disposed into municipal infrastructure.

2.3 PUBLIC AMENITIES

2.3.1 Water Services

All public institutions within the towns receive uncontrolled water supply from Stellenbosch Municipality. The Municipality is committed to keep on providing good quality of water to these public institutions and industries.

All the clinics and hospitals in Stellenbosch Municipality's Management Area have adequate and safe water supply and sanitation services. All tertiary education facilities and schools in the urban areas of Stellenbosch Municipality's Management Area have adequate and safe water supply services. **The water service levels of the primary schools in the rural areas need to be verified.**

It is important for the schools to focus on Water Demand Management activities and for Stellenbosch Municipality to support the schools with WDM initiatives. This will not only aid in Stellenbosch Municipality's demand management initiative directly by reducing the water consumption, but the education of learners at a young age regarding wise water use is a key component for sustainable supply in the long term.

It is not anticipated that the percentage distribution of residential, industrial and commercial consumers for the various distribution systems will change drastically in the nearby future. The water usage per sector is also presented graphically per distribution system in Annexure C of the Administration, Information and Comprehensive Overview Report.

Education Plan

All education facilities in the urban areas of Stellenbosch Municipality's Management Area are provided with adequate water services and no specific strategies, with regard to the provision of water services to these facilities, were therefore identified. Stellenbosch Municipality is however committed to work with the Education Department to address any possible shortcomings with regard to the provision of water services that might exist at any of the primary schools in the rural areas.

Health Plan

Stellenbosch Municipality will strive to continue to ensure that the minimum required SANS241:2015 water quality standards are met through the systematic upgrading of their WTWs. The monitoring of provision of basic minimum services to farm dwellers remains a challenge, in view of the limited funding and human resources.

The establishment and functioning of effective health systems and health care services is critical for not only the upliftment of communities but more so for the sustainability of communities. Health services are rendered throughout the area by a network of clinics. The environmental health function is currently with the Cape Winelands District Municipality.

Typical functions of the Cape Winelands District Municipality, with regard to health services, include the following:

- Households to meet the minimal health safety requirements
- Monitoring water quality
- Waste management
- Food control
- Schools to meet health requirements
- Contagious disease control
- Community development: Making communities aware of environmental health issues and communicates with farm workers regarding sanitation services.

The Municipal Health Services of the Cape Winelands District Municipality also report monthly to the Department of Health on water quality. The quality of life of the people within a Municipality is influenced by the available health care. Various factors influence the health conditions of people in any region, for example access to clean water, good sanitation, proper nutrition and adequate housing.

It is important that a co-operative relationship exist between the Cape Winelands District Municipality and Stellenbosch Municipality with regard to environmental health issues and that a good communication protocol is followed between the District Municipality and Stellenbosch Municipality to report on health issues.

The most vulnerable groups within Stellenbosch Municipality's Management Area are the persons living in informal areas with shared services. It is therefore of outmost importance that the communal standpipes are properly maintained, to promote better health and hygiene among users. It is necessary to:

- keep the standpipe area clean and free from stagnant water;
- avoid water spillage by keeping the tap closed when not in use;
- report and rectify leakages immediately;
- keep straying animals away from standpipe area; and
- keep the tap outlet, standpipe slab and soak away clean.

Promote health and hygiene awareness amongst standpipe users by focusing on the following:

- users must use the standpipe only for the filling of containers;
- no body or clothes washing is allowed at standpipes;
- no house pipes or other objects may be attached to the standpipes;
- use clean containers and close containers with a suitable lid when transporting water;
- disinfect containers when necessary; and
- immediately report any irregularities, contamination, tampering or vandalism at standpipes.

2.3.2 Sanitation Services

The clinics and hospitals in Stellenbosch Municipality's Management Area have adequate and safe sanitation services. All the schools in Stellenbosch Municipality's Management Area also have adequate and safe sanitation services.

Education Plan

All education facilities in the urban areas in Stellenbosch Municipality's Management Area are provided with adequate sanitation services and no specific strategies, with regard to the provision of sanitation services to these facilities, were therefore identified. Stellenbosch Municipality is however committed to work with the Education Department to address any possible shortcomings, with regard to the provision of sanitation services that might exist at any of the primary schools in the rural areas.

Health Plan

Stellenbosch Municipality's long-term goal is to connect all households to a waterborne sanitation system in order to prevent any future grey water problems that might occur and to reduce the possible risk of groundwater pollution from soak-aways. Stellenbosch Municipality primarily focus over the next few years will be on addressing the existing housing backlogs.

The supply of basic sanitation services on the farms needs to be linked to the provision of health and hygiene education. Improved health requires behaviour change, which cannot be achieved with a single health education talk given by an outside expert. Behaviour change requires sustained monitoring and promotion within the community. This is the key function of the community health workers employed on sanitation projects.

Damp and sometimes unsanitary conditions present in informal settlements provide an ideal breeding environment for bacteria. Some of the challenges WSAs phase in the informal settlements include the following:

- It is difficult to supply toilets to the dense informal settlements.
- Grey water pollution.
- Grey water run-off from standpipes.

Stellenbosch Municipality needs to continue to actively engage with service providers and NGOs in the fight against illnesses such as HIV/Aids and TB. A solution to the sustainability of the community health worker's position and employment within the community has been to link their position and function to the activities of the Department of Health. In addition support can be provided to the Community Health Workers through local clinics and through the programmes of the EHPs. Education on the HIV/Aids pandemic would play a key role in stemming the spread of the disease.

3. WATER SERVICES ASSET MANAGEMENT

Table 3.1: Master Plan for Water Services Asset Management		
Section	**Master Plan**	**Yes / No**
General Information	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Operation	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Functionality Observation	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Asset Assessment Spectrum	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Water and Sanitation Schemes	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes

From a water services perspective, the most significant challenges are the augmentation of the existing water sources, the replacement and upgrading of old infrastructure to accommodate development, the provision of sustainable basic services to informal settlements, and ensuring the provision of basic services to rural communities located on private farms (2025/2026 IDP, May 2025).

3.1 GENERAL INFORMATION

3.1.1 Asset Management Plan

Stellenbosch Municipality's Asset Register needs to be updated to include all the water and sewerage infrastructure as included in the WSDP and the CRC of the assets also needs to be included in the Asset Register. It is essential for any service delivery organisation to compile an Asset Management Plan (AMP) to ensure efficient, effective and optimal management, operation and maintenance of all assets, which includes treatment plants, reservoirs, structures, buildings, pipelines, sites, etc. The purpose of the AMP is to:

- Ensure the operation and maintenance functions are well planned.
- Demonstrate responsible management.
- Justify and communicate funding requirements.
- Service provisioning complies with regulatory requirements.

An AMP normally includes the following:

- documents the nature, extent, age, utilisation, condition, performance and value of the infrastructure work;
- identifies existing and target levels of service, as well as expected changes in demand;
- identifies the life-cycle management needs of the infrastructure (development, renewal, operations and maintenance);
- assesses capital and operational budget needs; and
- identifies infrastructure asset management improvement needs.

Stellenbosch Municipality needs to differentiate between budget allocated towards the operation and maintenance of the water and sewerage infrastructure and the budget allocated towards the replacement of the water and sewerage infrastructure (Best Practice). A budget of approximately 2% of the total asset value per annum should be allocated towards the replacement of the existing water and sewerage infrastructure. In the case of operations and maintenance of the system, a budget of approximately 1% to 2% of the value of the system is typically required to ensure that the system remains in good condition (Best Practice).

The objective of an Asset Management Plan is to support the achievement of the strategic goals of the Municipality and facilitate prudent technical and financial decision-making. It is also a vehicle for improved internal communication and to demonstrate to external stakeholders the Municipality's ability to effectively maintain its existing infrastructure as well as the new infrastructure to be developed over the next 20 years.

Priority should be given to rehabilitating existing infrastructure as this generally makes best use of financial resources and can achieve an increase in (operational) services level coverage's most rapidly. The preparation of maintenance plans and the allocation of sufficient funding for maintenance are required to prevent the development of a large condition backlog. The potential renewal projects for water and sanitation infrastructure need to be identified from the Asset Register. All assets with a condition grading of "poor" and "very poor" need to be prioritised.

The Asset Management Plan must be based on the principle of preventative maintenance in order to ensure that, as far as this is practical, damage to assets is prevented before it occurs. Stellenbosch Municipality must ensure that the maintenance and rehabilitation plan is part of the WSDP and that the plan is implemented. Assets must be rehabilitated and / or replaced before the end of their economic life and the necessary capital funds must be allocated for this purpose.

One of the key challenges of Stellenbosch Municipality is to identify adequate funds for the rehabilitation and maintenance of their existing infrastructure, which is critical to ensure the sustainability of the services that are provided by the Municipality. It is important for the Municipality to secure adequate funding for major refurbishment and maintenance work, the provision of bulk water and sewerage infrastructure and the augmentation of the existing water resources in order to keep up with the high demand for services.

3.1.2 Disaster Management Plan

Stellenbosch Municipality's Disaster Management Implementation Plan is indicated in the table below (2025/2026 IDP, May 2025)

Table 3.1.2.1: Disaster Management Implementation Plan

Project / Programme	Unit of Measurement	5 Year Target	2022/2023	2023/2024	2024/2025	2025/2026	2026/2027
Conduct fire awareness sessions	Number of fire awareness sessions conducted by 30 June	240	48	48	48	48	48
Facilitate COVID-19 vaccination drives in WC024	Number of COVID-19 vaccination drives facilitated by 30 June	5	5	n/a	n/a	n/a	n/a
Respond to fire incidents within 14 minutes	Percentage of fire incidents responded to within 14 minutes.	85%	85%	85%	85%	85%	85%
Installation of smoke alarms	Number of smoke alarms installed by 30 June	1500	300	300	300	300	300
Implement water safety programmes within WC024	Number of water safety programmes implemented within WC024 by 30 June	10	2	2	2	2	2
Create EPWP job opportunities within the Department: Fire and Disaster Management	Number of EPWP jobs created within the Department: Fire and Disaster Management by 30 June.	50	10	10	10	10	10
Conduct disaster risk assessments in WC024.	Number of disaster risk assessments conducted in WC024 by 30 June	10	2	2	2	2	2

3.1.3 Untreated Effluent Management Plan

There are no known untreated effluent discharged to the environment. The W_2RAPs include Management Procedures and Incident Response and Emergency Protocols for the management of all effluent.

3.2 FUTURE WATER AND SEWERAGE INFRASTRUCTURE REQUIREMENTS

3.2.1 Groundwater infrastructure (Boreholes)

Stellenbosch Municipality will implement a Groundwater Monitoring Programme for all their production boreholes when these boreholes are utilised in the future. The groundwater monitoring data will then be processed, analysed and reported on by an experienced hydrogeologists in order to ascertain whether the resources are being sustainably utilised and to ensure compliance with the approved Groundwater Monitoring Programmes and water use licenses. Managing groundwater for water supply purposes should have the following three main functions:

- Ensure that the aquifer is used optimally: The aquifer should not be over-pumped as that would negatively impact on its long-term sustainable yield or on the environment. It also means that if the aquifer is being under-utilised, this will become known.

- Ensure that the water quality in the aquifer is not negatively affected: This may be as a result of high abstraction from the aquifer, or from poor groundwater protection (from latrines, animal enclosures, etc.).

- Optimise borehole pumping rates so that the pumping equipment operates efficiently: Pumping rates are frequently set too high and this cause unnecessarily high pumping heads, a waste of energy, and at times, pump failure.

An additional function, which is usually captured in the first two points, is to ensure that environmental integrity is maintained. A botanical and streamflow monitoring programme is therefore also required. It is important for Stellenbosch Municipality to focus on aquifer protection, groundwater monitoring and wellfield management, in order to meet the town's future water requirements. The table below gives an overview of the key groundwater management functions.

Table 3.2.1.1: Key groundwater management functions

Activity	Responsible Person	Skills and qualifications required	Resources, tools and equipment	Remarks
Measuring and recording of water levels.	Pump operator	Literacy, numeracy, trained in taking water levels	Dip meter, ruler, log book, pen.	Done as part of operators' regular O&M activities.
Measuring and recording abstraction	Pump operator	Literacy, numeracy, trained in reading water meters.	Log book, pen	Done as part of operators' regular O&M activities.
Providing data to the authority that is responsible for water supply on a regular basis.	Pump operator and pump operator supervisor	Literacy, numeracy, keeping records.	Postal service or public transport.	Including as part of the reporting requirements of the pump operator.
Taking water samples	The authority that is responsible for water supply.	Trained in taking water samples, driving license.	Transport, sample bottles, cooler box.	Sampling routine defined by sampling plan.
Sending water samples for testing.	The authority that is responsible for water supply.	Keeping records.	Transport to laboratory	Sent to nearest accredited laboratory.
Defining the monitoring requirements of an individual borehole.	Technical manager of operations or hydrogeologist.	Hydrogeological degree or diploma, experience of hydrogeological conditions.	Reports and records on borehole, monitoring data.	

Table 3.2.1.1: Key groundwater management functions				
Activity	**Responsible Person**	**Skills and qualifications required**	**Resources, tools and equipment**	**Remarks**
Ensuring that boreholes are equipped with piezometer tubes for measuring water levels and water meters for measuring abstraction.	The authority that is responsible for water supply.	Project management	In house technical staff, suppliers, contractors, specifications.	
Ensuring that operators have the equipment and skills to do monitoring.	The authority that is responsible for water supply.	Project management	Trainers, suppliers, specifications.	
Monitoring the pump operator's competence to collect and record data.	Pump operator supervisor	Staff supervision, knowledge of pump operators' tasks.	Transport	Done as part of the supervision of O&M activities.
Processing data collected at the local level	Data clerk	Data capture, record keeping, filing, trained in operating software.	Computer, spreadsheet or groundwater management software, files.	Maintains an electronic and physical record of data.
Studying water level, water quality and abstraction data on a regular basis.	Technical manager of operations.	Technical training, operations experience.	Project files, monitoring data	Done as part of the management of O&M
Revising pumping recommendations and adjusting the monitoring requirements. Ensuring the recommendations are carried out and monitoring the implementation of the recommendations.	Technical manager with hydrogeologist as required.	Technical training, operations experience.	Reports and records on borehole, monitoring data, operational information.	Ongoing management of operations and groundwater resources.
Reporting to council and pump operator, providing summary data to the CMA.	Data clerk with supervision from technical manager.	Training in operating software.	Computer, spreadsheet or groundwater management software, printer.	Summary data defined by license (frequency, what data, form of data)

Table 3.2.1.2: Future groundwater infrastructure required					
System	**Recommendations included in the Water Master Plan**	**Item**	**Capacity**	**Year**	**Estimated Cost**
Stellenbosch	Potential new production borehole for system, detailed investigation required first	SSW.B56	864 m³/d @ 60m EGL	2035	R614 000
	Potential new production borehole for system, detailed investigation required first	SSW.B57	864 m³/d @ 60m EGL	2035	R614 000
	Potential new production borehole for system, detailed investigation required first	SSW.B58	864 m³/d @ 60m EGL	2035	R614 000
Total					**R1 842 000**

Detail information regarding the groundwater sources is available under Sections 3 of the Administration, Information and Comprehensive Overview Module.

3.2.2 Surface water infrastructure (Abstraction Points)

Section 6.1 of Topic 6 gives an overview of the years in which the annual water requirement is likely to exceed the total allocations or licence volumes for the various resources.

The preventative maintenance activities, as included under Section 4.1.2, are to be implemented by Stellenbosch Municipality for their surface water infrastructure.

3.2.3 Bulk Water Pipeline and Reticulation Network Infrastructure

The Water Master Plan (June 2025) has indicated that based on the most likely land-use development scenario, the following future bulk water pipeline and water reticulation infrastructure components will be necessary.

Table 3.2.3.1: Future bulk water pipeline and water reticulation infrastructure required

Recommendations included in the Water Master Plan	Item	Diameter (mm)	Length (m)	Year	Estimated Cost
Stellenbosch					
Required to control inflow into reservoir.	SSW.B13	200	FCV	2025	R489 000
Required to augment supply to Paradyskloof no. 2 reservoir.	SSW.B8	400	37	2025	R601 000
Supply pipe to network.	SSW13.1	315	126	2025	R652 000
Required to improve network conveyance when new 7.0 Ml reservoir in constructed.	SSW14.1	160	39	2025	R111 000
Remove old PRV from the network.	SSW8.6	160	8	2025	R59 000
Dedicated supply from Idas Valley to Papegaaiberg.	SSW.B20a	450	4582	2026	R45 218 000
Required to improve network conveyance.	SSW4.1	700	443	2026	R9 189 000
Required to improve network conveyance (Item can be implemented earlier with item SPW.B7).	SSW4.2	550	956	2026	R14 082 000
Inter-connection pipe.	SSW4.3	355	10	2026	R383 000
Inter-connection pipe.	SSW4.4	250	6	2026	R119 000
Required to improve network conveyance (Item can be implemented earlier with item SPW.B7).	SSW4.5	500	173	2026	R2 256 000
Inter-connection pipe to improve network conveyance in Central zone.	SSW6.1	200	25	2026	R115 000
Required to improve network conveyance.	SSW6.11	315	445	2026	R1 892 000
Inter-connection pipe to improve network conveyance in Central zone.	SSW6.2	200	21	2026	R110 000
Network upgrade to improve network conveyance to area (Replace existing 90Ø).	SSW6.3	200	577	2026	R1 199 000
Required to improve network conveyance (Replace existing 90Ø and 100Ø).	SSW6.5	160	226	2026	R382 000
Replace existing 75Ø pipe to improve fire flow capacity.	SSW6.6	160	260	2026	R473 000
Required to augment supply from Idas Valley to Papegaaiberg.	SSW6.8a	450	238	2026	R1 950 000
Required to improve network conveyance.	SSW6.8b	450	1556	2026	R11 298 000
Required when future areas S77 to S79 develop.	SSW1.4	200	241	2027	R522 000
Required when future areas S77 to S79 develop.	SSW1.5	160	237	2027	R397 000
Required to reduce high pressure in Techno Park.	SSW3.7	100	PRV	2027	R291 000
Required to reduce high static pressures in Uniepark 1 zone.	SSW7.1	100	PRV	2027	R291 000
Required to rezone network.	SSW7.2g	100	Valve	2027	R114 000
Required to improve network conveyance.	SSW7.4	160	134	2027	R245 000
Required to improve network conveyance.	SSW7.6	110	47	2027	R84 000
Dedicated bulk supply pipe to Uniepark and Helshoogte reservoirs	SSW.B11	450	1088	2028	R10 707 000
Supply pipe from Helshoogte reservoir to Papegaaiberg system.	SSW.B20b	450	854	2028	R8 515 000
Required to augment supply from Helshoogte to Rosendal.	SSW.B35	450	687	2028	R4 698 000
Inter-connection pipe to Uniepark reservoirs.	SSW.B36	450	48	2028	R824 000
Required to augment bulk supply to Rozendal reservoir.	SSW.B37	400	338	2028	R2 341 000
Inter-connection pipe to Arbeidslus supply.	SSW.B38	315	19	2028	R238 000
Network upgrade to improve network conveyance to area (Replace existing 150Ø AC pipe).	SSW15.3	200	260	2028	R614 000
Network upgrade to improve network conveyance to area (Replace existing 50Ø pipe).	SSW15.4	160	16	2028	R72 000
Network upgrade to improve network conveyance to area (Replace existing 160Ø pipe).	SSW15.5	200	406	2028	R919 000
Network upgrade to improve network conveyance to area (Replace existing 110Ø pipe).	SSW15.6	160	55	2028	R136 000
Required to reduce pressure in the Brandwacht area.	SSW22.4	100	PRV	2028	R291 000
Replace existing network pipe (Existing pipe reported to be in disrepair).	SSW23.1	110	163	2028	R227 000
New supply pipe to supply Plankenburg from Papegaaiberg reservoir	SSW4.18	355	1194	2028	R5 939 000
Network upgrade to improve network conveyance to area	SSW4.19	315	528	2028	R2 214 000
Inter-connection pipe	SSW4.22a	160	4	2028	R53 000
Inter-connection	SSW1.9b	200	14	2030	R95 000
Required when future areas S1 & S2 develop.	SSW13.10	110	135	2030	R180 000
Required when future areas S1 & S2 develop.	SSW13.11	160	131	2030	R260 000
Required when future area S120 develops (Replace existing 75Ø).	SSW13.15	110	184	2030	R252 000
Required to improve network conveyance (Replace existing 110Ø).	SSW13.16	160	122	2030	R246 000

Table 3.2.3.1: Future bulk water pipeline and water reticulation infrastructure required

Recommendations included in the Water Master Plan	Item	Diameter (mm)	Length (m)	Year	Estimated Cost
Required when future area S5 develops.	SSW13.9a	110	269	2030	R354 000
Required when future area S5 develops.	SSW13.9b	110	85	2030	R134 000
Required when Kayamandi A develops.	SSW15.10	200	297	2030	R628 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 50Ø and 75Ø).	SSW15.12	160	123	2030	R248 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 50Ø and 75Ø).	SSW15.13	200	233	2030	R558 000
Inter-connection pipe required to accommodate Kayamandi town centre redevelopment.	SSW15.14	200	76	2030	R229 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 75Ø and 100Ø AC pipes).	SSW15.7	160	228	2030	R389 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 75Ø).	SSW16.1	160	293	2030	R526 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 50Ø and 75Ø).	SSW16.2	160	312	2030	R558 000
Required when future areas S15, S17, S80 & S82 develop.	SSW18.1	400	203	2030	R1 436 000
Required when future areas S15, S17, S80 & S82 develop.	SSW18.2	400	206	2030	R1 453 000
Required when future areas S17, S81 & S82 develop.	SSW18.3	200	851	2030	R1 669 000
Required when future areas S15 and S99 develop.	SSW18.4	355	115	2030	R818 000
Required when future areas S15 and S99 develop.	SSW18.5	250	827	2030	R2 152 000
Required when future areas S15, S17, S80 & S82 develop.	SSW18.6	200	986	2030	R1 921 000
Required when future areas S15, S17, S80 & S82 develop.	SSW18.7	160	331	2030	R538 000
Require to reduce high static pressures.	SSW19.1a	200	PRV	2030	R489 000
Require to reduce high static pressures.	SSW19.1b	150	PRV	2030	R376 000
Required when future areas S15 and S99 develop.	SSW19.2	250	443	2030	R1 201 000
Required when future area S15 develops.	SSW19.3	150	PRV	2030	R376 000
Required when future areas S15 and S99 develop.	SSW19.4	250	243	2030	R706 000
Required when future area S81 develops.	SSW20.1	160	66	2030	R143 000
Required when future areas S56 & S57 develop.	SSW3.2a	200	106	2030	R4 184 000
Required as interim connection until supply from Adam Tas corridor development is constructed.	SSW3.2b	100	PRV	2030	R291 000
Required when future areas S56 & S57 develop.	SSW3.3	200	510	2030	R1 028 000
Required when future area S58 develops.	SSW3.4	200	1110	2030	R2 155 000
Required when future area S55 develops.	SSW4.10	250	501	2030	R1 346 000
Required to improve network conveyance to future area S91.	SSW4.14	200	1095	2030	R2 304 000
Required when future areas S115 and S133 develop.	SSW4.16	200	131	2030	R316 000
Required when future area S115 develops.	SSW4.17	110	185	2030	R235 000
Required when future area S131 develops.	SSW5.3	160	342	2030	R554 000
Required when future area S36 develops.	SSW7.5	110	368	2030	R435 000
Required when higher lying erven of future area S34 develops.	SSW8.1	160	431	2030	R686 000
Required when higher lying erven of future area S34 develops.	SSW8.2	110	492	2030	R571 000
Isolate 200Ø from network (200Ø to be utilised as bulk pipeline for groundwater from boreholes)	SSW.B48	200	Valve	2035	R194 000
Inter-connection pipe to improve network conveyance & redundancy when when 200Ø is isolated from the network.	SSW.B49	160	8	2035	R67 000
New raw water pipeline between boreholes in Stellenbosch Centre wellfield and existing 225Ø to Papegaaiberg reservoir site.	SSW.B50	200	628	2035	R1 386 000
Required to accommodate supply from Van der Stel & Stb Centre BH1 boreholes.	SSW.B51	160	164	2035	R315 000
Required to dedicate existing 225Ø pipe to Papegaaiberg borehole scheme.	SSW.B54	250	Valve	2035	R239 000
Required to accommodate supply from Stb Centre BH10 & Stb Centre BH12 boreholes.	SSW.B55	160	371	2035	R655 000
Required to improve network conveyance when future area S79 develops.	SSW1.3	315	246	2035	R1 011 000
Required to improve network conveyance when area S74 develops.	SSW1.6	160	153	2035	R297 000
Required to improve network conveyance when area S74 develops.	SSW1.7	160	1007	2035	R1 698 000
Required when Snake Valley is formalised	SSW15.1	100	PRV	2035	R291 000
Required when Snake Valley is formalised	SSW15.2	100	PRV	2035	R291 000
Required to improve network conveyance (Replace existing 150Ø AC pipe).	SSW22.2	200	435	2035	R945 000
Required to improve network conveyance (Replace existing 150Ø AC pipe).	SSW22.3	200	266	2035	R590 000
Required to improve network redundancy.	SSW3.5	200	682	2035	R1 500 000
Required to reduce high pressure in Techno Park.	SSW3.6	100	PRV	2035	R291 000

Table 3.2.3.1: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Required when future area S79 develops.	SSW1.8	200	485	2040	R980 000
Required when future area S14 develops.	SSW16.3	160	403	2040	R707 000
Required when future areas S49 - S52, S55, S57 & S58 develop.	SSW4.6	450	503	2040	R6 184 000
Required when future areas S50 & S52 develop.	SSW4.7	160	1087	2040	R1 659 000
Required when future areas S51, S55, S57 & S58 develop.	SSW4.8	315	186	2040	R804 000
Required when future areas S51, S55, S57 & S58 develop.	SSW4.9	250	889	2040	R2 307 000
Required to improve network conveyance.	SSW5.1	250	253	2040	R730 000
Required to improve network conveyance.	SSW5.2	200	284	2040	R603 000
New supply pipe from borehole to old Kayamandi sump & PS.	SSW.B64	160	233	2045	R372 000
New supply pipe from borehole to proposed package plant.	SSW.B69	160	74	2045	R155 000
Required when future area S99.1 develops	SSW18.9	100	PRV	2045	R291 000
Required when future areas S55, S57 & S58 develop.	SSW4.11	200	768	2045	R1 512 000
Required when future area S58 develops.	SSW4.12	160	812	2045	R1 250 000
Network upgrade to improve network conveyance to area.	SSW4.20	200	110	2045	R299 000
Network upgrade to improve network conveyance to area.	SSW4.21	160	119	2045	R241 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW.B16	160	1062	2055	R2 801 000
Required to control inflow into reservoir (Outside urban edge, potential longer term item).	SSW.B17	100	FCV	2055	R291 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW11.1	250	371	2055	R1 024 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW11.2	250	615	2055	R1 629 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW12.1	150	PRV	2055	R376 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW12.2	200	40	2055	R145 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW12.3	160	380	2055	R609 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW12.4	110	100	2055	R142 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW13.6	200	56	2055	R1 547 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW13.7	200	Valve	2055	R194 000
Required when future areas S66 & S67 develop (Outside urban edge, potential longer term item).	SSW2.1	200	283	2055	R601 000
Required when future area S67 develops (Outside urban edge, potential longer term item).	SSW2.2	160	402	2055	R642 000
Required when future area S66 develops (Outside urban edge, potential longer term item).	SSW2.3	160	289	2055	R476 000
Required when higher lying areas of future areas S66 & S67 develop.	SSW22.1	160	182	2055	R317 000
Telemetry at reservoirs, PRVs and bulk water meters	SSW.M1	-	-	Next 3 yrs	R800 000
Sub-Total					**R201 808 000**
Klapmuts					
Replace existing 200Ø PS inlet manifold (to Lower & Upper pumps).	SKW.B2a	500	10	2026	R657 000
Replace existing 200Ø PS inlet & outlet manifold (Upper pump).	SKW.B2b	400	17	2026	R511 000
Required to improve network conveyance.	SKW1.18	200	398	2028	R1 303 000
Required to improve network conveyance.	SKW1.19	200	224	2028	R2 068 000
Required to improve network conveyance.	SKW1.20	200	39	2028	R142 000
Required to improve network conveyance.	SKW1.35	200	437	2028	R986 000
Inter-connection pipeline from Klapmuts boreholes to Koelenhof PS.	SKW.B19	160	1025	2030	R1 567 000
Required when future areas K24.1 and K24.2 develop.	SKW1.10	250	674	2030	R1 773 000
Required when future areas K24.1 and K24.2 develop.	SKW1.11	200	735	2030	R1 450 000
Required when future area K24.1 develops.	SKW1.15	250	166	2030	R514 000
Required to improve network conveyance.	SKW1.16	200	261	2030	R559 000
Required when future area K24.1 develops.	SKW1.27	160	353	2030	R570 000
Required when future areas K13 and K22 develop.	SKW1.28	160	415	2030	R661 000
Required when future area K1.4 develops.	SKW1.31	250	133	2030	R432 000
Required when future area K1.3 develops.	SKW1.34	200	356	2030	R739 000
Required when future areas K24.1 and K24.2 develop.	SKW1.9a	315	160	2030	R713 000
Required when future area K24.1 develops.	SKW1.9b	250	140	2030	R451 000
Required to improve network conveyance.	SKW2.3	200	134	2030	R321 000

Table 3.2.3.1: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Required when future areas K24.1 and K24.2 develop.	SKW3.1	355	377	2030	R1 905 000
Required when future areas K15.2, K17 and K24.2 develop	SKW3.12	250	54	2030	R237 000
Required when future areas K16 and K24.2 develop.	SKW3.2	355	639	2030	R2 992 000
Required when future area K24.2 develops.	SKW3.3	250	311	2030	R874 000
Required when future area K24.2 develops.	SKW3.4	160	606	2030	R945 000
Replace existing 200Ø bulk pipe to Klapmuts Upper reservoir.	SKW.B4a	250	68	2040	R364 000
Inter-connection between existing 200Ø and existing 250Ø Klapmuts Upper reservoir feeder main.	SKW.B4b	250	4	2040	R118 000
Isolate existing 250Ø from Klapmuts Lower reservoir zone.	SKW.B4c	250	Valve	2040	R239 000
Inter-connection between existing 200Ø and existing 250Ø Klapmuts Upper reservoir feeder main.	SKW.B4d	250	3	2040	R113 000
Replace existing 200Ø feeder main to Klapmuts Upper reservoir.	SKW.B4e	250	355	2040	R1 092 000
Required to improve network conveyance (parallel reinforcement).	SKW1.13	200	255	2040	R548 000
Required when future areas K8. K9, K11, K12 and K24.1 develop.	SKW1.21	250	310	2040	R2 177 000
Required when future areas K8, K11 and K12 develop.	SKW1.22	250	591	2040	R1 568 000
Required when future area K12 develops.	SKW1.26	200	501	2040	R1 011 000
Required when future areas K15.2 and K17 develop	SKW3.14	250	924	2040	R2 393 000
Required when future areas K14.1, K21.1 and K21.2 develop.	SKW1.23	200	471	2045	R955 000
Required when future area K9 develops.	SKW1.25	160	161	2045	R285 000
Required to improve network conveyance.	SKW1.7	250	152	2045	R481 000
Required to improve network conveyance.	SKW2.4	200	546	2045	R1 095 000
Required when future areas K15.2 and K17 develop.	SKW3.15	200	401	2045	R822 000
Required when future areas K15.2 and K20 develop.	SKW3.16	160	1567	2050	R2 371 000
Telemetry at reservoirs, PRVs and bulk water meters	SKW.M1	-	-	Next 3 yrs	R460 000
Sub-Total					**R38 462 000**
Franschhoek					
Required to utilise storage capacity in Franschhoek reservoir for Groendal zone.	SFW1.2	250	728	2025	R1 907 000
Required as interim connection until Central Lower reservoir is constructed.	SFW1.6	100	PRV	2025	R291 000
Required when future area FH5 develops.	SFW1.7	200	253	2025	R544 000
New PRV installation.	SFW11.1	100	PRV	2026	R291 000
Required to implement Franschhoek PRV 1 zone.	SFW11.13	110	6	2026	R38 000
New PRV installation.	SFW11.2	100	PRV	2026	R291 000
Required to implement Franschhoek PRV 2 zone.	SFW12.10	150	Valve	2026	R153 000
Inter-connection pipe.	SFW12.13	160	14	2026	R67 000
Required to implement Franschhoek PRV 2 zone	SFW12.2	75	Valve	2026	R100 000
Required to implement Franschhoek PRV 2 zone	SFW12.7	150	Valve	2026	R153 000
Move connection over to higher pressure zone when Franschhoek PRV 1 zone is implemented.	SFW2.11	110	12	2026	R44 000
New bulk supply pipeline to new reservoir.	SFW.B24	200	267	2028	R570 000
Required when Langrug Upper reservoir is constructed.	SFW.B7	110	331	2028	R395 000
Required when future area LM3 develops.	SFW13.1	160	386	2028	R619 000
Required when future area LM4 develops.	SFW13.2	160	473	2028	R748 000
Required when Langrug Upper reservoir is constructed.	SFW7.1	160	337	2028	R546 000
New supply pipe for network.	SFW7.2	160	253	2028	R421 000
Inter-connection pipe for Upper reservoir network.	SFW7.3	110	15	2028	R48 000
Required to implement Langrug Upper reservoir zone.	SFW7.4	110	Valve	2028	R114 000
Required to implement Langrug Upper reservoir zone.	SFW7.5	110	Valve	2028	R114 000
Required when La Motte Upper reservoir is constructed.	SFW9.1	250	272	2028	R779 000
Implement with construction of new reservoir.	SFW9.2	250	259	2028	R745 000
Required to improve flow through the PS inlet/outlet manifold	SFW.B12	355	31	2030	R469 000
Required to augment bulk supply to Franschhoek.	SFW.B18	450	4158	2030	R35 072 000
Required when future area FH4 develops.	SFW1.9	160	153	2030	R274 000
Required to supply sufficient fire flow to Wemmershoek (after old supply to town is transferred to the raw water system).	SFW10.1a	250	86	2030	R316 000
Required to supply sufficient fire flow to Wemmershoek (after old supply to town is transferred to the raw water system).	SFW10.1b	200	306	2030	R644 000
Required to supply sufficient fire flow to Wemmershoek (after old supply to town is transferred to the raw water system).	SFW10.2	200	256	2030	R550 000
Required when future areas WH2 and WH3 develop.	SFW10.3	200	316	2030	R663 000
Insert valve and close to transfer network pipe to raw water system.	SFW10.5	200	Valve	2030	R194 000

Table 3.2.3.1: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Required to improve network conveyance.	SFW2.2	160	38	2030	R103 000
Replace existing 75Ø pipe.	SFW2.3	160	61	2030	R137 000
Required to improve network conveyance and redundancy.	SFW2.4	110	240	2030	R295 000
Inter-connection pipe.	SFW6.4	160	13	2030	R65 000
Required when future areas FH19 and FH20 develop.	SFW8.1	200	198	2030	R441 000
Required when future area FH19 develops.	SFW8.2	200	216	2030	R475 000
Required when future area FH22 develops.	SFW8.3	160	120	2030	R223 000
Required when future areas LM1 to LM6 develops.	SFW9.3	250	254	2030	R733 000
Required to augment bulk supply to Franschhoek.	SFW.B11	355	2909	2035	R12 413 000
Bulk pipe to transfer water from Bagatelle reservoir to FH Estate reservoirs.	SFW.B27	160	1349	2035	R2 047 000
Replace existing 100Ø feeder main to Bagatelle reservoir.	SFW2.1	160	114	2035	R215 000
Dedicated bulk supply from Franschhoek Lower reservoir to old Franschhoek Upper reservoir.	SFW.B10	250	14	2040	R138 000
Required to control flow into Groendal reservoir when Franschhoek Lower reservoir is constructed.	SFW.B39	200	FCV	2040	R489 000
Inter-connection pipe for dedicated bulk supply to Franschhoek Lower reservoir	SFW.B4	250	19	2040	R151 000
Inter-connection pipe to pump directly from La Motte bulk PS to new Franschhoek Lower reservoir.	SFW.B40	315	20	2040	R240 000
Required when Franschhoek Lower reservoir is constructed.	SFW1.10	315	662	2040	R2 441 000
Inter-connection pipe.	SFW1.3	160	42	2040	R109 000
Required when Franschhoek Lower reservoir is constructed.	SFW1.8	200	898	2040	R1 757 000
Required when future area LM2 develops.	SFW14.1	110	132	2040	R176 000
Required when future areas LM2, LM5 and LM6 develop.	SFW14.2	200	168	2040	R385 000
Required when future areas LM5 and LM6 develop.	SFW14.3	200	316	2040	R662 000
Required when future areas LM1 to LM6 develops.	SFW9.4	200	306	2040	R643 000
Required when future area LM6 develops.	SFW14.4	200	1079	2045	R2 097 000
Required when future area FH22 develops (Replace existing 200Ø AC pipe).	SFW2.5	160	325	2045	R528 000
Telemetry at reservoirs, PRVs and bulk water meters	SFW.M1	-	-	Next 3 yrs	R860 000
Sub-Total					**R74 983 000**
Dwars River					
Repalce existing 150 Ø CCT connection.	SDW.B20	400	45	2026	R670 000
Repalce existing 250Ø PS inlet manifold.	SDW.B4	300	8	2026	R143 000
Required to improve flow through the PS outlet manifold.	SDW.B7	300	14	2026	R157 000
Replace existing supply to Pniel Upper reservoir.	SDW.B29	110	124	2027	R181 000
Required to improve network conveyance.	SDW9.1	110	191	2027	R241 000
Required bulk supply to Lanquedoc reservoir.	SDW.B23	250	3238	2028	R9 114 000
Emergency connection from Lanquedoc reservoir to Kylemore PS 3.	SDW.B8	315	80	2028	R440 000
Emergency connection from Lanquedoc reservoir to Kylemore PS 3.	SDW.B9	200	PRV	2028	R489 000
New Lanquedoc PRV.	SDW10.1	200	PRV	2028	R489 000
Required when future areas DR19 - 21 & DR27 - 29 develop.	SDW10.10	200	440	2028	R896 000
Required when future areas DR19 - 21 & DR27 - 29 develop.	SDW10.11	200	586	2028	R1 171 000
New supply pipeline to Boschendal Village.	SDW10.2	315	1616	2028	R5 725 000
New supply pipeline to Boschendal Village.	SDW10.3	315	774	2028	R2 826 000
Required to reduce high static pressures.	SDW6.1	100	PRV	2028	R291 000
Required to rezone network.	SDW6.2	110	Valve	2028	R114 000
Required to improve network conveyance.	SDW6.3	160	33	2028	R95 000
Required to improve network conveyance.	SDW6.4	110	152	2028	R198 000
Required to improve network conveyance.	SDW7.1	160	267	2028	R442 000
Required to improve network conveyance.	SDW7.2	160	220	2028	R373 000
New supply pipe from Lanquedoc reservoir.	SDW8.0	400	536	2028	R3 114 000
New supply pipe from Lanquedoc reservoir.	SDW8.1	355	1116	2028	R4 972 000
New supply pipeline to Boschendal Village.	SDW8.2	315	699	2028	R2 570 000
Required when future areas DR14 & DR20 develop.	SDW10.8	200	366	2030	R756 000
Required when future area DR14 develops.	SDW10.9	160	603	2030	R940 000
New supply pipeline to Lanquedoc.	SDW8.3	200	625	2030	R1 244 000
New supply pipeline to Lanquedoc.	SDW8.4	160	452	2030	R716 000
New supply pipeline to Lanquedoc.	SDW8.5	200	499	2030	R1 007 000
New supply pipeline to Lanquedoc.	SDW8.6	160	306	2030	R548 000

Table 3.2.3.1: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Required to improve network redundancy when future area DR4 develops.	SDW2.4	160	33	2035	R95 000
Required to improve network conveyance.	SDW5.1	160	447	2035	R709 000
Replace existing 300Ø supply pipeline when it reaches capacity or reaches end of operational life.	SDW.B21	400	2887	2040	R16 872 000
Required when future areas DR3 & DR5 develop.	SDW1.1	200	416	2040	R851 000
Required when future area DR15 develops.	SDW10.13	110	381	2040	R450 000
Required when future areas DR16 - 18 & DR21 develop.	SDW10.14	200	389	2040	R800 000
Required when future area DR16 develops.	SDW10.15	110	265	2040	R322 000
Required when future areas DR17, DR18 & DR21 develop.	SDW10.16	160	407	2040	R650 000
Required when future area DR21 develops.	SDW10.17	160	382	2040	R613 000
Required when future areas DR13 & DR25 develop.	SDW8.7	200	615	2040	R1 224 000
Required when future area DR31 develops.	SDW10.18	160	294	2045	R482 000
Required when future area DR29 develops.	SDW10.4	160	174	2045	R304 000
Required when future areas DR27, DR28 and DR31 develop.	SDW10.5	200	326	2045	R937 000
Required when future area DR28 develops.	SDW10.6	160	51	2045	R122 000
Required when future area DR27 develops.	SDW10.7	160	275	2045	R454 000
Telemetry at reservoirs, PRVs and bulk water meters.	SDW.M1	-	-	Next 3 yrs	R580 000
Sub-Total					**R65 387 000**
Raithby					
Required to improve network conveyance (Replace existing 75Ø pipes).	SRW1.3	200	695	2026	R1 375 000
Inter-connection pipe to booster zone (after Raithby reservoir & booster PS are decommissioned).	SRW1.4	160	16	2026	R70 000
Close supply but maintain for emergencies.	SRW.B2	150	Valve	2030	R153 000
Dedicated bulk supply to CCT Faure service reservoir from Raithby bulk PS.	SRW.B3	160	219	2030	R616 000
Inter-connection pipe with bulk meter from Faure service reservoir to Raithby supply pipe.	SRW1.1	250	9	2030	R138 000
Required when future area R5 develops.	SRW1.6	110	118	2030	R161 000
Replace existing 150Ø pipe when pressure problems occur.	SRW1.2	250	3414	2045	R8 564 000
Telemetry at bulk water meter to town.	SRW.M1	-	-	Next 3 yrs	R20 000
Sub-Total					**R11 097 000**
Faure					
Required when Welmoed future area develops.	RFW1.1	250	254	2030	R812 000
Required when Welmoed future area develops.	RFW1.2	200	1534	2030	R3 286 000
Required when Welmoed future area develops.	RFW1.5	160	287	2030	R517 000
Required when Welmoed future area develops.	RFW1.6	200	23	2030	R118 000
Sub-Total					**R4 733 000**
Polkadraai					
New supply pipe to Papegaaiberg from Polkadraai.	SPW.B7	400	5210	2026	R41 264 000
Network upgrade to accommodate development along Vlottenburg Road.	SPW1.8	315	1070	2027	R4 319 000
Implement new PRV to manage high static pressures.	SPW1.7	200	PRV	2030	R489 000
Required when Welmoed future area develops.	SPW3.1	200	2116	2030	R4 506 000
Required when Welmoed future area develops.	SPW3.2	100	PRV	2030	R291 000
Required when Welmoed future area develops.	SPW3.3	200	257	2030	R609 000
Emergency supply to Welmoed from Skilpadsvlei.	SPW3.4	200	137	2030	R356 000
Required when future area PD4.1 develops.	SPW4.1	160	209	2030	R390 000
Telemetry at reservoirs, PRV and bulk water meters.	SRW.M1	-	-	Next 3 yrs	R120 000
Sub-Total					**R52 344 000**
Koelenhof					
Required to augment bulk supply to Koelenhof area.	RKW.B6a	560	4143	2028	R57 387 000
Required to augment supply to Sonop and Devon Valley reservoirs.	RKW2.2	315	1206	2030	R4 844 000
Required when future area KP6 develops.	RKW2.5	160	219	2030	R370 000
Required to improve network conveyance.	RKW4.1	110	518	2030	R600 000
Required to improve network conveyance.	RKW4.2	110	763	2030	R870 000
Required when future area KP20 develops (Replace existing 75Ø pipe).	RKW5.1	110	680	2030	R779 000
Required when future area KP20 develops (Replace existing 50Ø pipe).	RKW5.2	110	237	2030	R292 000
Bulk supply pipeline to Kriekbult reservoir.	RKW.B10	315	1446	2035	R5 777 000
Required to control flow into the Kriekbult sump.	RKW.B7	300	FCV	2035	R797 000
Supply pipeline from Kriekbult reservoir to network.	RKW2.1	355	1463	2035	R6 411 000

3.2.4 Water Treatment Works infrastructure

The table below gives a summary of the existing hydraulic design capacities and average daily flows and peak month average daily flows for the 2023/2024 financial year for each of the WTWs.

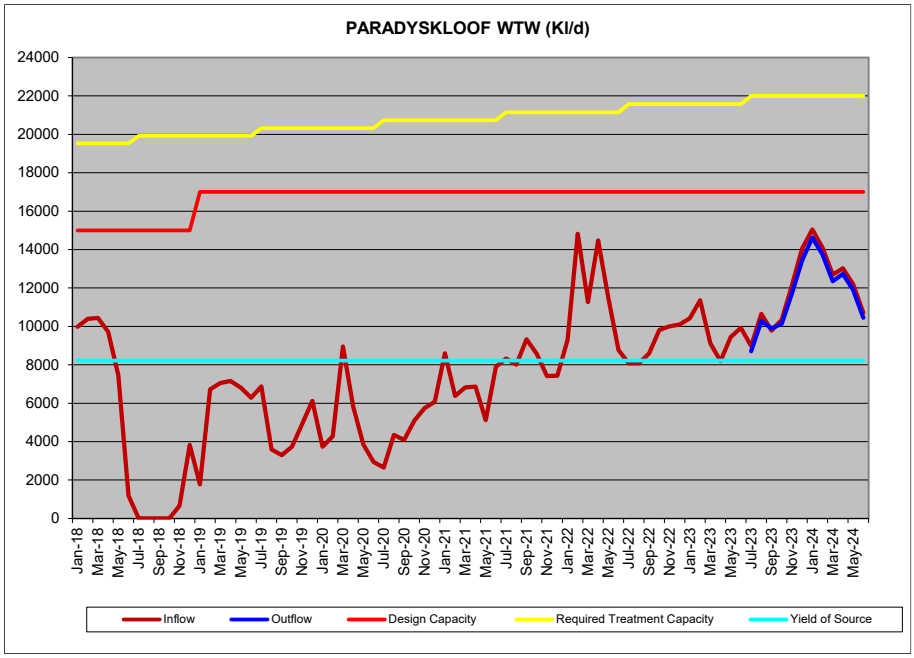

Table 3.2.4.1: Existing hydraulic design capacities and average flows at each of the WTWs and water quality failures in network					
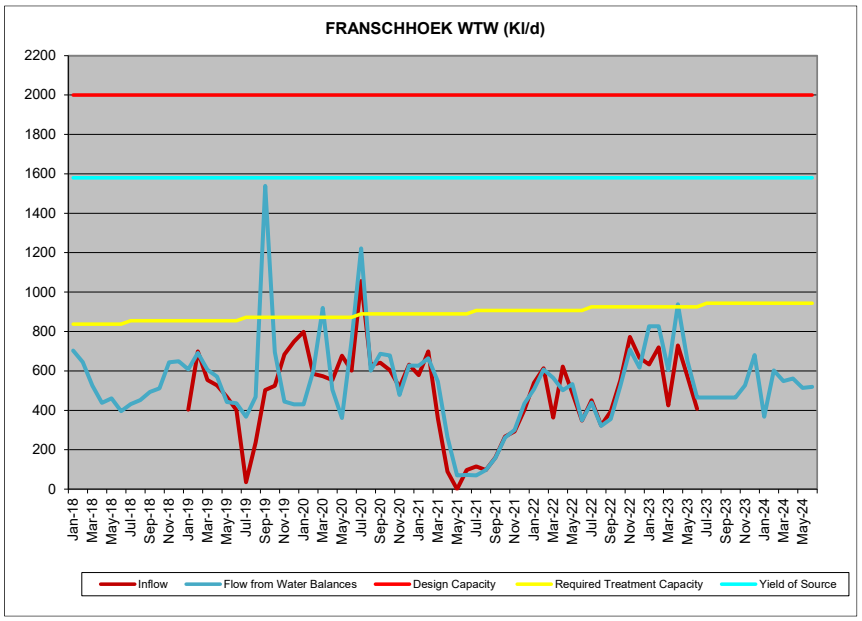
WTW	**Existing Hydraulic Capacity**	**Peak Month Average Daily Flow (2023/2024)**	**Average Daily Flow (Jul 2023 – Jun 2024)**	**Required Treatment Capacity (1.5 x AADD10yr)**	**2023/2024 Water Quality Failures for Network (SANS0214:2015)**
	Ml/d	**Ml/d**	**Ml/d**	**Ml/d**	
Idas Valley	21.000	16.309 (Oct)	11.872	21.708	Microbiological, Operational
Paradyskloof	17.000	15.040 (Jan)	12.004	22.001	Microbiological, Operational
Franschhoek	2.000	0.680 (Dec)	0.516	0.943	Microbiological

Note: The Idas Valley WTW was originally designed for a hydraulic capacity of 27.0 Ml/d, but due to the age of the plant the current available hydraulic capacity is only 21.0 Ml/d.

The graphs below give an overview of the inflows and outflows at the various WTWs, the existing and required treatment capacities and the safe yields or registration volumes of the resources.



The Idas Valley WTW was operating at 56.5% (AADD) of its design capacity of 21.0 Ml/d for the 2023/2024 financial year. 42.9% of the 2023/2024 System Input volume of the Greater Stellenbosch system was treated at the Idas Valley WTW. The peak monthly flows at the WTW for the 2022/2023 and 2023/2024 financial years were 10.979 Ml/d (Aug.) and 19.991 Ml/d (Oct). The existing reduced hydraulic capacity of 21.0 Ml/d for the Idas Valley WTW is inadequate for the future required treatment capacity.

The Paradyskloof WTW was operating at 70.6% (AADD) of its design capacity of 17.0 Ml/d for the 2023/2024 financial year. 43.5% of the 2023/2024 System Input volume of the Greater Stellenbosch system was treated at the Paradyskloof WTW. The peak monthly flows at the WTW for the 2022/2023 and 2023/2024 financial years were 11.358 Ml/d (Febr.) and 15.040 Ml/d (Jan.). The existing hydraulic capacity of 17.0 Ml/d for the Paradyskloof WTW is inadequate for the future required treatment capacity.

The upgrading of both the Idas Valley WTW and the Paradyskloof WTW depends on increased allocations from the Eerste River and the WCWSS and no costs were therefore linked to these upgrades at this stage.

The Franschhoek WTW was operating at 25.8% (AADD) of its design capacity of 2.0 Ml/d for the 2023/2024 financial year. 14.9% of the 2023/2024 System Input volume of the Franschhoek system was treated at the Franschhoek WTW. The peak monthly flows at the WTW for the 2022/2023 and 2023/2024 financial years were 0.772 Ml/d (Nov.) and 0.602 Ml/d (Febr). The existing hydraulic capacity of 2.0 Ml/d for the Franschhoek WTW is adequate for the future treatment requirements.

The WTWs are all operational and the treatment plants are in a good condition, with no non-functional treatment processes. Some of the minor items to be addressed at the WTWs, as identified through the WSDP inspection process during May 2023, are as follows.

Idas Valley WTW:

- Inadequate water quality testing equipment.
- Raw water inflow meters faulty for Tower 1 and Tower 3. No final water outflow meter.
- Valve of Filter No.13 is problematic.
- Lime stone tank No.2 not in use. Safety railings of lime stone tanks to be repaired, safety risk.

Paradyskloof WTW:

- Lime feeder for filters No.5-8 not operational.
- No final water outflow meter.
- Only one of the sodium aluminate dosing pumps is operational.

Franschhoek WTW: No access.

The following upgrades are required with regard to the WTWs.

Table 3.2.4.2: Future upgrades of the WTWs

WTW	Short description	Time Frame	Estimated cost
All WTWs	Upgrade chlorination installations	2025-2027	R750 000
Idas Valley WTW	Upgrade Idas Valley WTW	2025-2028	R52 000 000
Total			**R52 750 000**

3.2.5 Water pump stations

The water pump stations, as inspected during the WSDP site visits in May 2023, are all operational and well maintained. Duty and Standby pumps are available for most of the pump stations. Leaks were observed at some of the pumps during the site visits. The pump stations are fenced and locked and some are supplied with alarms to prevent any possible theft or vandalism. Key issues to be addressed at the water pump stations, as identified through the WSDP inspection process, are as follows:

- Pump stations without any standby pumps: Brandwacht PS (at WTW), Paradyskloof PS, Pniel PS and Winery Booster PS.
- Pump No.2 of the Rozendal PS was removed for repairs.
- Ceiling of Welgelegen PS building needs to be replaced.
- Motor No.2 at Blackheath PS not connected.
- Pump stations with leaks: Kylemore PS No.3, Pniel PS, Uniepark PS, Pappegaaiberg and Kleinvallei PS, Blackheath PS, De Zalze PS, Koelenhof PS and Devon Valley PS.
- Kleinvallei and Kayamandi PS: Not fenced and electrical installations were vandalised.

The Water Master Plan (June 2025) has indicated that based on the most likely land-use development scenario, it will be necessary for the following future water pump stations.

Table 3.2.5.1: Future water pump stations required

System	Recommendations included in the Water Master Plan	Item	Year	Capacity (l/s)	Head (m)	Cost (R Million)
Stellenbosch	170 L/s to new Helshoogte reservoir	SSW.B10a	2028	170	71	R10 323 000
	80 L/s to Rozendal reservoir	SSW.B10b	2028	80	15	R1 191 000
	Required to augment bulk supply to Polkadraai (Pumps only)	SSW.B26	2030	50	35	R4 132 000
	Required when future area S81 develops	SSW20.2	2030	7	30	R2 843 000

System	**Recommendations included in the Water Master Plan**	**Item**	**Year**	**Capacity (l/s)**	**Head (m)**	**Cost (R Million)**
Koelenhof	Upgrade/refurbish Sonop and Devon Valley pumps (Sonop pumps currently not operational)	RKW.B12	2026	45	100	R2 327 000
	New sump for Kriekbult pump station	RKW.B8	2035	100	150	R1 408 000
	Required when Kriekbult reservoir is constructed	RKW.B9	2035	90	76	R6 874 000
	Required to supply bulk water from the Koelenhof system to the Kayamandi system	RKW.B15	2040	60	120	R3 252 000
	New sump for Koelenhof bulk pump station no. 2	RKW.B4	2045	100	150	R1 408 000
	New Koelenhof bulk PS	RKW.B5	2045	150	30	R7 328 000
	Sub-Total					**R22 597 000**
Total						**R89 457 000**

3.2.6 Reservoir infrastructure

Most of the reservoirs and water towers in Stellenbosch Municipality's Management Area are in a good condition and well maintained. The levels of the reservoirs are monitored through the scada systems. No leaks were noticed at any of the reservoirs during the WSDP site visits in May 2023. Most of the reservoir sites are fenced and locked, the reservoir covers are locked and the air vents are covered.

Some of the issues to be addressed at the water reservoirs and towers, as identified through the WSDP inspection process, are as follows.

- Reservoirs not fenced: La Motte and Pniel Upper.
- Reservoirs with covers not locked: Wemmershoek, La Motte, Bagatelle, Pniel Lower and Upper and Uniepark No.2
- Roof of Uniepark No.1 vandalised and needs to be repaired.

The 2023/2024 storage factors of the total reservoir storage capacity for the various systems, based on 1 x PDD (24 hours storage capacity), are 1.31 for Stellenbosch, 1.86 for Franschhoek, 2.27 for Dwars River and 3.05 for Klapmuts. Even though the overall storage capacity might be adequate for all of the towns there can be distribution zones within some of the towns with inadequate storage capacity, which require additional reservoirs.

The Water Master Plan (June 2025) has indicated that based on the most likely land-use development scenario, it will be necessary for the following future reservoirs.

Table 3.2.6.1: Future reservoir storage capacities required					
System	**Recommendations included in the Water Master Plan**	**Item**	**Capacity (Ml)**	**Year**	**Estimated Cost**
Stellenbosch	Additional reservoir capacity at Cloetesville	SSW.B14	7.000	2025	R25 308 000
	Required to augment bulk supply to Stellenbosch	SSW.B19	30.000	2028	R79 170 000
	Additional reservoir storage capacity for Papegaaiberg zone (20.0 ML as first phase, additional 20.0 ML required in future))	SSW.B21	20.000	2028	R58 290 000
	Additional reservoir storage capacity for Papegaaiberg zone (Phase 2)	SSW.B22	20.000	2045	R58 290 000
	Required when future areas S19, S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	SSW.B18	1.500	2055	R8 255 000
	Additional reservoir storage capacity for Brandwacht zone	SSW.B32	1.500	2055	R8 255 000
	Additional reservoir capacity at Paradyskloof 2 (Potential longer term upgrade)	SSW.B6	1.500	2055	R8 255 000
	Sub-Total				**R245 823 000**
Klapmuts	Additional reservoir storage capacity for Klapmuts Lower reservoir site	SKW.B10	9.000	2035	R30 798 000
	Additional reservoir storage capacity for Klapmuts Upper	SKW.B5	5.000	2040	R19 575 000
	Sub-Total				**R50 373 000**
Franschhoek	Additional reservoir storage capacity for Langrug (Existing storage capacity insufficient. Additional 1.0 ML higher lying reservoir also proposed for Langrug area)	SFW.B3	1.000	2025	R6 192 000

Table 3.2.6.1: Future reservoir storage capacities required					
System	**Recommendations included in the Water Master Plan**	**Item**	**Capacity (Ml)**	**Year**	**Estimated Cost**
	New reservoir storage capacity for La Motte (can be phased)	SFW.B25	3.000	2028	R13 398 000
	Decommission existing La Motte reservoir once La Motte Upper reservoir is constructed.	SFW.B23	0.500	2028	-
	Reservoir storage capacity for Langrug Upper zone (required to service higher lying structures in Langrug)	SFW.B8	1.000	2028	R6 192 000
	Additional reservoir storage capacity for Wemmershoek	SFW.B17	0.750	2030	R5 132 000
	Additional reservoir capacity for future areas	SFW.B5	5.000	2040	R19 575 000

Sub-Total					**R529 000**
Total					**R317 155 000**

3.2.8 Sewer pump stations

Most of the sewer pump stations, as inspected during the WSDP site visits in May 2023, are operational and well maintained. Duty and Standby pumps are available for most of the pump stations. No spillages were observed at any of the sewer pump stations during the site visits. Most of the pump stations are also fenced and locked and some are supplied with alarms to prevent any possible theft or vandalism.

Some of the issues to be addressed at the sewer pump stations, as identified through the WSDP inspection process, are as follows.

- Pump Stations where the electrical fence is not working: Klapmuts PSs No.1, No.2 and No.3.
- Mechanical screen at Klapmuts PS No.2 not operational.
- Erosion and part of fence at Digteby PS to be repaired.

The Sewer Master Plan (June 2025) has indicated that based on the most likely land-use development scenario, it will be necessary for the following future sewer pump stations:

Table 3.2.8.1: Future sewer pump stations required

Drainage System	Recommendations included in the Sewer Master Plan	Item	Capacity (l/s)	Year	Estimated Cost
Stellenbosch WWTW	Investigate existing Pump Station (Distell 1 system)	SSS10.3	-	2025	R32 000
	Investigate existing Pump Station (KWV system)	SSS12.4	-	2025	R32 000
	Investigate existing Pump Station (Distell 2 system)	SSS13.3	-	2025	R32 000
	Investigate existing Pump Station (Stellentia (Gilbeys) system)	SSS16.2	-	2025	R32 000
	Investigate existing Pump Station (Nuutgevonden system)	SSS21.1	-	2025	R32 000
	Investigate existing Pump Station (Welgevonden 2 (Stellenvista) system)	SSS23.2	-	2025	R32 000
	Investigate existing Pump Station (Welgevonden 1 system)	SSS24.2	-	2025	R32 000
	Investigate existing Pump Station (De Zalze 3 system)	SSS6.2	-	2025	R32 000
	Investigate existing Pump Station (Audacia PS 2 system)	SSS8.2	-	2025	R32 000
	Investigate existing Pump Station (Audacia PS 1 system)	SSS8.4	-	2025	R32 000
	Investigate existing Pump Station (Die Boord system, potentially downsize pump station)	SSS14.2	-	2026	R32 000
	New Pump Station required when future areas in the Fleurbaix PS drainage area develop (Initial capacity of 150 l/s, ultimate capacity of 285 l/s)	SSS2.3	150	2030	R12 551 000
	New Pump Station required when future areas in the Welmoed PS drainage area develop.	SSS5.2	-	2030	R2 834 000
	New Pump Station required when future areas in the Droe Dyke PS drainage area develop.	SSS2.24	-	2040	R3 443 000
	Upgrade existing Pump Station (Investigate the capacity of the Plankenburg pumping system first, potentially upgrade pump station)	SSS25.2	-	2040	R1 178 000
	Abandon existing Pump Station when the outfall sewer to Fleurbaix PS is complete.	SSS3.2	-	2040	R286 000
	Upgrade capacity of PS when future areas in the Fleurbaix PS drainage area develop (Initial capacity of 150 l/s, ultimate capacity of 285 l/s)	SSS2.30	135	2045	R2 580 000
	New Pump Station when future area S99.1 develop.	SSS29.2	-	2045	R2 533 000

Total					**R56 642 000**

3.2.9 Waste Water Treatment Works

The table below gives a summary of the existing hydraulic design capacities and current flows at each of the WWTWs, as well as the final effluent quality compliance percentages for the 2023/2024 financial year.

Table 3.2.9.1 Existing hydraulic design capacities and flows at each of the WWTWs						
WWTW	**Existing Hydraulic Capacity**	**Peak Month Average Daily Flow**	**Average Daily Flow (2023/2024)**	**Average Wet Weather Flow (April to September)**	**Average Daily Flow as a % of Design Capacity**	**Final Effluent Compliance for 2023/2024**
	Ml/d	**Ml/d**	**Ml/d**	**Ml/d**	**%**	
Stellenbosch	35.000	36.963 (Sept)	23.718	25.978	67.77	Stellenbosch 1 Microbiological: 0.0% Chemical: 25.0% Physical: 44.4% Stellenbosch 2 Microbiological: 0.0% Chemical: 50.0% Physical: 69.4%
Wemmershoek	3.600	11.442 (Jun)	4.120	5.327	114.44	Microbiological: 33.3% Chemical: 27.1% Physical: 66.7%
Pniel	4.500	3.856 (Sept)	2.347	2.649	52.16	Microbiological: 0.0% Chemical: 47.9% Physical: 91.7%
Klapmuts	2.400	2.209 (Nov)	1.537	1.593	64.04	Microbiological: 50.0% Chemical: 62.5% Physical: 77.8%
Raithby	0.150	0.206 (Oct)	0.065	0.062	43.33	Microbiological: 33.3% Chemical: 77.1% Physical: 88.6%

Note: The Wemmershoek WWTW was originally designed for a hydraulic capacity of 5.0 Ml/d, but due to design errors the current hydraulic capacity of the plant is only 3.6 Ml/d.

The organic design capacities of the WWTWs and the current loadings at the WWTWs are indicated in the table below.

Table 3.2.9.2: Existing organic design capacities and loadings at the WWTWs					
WWTW	**Organic Design Capacity**	**2022/2023**		**2023/2024**	
		Average Load	**% of Organic Design Capacity**	**Average Load**	**% of Organic Design Capacity**
	kg COD/d	**kg COD/d**	**%**	**kg COD/d**	**%**
Stellenbosch	35 000	17 201	49.15	24 237	69.25
Wemmershoek	4 350	1 953	44.90	2 979	68.48
Pniel	4 500	1 511	33.58	937	20.82
Klapmuts	2 700	1 372	50.81	1 715	63.52
Raithby	53	61	115.09	39	73.58

The projected future WWTW flows are included in the future water requirement projection models. The table below gives an overview of the average daily future projected WWTW flows.

Table 3.2.9.3: Average daily and peak month future projected WWTW flows (Ml/d)

WWTW	Existing Hydraulic Capacity	Average Daily Future Projected WWTW Flows					Peak Month Average Daily Future Projected WWTW Flows				
		2028	2033	2038	2043	2048	2028	2033	2038	2043	2048
Stellenbosch	35.000	26.535	31.769	38.165	43.690	50.301	33.434	40.029	48.088	55.049	63.379
Wemmershoek	3.600	3.723	4.409	5.252	6.288	7.566	5.585	6.614	7.878	9.432	11.349
Pniel	4.500	2.212	2.334	2.478	2.646	2.839	2.765	2.918	3.098	3.308	3.549
Klapmuts	2.400	1.759	2.127	2.748	3.381	4.425	1.935	2.340	3.023	3.719	4.868
Raithby	0.150	0.087	0.117	0.156	0.209	0.280	0.134	0.180	0.240	0.322	0.431

Note: The peak month factors used in the above table is 1.26 for Stellenbosch, 1.50 for Wemmershoek, 1.25 for Pniel, 1.10 for Klapmuts and 1.54 for Raithby.

Stellenbosch WWTW: The 2022 Green Drop Score for the Stellenbosch WWTW was 84% and the DWS's Wastewater Risk Rating increased from 55.6% (Medium Risk) in 2021 to 86.4% in 2023 (High Risk). The capacity of the WWTW is adequate to meet the short term future treatment requirements (Next three years), but the Municipality will need to budget for the upgrading of the WWTW in the nearby future. The following operational problems were noticed during the WSDP site visit in May 2023.

- Inlet works: Only one of the three mechanical front raked screens was operational. One of the wash compactors was not operational. Seepage pump was not operational due to blockages from the broken wash compactor. Odour system not operational. One of the degritters was not operational.
- Four rotating brush fine screens: Screens No.1 and No.4 were not working.
- Bio-reactor: One of the five aerators was not operational.
- MBR: Valve broken off, to be repaired. The shaft of one of the actuators was broken. Hach inline sampler not operational. Membrane pumps No.2 and No.4 not working.
- SST No.1 and No.3: Scum plates were removed at various sections. SST No.2 leaking at floor and bridge wheel was removed.
- UV disinfection system: Not operational due to broken sensor.
- Belt press: Only one of the two sludge pumps was operational. Pumps need to be operated manually.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Stellenbosch WWTW were as follows:

- The plant is in general in a good condition and seems well managed.
- The plant is not fully compliant with the stringent special limits, but comply well within the general limits.
- The application for relaxing for effluent limits of Conductivity, COD, Ammonia, E.Coli and Nitrate limits with DWS should be followed up . It is reported that the application has been in review by DWS since 2018.

Wemmershoek WWTW: The 2022 Green Drop Score for the Wemmershoek WWTW was 83% and the DWS's Wastewater Risk Rating increased from 63.6% (Medium Risk) in 2021 to 82.4% in 2023 (High Risk). The reduced capacity of 3.6 Ml/d of the Wemmershoek WWTW is inadequate to meet the current and future treatment requirements and the capacity of the WWTW needs to be increased. The following operational problems were noticed during the WSDP site visit in May 2023.

- Lighting at plant not adequate, which is a safety and security risk.
- Office building: Geyser is not working. No sampling equipment for operational sampling.
- Inlet works: Two mechanical front raked screens were not operational. Service water pumps for water at inlet works not operational.

- Raw feed tank: Level sensors were faulty. One of the three submersible pumps was not operational.
- SBR: Valve malfunctioning (SBR No.2). One of the four blowers was not working.
- Two linear screen and belt wash pumps were not operational (Alignment). One of the service water pumps was not operational. Compressor for linear screen and belt wash pumps was not operational.
- Silo for belt press: No control valve, dried sludge push out when full. Level sensor also faulty.
- Chlorine Disinfection: Door of chlorine building to be replaced. No BA sets or other chlorine safety equipment. No water at emergency shower. Vacuum regulator for second chlorine cylinder not operational, only one cylinder can be used. Extraction fan is not operational.
- Electrical fence was vandalised, not operational.
- No final effluent flow meter.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Wemmershoek WWTW were as follows:

- The plant is generally in good condition regarding civil structures, but various mechanical equipment is not operational.
- The works is organically overloaded and additional to this, the works was never designed to achieve Special Limits at these high organic loads.
- Phase 1 of the planned upgrade was underway during writing which will address most of the short falls and operational challenges.

Pniel WWTW: The 2022 Green Drop Score for the Pniel WWTW was 83% and the DWS's Wastewater Risk Rating increased from 58.8% (Medium Risk) in 2021 to 82.4% in 2023 (High Risk). The capacity of the WWTW is adequate to meet the medium to long term future treatment requirements (Next ten years). The WWTW was in a very good condition during the WSDP site visit in May 2023. Only two items were noticed during the site visit.

- Bio-reactor: Anoxic Basin: One of the two mixers were removed for repairs.
- Sludge drying beds to be cleaned of weeds and grass.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Pniel WWTW were as follows (Before upgrade):

- The plant is generally in good condition regarding civil structures, but various mechanical equipment is not operational.
- The works is organically overloaded and additional to this, the works was never designed to achieve Special Limits at these high organic loads.
- Upgrade is currently underway which will address most of the short falls and operational challenges.

Klapmuts WWTW: The 2022 Green Drop Score for the Klapmuts WWTW was 82% and the DWS's Wastewater Risk Rating increased from 41.2% (Low Risk) in 2021 to 70.6% in 2023 (High Risk). The capacity of the WWTW is adequate to meet the short to medium term future treatment requirements (Next three to five years), but the Municipality will need to budget for the upgrading of the WWTW in the nearby future. The Klapmuts WWTW was in a very poor condition during the WSDP site visit in May 2023 and the following operational problems were noticed.

- General: WWTW terrain overgrown with grass, inadequate maintenance. Grass also to be removed from sludge holding tank.
- No sampling equipment for operational sampling.
- Inlet works: Mechanical front raked screen was removed for repairs.

- Bio-reactor: Only one of the a-cycle pumps was operational. Both submersible waste sludge pumps were not operational. Inline DO and Turbidity meters were not working.
- SST No.2 not operational, because of faulty RAS PS valve. One of the submersible pumps is not working.
- Chlorine disinfection: No disinfection was done at the time of the site visit, due to chlorine shortage. The chlorine tablet disinfection system was also not operational.
- Only one of the pumps for the final effluent for the Belt Press was operational, the other pump was removed for repairs. The Belt Press was not operational due to loose belt.
- Maturation pond to be cleaned and full of scum on the surface. Sludge lagoon also overgrown with grass and needs to be cleaned.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Klapmuts WWTW were as follows:

- There is a serious theft problem at the works in spite of the presence of 24 hours security present. Due to this, and lengthy parts/ equipment replacement period, the operation of the works is affected resulting in violating the license effluent limits.
- The emergency sludge lagoon remains filled to capacity resulting in zero sludge handling capacity in case of belt press breakdowns.
- The security on site needs to be tighten and emergency sludge handling capacity needs to be created.

Raithby WWTW: The 2022 Green Drop Score for the Raithby WWTW was 73% and the DWS's Wastewater Risk Rating increased from 64.7% (Medium Risk) in 2021 to 76.5% in 2023 (High Risk). The capacity of the WWTW is adequate to meet the short term future treatment requirements (Next three years), but the Municipality will need to budget for the upgrading of the WWTW in the nearby future. The following operational problems were noticed during the WSDP site visit.

- Inlet works: Mechanical front raked screen needs to be reset after each load shedding period.
- Only one of the six rotating biological contactors was operational.
- Back-up emergency sludge lagoon needs to be cleaned, also overgrown with grass and reeds.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Raithby WWTW were as follows:

- The plant is generally in good condition regarding civil structures with only few mechanical equipment not operational.
- The works is organically overloaded and require additional treatment capacity.
- An upgrade for the works was at planning state.

The following future upgrades are required with regard to the WWTWs.

Table 3.2.9.4: Future upgrades of the WWTWs

WWTW	Short description	Time Frame	Estimated cost
Stellenbosch	Pond rehabilitation and pond pumping systems construction	2025-2028	R4 400 000
Stellenbosch	Extension of WWTW	2025-2028	R82 200 000
Wemmershoek	Upgrade of WWTW	2025-2027	R31 000 000
Klapmuts	Upgrade of WWTW	2025-2028	R81 000 020
Raithby	Refurbish plant and equipment	2025-2027	R10 000 000
Stellenbosch	Upgrade WWTW with an additional 15 Ml/d	2030	R375 000 000
Stellenbosch	Upgrade WWTW with an additional 15 Ml/d	2040	R375 000 000
Wemmershoek	Upgrade WWTW with an additional 4.5 Ml/d	2034	R112 500 000
Total			**R1 071 100 020**

3.3 WATER AND SANITATION SCHEMS

3.3.1 Water Schemes

The Water Master Plan (July 2025) indicates the future water reticulation network components that will be necessary for the various developments and the required changes to the existing networks (Proposed distribution zones, future systems and required works). The water master plan items and tables are included in Annexure A.

3.3.2 Sanitation Schemes

The Sewer Master Plan (July 2025) indicates the future sewer drainage network components that will be necessary for the various developments and the required changes to the existing networks (Proposed drainage zones, future systems and required works). The sewer master plan items and tables are included in Annexure A.

4 WATER SERVICES OPERATION AND MAINTENANCE

It is important for Councils to understand the value of maintenance and provide the necessary funding to properly operate and maintain infrastructure. There is a conflict of interest in Councils, due to backlogs of basic necessities such as housing and water, sanitation and electricity services, which many poor people urgently need, and expect councillors to provide. They are inclined to prioritise the needs for extending services before maintaining existing services.

It is the responsibility of the municipal and technical managers to educate and inform Councils on this and help councillors explain these issues to their communities. **Successful municipalities depend to a single principle – effective and efficient management!**

Much of the routine work of technical departments involves managing and undertaking the O&M of services that is done in-house by municipal staff. A second major aspect of work is managing O&M undertaken by external service providers. The third major area is new or capital projects, also usually undertaken by external service providers.

Each service area in Stellenbosch Municipality needs an O&M system that monitors and assesses infrastructure condition and plans the required preventative maintenance, and when necessary, rehabilitation, upgrading or replacement of infrastructure. This is a major part of an overall Asset Management System, which

- records, describes all infrastructure assets;
- monitors and assesses their condition;
- plans and monitors maintenance;
- plans upgrading, rehabilitation and replacement; and
- values assets and the costs of maintenance, upgrading, rehabilitation and replacement.

There are a wide range of **desirable objectives** that should be achieved with the help of maintenance.

- Retain an asset in a serviceable condition during its designed life span.
- Optimize the reliability of equipment and infrastructure.
- Ensure that the equipment and infrastructure are kept in a good condition.
- Ensure prompt emergency repair of equipment and infrastructure to sustain service delivery.
- Take action before repair costs become too high.
- Ensure operation by eliminating breakdown risks or limiting them as much as possible.
- Improve delivery by upgrading infrastructure.
- Enable repairs under the best possible conditions.
- Improve operational safety and remove causes of accidents.
- Reduce the overall management burden through better work preparation and reduced unforeseen production stoppages.
- Protect the environment.

To achieve these objectives, it is necessary to train personnel in specific maintenance skills and to influence their attitudes, as better operational results depend on motivated staff who are committed to proper maintenance procedures and standards.

Setting up a preventative maintenance programme is one of the most effective ways of reducing breakdowns and keeping equipment and infrastructure in good condition. It is important to implement such a programme as soon as new equipment or infrastructure is put into service.

Implementing a preventative maintenance programme requires a **maintenance plan**, with particular emphasis placed on the following:

- Periodic inspection of equipment according to a pre-established programme so that working conditions may be checked.
- Systematic servicing – the first step in devising this programme is to forecast the life of parts and components subject to wear, i.e. the study of reliability, failure modes and effects and fault analysis.
- Overhauls, which often require considerable work, should be planned during low production periods.

4.1 OPERATION AND MAINTENANCE PLAN

Table 4.1.1: Master Plan for Water Services Operation and Maintenance

Section	Master Plan	Yes / No
Operation and Maintenance Plan	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Partly
Resources	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Partly
Information	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Partly
Activity Control and Management	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Partly

The complexity of maintenance activities should be analysed to set up an efficient maintenance plan and to take management decisions, e.g. regarding use of own resources and unskilled or skilled resources. **Five levels of maintenance** can be distinguished, depending on the complexity of the work and the urgency of action.

- Simple adjustments are generally applicable to accessible components and require no dismantling or opening of the equipment. These adjustments involve the completely safe replacement of accessible consumable components such as signal lights or some types of fuses. Servicing of this type may be performed by the operator on site, without tools, following the instructions for use. The stock of consumable parts required is very small.

- Troubleshooting entails minor preventative maintenance operations such as greasing or checking for proper functioning. Servicing of this type may be performed on site by an authorised technician. An authorised technician has received training that enables him/her to perform such maintenance work safely and is well aware of potential problems.

- Breakdowns require identification, diagnosis and repairs by replacing components or working parts. Servicing of this type must be carried out by trained persons, on site or in the maintenance shop, using the documentation (manuals, spare part lists, etc.) necessary for maintenance of equipment.

- Major maintenance work covers all major corrective or preventative work except modernization and rebuilding. Servicing of this type must be carried out by a team that comprises highly skilled technical specialists, using the relevant documentation.

- Modernising and rebuilding equipment or executing major repairs is usually done by the manufacturer or builder. Resources are specified and usually very similar to those used in the original manufacturing or construction.

In order to ensure **good quality O&M**, technical managers firstly need to ensure that staff responsible for in-house O&M

- understand equipment and infrastructure;
- understand and implement the proper O&M requirements and procedures;
- understand the required service and operating standards;
- have and develop the necessary O&M skills;
- assess equipment and infrastructure conditions;
- understand and identify typical defects and problems;
- solve problems and make necessary repairs, or engage experts to do so; and
- record all activities to provide data for planning and analysis of O&M.

Secondly technical managers must ensure that they contact competent external service providers.

The bulk of O&M activities should be of a preventative nature. That is regular checking all the water and sewerage infrastructure and ensuring that everything is in good operational condition. The sections 4.1.1 to 4.1.10 below include recommended O&M tasks for the various water and sewerage infrastructure components that should be implemented by Stellenbosch Municipality.

4.1.1 Groundwater infrastructure

The boreholes developed by Stellenbosch Municipality during the Drought Intervention Programme are currently not in use. O&M of boreholes has often been neglected, and when performance declines beyond a prescribed level, they are abandoned and new boreholes are drilled. This waste of and disrespect for scarce water resources has been allowed to continue for years in many municipalities. There are many causes of decreased borehole yields and failure including

- mechanical failure related to breakdown of the pumping equipment;
- inefficient hydraulic flows in borehole feeding pipes due to incorrect pipe sizes, poorly matched pumps and inefficient use of valves;
- geohydraulic failure as a consequence of over-pumping, which can cause inelastic compression of fractures, pumping of silts, sealing or encrustation of aquifer pores and screen openings by fine particles, or chemical/biological precipitation caused by iron bacteria on the slotted casing; and
- geohydraulic failure can also be caused by poor borehole design, which leads to borehole collapse, or the entry of unacceptably high volumes of sediment.

Maintenance is needed to prevent specific problems, and rehabilitation can restore the optimum efficiency of a borehole. Boreholes often need to be rehabilitated every 15 years, and sometimes as often as every six or nine years. In some cases, major reconstruction may be necessary, such as replacing the screen or a portion of the casing. Three aspects need to be taken into account when considering the implementation of a borehole maintenance or rehabilitation programme.

- Human Factors: It is often difficult to obtain support for a comprehensive maintenance and rehabilitation programme. Such programmes often lack status and excitement, compared to the implementation of new projects. Poor management, pride and reluctance to admit project failure by implementing agents, and an ignorance concerning the importance of regular maintenance are other factors. There is often a belief that as long as a borehole is operating there are no problems and no need to monitor borehole performance. When this perception is prevalent, it is often difficult to identify those problems that could be remedied by rehabilitation at an early and ‘curable’ stage.

- Economic Factors: It is often cheaper to maintain or rehabilitate a borehole than to replace it, once its performance has deteriorated significantly. Even when rehabilitation is more economical, as is often the case, money for rehabilitation is often more difficult to obtain than money for new projects. New projects are mostly grant funded, while O&M and rehabilitation are funded by municipal income. Since the water services income is not ring-fenced to cover necessary O&M costs related to delivering services, but used for other municipal expenses, this leads to less and less resources being allocated to O&M. It is understandable that desperate technical managers sometimes try to secure O&M resources via new projects, by disguising replacement costs as new infrastructure projects.

- Technical Factors: Technical factors relate to understanding the processes which cause declining borehole performance, and the means by which they can be avoided or rectified. If potential causes of declining performance can be diagnosed, maintenance methods to prevent their occurrence can be planned and included in the O&M budget. But effective preventative maintenance and rehabilitation require that accurate borehole construction records be kept, showing geological conditions and hydraulic performance profiles. Experience has shown that once a borehole's performance drops by about 25 %, expressed as a decline in specific yield, it is time to rehabilitate the borehole.

No production boreholes are currently utilised by Stellenbosch Municipality. It is however important for Stellenbosch Municipality to implement the following recommended daily, weekly, monthly and six monthly O&M activities for their boreholes when in operation.

Table 4.1.1.1: Recommended daily, weekly, monthly and six monthly O&M activities for the boreholes

O&M Activity	Frequency
Borehole underground condition and equipment	
For a borehole with a rotary pump; pull out the rising main and pump element: - Clean and check the pump element (screen, rotor and stator). - Clean and check all sections of the rising main (columns). - Check the rubber stabilizers and replace any badly worn. Assess if the borehole needs cleaning and/or rehabilitation. Decide when this must be done.	Every three years, depending on the geological formations. In some areas it might be necessary to do it more often.
For a borehole equipped with a submersible pump: start the pump and monitor the full load current to ensure correct operation.	At least once a week.
Remove the submersible pump from the borehole and remove trapped particles and deposits from the inlet screen with a jet of clean water.	Every six months
Change the oil on the submersible pump if the oil can be replaced, some pumps are sealed units.	Every six months
Record water levels: static water level and drawdown during operation or just after operation.	If the borehole is connected to a telemetry system, this is done automatically and daily. Otherwise the operator must take and record the measurements.
Pump house and pump installation above ground	
Check and attend to the condition of the pump house foundation (plug any gaps or holes), walls and roof, door and lock, ventilation bolts and paint condition. Patch up where necessary. Apply a drop of oil on the lock.	Monthly
Start the pump and monitor the full load current and check operating pressure on the delivery pressure gauge. Also check for abnormal vibration, abnormal temperature and strange noise. Check oil level.	Weekly
Check condition of gland packing and adjust to provide a steady drip.	Weekly
Check and tighten base plate mounting bolts.	Weekly
Check the alignment of the drive pulley and pump pulley. Correct if necessary. Listen for any bearing noise. Check that the safety cage is Ok and securely mounted.	Weekly
Check the tension and condition of the v-belt and replace if frayed or worn.	Weekly
Check the operation of the motor cooling fan.	Weekly
Petrol/diesel driven pump: check for any oil or fuel leakage and spill. Check the gaskets and replace if leaking. Check the oil and fuel spill collection sump and take out any spill and it to the workshop. Under no circumstances is it allowed to be dumped in the veld.	Weekly

Table 4.1.1.1: Recommended daily, weekly, monthly and six monthly O&M activities for the boreholes	
O&M Activity	**Frequency**
Other equipment	
Check the operation of the non-return valve. Failure of this valve can result in a sheared pump shaft or a snapped v-belt.	Daily
Check for and attend to leaks from gaskets, joints, and corroded piping, and for ingress of rainfall.	Daily
Take the reading of the flow meter if not automated. Keep the meter clean and check that it is in good order. If automatic reading, check connection to telemetry.	Daily
Check flow switch and pressure switch.	Daily
Check pressure gauge with ball valve on tee.	Daily
Check the scour valve.	Daily
Daily check that the air/pressure release valves are in good order.	Daily
Replace the air valve with a back-up while maintaining the valve in workshop every six months.	Every six months
Borehole yard	
Check that rainfall runoff is directed away from the yard and that there are no puddles in the yard. Check also that there are no other pollution risks in or near the yard.	As necessary after heavy rains, otherwise this is a monthly check point.
Clean the yard of any scrap and discarded containers etc. Never allow any waste to be dumped within the yard and the inner protection zone.	Monthly
Keep the grass and weeds short. Remove any 'emerging' bushes and trees.	Monthly
Check condition of fence, gate, lock, sign board (is the information on the sign still readable, telephone number correct etc.?). Apply a drop of oil on lock. Repair as necessary, immediately. Never allow the borehole yard to be un-protected.	The operator would do these checks every day, but a more thorough inspection to be done monthly.
If the borehole is equipped with a rain gauge, check it as a matter of routine every day and record any rainfall.	Daily
Electrical installations (Note that most of the required activities can only be performed by an electrician)	
Clean the cabinet and the contactors.	Weekly
Check functioning of all starters, contactors and trip mechanisms.	Weekly
Check over/under voltage relay.	Weekly
Start the pumps and other electrical equipment manually and check the operation of all instruments such as am-meters and volt meters for correct functioning.	Weekly
Check that all panel lamps and site lights are working. Replace bulbs where necessary.	Weekly
Check the operation of the control system which may be an ultrasonic sensor, float switches, pressure transducer or a liquid level sensor.	Weekly
Check the operation of the telemetry system (if installed).	Weekly
Listen to all motor bearings for excessive wear.	Weekly
Inspect the entire installation and ensure all equipment is to required specification. Repair or replace all damaged parts of the equipment.	At least every three months
Clean all cabinets and enclosures thoroughly by washing down with a damp cloth on the outside and blowing out all dust, spider webs and insects on the inside using an electrical industrial blower.	At least every three months
Remove and clean all contactors with a solvent approved for electrical components.	At least every three months
Tighten all cable glands and ensure all cables are secured on cable racks and in conduits.	At least every three months
Check all terminations for integrity and signs of corrosion.	At least every three months
Clean level sensors and check the settings.	At least every three months
Inspect all wiring for evidence of heat build-up and tighten motor terminals to avoid hot connections.	At least every three months
Grease all motor bearings.	At least every three months
Inspect frame and tighten mounting bolts.	At least every three months
Measure supply voltage.	At least every three months
Check all earthing systems and lightning arrestors for correct functioning, and replace if faulty.	At least every three months
Ensure all labelling and name plates are in place and readable.	At least every three months

Table 4.1.1.1: Recommended daily, weekly, monthly and six monthly O&M activities for the boreholes	
O&M Activity	**Frequency**
Paint cabinet if required to protect it from corrosion.	At least every three months
Check canopy; tighten mounting bolts and patch up the corrosion protection.	At least every three months
Telemetry System	
Clean the battery terminals.	Monthly
Test the charger and test batteries for 12 volt.	Weekly
Check that the antenna is fixed in the right direction.	Monthly
Check the cabinet frame, canopy, and mounting bolts. Clean cabinet with a blower and a soft cloth. Check for corrosion, and patch up with paint where necessary.	Monthly
Quality control, log books and reports	
Fill in the logbook daily as required.	Daily
Adjust if necessary, the inspection and maintenance schedules.	Monthly
Measure and record the (turbidity), electric conductivity and pH levels.	Monthly
Take water sample for bacteriological testing.	Monthly or as agreed with DWS
Draft and submit prescribed reports.	Monthly
Up-date records of all production and monitoring boreholes. Most importantly: volumes abstracted during the year, water levels and physical parameters (electrical conductivity, pH, (turbidity) beginning and end of year, and summarise lab reports on bacteriological testing. Once a year have a water sample tested for chemical parameters. Compare records with DWS authorization/license and with Management Recommendation, e.g. level of pump intake. Highlight trends and draw conclusions and include in an annual report.	Monthly and annually

Note: As can be seen in the table, most activities are part of the daily O&M performed by the operator. Many monitoring activities can also be automated in a telemetry system. If the borehole is connected to a telemetry system, then a maintenance operator or the technical supervisor must visit the borehole at least twice a month and do the checks and associated maintenance. It is important to validate automated records with regular on-site observations and measurements.

4.1.2 Surface water infrastructure

Jonkershoek Weir (Raw water supply to Idas Valley WTW, old photo)

Inlet Idas Valley WTW (Supply from Jonkershoek – Eerste River)

Inlet Paradyskloof WTW (Supply from Theewaterskloof Tunnel)

The surface water abstraction points are regularly inspected by the operational personnel to ensure a continuous supply of raw water to the WTWs. Some of the O&M activities implemented by Stellenbosch Municipality for their surface water abstraction points include the following:

- Routine inspections of all abstraction points;
- Recording of abstraction volumes and rainfall readings;
- Daily monitoring of water levels at weirs and cleaning of weirs.
- Full SANS sampling of raw water quality every six months.

The following preventative maintenance procedures are necessary to ensure satisfactory operation of the abstraction facilities for the surface water sources.

- Operate the intake gates through one cycle at least once a month.
- Clean debris from the intake area as the need arises or at least six times per year.
- Monitor debris build-up on screens continuously.
- Check level of abstraction point, (i.e. not at bottom or too near to top).
- Lubricate the bearings of screens as Scheduled.
- Check cleaning systems of screens periodically.
- Remove screenings daily and dispose in an approved landfill.
- Calibrate raw water meters so that an accurate indication can be obtained of the volume of water that is abstracted and treated. Calibration must be done by a trained technician.
- Clean raw water pump stations and attend to any abnormal noise, smell, excessive heating etc.

4.1.3 Bulk and water reticulation networks and fittings

The water reticulation networks and pipe fittings are well operated and maintained. Most of the bulk water meters and valves are operational and no major leaks were noticed during the WSDP site visits. The water infrastructure is also protected against possible theft and vandalism. Most of the chambers are supplied with lockable covers.

Some of the O&M activities implemented by Stellenbosch Municipality for their bulk and water reticulation networks and fittings include the following:

- Regular calibrations of all bulk water meters;
- Regular servicing of hydrants, control valves, scour valves, air valves, PRVs, etc.;
- Protecting valves and fittings against corrosion;
- Protecting infrastructure against possible theft and vandalism;
- Regular replacement of faulty meters, valves and fittings;
- Immediately repairing any leaks on the networks or at valves, hydrants or other fittings;
- Scada system that monitors the flows and the PRVs;
- Standby teams over weekends and during holiday periods to attend to any required O&M tasks; and
- Customer complaints system to respond immediately to any possible water complaints.

The table below gives some of the Maintenance actions that can be implemented by Stellenbosch Municipality on their water reticulation networks and fittings.

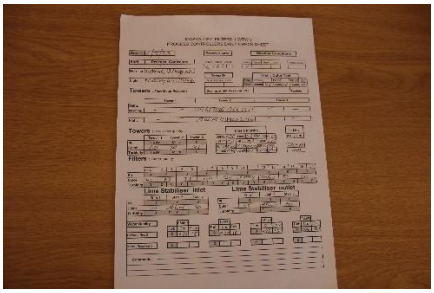

Table 4.1.3.1: Maintenance activities for the water reticulation networks and fittings

No.	Maintenance Action	Daily	Weekly	Monthly	Annually	Other
1	**Pipelines**					
1.1	Check for leakages in system (block by block)			**X**		
1.2	Check and clean chambers. Check chamber lock.			**X**		
1.3	Stock taking of spares (materials for pipe repairs)			**X**		
1.4	Flush entire system					**X**
1.5	Check marker posts and beacons				**X**	
1.6	Refurbish marker posts and beacons					**X**

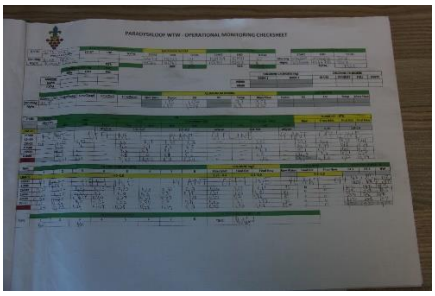

Table 4.1.3.1: Maintenance activities for the water reticulation networks and fittings						
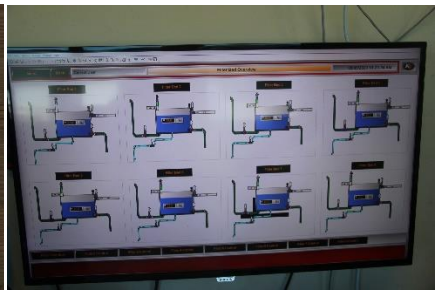
No.	**Maintenance Action**	**Daily**	**Weekly**	**Monthly**	**Annually**	**Other**
2	**Standpipes (Communal and Public Buildings)**					
2.1	Check for leakages	X				
2.2	Clean standpipe slab and surroundings		X			
2.3	Clean soak away		X			
2.4	Maintain standpipe equipment / accessories		X			
2.5	Read meters and clean meter chambers			X		
2.6	Replace biptap				X	
3	**Bulk Meters**					
3.1	Reading of bulk meters			X		
3.2	Cleaning of chambers			X		
3.3	Check for leakages			X		
3.4	Calibration of meters				X	
3.5	Replacement of registering unit					X
3.6	Replacement of entire meter					X
3.7	Check and empty all strainers protecting the bulk meters			X		
4	**Consumer Meters**					
4.1	Reading of meters			X		
4.2	Cleaning of meter chamber			X		
4.3	Check for leakages			X		
4.4	Check for tampering			X		
4.5	Check meter accuracy					X
4.6	Replacement of entire meter					X
5	**Valves**					
5.1	Open and close isolating valves			X		
5.2	Check functionality of scour valves			X		
5.3	Check functionality of air valves			X		
5.4	Check functionality of pressure reducing valves			X		
5.5	Service pressure management valves (Pressure Controllers) every 2 yrs					X
5.6	Maintain valve equipment / accessories				X	
5.7	Replacement of valves					X
5.8	Clean valve chambers. Check the cover lock			X		
6	**Fire Hydrants**					
6.1	Check for leakages			X		
6.2	Check and if required refurbish beacon / marker				X	
6.3	Check functionality of hydrants			X	X	
6.4	Test flow rate of hydrants				X	
6.5	Maintain hydrant equipment / accessories				X	
6.6	Replacement of fire hydrants					X
7	**Record Keeping and Reporting**	X	X	X	X	

Stellenbosch Municipality needs to evaluate the existing O&M schedules for their water reticulation networks and fittings against the above recommended daily, weekly, monthly and annual maintenance checklists and needs to ensure that all required activities are adequately monitored and recorded.



4.1.4 Water Treatment Works

Idas Valley WTW: Process Controllers Daily Check Sheet

Paradyskloof WTW: Operational Monitoring Check Sheet

Paradyskloof WTW: Scada Filter Bed Overview

The WTWs are all well maintained and operated with adequate control and monitoring systems in place to ensure proper process control. The WTW sites are also fenced and locked with access control and adequately secured against possible theft and vandalism. The identified O&M problems to be addressed at the WTWs are summarised under Section 3.2.4.

Larger plants generally employ maintenance staff to carry out maintenance tasks, and even outsource more technical tasks to external contractors. At smaller works, some maintenance tasks can be carried out by the operators. The amount and level of maintenance that operating staff can carry out depends on their skills. The complexity of tasks relative to the skill of the operators should be decided by the technical manager or supervisor.

Coagulation and Flocculation: Effective coagulation and flocculation are critical for the successful operation of subsequent treatment processes. Problems associated with coagulation-flocculation processes will result in high turbidity water in the overflow of the sedimentation tank and/or the filtered water.

- Perform jar tests on raw water samples when significant raw water quality changes occur (such as after heavy rainfall), in order to determine new coagulant dosages and mixer speeds.
- Clean accumulated precipitate and sludge from rapid-mix and flocculation basins when the need arises, or at least every six months.
- Ensure that chemical feeders are calibrated every month (by the supplier).
- Check that the chemicals supplied comply with the specifications and adjust feed rates as indicated by the analysis and jar tests.

Sedimentation: Sedimentation can typically remove 80 to 95% of suspended solids and will result in better filter performance and longer filter runs. However, the performance of sedimentation tanks is dependent on effective coagulation-flocculation. Operational problems associated with sedimentation tanks typically relate to ineffective sludge removal or short-circuiting. Ineffective sludge removal is commonly associated with equipment problems or inadequate sludge removal practices. Short-circuiting is typically the result of poor inlet or outlet design. This occurs when the water is able to find a short route between the inlet and outlet, reducing retention time and resulting in poor sedimentation and poor quality water. Short-circuiting can also be the result of wave action, density currents, hydraulic overloading or temperature currents. The aim is to have a settled turbidity of < 5 NTU.

Preventative maintenance at the sedimentation tanks include the following:

- Clean launder and overflow weir daily. Launder is the channel in the sedimentation tank in which the water overflows.
- Remove floating solids daily
- Clean the tanks annually to remove any accumulated sludge and algae growth

- Maintain sludge collection equipment as recommended by the manufacturer
- Test turbidity of effluent daily and whenever the raw water quality or flow rate changes.

Filtration: The operation and maintenance of the filters at the works is aimed at ensuring that clear water is produced. The aim is to have a filtered turbidity of less than 1 NTU. When the water leaving the filters is not acceptable, the following questions should be asked (in this order)

- Can the measurements be trusted?
- Is the pre-treatment sufficient for the water currently being treated?
- Is the operation correct and suitable for the water currently being treated?
- Is the maintenance up to date?

The four checks below provides an indication of the seriousness of the implications in terms of the cost and time required to rectify a problem. Each of the four questions forms the focus of a series of investigations that are listed below. The maintenance of the filter components should be done on a routine, preventative basis. The success of filtration depends not only on whether equipment is working, but on equipment working effectively and accurately. For this reason, frequent calibration, lubrication and overhaul according to the manufacturer's specifications should form the basis of the maintenance programme.

- Check No.1: Measurement (Ensure you can trust what your instrument tells you)
  - Check whether the turbidimeters are calibrated correctly
  - Check the measuring cylinders for cleanliness and scratches
  - Check whether the sample is representative and well mixed
  - Check whether the sampling procedure is sound
  - Check expiry date of calibration standards.
- Check No.2 Pre-treatment (Pre-treatment issues that may cause filter turbidity problems)
  - Check if anything is blocking the chemical dosing points
  - Check for proper chemical mixing
  - Check that the coagulant dose is set at the correct rate
  - Verify the dosing rates required with jar tests and visually inspect that this is applicable in practice
  - Check for poor floc retention in the tanks
  - Check that chemical feeder tanks are not empty
  - Check that dilution/carrier water supplies are functioning acceptably
  - Check that turbidity of water is less than 5 NTU.
- Check No.3 Operation (Operating issues that may cause filter turbidity problems)
  - Check current position of the filter in the filtration cycle. Has the filter run extended into breakthrough or is the filter still within a ripening stage?
  - Check the backwash operation and take the filter out of operation if the previous backwash was not performed properly
  - Check that the flow rate is acceptable and that the filter is not operating outside of acceptable limits
  - Check that the filter is not being operated at excessive pressure
  - Carry out a backwash to end the filter run
  - Consider implementing techniques for managing filter ripening (becoming dirty)

  - Check that turbidity is less than 1 NTU.
- Check No.4 Maintenance (Maintenance issues that may cause filter turbidity problems)
  - Check that the filter contains the correct depth of filter media
  - Check the filter media condition. Look for an even flat surface, watch out for mud balls and cracks
  - Watch filter backwash. Check for even distribution of air scour and backwash water
  - Check backwash bed expansion
  - Check backwash rates.

Disinfection:

Routine and preventative maintenance of chlorine systems and ancillaries include the following:

- Visually inspect and report on complete system (Daily);
- Clean complete installation thoroughly so that leaks would be obvious when they occur (Weekly);
- Check, service, repair and clean dosing apparatus from blockages (Monthly);
- Corrosion protect all equipment and ancillaries (Whenever necessary);
- Check for and repair all leaks. Report leaks. (Monthly);
- Check dosing rate and reset regulators if necessary (Monthly); and
- Measure residual chlorine in the drinking water system (At least daily).

SABS 0298 must also be adhered to in the routine preventative maintenance of vacuum systems for gas chlorination.

The following two daily and monthly O&M tasks are provided as a guide of actions that should be carried out to ensure the proper functioning of a WTW. Some of these actions are already included in the existing O&M schedules of each plant.

Table 4.1.4.1: Recommended daily O&M tasks for the WTW

Item	Component	Monitor	Remarks
Screens / Grids	Screens / Grids	Clean screens/grids and check for debris or distortion/breakage. Remove all debris, leaves, etc.	Replace screens/grids if damaged
Raw water pumps	Motor / Gearbox	Check oil level	Refill if necessary
		Check for vibrations and / or bearing noise	Stop and inspect if necessary. Replace bearing if vibrating or noisy
		Inspect for leakages	Repair
	Coupling	Inspect coupling between motor and pump	Repair if damaged
			If cover has been removed, replace
	Pump	Record pressure reading at output/delivery	If pressure is low, pump is damaged or suction pipe is blocked
	Pressure gauge	Record pressure gauge reading before and after pumps	Compare with previous day's reading. If suction pipe pressure builds up, suction pipes are blocked. If delivery side builds up, delivery pipes are blocked.
Chemicals	Quantity	Inspect bulk supply container	If level is lower than half, order new supply
		Inspect mixing tanks	Fill up daily and monitor regularly
Chlorine dosing	Chlorine dosing	Inspect venture	Repair

Table 4.1.4.1: Recommended daily O&M tasks for the WTW

Item	Component	Monitor	Remarks
		Check sufficient chlorine in cylinders / tanks	Switch tank / re-order
		Test for gas leaks	Repair
		Inspect switch on chlorine regulator	Repair if necessary
Dosing pumps	Pump and motor	Check for vibration and noise	Repair if necessary
		Check oil	Refill
	Dosing rate	Set dosing rate	Set rate based on quality of inflow and jar tests that have been carried out
Settling tanks	Valves	Inspect valves for leakages	Replace or repair
	Desludging	Desludge settling tank at least three times a day	Inspect desludged water and stop if water runs clear
	Overflow / top water	Do visual inspection of quality of overflow water and sludge blanket	If quality reduces, change dosing or desludge on a more regular basis
	Bridge	Check rotating bridges for free operation.	Free obstructions. Repair if damaged.
		Check desludging mechanism and ensure free operation.	Free obstructions. Repair if damaged.
	Distribution box	Inspect the distribution box	Remove all settled solids. Clean the weirs, gates and walls as necessary.
	Effluent box	Inspect the effluent box. Measure the head over the weir routinely	Clean the weir and walls if necessary. Record.
	General	Check for floating solids	Remove
		Inspect inside exposed vertical walls and channels	Clean if necessary
Filter pumps	Motor / gearbox	Check oil	Refill if necessary
		Check for vibrations and/or bearing noise	Stop and inspect, if necessary. Replace bearings if vibration or noise increases.
		Check for leaks	Repair
	Coupling	Inspect coupling between motor and pump.	Repair if damaged.
			If cover has been removed, replace.
	Pump	Record pressure reading at output/delivery side.	If pressure reduces, pump is damaged or suction pipe is blocked
	Pressure gauge	Record pressure before and after pumps.	Compare with previous day's reading. If suction pipe pressure builds up, suction pipes are blocked. If delivery side builds up, delivery pipes are blocked.
Filters	Valves	Inspect valves for leaks.	Repair or replace
	Pressure gauges	Inspect pressure gauge readings before and after filters.	If pressure increases over filters, backwash. If pressure remains unchanged, check meters are operating.
	Back wash	Inspect pattern of backwash water and air.	If patterns are uneven, there are damaged nozzles.
		Check sand level.	If the sand level is falling, check if nozzles are damaged or sand is being washed out with backwash water. Fill up with sand. Monitor and replace nozzles if necessary.
Switchboard	Switch	Check switchboard for any alarms.	Reset and inspect fault
Water samples	Take water samples	Take water samples at identified sampling points.	Keep record of all readings and take corrective action if quality decreases.
Control equipment	Level-control	Inspect level-control equipment at the clear water reservoir.	If levels given are faulty, repair.

Table 4.1.4.1: Recommended daily O&M tasks for the WTW			
Item	**Component**	**Monitor**	**Remarks**
Record keeping / Diary	Recording	A record should be kept of all daily activities and inspections.	If record is not kept properly, implement immediately.

Table 4.1.4.2: Recommended monthly O&M tasks for the WTW			
Item	**Component**	**Monitor**	**Remarks**
Screens / Grids	Screens / Grids	Inspect working of screens/grids	Replace any component if necessary. Clean and tidy
Raw water pumps	General	Clean motor and pump	Paint and clean if necessary
Pipelines	Pipes and valves	Inspect pipelines for blockages	Flush and clean pipes if necessary
Settling tanks	Structure	Check for leaks	Repair

The O&M schedules need to be signed by the Process Controller and the Supervisor for each specific plant. The Supervisor for each plant should also carry out the following **weekly** tasks:

- Check work of operators and discuss performance.
- Check logbooks and action where necessary.
- Check gauge readings and calibrate if necessary.
- Check samples of final outflow and send for analysis. This can also be done on a monthly basis.
- Check that pumps and mechanical equipment are being maintained.
- Check the working of the chlorine dosing unit where applicable.
- Check for any other issues that may need attention.

According to the Water Act, an independent person must visit a WTW **quarterly** and do the following:

- Take and test a sample of the inflow and final outflow.
- Check the mechanical equipment.
- Check that the recommendations of the previous visit have been implemented.
- Write and submit a report to the Supervisor and the DWS.

Stellenbosch Municipality needs to evaluate the existing O&M schedules for their WTWs against the above recommended O&M tasks and needs to ensure that all required activities are adequately monitored and recorded.

Record keeping and reporting for the WTWs generally occurs on the following three levels.

- Level 1: The plant operator collects and records data.
- Level 2: The plant supervisor uses the Level 1 data to inform the technical manager on a weekly or monthly basis.
- Level 3: The technical manager must submit a monthly report to the DWS's Regional Office on water quality. The technical manager should also submit a quarterly report to the Council describing issues such as capital expenditure, O&M costs as well as other pertinent matters.

The monthly report from the WTW supervisor to the technical manager should contain the following information.

- Status of personnel: Number of operators; details of vacancies; and other notes such as work hours lost due to injury or illness, training needed and safety issues that need attention.

- Production figures: Total monthly volume of raw water abstracted; average daily flow; total monthly volume of potable water produced; total monthly volume of sludge produced; and water quality status as per own tests and lab report.

- Consumed items: Chlorine consumption and stock for month; value of consumed chlorine; coagulation chemicals consumption for month; value of coagulation chemicals consumed; diesel consumption and stock for month; value of consumed diesel; electricity consumption for the month; maximum electricity demand for month; value of consumed electricity; and total value of consumed items for the month.

- General remarks: A short report on the repair of the mechanical equipment and any other activities and/or problems experienced at the plant during the past month. Also include major planned maintenance and repair activities for the next month.

It is recommended that Stellenbosch Municipality ensure that at least the following four record types are kept and maintained at each WTW.

- Daily Occurrence Book: Should record the daily activities as well as any unusual occurrences at the works during the day e.g. visitors, breakdowns, power failures, etc.

- Daily Operational Log: Should provide a record of operational details such as flow, meter readings, chemical usage, times of desludging and pumping, etc. The data can be recorded hourly, two hourly or once per shift as required.

- Analytical Data Log: Is a record of the results of any analysis. Some of this data may not be determined at the works, but by outside laboratories. Such data should also be filed and kept at the works. The results of these tests can be used by the operators to effect operational adjustments as and when required.

- Order Book Record: Is a record of the orders placed for chemicals, parts and tools.

4.1.5 Water Pump Stations

Klapmuts PS

Wemmershoek Booster PS

Park Street PS

The water pump stations are all well maintained and adequately secured against possible theft and vandalism (Pump station buildings are fenced and locked). Mobile generators are also available for use during power failures at some of the pump stations. Control and monitoring systems are also in place to ensure adequate operation and maintenance of the water pump stations, with regular

inspections by operational personnel. The O&M problems to be addressed at the water pump stations, as identified during the WSDP site visits, are summarised under Section 3.2.5.

Pump Maintenance: Most pumps require limited maintenance, if correctly selected and of sufficient quality. All pumps require at least weekly attention. All pump stations should be inspected at least once a week, whether maintenance is required or not. Always follow the manufacturer's O&M instructions. The following minimum **WEEKLY** maintenance is required with conventional centrifugal pumps.

- Check oil level;
- Check condition of gland packing and adjust to provide a steady drip;
- Lightly grease the threads of the gland follower studs with a copper coat or water-resistant grease;
- Check tightness of the base plate mounting bolts;
- Check for abnormal vibration;
- Check for abnormal temperature;
- Listen for any strange noises (bearing whine or cavitation);
- Start the pump and monitor the full load current;
- Check operating pressures on the delivery pressure gauge;
- Check the alignment on the motor shaft to pump shaft coupling;
- Check the condition of the coupling and coupling guard; and
- Check the operation of the non-return valve.

The above maintenance actions are fairly generic to most types of pumps including positive displacement pumps.

Electrical Maintenance: The municipality should have either an in-house maintenance electrician or an arrangement with a private contractor to conduct regular preventative maintenance. A maintenance electrician should visit all pump stations at least **WEEKLY** to do the following basic maintenance.

- Check functioning of all starters, contractors, trip mechanisms and overloads, etc.
- Check over/under voltage relay operation;
- Start the pump manually and check the operation of all instruments, such as ammeters and voltmeters;
- Check that all panel lamps and site lights are working;
- Check the operation of the level control system, if the pump station is equipped with one;
- Check operation of the telemetry system (if installed);
- Listen to all motor bearings for excessive wear (a worn bearing makes a cyclic whining noise which can be heard by putting your ear against a screwdriver which is touching the bearing housing); and
- Clean the distribution and control panels.

In addition to weekly inspections, the following general quarterly electrical maintenance, **EVERY THREE MONTHS**, should be done.

- Clean all enclosures thoroughly by washing down with a wet cloth on the outside and blowing out all dust, spider webs and insects on the inside with an electrical industrial blower;
- Remove and clean all contactors with a solvent approved for electrical components;

- Tighten all cable glands;
- Ensure that cables are properly secured on cable racks and in conduits;
- Check all terminals for integrity, signs of corrosion and “hotspots”
- Clean level sensors and check settings;
- Check and tighten motor terminals;
- Grease all motor bearings; and
- Check all earthing systems and lightning arrestors for correct functioning and replace if faulty.

Preventative maintenance should also be carried out on a three monthly basis on the transformers and surge arrestors and on a weekly basis for the generators, compressors and air blowers.

Stellenbosch Municipality needs to evaluate the existing O&M schedules for their water pump stations against the above recommended weekly and monthly maintenance O&M tasks and needs to ensure that all required activities are adequately monitored and recorded. The operational personnel needs to inspect all the water pump stations weekly.

4.1.6 Reservoirs

Klapmuts old reservoir, fenced & locked

Groendal Reservoir, cover locked.

Johannesdal Upper Reservoir, fenced

The reservoir sites are fenced and locked and the reservoirs are well maintained. Not all the reservoir covers and chambers are locked. The air vents of most of the reservoirs are covered. The O&M problems to be addressed at the reservoirs, as identified during the WSDP site visits, are summarised under Section 3.2.6.

The four general problems that can affect reservoirs include contamination of open reservoirs, silt build-up in the reservoir, overly long retention times in large reservoirs and sabotage. The recommended daily, weekly, monthly and annual O&M activities for the reservoirs, the associated piping and fittings and the reservoir premises include the following.

Daily:

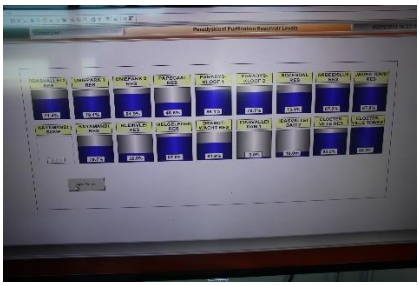
- Check fence, gate and gate lock and repair (replace lock if broken) immediately if necessary.
- Check that the water meters are running properly and that there are no leaks in valve chambers. Attend to any leaks. Dysfunctional water meters should be repaired or replaced immediately.
- Check for any leaks in the pump house. Check the pressure gauge and ensure that the pump is pumping against the right pressure. Check the chlorinator devices in the pump house if applicable. Investigate and attend to any problems.
- Walk along the pipeline route and check for any leaks. Check the pipe connections to reservoirs for leaks. Ensure all valves are in the correct position (closed or open).

- Inspect the exterior of the reservoir for leaks and report for immediate action. Check the discharge for any water from the under floor drainage.
- Check that lamps in pump house and on the premises are OK. Replace bulbs or repair faulty lamps.

Weekly:

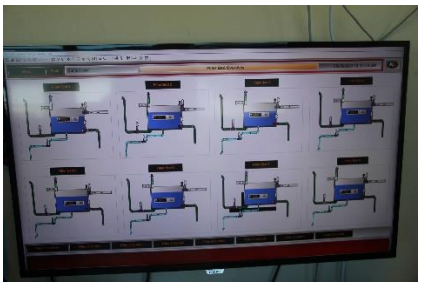
- Check water level indicators. Move them a little up and down to ensure they are OK. If necessary, grease the outside indicator rail. Patch up the level markings when necessary.
- Clean yard and keep grass short. Remove any vegetation on roof and around the concrete reservoir apron and stormwater and scour/drainage channel. Make sure that any drainage water can flow freely out from the premises. Remove all potential bushes and trees within the premises.

Monthly:



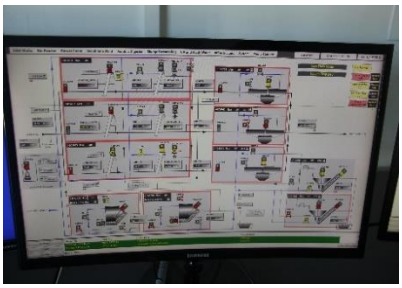
- Check all valve and meter chambers and the various installations in them to ensure that they are in good operational order. Clean chambers from any sand and mud intrusion. Open the strainer and remove any trapped solids. Take the meter readings and wipe off the meters. Check the chamber lids and locks, and oil the hinges.
- Check all valves by partly opening and closing all inlet, outlet, scour and other valves on the premises. Attend to any leaking valves. Wipe off spindles and handles, patch up any corrosion protection. Be careful when opening and closing any gate valve to avoid damages to the piping system through water hammer.
- Check the pump house door lock, gate lock and access manhole cover lock and oil them. Oil the access lid hinges and the locks.
- Check that the text on the entrance sign is clearly legible.
- Check pH, turbidity and free residual chlorine at the outlet from the premises. Take water samples for water quality testing at laboratory.
- Take the water meter readings. Compare the readings of the inlet and the outlet meters. Investigate any abnormalities. Take the electrical meter reading. Compile all information regarding production, consumption and O&M activities in a brief monthly report. Edit the records and report and share it with the municipal manager, O&M Support Unit and others as required.
- Grease movable parts on all valves (Every three months).

Once a year:



- Drain and clean the reservoir. Check the roof for leakages and remove any obstacles to rainwater runoff.
- Organise for a specialised contractor or engineer to do a thorough inspection of the interior and exterior of the reservoirs. Attend to any rust, cracks and potential leaks. Pay special attention to the joints and call for a specialised contractor if the joints and sealants have deteriorated to the extent that there is a risk of leaks. This inspection should be done in conjunction with the annual cleaning of the reservoir.
- Draft and submit annual O&M summary report.

Stellenbosch Municipality needs to evaluate the existing O&M schedules for their reservoirs against the above recommended maintenance activities and needs to ensure that all the required activities are adequately monitored and recorded.



4.1.7 Remote Monitoring and Control Systems

Reservoir Levels (Paradyskloof WTW)

Paradyskloof WTW (Filters)

Stellenbosch WWTW: Inlet Works

The SCADA systems for the WTWs, WWTWs, water pump stations, sewer pump stations and control valves are operational and well maintained, with ad-hoc budget allocations towards the upgrading of the systems.

Maintenance of a SCADA system has many facets and is much wider than just telemetry equipment technical functionality. It involves the equipment, which is being monitored and controlled, as well as the ancillary equipment necessary for the successful operation of such equipment. If this equipment is not in good functioning order, the SCADA system loses much of its purpose.

Telemetry Equipment: All the equipment used for signal processing and communication is grouped under this heading. The electronic equipment, including radios, does not require maintenance as such, apart from ensuring it is clean and protected from excessive heat and environmental threats (rain, dust, insects, etc.). The central station equipment is housed indoors and is well-protected. The cabinet and equipment should be inspected on a **four monthly** basis for damage, signs of overheating and dust ingress. The latter should be carefully blown out by low pressure air, or removed by vacuum extraction.

Outstations are more vulnerable and prone to environmental damage. The panels and equipment should be inspected and cleaned as described above on a **two monthly** basis, or more frequently, depending on local conditions. Outdoor-type outstations must be protected against direct sunlight, and I/O terminals should be tightened annually. The following in particular must be attended to:

- Door seals – to prevent dust and sand ingress;
- Moisture ingress – the source must be identified and eliminated;
- Paintwork – external paint finishes must be kept in good condition and damage repaired immediately. Any internal and external rust detected must be treated immediately;
- Cable glands must be checked for tightness;
- Insect ingress – the point of entry must immediately be sealed off; and
- Earthing arrangement of the antenna and steelwork – connections must be checked for tightness and the earth resistance should be checked annually.

Batteries: Batteries both at outstations and at the central stations should be checked at the scheduled intervals, at least **twice a year**. The battery charges and battery voltage should be checked. A subsequent load test in accordance with the manufacturer's recommendation for the specific battery must also be done to determine whether the battery is serviceable or should be replaced.

Central station computer and outstation input/output modules: The computer does not require any specific maintenance other than making sure that it is well ventilated and operating in a relatively dust-free room at normal room temperature. The computer internal cooling fans must be checked **daily**. This is done by feeling the airflow or listening to hear that the fan is operating. The outstation I/O needs to be verified for correct functioning approximately **once a year** to ensure the integrity of the system. This serves the dual purpose of testing the control and protection functions of protection equipment and instrumentation.

Follow up on alarms: An important aspect of I/O maintenance is the follow-up of alarms. Any alarm is the result of some sort of failure. Whether it is a real alarm caused by system failure or a protection device, or a false alarm caused by a component failure or human error, it needs to be investigated and the cause established, to retain system integrity. Sometimes a recurrent alarm due to a system malfunction is just ignored as a nuisance, instead of rectifying the cause. This could lead to an actual system failure without warning, or to the system being seen as unreliable, so that other critical alarms are ignored.

Maintenance Management: One person within the organisation must have overall responsibility for the maintenance function. This person must have a reasonable electrical background and a thorough understanding of overall system functioning. They can do the maintenance themselves, if they have the necessary skills, or only manage the maintenance function, with an external service provider doing the actual work.

It may be a viable option to let an external service provider do the specialised maintenance on a contract basis. There is no general rule and the needs of each system must be assessed individually. Factors to consider are the available in-house expertise and the cost of outsourcing, which depends on the distance from the service centre, the size of the system, the number of outstations, the area involved and accessibility (e.g. boreholes on private property). Most service providers can also provide an online diagnostic service on a dial-in basis. A typical contract would include the following main items

- Conditions of service such as overall purpose of the contract, what needs to be done, how and when, how often, costs and terms of payment
- A description of the system to be maintained
- Inspections and reports
- Instrumentation
- Work, travel and time schedules
- Charge schedule
- Capacity building of departmental staff
- After hours call-outs.

Even if the maintenance is outsourced, there must still be a responsible person in the department to manage the contract, to be accountable and report to management. The contract must clearly define the scope of work to be performed, and work done must be fully documented and auditable.

A comprehensive O&M Manual specific to the system can be compiled once all of the above has been put in place.

Routine Inspections: Each system is unique and therefore warrants a unique inspection schedule. Many items, as listed below, need to be checked twice a year. Some of the items can be checked by in-house staff; others require specialist competence. The municipality needs to agree with their service provider what maintenance can be done in-house, depending on the competence of available staff, and how selected staff members should be trained on-the-job by the service provider. Routine inspections of the antennas, batteries, computers, earthing, mains and power supply, mimic panel, outstation commissioning, radio, solar panel, telemetry enclosure and UPS can be necessary.

Stellenbosch Municipality needs to continue to adequately maintain their SCADA systems and maintenance checklists need to be compiled for the above activities.

4.1.8 Sewer Pump Stations

Klapmuts sewer PS No.2, front raked mechanical screen not operational

Lanquedoc sewer PS, mechanical screen not operational

Kylemore sewer PS: Fenced and locked

The sewer pump stations are adequately protected against possible theft and vandalism. Some of the pump stations are provided with backup generators for load shedding periods. Control and monitoring systems are also in place to ensure adequate operation and maintenance of the sewer pump stations, with regular inspections by operational personnel. The O&M problems to be addressed at the sewer pump stations, as identified during the WSDP site visits, are summarised under Section 3.2.9.

It is important to maintain accurate information concerning the sewer pump stations. Another important issue for technical managers and supervisors is to respond rapidly to any overflow or wastewater. Failure to do so can create a health hazard in the community. The law also requires that overflows are reported to the DWS. All sewer pump stations should be inspected at least once a week, whether maintenance is required or not. Submersible pumps require limited maintenance, if correctly selected and of sufficient quality. Regular horizontal end-suction centrifugal pumps require at least weekly attention.

Submersible pumps require the following **regular** maintenance:

- Remove blockages from the impellor when required.
- Start the pump and monitor the full load current to ensure correct operation, at least once a week.
- Remove the pump from the sump every six months and remove coagulated grease and fat deposits with a jet of clean water.
- Change the oil at least once a year.

The following minimum **weekly** maintenance is required for centrifugal pumps:

- Check oil level.
- Check condition of gland packing and adjust to provide a steady drip.
- Check tightness of the base plate mounting bolts.
- Check for abnormal vibration.
- Check for abnormal temperature.
- Listen for any strange noises.
- Start the pump and monitor the full load current.
- Check operating pressures on the delivery pressure gauge.
- Check the alignment of the motor shaft to the pump shaft coupling.

- Check the condition of the coupling and coupling guard.
- Check the operation of the non-return valve (failure of this valve can result in a sheared pump shaft).
- Check operation of the motor cooling fan.

Sump maintenance: Stellenbosch Municipality needs to ensure that a schedule exist for the cleaning of pump station sumps. It is preferable to clean out all sumps at least once a year, depending on the volume of solids and grit in the wastewater stream.

Electrical Maintenance: The municipality should have either an in-house maintenance electrician or an arrangement with a private contractor to conduct regular preventative maintenance. A maintenance electrician should visit all sewer pump stations at least **WEEKLY** to do the following basic maintenance.

- Check functioning of all starters, contractors, trip mechanisms, etc.
- Check over/under voltage relay operation;
- Start the pump manually and check the operation of all instruments, such as ammeters and voltmeters;
- Check that all panel lamps and site lights are working;
- Check the operation of the level control system;
- Check operation of the telemetry system (if installed); and
- Listen to all motor bearings for excessive wear (a worn bearing makes a cyclic whining noise which can be heard by putting your ear against a screwdriver which is touching the bearing housing).

In addition to weekly inspections, the following general quarterly electrical maintenance, **EVERY THREE MONTHS**, should be done.

- Clean all enclosures thoroughly by washing down with a wet cloth on the outside and blowing out all dust, spider webs and insects on the inside with an electrical industrial blower;
- Remove and clean all contactors with a solvent approved for electrical components;
- Tighten all cable glands;
- Ensure that cables are properly secured on cable racks and in conduits;
- Check all terminals for integrity and signs of corrosion.
- Clean level sensors and check settings;
- Check and tighten motor terminals;
- Grease all motor bearings; and
- Check all earthing systems and lightning arrestors for correct functioning and replace if faulty.

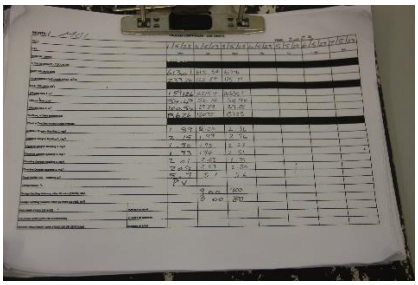
Stellenbosch Municipality needs to evaluate the existing O&M schedules for their sewer pump stations against the above recommended weekly and quarterly maintenance activities and needs to ensure that all the required activities are adequately monitored and recorded. The operational personnel needs to continue to inspect all centrifugal pump stations on at least a weekly basis.

Procedures in case of wastewater overflow: The following steps must be taken as soon as becoming aware of an overflow/spillage:

- Try to contain the spilled wastewater by placing earth berms around the spill.
- Call a suction tanker to remove spilled wastewater and empty the pump sump.

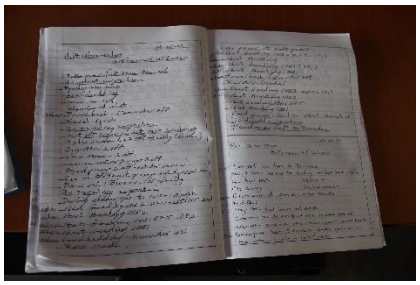
- Sprinkle the area affected by the spill with HTH granular chlorine or slaked lime after excess liquids have been removed. It will combat odour and prevent the breeding of flies and other nuisance causing insects.
- Assess the cause of the problem – electricity failure, pump failure, etc.
- In case of electricity failure, contact the local electrical department to restore the supply.
- In case of a pump failure, remove the faulty pump and replace it with a stand-by unit as soon as possible.
- In many cases, a simple blockage in the pump is the cause of an overflow. The pump may be running, but not pumping a drop of liquid. Nylon stockings are notorious for blocking pump impellors. In such a case, stop the pump, remove it from the piping to gain access to the impellor and remove the stocking by cutting it out with a knife. Place the pump back into position and reconnect the piping.
- As soon as the pump station is operational again, organise the clean-up operation. This entails removal of any liquid, faeces and debris from the spillage area. These materials must be disposed of at the sewage treatment plant, or by incineration.
- Sprinkle lime over the area affected by the overflow to control flies.

4.1.9 Bulk and sewer drainage networks



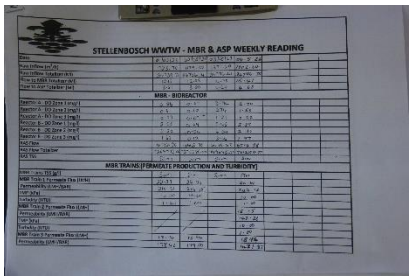
Bulk and sewer drainage networks: Municipalities should clean their entire collection system, including all pipes and manholes, at least once a year. This requires dedicated teams equipped with the correct tools and instruments. Annual, monthly and weekly schedules or team activity programmes should be drawn up by the technical manager or supervisor. A **weekly** schedule and programme should include the following:

- Name of the team supervisor.
- Name of the area to be cleaned that week.
- Sewer network to be cleaned from manhole number – to manhole number.
- A map of the specified area.
- A section to record what cleaning materials and equipment were removed from the store.
- A section to record debris and foreign objects removed and measured from the sewers.
- Proof of how foreign materials were disposed of, i.e. delivered to the sewage treatment plant, incinerated or buried.



Regular cleaning of sewer lines is the most typical O&M issue that should be carried out in a systematic and scheduled way so as to cover the whole system over a year's time (Rodding, Flushing, Jetting, Handling emergencies and clearing blockages, chemical cleaning, bio-augmentation, root removal, etc.)

Record Keeping: It is of utmost importance that all blockages and their precise locations are recorded. This serves several purposes. Firstly, a recurring blockage in the same place warrants further investigation. There may be a problem with either the design or faulty construction of the system. Secondly, it allows the technical manager to budget for the operational expenses incurred by the sewer cleaning team, and to determine if staffing is sufficient. In addition, these blockages are usually reported by members of the public. The reaction time from the complaint until the blockage is cleared is an excellent performance indicator for the municipality. The aim should be to make this as short as possible, and provide excellent service to consumers who pay rates and taxes.



4.1.10 Waste Water Treatment Works

Pniel WWTW: Flow and sampling

Wemmershoek WWTW: Daily Logbook

Stellenbosch WWTW: MBR and ASP Daily readings

All the WWTW sites are fenced and locked with access control. Most of the WWTWs are well maintained and operated with adequate control and monitoring systems in place to ensure proper process control. The O&M problems to be addressed at the WWTWs are summarised under Section 3.2.10.

Oxidation Pond Systems: Oxidation ponds require a much smaller operational input than conventional plants, due to the nature of the processes and the fact that very few parameters can be controlled. O&M duties of the operators, supervisors and technical manager for oxidation pond systems include the following:

- set chemical dosages and feed rates (if the final effluent is chlorinated);
- monitor flow rates;
- desludge ponds;
- monitor the condition of plant and equipment;
- manage irrigation using plant effluent;
- keep records and submit reports;
- analyse basic plant parameters and take corrective action;
- perform and follow-up regular maintenance activities;
- monitor quality of treatment; and
- maintain safety procedures.

It is essential for the successful functioning of an oxidation pond system that the work carried out is recorded in a suitable format.

The Plant Superintendent should inspect and sign the log sheets daily, to ensure that they are filled in properly, and also to obtain any information that may require action by him or her. The same principle applies to basic analysis of results. The Plant Supervisor should scrutinize the results daily, as these are a barometer of plant efficiency. Major items in log sheets, analysis sheets and the occurrence book should be summarized in a monthly report to the Technical Manager.

Parameters that should be recorded in a typical log sheet, occurrence book page and in the monthly report include the following:

- Log Sheet: Day and date, incoming wastewater flow, incoming wastewater flow rate, consumption of potable service water, pump running hours, volume of screenings removed, number of night soil buckets received, volume of night soil received, electricity consumption and electricity – maximum demand should be recorded in a logbook. The total volume passing through the plant should be read and

recorded in the plant logbook once every **24 hours** by the operator. The operator should clean recording and measuring devices daily.

- Occurrence Book Page: Typical parameters that should be recorded in a log/occurrence book are date and day, time of shift, name of Process Controller on duty, hourly entries of occurrences and activities, process readings, signature of Process Controller and signature of Supervisor.

- Monthly Report: A monthly report should be generated from the above logs by the Plant Supervisor for the Technical Manager. The report should include the Status of Personnel (Number of operators, details of any vacancies), Production figures (Monthly volume treated, average daily flow, volume of screenings removed for the month and volume of night soil received for the month) and Consumed items (Electricity consumption for the month, electricity maximum demand for the month, value of consumed electricity and total value of consumed items for the month).

The table below gives a typical checklist for the O&M tasks for Process Controllers at an oxidation pond system.

Table 4.1.10.1: O&M tasks for Process Controllers at an oxidation pond system

No.	O&M Tasks	06:00	08:00	10:00	12:00	14:00	16:00	18:00
1	**Inlet Works**							
1.1	Check operation of Automated Screen (if fitted)							
1.2	Operate air-lift pump to remove grit from grit trap							
1.3	Operate grit classifier to remove grit from wastewater stream							
1.4	Use rake to remove screenings from hand-raked screen bars							
1.5	Allow screenings to dry out and place in a wheelbarrow for disposal							
1.6	Count number of wheelbarrows for the day and record							
1.7	Bury or burn dry screenings							
1.8	Check operation of flow measurement system							
1.9	Check operation of flow data recorder							
2	**Grit Removal**							
2.1	Check operation of channels							
2.2	Block off one channel and drain liquid							
2.3	Remove grit from channel							
2.4	Place grit in wheelbarrow and record volume							
2.5	Bury or burn removed grit							
3	**Main Pump Station**							
3.1	Check for any RED lights on electrical panel (trip indication)							
3.2	Check pumps for temperature							
3.3	Check pressure gauge readings							
3.4	Inspect gland packings for excessive leakage and adjust							
3.5	Check liquid level in suction sump							
4	**Primary Ponds**							
4.1	Check inlet valve operation. Close and open completely							
4.2	Scrub off algal growth on inlet and outlet structures							
4.3	Check pond water level. Increase in level indicates an outlet blockage							
4.4	Check for different smell of the pond							
4.5	Check for colour changes in the pond contents							
4.6	Remove screenings from the surface							
4.7	Remove weeds from embankments and water fringes							
5	**Facultative Pond**							
5.1	Scrub off algal growth on inlet and outlet structures							

Table 4.1.10.1: O&M tasks for Process Controllers at an oxidation pond system

No.	O&M Tasks	06:00	08:00	10:00	12:00	14:00	16:00	18:00
5.2	Check for different smell of the pond			■				
5.3	Check for colour changes in the pond contents			■				
5.4	Check pond water level. Increase in level indicates an outlet blockage			■				
5.5	Remove screenings from the surface			■				
5.6	Remove weeds from embankments and water fringes						■	■
6	**Secondary Ponds**							
6.1	Scrub off algal growth on inlet and outlet structures					■		
6.2	Check for different smell of the pond				■			
6.3	Check for colour changes in the pond contents				■			
6.4	Check pond water level. Increase in level indicates an outlet blockage				■			
6.5	Remove screenings from the surface				■			
6.6	Remove weeds from embankments and water fringes						■	■
7	**Connector Piping**							
7.1	Ensure pipes are open and flowing freely	■	■	■	■	■	■	■
7.2	Remove any stones, rags from pipe inlets	■			■			■
7.3	Clean out stilling chambers and weirs				■			
8	**Chlorination**							
8.1	Check the scale and record the chlorine mass	■						
8.2	Check all gas connections with ammonia vapor for leaks	■			■			■
8.3	Test the Chlorine gas alarm operation	■						
8.4	Ensure that the chlorine gas rotameter indicates the correct flow of gas	■			■			■
8.5	Ensure that all service water valves are open	■						■
8.6	Take a sample of Final Effluent and test the Free Chlorine level (record)	■						
8.7	Adjust the Chlorine dosage to maintain 1 mg/l free chlorine content	■						■
9	**Final Effluent Storage Pond**							
9.1	Check available storage capacity						■	
9.2	If dam is full, operate irrigation outlet valve						■	
9.3	Irrigate the effluent on the demarcated irrigation area						■	■
10	**Administrative Activities**							
10.1	Record incoming flow reading in log							■
10.2	Record service water flow in log							■
10.3	Record average flowrate (l/s) in log	■	■	■	■	■	■	■
10.4	Record total consumption of chlorine for 24 hours in log (kg)							■
10.5	Record average chlorine dosage in log	■	■	■	■	■	■	■
10.6	Record hour meter readings of pumps							■
10.7	Record storage dam level and indicate if irrigation was done or not							■
11	**General**							
11.1	When handing over the shift, walk through the plant with next operator	■						■
11.2	Check the perimeter fence for holes and repair if required	■						■
11.3	Operator on dayshift must ensure that gates are locked at 17:00						■	■
11.4	Answer all telephone and radio calls to the plant	■	■	■	■	■	■	■
■	Time of required activity							

Conventional Plants:

The various aspects in the operation of a WWTW are as follows:

- Operation: Physical activities required to treat the water.
- Supervision: Overseeing of operating activities by a competent person.
- Control: The processes and routines that ensure operation of a suitable standard.
- Management: The activities to ensure overall proper functioning and sustainability, such as long-term planning, etc.
- Public relations: An important function that provides feedback on the acceptability and quality of the wastewater treated and services.

The operational tasks of the Process Controllers at the WWTW include the following:

- Monitoring flow rates;
- Setting chemical dosages and feed rates;
- Basic analysis of plant parameters and corrective actions;
- De-sludging of sedimentation tanks;
- Monitoring the condition of plant and equipment;
- Basic first-line maintenance;
- Start-up and shut-down of plant;
- Sampling for process control analysis;
- Record keeping;
- Maintenance Schedules;
- Safety procedures;
- Handling of chemicals; and
- Retraining of operators.

It is essential for the successful functioning of a WWTW that the work carried out is recorded in a suitable format.

- Parameters that should be recorded in a log sheet are day and date; incoming wastewater flow; incoming wastewater flow rate; consumption of potable service water; diesel consumption by incinerator; mass reading of chlorine scale; chlorine consumption; pump running hours; storage dam flow meter reading; volume of grit/sand removed; volume of rags/screenings removed; number of night soil buckets received; volume of night soil received; electricity consumption; electricity – maximum demand; number of drying beds emptied; volume of dried sludge in stock; and volume of dried sludge sold.

- Parameters that should be recorded in an occurrence book are date and day; time of shift; name of Process Controller on duty; name of works assistant on duty; hourly entries of occurrences and activities; process readings; time of handover to next shift, and names of next shift Process Controller; signature of Process Controller; signature of Supervisor.

- Monthly Report: A monthly report should be generated from the above logs by the Plant Supervisor for the Technical Manager. The report should include the Status of Personnel (Number of operators, number of plant assistants, number of labourers, details of any vacancies), Production figures (Monthly volume treated, average daily flow, volume of screenings removed for the month, volume of grit/sand removed for the month and volume of night soil received for the month), Consumed items (Chlorine

consumption, value of consumed chlorine, diesel consumption for month, value of consumed diesel, electricity consumption for the month, electricity – maximum demand for month, value of consumed electricity and total value of consumed items for the month) and Sales of Dried Sludge (Volume of dried sludge at the beginning of the month, volume of dried sludge produced during the month, volume of dried sludge sold during the month and total volume of dried sludge in stock at the end of the month).

The table below gives a typical checklist for the O&M tasks for Process Controllers at a conventional WWTW.

Table 4.1.10.2: O&M tasks for Process Controllers at a conventional WWTW

No.	O&M Tasks	06:00	08:00	10:00	12:00	14:00	16:00	18:00
1.	**Main Pump Station**							
1.1	Check for any RED lights on electrical panel (trip indication)							
1.2	Check pumps for temperature							
1.3	Check pressure gauge readings							
2.	**Lifting Station**							
2.1	Inspect gland packings for excessive leakage and adjust							
2.2	Check pumps for temperature							
2.3	Check liquid level in suction sump							
3.	**Primary Settling Tanks**							
3.1	Check rotating bridges for free operation							
3.2	Check desludging mechanisms for free operation							
3.3	Desludge the primary settling tanks by operating desludge valve							
3.4	Remove any floating debris such as rags and plastic off the surface							
3.5	Observe the colour of the tank contents (change of colour indicates a problem)							
4.	**Inlet Works**							
4.1	Check operation of Automated Screen							
4.2	Operate air-lift pump to remove grit from grit trap							
4.3	Operate Grit Classifier to remove grit from wastewater stream							
4.4	Check operation of Flow Measurement system							
4.5	Check operation of Flow Data Recorder							
5.	**Biological Filters**							
5.1	Check operation of Flow Division Box							
5.2	Check operation of Biofilter Distributors (leakage and scraping of arms)							
5.3	Check biofilter effluent canals and clean if needed							
6.	**Activated Sludge Reactor**							
6.1	Check aerator motors for excess temperature and vibration							
6.2	Measure the DO Levels and record (must be more than 2 mg/l)							
6.3	Ensure that aerators change over automatically							
6.4	Check that the odour of the mixed liquor is healthy							
6.5	Measure the pH level and record the reading							
6.6	Measure the settleable solids content of the mixed liquor and record							
6.7	Check that the Waste Activated Sludge outlet sluice is set correctly							
6.8	Ensure that the Return Activated Sludge stream is running.							
7.	**Return Activated Sludge Pump Station**							
7.1	Check for any RED lights on electrical panel (trip indication)							
7.2	Check pumps for temperature							
7.3	Check pressure gauge readings							
7.4	Check operation of automated level control							
7.5	Check oil levels of the pumps							

Table 4.1.10.2: O&M tasks for Process Controllers at a conventional WWTW

No.	O&M Tasks	06:00	08:00	10:00	12:00	14:00	16:00	18:00
7.6	Sweep out dust and wipe electrical panels							■
8.	**Secondary Settling Tanks (Clarifiers)**							
8.1	Check rotating bridges for free operation	■						■
8.2	Check desludging mechanisms for free operation	■						
8.3	Check for carry-over of sludge at the overflow weirs	■						
8.4	Adjust continuous desludging valves to maintain sufficient rate.	■						
8.5	Observe the colour of the overflow liquid (should be clear)	■		■		■		■
9.	**Chlorination**							
9.1	Check the scale and record the chlorine mass	■						■
9.2	Check all gas connections with ammonia vapor for leaks				■			
9.3	Test the Chlorine gas alarm operation	■						
9.4	Ensure that the chlorine gas rotarmeter indicates the correct flow of gas	■				■		■
9.5	Ensure that all service water valves are open	■						■
9.6	Take sample of Final Effluent and test the Free Chlorine level (record)				■			
9.7	Adjust the Chlorine dosage to maintain 1 mg/l free chlorine content	■						■
10.	**Control Room**							
10.1	Record incoming flow reading in log							■
10.2	Record service water flow in log							■
10.3	Record average flowrate (l/s) in log	■	■	■	■	■	■	■
10.4	Record total consumption of chlorine for 24 hours in log (kg)							■
10.5	Record average chlorine dosage in log	■		■		■		■
10.6	Write down at what time Primary Tanks were desludged	■		■		■		■
10.7	Record hour meter readings of pumps							■
10.8	Record Storage Dam level and indicate when return pump is started							■
11.	**General**							
11.1	When handling over the shift, walk through the plant with next operator	■						■
11.2	Operator on Dayshift must ensure that gates are locked at 17:00						■	
11.3	Answer all telephone and radio calls to the plant	■	■	■	■	■	■	■
■	Time of required activity							

Operating and maintaining a conventional treatment plant is a complex and challenging endeavour. It requires the best of managerial skills and committed staff. The plant itself is an expensive municipal asset with a long expected life span that needs to be cared for properly. The service it delivers is a national priority due to its importance for the improved health, dignity and living standards of people. Effective wastewater treatment is also essential to protect the environment and water resources, which in turn affects public health and the quality of life.

Stellenbosch Municipality needs to evaluate the existing O&M schedules for their conventional WWTWs against the above recommended O&M tasks and needs to ensure that all required O&M activities are adequately monitored and recorded.

Stellenbosch Municipality‘s Operational and Maintenance Plans, as required by the DWS, are included at the end of this Topic. The plans provide a framework for further development and aim to address those aspects of the assessment that do not meet the minimum required level.

DWS's minimum requirements for a Maintenance Team at WTWs and WWTWs are as follows:

- An organogram of the Maintenance Team used for general maintenance work at the plant (both Mechanical and Electrical);

- In cases where the maintenance function is outsourced, a copy of the contract between the Municipality and the Service Provider is required to serve as evidence of engagement of external maintenance expertise;

- Proof is required on team competency (internal or external). The Municipality must present evidence on the Qualification and Experience of the supervisors of the Mechanical, Electrical and Civil sections of the Maintenance Team individual. A trade-test certificate is accepted as adequate evidence, and

- Records of planned maintenance schedules and planned and reactive maintenance undertaken for selected infrastructure must be presented to indicate that maintenance does take place on an on-going basis.

Responding to breakdowns cannot be scheduled, but Stellenbosch Municipality needs to plan and prepare for such situations. Scheduled O&M should not be allowed to occupy the entire workforce 100% of the time. There must always be a certain percentage of time and other resources reserved for responding to emergencies and breakdowns.

The entire staff must be organised in a flexible manner, and the more staff that are multi-skilled, the better. Rigid job descriptions should be abandoned in favour of multi-skilling, multi-tasking and flexibility. The motto must be "the best of services to our customers at all times!" Every staff member must be focused on quality services, resulting from the best of their collective ability. Individual staff members must be able and willing to step in to help each other whenever needed.

Planned and proactive O&M should be systematic and scheduled and activities need to be recorded and reported. **Without records, there is no history as a basis for professional planning and budgeting.** Pipes can last a long time, but not forever. Certain parts of the network are more seriously affected by irregular pressure or other factors and are prone to have more leaks than other sections, and thus need to be checked more often.

The future O&M Expenditure and Income budgets for water and sanitation services for the next three financial years are included under Topic 7, Sections 7.1.3. and 7.2.1.

A budget of approximately 2% of the total asset value per annum should be allocated towards the replacement of existing infrastructure, in terms of Best Practice. In the case of the operations and maintenance of the systems, a budget of approximately 1% to 2% of the value of the system is typically required to ensure that the systems remain in good condition.

The table below gives an overview of the Opening Cost and Book Value of the water and sewerage infrastructure included in Stellenbosch Municipality's Asset Register (June 2024). The recommended budgets for the replacement of the existing infrastructure and the operation and maintenance of the existing infrastructure, based on the Opening Cost, are also indicated.

Table 4.1.10.3: Recommended budgets for the replacement and the operation and maintenance of the existing water and sewerage infrastructure.

Asset Type	Asset Register June 2024		CRC	Recommended Annual Replacement Budget (Best Practice)	Recommended Annual O&M Budget (Best Practice)	Depreciation and Amortisation: Actual Expenditure
	Opening Cost	Book Value		2.0% of CRC	1.5% of CRC	2023/2024
Borehole	R86 227 551	R61 774 220	R3 000 000	R60 000	R45 000	R32 615 905
Water Mains	R225 179 114	R178 123 277	Incl. under Ret.	Incl. under Ret.	Incl. under Ret.

5. CONSERVATION AND DEMAND MANAGEMENT

The National Development Plan stresses that economic growth should be environmentally sustainable and that Water Conservation must be a priority to ensure sufficient water to support equitable economic growth and to support the achievement of the national developmental goals. Thus, all sectors of the economy need to prioritise Water Conservation in their development plans.

Stellenbosch Municipality can also develop a vision and mission statement for their existing WC/WDM Strategy, when it is updated. The vision should deal on the one hand with the quantity and quality of the water provided and on the other hand with the efficient and equitable use of water.

A number of key features flowed from the vision statement of the City of Cape Town with regard to WC/WDM and could be included similarly in the Municipality's Vision.

Equitable: A tariff system that ensures that large consumers pay the appropriate tariff rate. A flat tariff for water usage is counterproductive to Water Conservation. One of the key principles of water conservation is in fact addressing the tariff structure. This promotes equity since consumers who use more than their equal share of existing water resources should be made liable / accountable for any new bulk infrastructure and water resources.

People Centred: The WC/WDM model should place an emphasis on the consumers, the environment and their needs. The availability and supply of water in surrounding rural areas needs to be addressed as critical component of water services.

Affordable: The WC/WDM Strategy and implementation plan should be affordable and measurable. The process to ensure affordability will be to capitalise on the projects that have a sustained saving factor, e.g. Pressure Management.

Sustainable: Limited water resources generally threaten the sustainability of water services. WC/WDM can extend the assurance of supply of the existing water resources and can go a long way in reconciling future demand and supply.

Services to All: WC/WDM can greatly increase the ability to supply water services to all by reallocating existing bulk capacity and water resources from inefficient use to new consumers and ensuring that new water supply projects are sustainable and affordable.

Some of the current causes / challenges that contribute to high NRW and Water Losses for water distribution systems in South Africa are as follows:

- Water lost during pipe breakages or leakages, which include underground leakages, is difficult to quantify. It include the flushing of the networks after repairs.
- By-passed water meters in certain areas, especially consumers with pre-paid water meters.
- Inaccurate billed metered consumption, due to inaccurate domestic or conventional meter readings (Old water meters and prepaid water meters).
- There has been a growing concern about the lack of action by municipalities to attend to high water consumption caused by water leaks in households.
- Vandalism and theft of water infrastructure.
- Building contractors of low cost housing projects not metering their water usage.
- Ageing infrastructure and insufficient funds for adequate replacement and refurbishment is one of the biggest challenges. Water losses will not drop to below 15% and might even increase as water networks deteriorate and collapse.

WC/WDM Strategy

Water is scarce and it is important that water be used wisely and that due attention be paid to water conservation and water demand management. One of the visions of the Sector is that water is used effectively, efficiently and sustainably in order to reduce poverty, improve human health and promote economic development.

The Revised Compulsory National Water and Sanitation Standards, as published in Government Gazette No.52814 of 6 June 2025, include the following WC/WDM requirements:

- Where spillages or leaks in its water supply network are detected or reported, a Water Services Institution must record such cases and ensure that they repair all leaks within 48 hours of becoming aware thereof.
- A Water Services Institution must isolate 95% of detected or reported water pipe bursts in its water supply system within a maximum of four (4) hours of becoming aware thereof.
- Where spillages or sewer blockages in its wastewater collection network are detected or reported, a Water Services Institution must record such cases and ensure that they are contained and must be repaired within 24 hours of becoming aware thereof. The affected surface area must be cleaned and or disinfected.
- A Water Services Institution must have a 24-hour consumer care facility supported by the system to which leaks, spillages or water service related enquiries and complaints can be reported and feedback be given to the consumer.
- Whenever emergency or alternative water supply is provided in terms of Regulation 4(1), the Water Services Institution must ensure that taking of water from a bulk line, if applicable, is appropriately metered and recorded (i.e. if alternative water is provided through tankering the number of tankers and their volume must be recorded when taking from a bulk metered pipeline).
- A Water Services Institution must implement a Pressure Management Programme allowing water reticulation systems to be operated at a minimum pressure of 20 m and maximum of 90 m.
- Where water pressure in a water reticulation system could rise above 90 m, a Water Services Institution must install a pressure control device to prevent the pressure at any domestic consumer connection from rising above 90m.
- A Water Services Institution must take steps to measure and progressively reduce losses, maintain the water use efficiency KPIs including the quantity of water losses, the quantity of NRW, ILI and per capita usage to within international accepted standards as follows:
  - NRW 20% – 30%;
  - Water Losses 10% - 20%;
  - Infrastructure Leakage Index 2 – 4; and
  - Per Capita Usage 120 l/c/d – 180 l/c/d
- Water Services Institutions must develop and implement a 10-year Council approved WC/WDM Strategy and an Annual Plan within 6 months of the publication to be uploaded on the IRIS system and must consist of at least the following:
  - Situation Assessment;
  - Key issues and challenges;

- Focus areas of interventions;
- List of proposed interventions;
- Set targets for demand, NRW, water losses (commercial and real losses), ILI and per capita usage in line with subsection above; and
- Budgets and Multi-year Implementation timelines.

- WSAs must require greenfield developments or major brownfield redevelopments, prior to planning approval, to indicate the manner and extent in which WC/WDM and water efficient sanitation solutions (WESS) has been accommodated and accounted for in their selected technology options, in terms of efficient water use and off-grid sanitation.

DWS's Municipal Scorecard for assessing the potential for WC/WDM efforts in Municipalities was used to assess the potential for WC/WDM efforts in Stellenbosch Municipality. The status quo score for Stellenbosch Municipality is 69 out of 100 suggesting that the Municipality is making good progress with regard to the implementation of specific WC/WDM activities.

The proposed WC/WDM Strategy for Stellenbosch Municipality is based on the 25 items included in the Scorecard and the sections below discuss each of these items in detail.

ITEM 1: DEVELOPMENT OF A STANDARD WATER BALANCE

Introduction: The development of a standard water balance based on the IWA methodology is considered as one of the most important actions that all water utilities must undertake in order to establish the levels of water loss and NRW in their supply systems.

Situation in Stellenbosch LM:

Detail IWA Water Balances are available for each of the water distribution systems. The percentage Treatment Losses, NRW and Water Losses for the systems are summarised in Table 5.3.2. under Topic 5 of the Administration, Information and Comprehensive Overview Report.

A WSDP Performance and Water Services Audit Report, which include the IWA water balances, is also compiled annually by the municipality.

Recommendation and Strategy:

- Continue with the monthly updating of the IWA Water Balances for all the systems and reporting on the NRW and Water Losses for each of the systems to management. Continue to manage NRW analysis on a monthly basis.
- Continue with the drafting of an annual WSDP Performance and Water Services Audit Report, as required by the Water Services Act, which include the IWA Water Balances.
- Implement the recommended WC/WDM activities in order to reduce the NRW and Water Losses even further.
- Determine all unbilled authorized consumption by firstly identify all the relevant consumers, e.g. Municipal buildings, parks, fire services, sport fields, etc. Unbilled consumption do not generate income, but will enable the municipality to better quantify their actual water losses.

Funding and Budget Requirements:

The IWA Water Balances for the systems are updated on a monthly basis by the municipality.

Scorecard Result:

3 out of 4: Stellenbosch Municipality has developed reliable water balance and results indicate UAW/NRW at 20% to 40%

ITEM 2: PRESSURISED SYSTEM AT ALL TIMES

Introduction: All water utilities must aim to keep their reticulation systems pressurised 100% of the time as any level of intermittent supply can lead to serious health problems as well as causing damage to the reticulation system.

Situation in Stellenbosch LM:

The water reticulation networks are always pressurised. There are therefore no intermittent supply, which can lead to serious health problems and can cause damage to the reticulation networks. Table 5.1.1.3.3 under Topic 5 of the Administration, Information and Comprehensive Overview Report includes the Residual and Static pressures for the different zones.

Recommendation and Strategy:

- Adequate human resources, technical skills and O&M budgets need to be allocated towards the operation, maintenance and refurbishment of the existing infrastructure, in order to ensure that systems are always pressurised.
- Ensure proper maintenance of the existing PRVs.
- The Water Master Plans to be consulted in conjunction with the WC/WDM priority projects to identify future areas where pressure reduction can be implemented. Recommended future PRV zones are included in Table 5.1.1.3.2.

Funding and Budget Requirements:

- Budgets as indicated under the individual items of the WC/WDM Strategy.
- Increase O&M budget allocations towards the refurbishment and replacement of old water infrastructure.
- An estimated budget of R3 500 000 is required for the implementation of the future recommended PRV zones.

Scorecard Result:

4 out of 4: Stellenbosch Municipality maintains a pressurised supply to all areas within the water distribution network all of the time at a minimum pressure of 20m

ITEMS 3 AND 4: METERING SYSTEM

Introduction: Stellenbosch Municipality must continue to meter and bill all consumers. It is important that systems are in place to undertake monthly meter reading and billing, with the necessary back-up customer complaint services.

Situation in Stellenbosch LM:

More than 98% of all non-residential connections, including fire supply connections, and between 75% to 98% of residential connections are metered and billed on a monthly basis based on metered water usage. Required systems are also in place to undertake monthly meter readings and billing with the necessary back-up customer complaint services.

Recommendation and Strategy:

- All un-metered water connections need to be provided with water meters. Meters need to be read on a monthly basis and consumers need to be billed monthly according to their actual water usage. In addition to water theft, many water accounts go unnoticed in the system or have some type of data inconsistency that results in no revenue being generated for the particular water use event. The SWIFT data needs to be used to clean the Treasury data and the municipality needs to identify and correct any inaccurate data in the system (Linkage of Treasury data with cadastral data).
- Consumer consumption checks / investigations need to be carried out where water usage are very low, but there are households on the property (Use SWIFT data). This project will give a clear indication of where illegal or unregistered connections is being made and whether the meter is under reading the actual consumption, thus water is being used but not billed or recorded.
- Use the SWIFT data to identify all unmetered erven and all meters with zero consumption. All illegible / broken / old meters should be replaced. Any un-metered stands should be metered and meter readings in the billing system should be updated where required. All meter chambers should also be cleaned as part of the inspections.
- Municipality needs to continue with the implementation of their Meter Management / Replacement program. An effective Meter Management / Replacement Program needs to achieve the following objectives:
  - Determine the on-going meter replacement programme;
  - Determine exception reports on meters which are suspected to be faulty;
  - Test and replace faulty meters; and
  - Size meters correctly.

  The activities of this program that needs to be budgeted for are as follows:
  - SWIFT analysis of treasury data.
  - Research and development of a meter replacement policy and meter management / replacement programme;
  - Implementation of a uniform meter management information system;
  - Testing and replacing faulty meters reported by consumers (Part of reticulation function).
  - Replacement of domestic meters with AMR enabled format (where appropriate) in accordance with meter management / replacement programme.

Funding and Budget Requirements:

Allow a budget of approximately R200 000 for an annual SWIFT analysis to identify unmetered erven and erven with no or very low consumption. Estimated budget of R4 070 000 is necessary for the installation of water meters at the potential unmetered erven and the erven with a meter, but with zero demand (814 connections).

Scorecard Result:

3 out of 4: Indicating that between 75% and 98% of all residential connections are metered and billed based on metered use.

4 out of 4: Indicating that more than 98% of all non-residential connections, including fire supply connections, are metered and billed based on metered use

ITEM 5: EFFECTIVE AND INFORMATIVE BILLING SYSTEM

Introduction: An effective and informative billing system is used to help consumers understand how much water they are using and how their water bill is made up. It is usually very helpful in explaining how the block-tariffs are applied to each customer so that they can see exactly what they pay for water in each block. This in turn will encourage many customers to reduce their water use and, in this regard, such informative billing becomes another WDM intervention.

Situation in Stellenbosch LM:

- Customer's meters are read on a monthly basis and customers are always billed on a monthly basis according to the actual volume of water used for the specific month.
- Commercial data analysis is also done on the billed metered consumption data, which include the identification of un-metered erven, investigating meters with zero consumption, investigating abnormal low and high consumption readings, oversized / undersized meters, etc.

Recommendation and Strategy:

- Municipality needs to continue to ensure that all customer's meters are read on a monthly basis and that the customers are billed on a monthly basis according to the actual volume of water used for the specific month.
- Municipality needs to continue with the commercial data analysis done on the billed metered consumption data, which include the identification of un-metered erven, investigating meters with zero consumption, investigating abnormal low and high consumption readings, oversized / undersized meters, etc.
- The Municipality can consider the following additional measures to make the current consumer bills more informative.
  - Adding a graph of the previous 12 months' consumption and helpful hints on effective water usage on the monthly bills.
  - Alert consumers of possible leaks on their properties. For instance if the consumption for a particular month is >25% than the average consumption of the previous months the consumer may be alerted of a possible leak on the property.
  - Monitor trends and follow up telephonically.

Funding and Budget Requirements:

Estimated cost to enhance the user friendliness of the municipal bill is R450 000.

Scorecard Result:

4 out of 4: Indicating that the municipality produces informative billing to all customers based on meter readings.

ITEMS 6 AND 7: GENERAL COMPLAINTS SYSTEM

Introduction: Every municipality should have a complaints system where consumers can lodge technical or billing complaints and where water leaks can be reported. Residents should be encouraged to report any leaks they find. This is one of the key elements of an efficient WC/WDM strategy since most leaks repaired in South Africa result from such Passive Leakage Control and not Active Leakage Control.

Situation in Stellenbosch LM:

A Customer Complaints System is implemented by the municipality. The Customer Complaints System include the logging of complaints, response times to address complaints and the reporting of complaints and response times to management. A Customer Care Service Charter is also in place as a commitment to excellent service delivery. The Customer Care Service Charter includes the following service standards for water and sanitation services.

Water and Sanitation Service standards (Customer Care Service Charter)

Section	Query	Reaction Time
Water Network	Burst water mains	1 Day
	No water	1 Day
	Water leak	1 Day
	Fire hydrant	1 Day
	Water network – valve	1 Day
	Water network – stopcock	1 Day
	Water network – leak	1 Day
	Hydrant cover missing	1 Day
	Water connection	1 Day
	Illegal water connection	1 Day
	Water meter faulty	1 Day
	Smart meter faulty	1 Day
	Rehabilitate area after repairs	1 Day
	Low water pressure	1 Day
	Maintain reservoir sites	1 Day
	High consumption	1 Day

Sewer Network	Blockage	1 Day
	Sewer manhole cover missing	1 Day
	Sewer spillage	1 Day
	Sewer connection	1 Day
	Ablution maintenance	1 Day
	Illegal sewer connection	1 Day
	Vector control	1 Day
Wastewater	Spillage	1 Day
	Quality	1 Day
	Pump stations not operational	1 Day
	Empty septic tanks	1 Day
	River pollution	1 Day
Pollution	Pollution control – river pollution	1 Day
	Industrial effluent not compliant	1 Day
	Illegal dumping of effluent	1 Day
Water Treatment	Water quality	1 Day
	Turbidity / Colour	8 Hours
	Taste / Odour	8 Hours
	Augmentation (Boreholes)	1 Day

Help-desks were developed at all the municipal administrations with the objective to assist customers. Disabled people are supported to do business from the help-desks. Requests by the illiterate are being captured and forwarded to the relevant official / section. Most of the municipal buildings are accessible and wheel-chair friendly.

After hour emergency requests are being dealt with by the control room on a twenty-four hour basis. Requests are furthermore captured through the Customer Complaints system to ensure execution thereof.

Recommendation and Strategy:

The municipality needs to ensure that all consumers are familiar with the telephone numbers to lodge complaints and report leaks. Telephone numbers to lodge complaints and report leaks are included on the monthly water bills and on the Municipality's website. Suggestions would be to also include it on strategically located notice boards, radio broadcasts, etc.

The projects and measures that can be implemented for passive leakage control are as follows:

- Improve the help-line and install an automated answering system.
- Advertise the help-line.
- Investigate current problems in responding to leaks and allocate adequate resources to avoid lengthy delays.
- Review and develop a policy regarding responses to leaks with the aim of reducing response time, prioritising and keeping consumers informed.
- Develop a monitoring system and quality assurance measures to ensure problems are resolved adequately. Link such a KPI to the SDBIP.

The Customer Care Service Charter should include the following information:

- Commitment to deliver excellent services to our clients (Executive Mayor and Municipal Manager).
- Standards of services (Enquiries written and telephonic; Accounts enquiries and distribution of accounts).
- Response times for different services (Water: Repairs to networks, installation of new household water connections, etc.)
- Contact details for different areas.

Funding and Budget Requirements:

Budget requirement for improved customer awareness raising with regard to the Municipality's Customer Complaints System R150 000/annum.

Scorecard Result:

4 out of 4: Indicating that an efficient reporting system is in place for network (leakage) complaints (90% of reported leaks are repaired within 24 hours);

3 out of 4: Indicating that an efficient reporting system is in place for metering and billing problems (90% of problems are dealt with within one month).

ITEM 8: ASSET REGISTER FOR WATER INFRASTRUCTURE

Introduction: It is essential for all water utilities to establish a proper asset register as a pre-requisite to some form of asset management programme. Unless a proper asset register has been developed, the water utility cannot allocate the appropriate maintenance budget to ensure that the water reticulation system is kept in good condition.

Situation in Stellenbosch LM:

A Comprehensive Asset Register is in place, which include all the water and sewerage infrastructure. The Asset Register include the Opening Cost, Book Value, RUL and Age of all the infrastructure. See Topic 3 of the Administration, Information and Comprehensive Overview Report for the summary of the different components.

Recommendation and Strategy:

- Continue with the annual updating of the Asset Register.
- Continue to ensure that all the existing water and sewerage infrastructure are included in the Asset Register.
- The Conditions of the assets need to be included in the Asset Register.

Funding and Budget Requirements:

None - To be done as part of the annual updating of the Asset Register by the municipality.

Scorecard Result:

3 out of 4: WSA has a partially completed accurate asset register in place.

ITEM 9: ASSET MANAGEMENT CAPITAL WORKS

Introduction: Water utilities should allocate a budget of approximately 2% of the total asset value per annum to undertake replacement of existing infrastructure. The 2% is calculated based on an approximate design life of 50 years for the different infrastructure components. If components of the system has a design life of 100 years then at least 1% of the asset value should be spend annually on replacing those components of the system. It is important to differentiate between budget allocated to maintenance of the water infrastructure and budget for the replacement of the infrastructure.

Situation in Stellenbosch LM:

The historical capital expenditure for water and sewerage infrastructure is included in Table 7.1.4.1.1 and Table 7.1.4.2.1 of Topic 7 of the Administration, Information and Comprehensive Overview Report. It is estimated that less than 1% of the value of the existing water infrastructure is invested annually into new capital works.

Recommendation and Strategy:

Allocate a budget of at least 2% of the total water asset value per annum towards the replacement of existing infrastructure. Municipality needs to differentiate in their capital budget between new projects and projects that are for the replacement of existing infrastructure, in order to accurately calculate the annual percentage allocated towards the replacement of existing infrastructure.

Funding and Budget Requirements:

Capital budget of at least 2% of the total water and sewerage asset value allocated towards the replacement of the existing water and sewerage infrastructure.

Scorecard Result:

2 out of 4: Indicating that less than 1% of the value of the water network is invested annually into the maintenance of the existing infrastructure.

ITEM 10: ASSET MANAGEMENT OPERATION AND MAINTENANCE

Introduction: Lack of maintenance of water infrastructure is one of the key problems facing most municipalities in South Africa. It is important for a water utility to differentiate between budget allocated to maintenance of the water infrastructure and budget for the replacement of infrastructure. In the case of operations and maintenance of the system, a budget of approximately 1% to 2% of the value of the system is typically required to ensure that the system remains in good condition.

(The 1% - 2% guideline is based on discussions with technical staff from some municipalities and will obviously vary from area to area. Very few municipalities in South Africa spend enough on operations and maintenance and as a result, there is a serious backlog of maintenance developing in many areas – and the problem continuous to grow with each year that insufficient maintenance budget is allocated to the water infrastructure.)

Situation in Stellenbosch LM:

The current O&M Budget allocated towards the refurbishment and maintenance of the existing water and sewerage infrastructure is inadequate. The historical water and sewerage O&M expenditure are indicated in Tables 7.1.3.1.1 and 7.1.3.2.1 of the Administration, Information and Comprehensive Overview Report. The water and sewerage infrastructure currently included in the municipality's asset register is included under Topic 3 of the Administration, Information and Comprehensive Overview Report.

Recommendation and Strategy:

The municipality needs to differentiate between budget allocated towards the operation and maintenance of the water infrastructure and the budget allocated towards the replacement of the water and sewerage infrastructure. A budget of approximately 1% to 2% of the value of the system is typically required for the operations and maintenance of the system to ensure that the system remains in

good condition.

The municipality needs to compile an Asset Management Plan (AMP) to ensure efficient, effective and optimal management, operation and maintenance of all assets, which includes treatment plants, reservoirs, structures, buildings, pipelines, sites, etc. The purpose of the AMP is to:

- Ensure the operation and maintenance functions are well planned.
- Demonstrate responsible management.
- Justify and communicate funding requirements.
- Service provisioning complies with regulatory requirements.

An AMP normally includes the following:

- documents the nature, extent, age, utilization, condition, performance and value of the infrastructure work;
- identifies existing and target levels of service, as well as expected changes in demand;
- identifies the life-cycle management needs of the infrastructure (development, renewal, operations and maintenance);
- assesses capital and operational budget needs; and
- identifies infrastructure asset management improvement needs.

It is important for the municipality to develop an AMP from their Asset Register. The objective of an AMP is to support the achievement of the strategic goals of the Municipality and facilitate prudent technical and financial decision-making. It is also a vehicle for improved internal communication and to demonstrate to external stakeholders the Municipality's ability to effectively manage its existing infrastructure as well as the new infrastructure to be developed over the next 20 years.

This plan must be based on the principle of preventative maintenance in order to ensure that, as far as this is practical, damage to assets is prevented before it occurs. The municipality needs to ensure that the maintenance and rehabilitation plan is part of the WSDP and that the plan is implemented. Assets must be rehabilitated and / or replaced before the end of their economic life and the necessary capital funds must be allocated for this purpose. Priority should be given to rehabilitating existing infrastructure as this generally makes best use of financial resources and can achieve an increase in (operational) services level coverage's most rapidly. The preparation of maintenance plans and the allocation of sufficient funding for maintenance are required to prevent the development of a large condition backlog. The potential renewal projects for the water infrastructure need to be identified from the Asset Register. All assets with a condition grading of "poor" and "very poor" need to be prioritised.

The O&M Budget allocated towards repairs and maintenance should include the replacement of malfunctioning and old bulk water meters and consumer water meters, clearing of meter chambers, buying replacement mechanisms for bulk water meters, speedy repair of leaks, leak detection in areas with high water losses and NRW and higher than expected night flows, etc. The budget should also be used for preventative maintenance, which include the following:

- Inspection of isolation valves and packing.
- Control valve inspection and maintenance.
- Inspection of cathodic protection of steel pipes.

Funding and Budget Requirements:

Additional budget should be allocated towards the repairs and maintenance of the existing water and sewerage infrastructure. The additional budget should be determined by the municipality once an AMP is developed. A budget of approximately 1% to 2% of the value of the system is typically required for the operations and maintenance of the system to ensure that the system remains in good condition (Best Practice).

An estimated budget for the drafting of an AMP for all the water and sewerage infrastructure is R1 000 000.

Scorecard Result:

2 out of 4: Indicating that less than 1% of the value of the water network is invested annually into the maintenance of the existing infrastructure

ITEM 11: DEDICATED WC/WDM SUPPORT

Introduction: Municipalities should have a dedicated section that deals with WC/WDM initiatives.

Situation in Stellenbosch LM:

The municipality currently does not have staff only dedicated to WC/WDM. The managers and operational personnel within the various towns all assist with WC/WDM where possible.

Recommendation and Strategy:

The municipality should allocate at least one (1) person to head WC/WDM for a start. The number of people involved with WC/WDM measures can later be increased as and when required.

Funding and Budget Requirements:

The municipality may be able to use one of their existing staff members. If a new person has to be appointed the municipality can determine the costs involved with such an appointment.

Scorecard Result:

1 out of 4: Indicating that no WDM section currently in place, intention to create WDM section

ITEM 12: ACTIVE LEAKAGE CONTROL

Introduction: Active Leakage Control involves sending teams out to search for unreported leaks as opposed to Passive Leakage Control which involves relying on residents to report leaks.

Situation in Stellenbosch LM:

The overall NRW and Water Losses should be lowered. No visible leakages were noticed during the WSDP site visits. The IWA Water Balances and the night flow analysis are used to identify the zones with higher than expected night flows (leakages).

Recommendation and Strategy:

The following process needs to be followed for active leakage control of the reticulation network:

Decide on how the work will be undertaken:

- The appointment and training of additional staff.
- The training of existing staff.
- Appoint an external contractor in the first few years with the objective of using this contractor to train the internal teams and build capacity to do all work internally.
- The above three options need to include the purchase or re-allocation of equipment.
- Complete outsourcing of the activity.

Leak detection: Identify areas with highest leaks and send teams into the field to detect leaks.

Repair of leaks once identified: Once leaks were detected they will need to be repaired. Depending on the extent of the leaks and other workloads, the leak repairs need to be carried out by either the internal teams or a contractor.

Funding and Budget Requirements:

R1 000 000 to undertake leak detection in zones with high excess night flows. In addition allocate approximately R350 000 per year for general visual leak inspections.

Scorecard Result:

1 out of 4: Indicating that no active leakage detection is currently undertaken however the WSA intends to initiate such measures

ITEM 13: SECTORIZATION OF RETICULATION SYSTEMS

Introduction: In order to manage a large water reticulation system it is necessary to split the system into smaller zones which can then be monitored individually in order to identify and localize key problem areas. This process is called Sectorization and is one of the key elements of an effective WC/WDM programme.

Situation in Stellenbosch LM:

The individual water reticulation systems have already been sectorized in reservoir and PRV supply zones. These zones hare however not yet regularly checked for discreteness.

Recommendation and Strategy:

The billed metered data is currently linked to the distribution systems and should also be linked to the different zones in the future where possible, in order to accurately determine the NRW and water losses for the specific zones in the future. Faulty bulk water meters need to be replaced and new meters need to be installed for the zones with no bulk water meters.

The Financial Department needs to continue to provide the billed metered consumption data separately for each of the systems. Sectorization will assist with the following:

- Clear indication of how much water is being used per area / zone.
- Areas with high NRW and water losses can easily be identified.
- Leakage and pressure control can be better managed.
- Water demand per area / zone can be determined.

Night flows need to be measured for zones with expected high water losses. It is recommended to re-log the night flows every few years to determine if there was an increase in leakage.

Funding and Budget Requirements:

The estimated cost for the logging of flows and pressures for zones with expected high water losses is R1 000 000. The logging exercise should be repeated at least every three years.

A budget should be allocated to investigate and resolve possible zone interconnections. It is, however, difficult to price such investigations at this stage.

Scorecard Result:

3 out of 4: Reticulation network has been sectorised, but it is not checked regularly to ensure discrete zones.

ITEM 14: EFFECTIVE BULK METERING MANAGEMENT SYSTEM

Introduction: Bulk meters are typically used to measure the water supplied from the source, at the inlet and outlet of the WTWs, on the rising mains of the water pump stations and on the inlet and outlet of storage reservoirs.

Situation in Stellenbosch LM:

Most of the bulk water meters are adequately protected from possible vandalism and are in a good condition. Some of the current challenges with regard to the bulk water meters are as follows:

- Adequately protecting the meters from vandalism.
- Some of the reservoirs and water pump stations are not supplied with bulk water meters and the meter readings are not always taken of the reservoirs and pump stations supplied with bulk water meters. This make the calculation of the actual water usage for specific zones sometimes difficult.

Recommendation and Strategy:

- Municipality needs to continue to read all the bulk water meters at the existing sources, WTWs, reservoirs and pump stations and need to record the readings on at least a monthly basis.
- All bulk water meters need to be installed in lockable meter chambers and reservoir sites and water pump stations need to be secured in order to prevent unauthorised access and possible damage to the water meters.
- New bulk water meters need to be installed correctly. Ideally a straight pipe section upstream of the meter of at least 5x the meter dia. and 3x the meter dia. downstream of the meter. Strainers need to be installed to protect the meters. These strainer elements must be removable from the top, for ease of cleaning. Gate valves are required for maintenance before and after meters.
- Every informal area with unmetered communal services to be supplied with a bulk water meter in order to determine the unbilled metered consumption. All discrete zones are to be supplied with a bulk water meter. The meter readings must be recorded on at least a monthly basis. The readings can be used to quantify both the water supplied and the leakage for a specific area.

Funding and Budget Requirements:

- Allow an annual budget of approximately R800 000 for the installation of new bulk water meters, the replacement of faulty bulk water meters and to adequately protect existing bulk water meters.

Scorecard Result:

3 out of 4: All bulk water sources to the WSA are metered by the Bulk water supplier or by the WSA

ITEM 15: EFFECTIVE ZONE METER MANAGEMENT AND ASSESSMENT OF NIGHT FLOWS

Introduction: Zone meters are used to monitor the water supplied into the zones with particular emphasis on the recording of the MNFs. From the analyses of the MNF it is possible to establish the level of leakage and/or wastage in each zone after which selective WDM interventions can be properly prioritised.

Situation in Stellenbosch LM:

Some of the reservoir and PRV zones are metered, but all the readings of the bulk water meters at the reservoirs and pump stations are not always taken. The night flows for all the various zones are not yet all monitored.

Recommendation and Strategy:

See recommendations under Item 14.

Funding and Budget Requirements:

See funding and budget requirements included under Item 14.

Scorecard Result:

1 out of 4: Zone inputs are currently not metered although the WSA has planned to install meters on all zone inlets

ITEM 16: PRESSURE MANAGEMENT

Introduction: Pressure management is one of the key WDM interventions that can be used to reduce leakage and extend the life of the reticulation system in areas which experience high leakage. The basic principle is that any reduction in pressure will result in a reduction of water leakage.

The volume of losses experienced as well as the volume of water used by consumers is related to the pressure in the system. The concept of pressure management is to reduce the excess system pressure in order to reduce leakage, the occurrence of pipe bursts and also reduce excessive consumption by consumers.

Situation in Stellenbosch LM:

See Item 2.

Recommendation and Strategy:

See Item 2.

Funding and Budget Requirements:

See Item 2.

Scorecard Result:
3 out of 4: Reticulation is comprehensively sectorised into pressure zones which are all discrete. PRV's are only maintained when problems become apparent.

ITEM 17: AS-BUILT DRAWINGS OF BULK AND RETICULATION INFRASTRUCTURE

Introduction: Proper "as-built" drawings are essential to any water utility. In many parts of South Africa it is found that even if the municipality has drawings of the reticulation system the drawings do not always match the pipes as laid in the ground and this in turn can result in operational difficulties and water supply problems.
It is therefore necessary for a water utility to have some form of system whereby the drawings can be updated to reflect the "as-built" conditions and that measures are taken to clarify the situation in areas where it is known that the available drawings may not be accurate.

Situation in Stellenbosch LM:
As-built drawings are available for all water reticulation networks in Stellenbosch Municipality.

Recommendation and Strategy:
Continue with the updating of as-built drawings on an ongoing basis. Continue also with the regular updating of the Water and Sewer Master Plans.

Funding and Budget Requirements:
Allow a budget of approximately R2.000 million for the updating of the Water and Sewer Master Plans every three to five years.

Scorecard Result:
4 out of 4: Indicating that accurate as-built drawings are available digitally for all reticulation.

ITEM 18: SCHEMATIC LAYOUTS OF WATER RETICULATION SYSTEMS

Introduction: Schematic layouts of the water distribution systems are necessary in order to understand the systems better and to indicate the position of the sources, WTWs, reservoirs, pump stations and bulk water meters. The schematic layouts also assist with the development of an accurate water balance.

Situation in Stellenbosch LM:
Schematic layouts are available for all the systems.

Recommendation and Strategy:
Municipality needs to continue to update the schematic layouts on a regular basis, in order to ensure they remain accurate.

Funding and Budget Requirements:
None

Scorecard Result:
4 out of 4: An up-to date and detailed schematic of the whole bulk reticulation network is available showing all bulk mains, pumps, reservoirs and meters.

ITEM 19: REGULATION AND BYLAWS

Introduction: Water Services By-laws need to be in place and enforced by the WSA. Water utilities should regulate the type of water fittings that may be installed in buildings and enforce the use of these fittings through by-laws. Water utilities should also have by-laws that relates to water conservation and effective water usage and enforce these by-laws when required.

Situation in Stellenbosch LM:
Water Services By-law (13 September 2019) is in place. The By-law includes the following "Water Conservation" sections:

- Unauthorised services;
- Water audit;
- Water demand management;
- Water restrictions;
- Waste of water;
- Illegal re-connection; and
- Interference with infrastructure.

Recommendation and Strategy:
Allocate sufficient budget and personnel for the enforcement of the Water Services By-law.

Funding and Budget Requirements:
To be determined by Municipality.

Scorecard Result:
3 out of 4: Regulations and Bylaws are in place which address WDM issues but are not enforced.

ITEM 20: TARIFFS

Introduction: Wasteful or inefficient use of water is discouraged through an increased step block tariff system. The determination of tariff policies should seek to address both commercial and social welfare concerns. The **CAFES**-principles are outlined below:

- **C**onserving: Tariffs should encourage consumers to purchase enough water to meet their needs without being wasteful.
- **A**dequate: Future investment should also be considered when setting the tariffs.
- **F**air: The utility should achieve financial sustainability while maintaining access for poor communities.
- **E**nforceable: Tariffs that cannot be enforced are unlikely to be sustained.
- **S**imple: The tariffs should be easy for the Municipality to administer and easy for customers to understand. Consumers generally show greater willingness to pay water bills that they understand.

Situation in Stellenbosch LM:

The existing water tariff structure adequately differentiate between the different type of consumers. The current step block tariff structure discourages the wasteful or inefficient use of water. Stellenbosch Municipality's existing water and sanitation tariffs are summarised in Tables 7.3.1 and 7.3.2 under Topic 7 of the Administration, Information and Comprehensive Overview Report.

Recommendation and Strategy:

See Section 7.3 under Topic 7.

Funding and Budget Requirements:

Financial study to determine the impact of changing the sanitation tariff structure from a fixed monthly amount, which is based on the size of the erf, to a stepped tariff based on water consumption in the future. Estimated cost of a financial analysis is R400 000.

Scorecard Result:

4 out of 4: Stellenbosch Municipality has rising block tariffs in place that encourage water use efficiency.

ITEM 21: TECHNICAL SUPPORT TO CUSTOMERS

Introduction: Municipalities should be able to offer support to customers (especially large customers) on WC/WDM initiatives.

Situation in Stellenbosch LM:

Stellenbosch Municipality only provides technical support on WDM to their consumers on a reactive basis.

Recommendation and Strategy:

The objective of a Technical Support programme is not limited to assisting consumers in reducing their water demand, but is also to look at wastewater, monitor compliance with by-laws and service conditions and offer general customer support. Once a dedicated person has been allocated to WC/WDM it is recommended to engage with large customers and to identify areas where the municipality can provide assistance. The proposed activities of this programme that can be budgeted for are as follows:

- Train existing staff;
- Identify and visit large consumers (Checking that large consumers are correctly metered and billed, providing tips on WC/WDM, test the accuracy of all large consumer meters, install data-loggers on all large consumer meters and informing consumers of any sudden change in consumption patterns).
- Arrange leakage inspections in public buildings;
- Provide assistance and technical know-how for large consumers; and
- Introduce compulsory water management plans for large consumers.

Funding and Budget Requirements:

No additional funding – pending the appointment of a dedicated person for WC/WDM.

Scorecard Result:

2 out of 4: Indicating that Stellenbosch Municipality only offers technical support on WDM on a reactive basis.

ITEM 22: REMOVAL OF UN-AUTHORISED CONNECTIONS

Introduction: Illegal or un-authorised water connections is a serious problem in South Africa and one with which very few municipalities can deal with effectively. Un-authorised connections directly impacts on the NRW and can also negatively impact on the operation of the system if too many illegal connections are made in one area.

Situation in Stellenbosch LM:

The SWIFT analysis is regularly done by the Municipality and there is no known un-authorised connections according to the municipality.

Recommendation and Strategy:

Stellenbosch Municipality should continue to remove un-authorised connections as and when they are detected. See Section 5.1.1.5.

Funding and Budget Requirements:

Estimated annual budget of R500 000 is required to install water meters at any unmetered erven.

Scorecard Result:
4 out of 4: Stellenbosch Municipality actively monitors and removes all unlawful connections

ITEM 23: COMMUNITY AWARENESS ON WDM

Introduction: Community awareness programmes are required to ensure that any WDM interventions are clearly understood and supported by the community they are designed to serve. In many cases, WDM interventions that are technically sound and have been properly implemented fail due to the fact that they do not carry the support of the community. It is therefore essential that any water utility wishing to promote water use efficiency or any form of WC/WDM intervention has a proper community awareness programme in place to support any technical interventions.

Situation in Stellenbosch LM:
See Section 5.1.3 under Topic 5 of the Administration, Information and Comprehensive Overview Report. Awareness is being done on an ad-hoc basis via pamphlets, notices, newspaper articles and the local radio stations.

Recommendation and Strategy:
See Section 5.1.3

Funding and Budget Requirements:
It is estimated that R250 000 / year should be allocated for WC/WDM awareness campaigns and activities, material to be included with monthly water bills, placing notices in newspapers, billboards, competitions, etc.

Scorecard Result:
1 out of 4: Indicating that Stellenbosch Municipality currently does not conduct workshops on water conservation within the communities, however these interventions are proposed.

ITEM 24: SCHOOLS EDUCATION ON WDM

Introduction: Schools are often key problem areas with regard to water wastage and often the situation within schools is so bad that they are not fit to house the scholars they teach. Education on the value of water and how to conserve water does not form part of any formal curriculum in schools and where such training is provided, it is normally through the local water service provider.

Situation in Stellenbosch LM:
See Section 5.1.3.1 under Topic 5 of the Administration, Information and Comprehensive Overview Report.

Recommendation and Strategy:
See Section 5.1.3.1

Funding and Budget Requirements:
Allow a budget of approximately R100 000 per year for the implementation of WC/WDM measures at schools (Competitions, Awareness Raising events, etc.). The DWS can also assist the municipality with pamphlets and posters on WC/WDM initiatives.

Scorecard Result:
1 out of 4: Stellenbosch Municipality currently does not conduct workshops on water conservation within the schools, however these interventions are proposed.

ITEM 25: RETROFITTING

Introduction: In the context of WDM, retrofitting refers to projects that focus on fixing internal leaks and fitting of water efficient devices (i.e. water savings toilets, taps, etc.). In South Africa these types of projects have been mostly undertaken in the following buildings:

- Houses of Indigent users with high internal plumbing leakage, where consumers don't always have the funds or knowledge to fix the leaks themselves or to purchase water efficient devices.
- Public buildings with high internal plumbing leakage (i.e. schools, prisons, police stations, hospitals, etc.) It is a common problem in South Africa that many public buildings have high internal plumbing leakage and that water inefficient devices are still being used in the ablution facilities. One of the key contributors to water wastage in public buildings is tip-tray urinals. These urinals flush continuously and can be retrofitted with push button flush mechanisms, which will only flush when activated by a user.

Situation in Stellenbosch LM:
See Sections 5.1.2.1 and 5.1.2.2 of the Administration, Information and Comprehensive Overview Report.

Recommendation and Strategy:
See Sections 5.1.2.1 and 5.1.2.2

Funding and Budget Requirements:
Leak repair assistance programmes: R1 000 000 per annum for ongoing exercise to repair leakages at indigent properties using in excess of 20 kl/month. WSIG funding from DWS can be requested in this regard.
Retrofitting: R1 000 000 for a pilot project in one of the public buildings.

Scorecard Result:

2 out of 4: Stellenbosch Municipality has undertaken limited plumbing repairs in public buildings, but not inside properties of indigent users.

The way forward for Stellenbosch Municipality with the implementation of the proposed WC/WDM Strategy is as follows:

- Develop a detailed methodology for measuring the performance criteria for each of the twenty-five (25) WC/WDM Strategy items;
- Allow for budget required to implement the various measures;
- Monitor the impact of all WC/WDM measures on an on-going basis;
- Develop key benchmarks for all KPIs and categories and assign responsibility; and
- Review WC/WDM Strategy as necessary.

Stellenbosch Municipality needs to ensure that adequate funding is allocated under their Capital and Operational budgets towards the implementation of the WC/WDM Strategy. Key WDM projects to be taken into account during Stellenbosch Municipality's capital budgeting process are as follows:

- Replacement of old water networks (Areas with regular pipe bursts);
- Replacement of old bulk and consumer water meters (Meter replacement programme);
- Scada systems to provide for early warning;
- Installation of zone meters;
- Pressure Management;
- Leak detection; and
- Data loggers to establish MNFs.

The WDM initiatives can deliver excellent return on investment if well implemented and well managed. All external funding that could be utilised by Stellenbosch Municipality for this purpose should be sourced. The O&M Budget allocated to repairs and maintenance should be increased to address amongst other tasks the following:

- Replacement of malfunctioning and old bulk water meters and consumer meters;
- Construction of meter chambers for all bulk water meters not adequately protected against vandalism;
- Cleaning of bulk water meter boxes;
- Buying replacement mechanisms for bulk meters;
- Speedy repair of leaks; and
- Leak detection in areas with higher than expected night flows.

5.1 WATER RESOURCE MANAGEMENT

Table 5.1.1: Master Plan for Water Resource Management		
Section	**Master Plan**	**Yes / No**
Reducing Unaccounted for Water and Water Inefficiencies	Is there a Master Plan that addresses this problem?	WC/WDM Strategy
	Does this Plan address this problem 100%?	Yes
Leak and Meter repair programmes	Is there a Master Plan that addresses this problem?	Part of WC/WDM Strategy
	Does this Plan address this problem 100%?	Yes
Consumer/end-use demand management: Public Information and Education Programmes	Is there a Master Plan that addresses this problem?	Part of WC/WDM Strategy
	Does this Plan address this problem 100%?	Yes
Conjunctive use of surface- and groundwater	Is there a Master Plan that addresses this problem?	No
	Does this Plan address this problem 100%?	-
Working for Water	Is there a Master Plan that addresses this problem?	No
	Does this Plan address this problem 100%?	-

5.1.1 Reducing Unaccounted Water and Water Inefficiencies

During droughts (as experienced in the Western Cape during 2015-2017), some WC/WDM measures are often enforced by local government through water restrictions; however, an appropriate municipal water control (metering) and pricing structure (billing and revenue collection) could ensure that these measures become routine. The sustainability of future water services will largely depend on the ability of municipalities to properly maintain the reticulation systems, to minimise household plumbing leakages and to maintain pressurised supplies (assurance of supply) to justify payment from their clients for those services.

Stellenbosch Municipality has responded to the need to address NRW and water losses within their jurisdiction by implementing various WC/WDM initiatives over the last number of years. The Municipality will also continue to actively implement their WC/WDM Strategy in order to reduce the percentage of NRW and Water Losses even further and improve water use efficiency within the various schemes as follows.

Table 5.1.1.1: Commitment to reduce water losses and water inefficiencies				
Distribution System	**2023/2024**		**Committed Future Water Losses**	
	NRW	**Water Losses**	**2028**	**2048**
Stellenbosch	30.7%	27.5%	25.0%	10.0%
Franschhoek	28.9%	25.7%	20.0%	10.0%
Dwars River	40.8%	37.6%	30.0%	10.0%
Klapmuts	32.6%	29.4%	25.0%	10.0%

The large water users in Stellenbosch Municipality were identified as part of the Water Master Plans. Non-residential large users in Stellenbosch Municipality have potential to reduce water consumption via reuse of water. It is suggested that meetings should be arranged with these large users. These meetings should be informative on the current water consumption status; potential water saving volumes; cultivate a water saving awareness within each large user and at least involve 50% of the large water users. Issues to be taken into account include the end user, the water quality and the infrastructure required.

5.1.1.1 Night flow metering

The implementation of a WC/WDM strategy does not only refer to measures that reduce water wastage and inefficient use, but also include measures to effectively manage and sustain efficiency targets. Some of the priority requirements are to install systems that measure and identify certain key parameters such as MNFs and systems to enable detailed and regular water audits and water balances.

Ongoing night flow analyses should be implemented as part of the normal operational activities of the Municipality. This will provide information on system performance and give direction for interventions. Night flow analysis is one of the most practical and economical ways to identify water leaks and losses.

Stellenbosch Municipality is committed to continue with the monitoring of the MNFs for specific zones in order to identify areas for the implementation of specific WDM activities (Pressure Management, Repair of leaks, etc.) The Municipality will also in the future link their zone meters in the various distribution systems to the financial data, in order to accurately determine the percentage of NRW and Water Losses for the specific zones.

The minimum night flow / average daily demand ratio needs to be used to prioritize leak detection for cost effectiveness (Note: 80% of losses come from 20% of leaks). The key performance indicators to be measured before and after the implementation of the various water demand management measures include the following:

- Total Consumption (Ml / annum)
- Consumption per person (l / person / day)
- Consumption per property (Kl / property / month)
- Minimum night flow (litres / second)
- Excess night flow (litres / second)
- Expected night flow (litres / second)

5.1.1.2 Day flow metering

Stellenbosch Municipality is committed to continue to monitor the volume of raw water supplied from the Western Cape Water Supply System (WCWSS) to the Municipality, the abstraction from all the Municipality's own water sources, the raw water supplied to all the WTWs, the final water supplied from all the WTWs (System Input Volumes), the volume of water supplied to the various zones and to meter all water used by consumers within the various towns.

The Municipality will also continue with the reading of all the internal bulk zone meters to enable the identification of poor performing and leaking distribution infrastructure for specific zones. The following considerations need to be taken into account when zone meters are installed.

- A suitable strainer needs to be fitted with every zone meter (three to five pipe diameters before). For ease of cleaning these strainer elements must be removable from the top.
- Gate valves for maintenance before and after meters.
- Select meters with accurate forward and reverse flow capability.
- High frequency bi-directional pulse outputs capability.
- Pressure tapping for downstream pressure monitoring.
- Consider meters with fully shrouded pre-calibrated as-sized mechanisms.
- Counter sealed meters to IP68 to prevent condensation.

The Municipality needs to try to measure and analyse the MNFs at least every two years. The Municipality needs to keep stock of the meters at the depot so that meters can be replaced as soon as the Municipality becomes aware of a faulty meter.

The SWIFT analysis needs to be used to inspect all the potential unmetered erven and the metered erven with no consumption and very low consumption. The unmetered erven should be metered and consumers in the billing system should be updated where required. All water meter chambers should also be cleaned regularly.

5.1.1.3 Reticulation leaks

In addition to the current practices regarding the repair of reticulation leaks Stellenbosch. Municipality has to progress to the point of actively identifying and repairing reticulation leaks that are not visible to the human eye. Stellenbosch Municipality therefore needs to focus on active leak detection in the future. The Municipality also needs to continue with their pipeline replacement programme.

Leak detection should be conducted by means of a specialized leak detection company in areas of high MNF. The activity can be performed after the MNFs were calculated and the specific areas with high MNFs were determined.

The Municipality needs to continue to record the location of all pipe failures (Leaks) per system with accurate GPS coordinates. This would improve the integrity of the pipeline replacement programme.

The leakage management programme should focus on system operations by considering each of the following:

- **Raw water supply and treatment.** The focus should fall on bulk water metering, reduced filtration loss at the WTWs and staff training.

- **Distribution system:** The focus should fall on pressure management, leak repair, consumer metering and billing and staff training.

- **End-users.** The focus should fall on awareness campaigns (to encourage high-income users to reduce on-property leaks) and on water audits and leak repair at individual properties (for low-income users in the free-basic water category).

Table 5.1.1.3.1: Tasks and tools that can be included in the Leakage Management component of a WDM Strategy

Question/Solution	Task
How much water is being lost? Measure components	Water balance ▪ Improved estimation/measurement techniques ▪ Meter calibration policy ▪ Meter checks ▪ Identify improvements to recording procedures
Where is it being lost from? Quantify leakage Quantify apparent losses	Network audit ▪ Leakage studies (reservoirs, transmission mains, distribution network) ▪ Operational/customer investigations
Why is it being lost? Conduct network and operational audit	Review network practices Investigate: ▪ Historical reasons ▪ Poor practice ▪ Quality management ▪ Procedure ▪ Poor materials/infrastructure ▪ Local/political influences ▪ Cultural/social/financial
How to improve performance? Upgrade the network Design a strategy and action plans	Strategy development ▪ Update record systems ▪ Introduce zoning ▪ Introduce leakage monitoring ▪ Address causes of apparent losses

Table 5.1.1.3.1: Tasks and tools that can be included in the Leakage Management component of a WDM Strategy	
Question/Solution	**Task**
	▪ Initiate leak detection/repair policy ▪ Design short/medium/long term action plans
How to sustain performance? Ensure sustainability with appropriate staffing and organisational structures	Training and O&M ▪ Improve awareness ▪ Increase motivation ▪ Transfer skills ▪ Introduce best practice/technology ▪ Community involvement ▪ Water conservation/demand management programmes ▪ Monitor action plan recommendations ▪ Introduce O&M procedures

The following future PRVs were proposed in the Bulk Water Resources Drought Intervention Projects study, in order to reduce the pressures in the reticulation networks, which will also assist in reducing the number of pipe bursts due to high pressure.

Table 5.1.1.3.2: Proposed future PRV projects (June 2019)		
Distribution System	**Proposed pressure management project**	**Recommendations**
Stellenbosch Town	Kayamandi PRV project: Phase 1	• Ensure discreteness of existing PRV zones in Kayamandi (Project completed)
	Kayamandi PRV project: Phase 2	• Optimise operation of existing PRVs in Kayamandi. • Include data on live telemetry system (Project in progress)
	Stellenbosch PRV refurbish project	• Refurbish controllers and critical point loggers at the Kleinvallei PRVs, Welgelegen PRV, Paradyskloof PRV and Brandwacht PRV. • Include data on live telemetry system (Project in progress).
	Arbeidslus PRV investigation project	• Log pressure and flow, determine operation of PRV and discreteness of zone. • Prepare short report on findings (Project in progress)
	Uniepark PRV project	• Implement new PRV zone. • Include data on live telemetry system (Future project)
	Brandwacht PRV2 project	• Implement new PRV zone. • Include data on live telemetry system (Future project)
	Techno Park PRV project	• Implement new PRV zone • Include data on live telemetry system (Future project)
Dwars River	Pniel PRV project	• Implement new PRV zone • Include data on live telemetry system (Future project)
Franschhoek	Franschhoek PRV investigation project	• Log pressure and flows of Lientjiesdorp and Franschhoek PRVs, determine operation of PRVs and discreteness of zones. • Prepare short report on findings (Project in progress)
	Franschhoek new PRV1 project	• Implement new PRV zone • Include data on live telemetry system (Future project)
	Franschhoek new PRV2 project	• Implement new PRV zone • Include data on live telemetry system (Future project)
Klapmuts	Klapmuts PRV project	• Implement new PRV zone • Include data on live telemetry system (Future project)
Rural	Koelenhof PRV project	• Verify settings and operation of existing PRVs • Install bulk water meters and critical point loggers where required. • Include data on live telemetry system (Future project)
	Polkadraai PRV project	• Verify settings and operation of existing PRVs • Install bulk water meters and critical point loggers where required. • Include data on live telemetry system (Future project)

5.1.1.4 Illegal connections

Stellenbosch Municipality will continue to monitor all erven with 0 kl consumption on a monthly basis from their financial data and from the SWIFT analysis in order pick up on any illegal connections. The Municipality will prioritise the installation of new water meters at the households with no meters or where the meters are faulty.

Types of illegal connections / use that can be identified include the following:

- Illegal use from fire hydrants;
- Illegal connections by consumers not currently serviced;
- Illegal individual household connections by consumers who are authorised for yard or standpipe delivery; and
- Illegal connections by developers and construction companies.

The disconnection of illegal connections can be sensitive if it involves consumers who are not currently serviced by the Municipality. It is therefore necessary to develop appropriate policies and procedures on how to deal with such situations. The activities of such a programme that needs to be budgeted for are as follows:

- Review / develop policies, procedures and by-laws regarding illegal connections;
- Carry out an investigation to identify illegal connections throughout the Municipality;
- Disconnect or legalise existing illegal connections;
- Check fire hydrant seals every three years; and
- Police and enforce by-laws with regards to water connections for developers.

5.1.1.5 Un-metered connections

All potential un-metered consumer connections and connection with a meter, but with zero demand, as identified through the detail Swift analysis (See Tables 5.1.1.4.1 and 5.1.1.5.1 in the Administration, Information and Comprehensive Overview Report), need to be inspected and connections need to be provided with water meters. The Municipality needs to continue to read all water meters on a monthly basis. All parks, which make use of irrigation water, and all communal facilities are also provided with meters.

In addition to water theft, many water accounts go unnoticed in the system or have some type of data inconsistency that results in no revenue being generated for the particular water use event. Stellenbosch Municipality is continuously busy with the cleaning of data in the financial billing system and to identify and correct any inaccurate data in the system. The Swift analysis will also be used for this purpose.

5.1.2 Leak and Meter Repair Programmes

5.1.2.1 Leak Repair Assistance Programmes

Stellenbosch Municipality should prioritise assistance programmes in the informal and low cost housing development areas. Such assistance programmes should include a number of measures that will ensure efficient water usage and build trust between consumer and the Municipality. Houses in these areas are not always adequately maintained, which often result in significant plumbing leaks. A Leak Repair and Assistance Programme that investigates and repairs leaks at all domestic households in low cost housing developments and poor areas with consumption above 15 kl / month should be implemented.

Leak programmes should include the following tasks:

- Identify areas with high MNFs. Record these flows before the project starts in order to ensure that the overall savings achieved by the project can be calculated.
- Visit properties occupied by indigent households on a prioritized basis (highest consumption first).
- Educate the customer about the project and water saving measures.
- Audit of properties for plumbing leaks and repair the leaks.
- Charge the owner for the plumbing repairs through the municipal account. If the consumption is maintained at a reasonable level for a period of 6 months and the current account is paid monthly and on time, the water arrears can be negotiated with the owner.
- Meters found to be faulty should be replaced.
- Identify where there may be inefficient water usage and water wastage.
- Identify the number of people living at the property so as to determine a reasonable water usage.
- Determine an affordable consumption.
- Social intervention – Awareness campaigns, education, public participation, etc.

Mechanisms for ensuring the customer repairs new water leaks, maintains an affordable consumption and does not build up arrears need to be addressed in the early stages of such a project, in order to ensure a sustainable solution (ongoing water and cost savings) is achieved. The consumptions of the repaired properties need to be monitored so that rapid action can be taken should leaks re-occur. Further efforts should be made to ensure that those who qualify as “Indigent” on an income basis will also qualify on a water consumption basis.

The challenges of effective management of water supply in low-income areas are significantly different from water supply in middle and higher income residential areas. Some of the common problems often linked to low-income areas that have existing individual house connections are as follows:

- Plumbing leaks (past the consumer meter) in excess of 20 kl / month;
- Poverty;
- Inferior or inadequate reticulation system;
- Inadequate consumer metering and billing;
- Very low levels of payment;
- High levels of reticulation losses;
- Very high levels of inefficient water usage;
- Consumer apathy; and
- Inferior plumbing installations

The aim of a comprehensive water management programme in low-income areas is to introduce a holistic approach that will capacitate consumers to take responsibility for their Water Services. The programme will introduce a combination of social, technical and regulatory interventions that will meet the requirements of the consumer and at the same time reduce non-revenue demand to sustainable levels. This approach recognises the social, technical and historical background of the many water supply problems and instead of focusing on getting the consumer to pay for excessive water demand, it assists the consumer in reducing and controlling the demand to affordable levels. It recognizes that rather than increase income to meet the

cost of water supply in low-income areas, it is preferable to reduce the water supply and the costs to affordable levels for both the community and the Council.

The proposed comprehensive water management programme for low-income areas will vary to the specific conditions of each area, but will generally consist of the following elements:

- Social Interventions: Awareness; Communication; Education; Public participation; and Refining and improving the Indigent Policy.
- Technical Interventions – Household: The installation or repair of meters or alternatively the installation of flow limiters and / or prepayment meters; the repair of plumbing leaks; and Retro fitting of toilets, taps and showers.
- Technical Interventions – Reticulation: Rehabilitation of reticulation system; Installation of pressure reducing valves; Leak detection and repair; and Installation of zones valves and meters.
- Regulatory / Financial Interventions: Credit Control; Enforcement of by-laws; Signing of service agreements; and Validation and correction of billing information.
- Maintenance Programme: Water forum; On-going awareness; and Establishment and support of a community water task team.

5.1.2.2 Retro-fitting of water efficient toilets

Lawn irrigation and toilet use are the two end-uses with the biggest impact on water demand in relation to other end-uses, with outdoor irrigation having by far the largest saving potential. In addition, water at these end-uses is not needed at potable standards. Improved, practical techniques for water supply and reuse with regards to garden watering and toilet flushing should be sought in addition to improved efficiency of use.

The nature of retro-fit projects can include the following:

- Change existing toilets to dual flush cisterns;
- Install high efficiency shower heads;
- Install flow controllers on taps and mixers;
- Balance plumbing systems (to be paid fully by consumer)
- Automated irrigation systems.

The retro-fit measures need to include education campaigns. Other considerations to take into account in considering the retrofit programmes are as follows:

- Limited experience of such projects in South Africa;
- Constraints on available products;
- Constraints on existing plumbing installations in households (i.e. should not install water efficient showers in a non-balanced system)
- Possible resistance by consumers;
- Overcoming the logistics of investing Council money in private properties.

Stellenbosch Municipality needs to focus on the installation of water saving devices (specific water efficient toilets) in all their municipal buildings. The Municipality also needs to focus on raising awareness regarding conservation projects and the installation of these products in order to reduce the water demand and their percentage of NRW.

The use and installation of these fittings should be included as a condition for the approval of building plans as well as provided for in the Water Services By-law.

5.1.2.3 Meter repair programme

Stellenbosch Municipality should place a very high priority on maintaining water meters in a good state or order by replacing old meters with new ones on a regular basis, and by identifying problem-meters for repair or replacement. All bulk water meters should also be located in meter chambers that adequately protect the meter from vandalism. Meter chambers also need to be cleaned regularly.

All consumer meters not working, as identified through the Swift analysis and follow-up inspections, need to be replaced and any leaks identified during the site inspections need to be repaired. The Municipality also needs to focus on a phased pro-active meter replacement programme in the future, where all the old water meters are replaced systematically.

Replacing all meters after a certain age is not economically feasible and a more sophisticated approach needs to be developed and implemented, which recognises that certain meters under certain conditions may be accurate for several more years than others. An effective meter repair programme needs to achieve the following objectives:

- Determine an ongoing meter replacement programme;
- Determine exceptions reports on meters which are suspected to be faulty;
- Test and replace faulty meters; and
- Size meters correctly.

A rough estimate of the number of meters that need to be replaced every year is the number of meters divided by 12, assuming that the life of the meters is not more than 12 years. Although it is assumed that the average lifespan of a meter is 12 years for budgeting purposes, it is necessary to carry out research to determine the most optimal replacement of age for each type of meter in various circumstances. The research should identify the different types of meters, in different pressure zones and carry out accuracy tests for a number of samples at different ages. In this way a policy can be developed of when each type of meter under various circumstances should be replaced. It is also recommended that, where deemed necessary new meters should be specified with AMR capacity to allow for remote meter reading. Such meters will assist in reducing meter-reading errors significantly.

The monthly consumption of all consumers should be checked to immediately identify a problem meter (where a reading suddenly becomes very high) and have it inspected. This will ensure that faulty or leaking meters are replaced as soon as possible and thus resulting in less water wastage and a greater income for the Municipality. Volume controllers can also be installed in areas where people cannot afford to pay for water. This ensures less water being wasted in the event of a leak or a tap left running.

5.1.3 Consumer / End-use Demand Management: Public Information and Education Programmes

The approach of promoting WC/WDM to consumers and society can be divided into a general consumer awareness education campaign for all consumers and a specific awareness campaign associated with focused projects such as plumbing leak repair, retrofitting projects, etc. The measures and projects that can be implemented are as follows:

- Generic consumer awareness campaign
- School education (Focus on schools)

- Special events
- Develop a WC/WDM web page

5.1.3.1 Schools Targeted by Education Programmes

Schools are considered to have a good potential to achieve water savings in Stellenbosch Municipality's area and of course have the added advantage of user education for the future generation. An extensive schools programme, which might also include annual competitions between schools (say with a prize for the lowest consumption, the lowest per capita consumption and for the best WDM-strategy poster design, etc.) can be implemented.

Water saving by schools often forms the basis of WDM programmes elsewhere, because it also involves learners who experience implementation of WDM measures first hand. Schools should be encouraged to make WDM programmes part of a long term project, where learners should be actively involved. A schools WDM programme should receive a high priority.

The activities of such a programme can include the following:

- Develop and distribute additional literature to schools;
- Hold school competitions (link to Water Week); and
- Assist / promote water audits, retrofitting of plumbing and use of boreholes.

5.1.3.2 Consumers Targeted by Public Information Programmes

Stellenbosch Municipality will continue with their current approach of adding helpful hints on effective water usage to the monthly bills. Community awareness programmes are required to ensure that any WDM interventions are clearly understood and supported by the community they are designed to serve. In many cases, WDM interventions that are technically sound and have been properly implemented fail due to the fact that they do not carry the support of the community. It is therefore essential that any Municipality wishing to promote water use efficiency or any form of WC/WDM intervention has a proper community awareness programme in place to support any technical interventions.

Education and awareness-raising campaigns are important mechanisms to bring the need for WC/WDM to the public and to trigger committed public actions and response. Social awareness is one of the key pillars of WC/WDM and is essential for the balanced and sustained use of South Africa's water resources. Engagement with the public and stakeholders through media and other mediums will highlight important principles of the efficient use of water, to ensure that relevant information is shared and the public is educated and that the profile of WC/WDM is heightened to achieve buy-in, involvement and accountability from citizens.

The outcome of an awareness campaign may be difficult to measure and it is for this reason that it is difficult to determine the amount of resources and intensity of such campaigns. It is also important to keep such campaigns fresh and interesting in order to ensure a progress impact on behaviour change.

The objectives of a generic WC/WDM awareness campaign are as follows:

- Inform consumers on the reason why water needs to be saved;
- Inform consumers on how to save water (link to programmes to promote water-wise gardening, water-efficient plumbing fittings, use of alternative resources and large users); and
- Inform consumers of various projects or initiatives that may have an impact on them.

The activities and programmes that need to be budgeted for are as follows:

- Press releases;
- Development and distribution of leaflets, fliers and posters;
- Distribution of small gadgets and stickers;
- Billboards, shopping centres and washrooms;
- Competitions;
- Develop a WC/WDM information help-line (can be a recording); and
- Hold public workshops and seminars.

5.1.4 Conjunctive Use of Surface- and Groundwater

The DWS developed an Artificial Recharge Strategy, which outlines all the environmental benefits of artificial recharge and details the global and southern African history of the technique. It also provides hydrogeological maps showing the areas with the greatest potential storage volumes. Clear criteria are also outlined for successful implementation, including high-quality surface water that is geo-chemically compatible with the existing groundwater and aquifer hydraulics which must allow for the recharged water to enter the aquifer rapidly and be contained within it. There is several management and technical issues around artificial recharge and good feasibility planning and testing are essential, with the correct siting of borehole injection points being an important factor. Clogging is identified as the key problem in most schemes around the world. Methods to prevent this from happening are detailed in the document along with the principles of 'safe yield' to ensure that groundwater levels are not raised or lowered beyond critical points.

Various new boreholes were drilled over the last number of years in order to augment the current surface water supply with groundwater. The additional supply from groundwater will also reduce the risk of no bulk water supply to the areas during drought periods. The potential for artificial recharge of the aquifers is an option that still needs to be assessed and investigated in the future.

5.1.5 Working for Water

Working for Water Programme of the DWS is currently clearing invasive alien plants in many of the catchments. This initiative creates employment for previously disadvantaged communities as part of the Expanded Public Works Programme. The focus is on removing invasive alien plants from riparian zones and mountain catchments.

It is important for Stellenbosch Municipality to identify ways in which they can support these initiatives of which the objectives should be as follows:

- Job creation and poverty relief through the eradication of alien invasive plant species.
- Provision of a sustainable source of drinking quality water.
- Protection of biodiversity through eradication of alien invasive species.
- Reducing the risk of fire in catchment areas.

Apart from the increased runoff gained from alien vegetation clearing these projects are often funded from "outside" and could thus become a valuable source of job creation and income to the Stellenbosch Municipality's poorer population areas that are typically employed to conduct the clearing operations.

5.1.6 Water Resource Management Projects

Stellenbosch Municipality needs to ensure that adequate funding is allocated under their Capital and Operational budgets towards the implementation of the WC/WDM initiatives. All external funding that could be utilised by Stellenbosch Municipality for this purpose should be sourced.

The O&M Budget allocated to repairs and maintenance should be increased to address amongst other tasks the following:

- Replacement of malfunctioning and old consumer meters;
- Clearing of meter boxes;
- Buying replacement mechanisms for bulk meters;
- Speedy repair of leaks; and
- Leak detection in areas with higher than expected night flows.

Key WDM projects to be taken into account during Stellenbosch Municipality's capital budgeting process are as follows:

- Replacement of old water networks as identified through the PRP model (See Section 5.1.1.3 of the Administration, Information and Comprehensive Overview Report);
- Replacement of old bulk and consumer water meters (Implementation of Meter Management and Replacement Programme)
- Telemetry systems to provide for early warning;
- Installation of zone meters;
- Pressure Management;
- Leak detection; and
- Data loggers to establish MNFs.

The WDM initiatives can deliver excellent return on investment if well implemented and well managed.

5.2 WATER BALANCE

The Revised Compulsory National Water and Sanitation Standards, as published in Government Gazette No.52814 of 6 June 2025, include the following water and wastewater balance analysis and determination of water losses requirements:

- A Water Services Institution must install and monitor appropriate water measuring devices or volume controlling devices to measure, detect and account for the volume of water abstracted (surface or groundwater), treated and consumed, as applicable to the technical configuration of infrastructure and the water use authorisation conditions.

- A Water Services Institution must install and monitor appropriate water measuring devices or volume controlling devices to measure, detect and account for the volume of water consumed to all user connections as applicable to the technical configuration of infrastructure.

- A Water Services Institution must install and monitor appropriate measuring devices or volume controlling devices to measure, detect and account for the volume of wastewater received at pump stations and the inlet of the WWTW. A WSA shall record minimum night flows, peak wet weather flow and average dry weather flow received at the inlet of a WWTW received from all user connections

conveyed, as applicable to the technical configuration of infrastructure and the water use authorisation conditions.

- A Water Services Institution must install and monitor appropriate measuring devices or volume controlling devices to measure, detect and account for the volume of wastewater discharged into the water resource as applicable to the technical configuration of infrastructure and the water use authorisation conditions.

- A Water Services Institution must ensure that all measuring devices or meters are properly maintained and in good working order, implementing a programme for meter in-situ verification and / or calibration.

- A Water Services Institution must account for its water balance on a monthly basis as follows:
  - Measure the daily volume abstracted and treated; and
  - Measure the quantity of water provided to each supply zone within its supply area.

- A Water Services Institution must account for its wastewater balance on a monthly basis as follows:
  - daily inflows in Ml/d; and
  - daily outflows in Ml/d.

- A Water Services Institution must determine the quantity of water losses and NRW in accordance with the Guideline for the preparation of an IWA Water Balance to determine NRW and Water Losses.

- The results of the water balance analysis and the records of the quantities of water measured must be reported to the Department's National Regulatory Information Management System on a quarterly basis.

A segregated single variable future water requirement model was developed for the WSDP and is available in electronic format. The projected future water requirement models for the various schemes are included in Annexure B. The future water requirement for each of the schemes is obtained by means of this model. It is used in this analysis to estimate the future water requirement for each of the distribution systems. The model differentiates between the different income levels. Different litre per capita per day (l/c/d) was allocated for the different income levels, and also for the different time steps evaluated where necessary. The model was calibrated by balancing the measured demands for 2023/2024 with the projected water requirements for 2023/2024, by changing the allocated litre per capita per day (l/c/d).

Input variables for the water requirement model include the population for 2023, the litre per capita per day (l/c/d), the percentage NRW as well as the quantity (kl/d) of water used by industrial and other water users. The commercial and other water users' demands for 2023 were calculated from the 2023/2024 billed metered consumption data. Annual growth rates of 3% and 5% per year were estimated for the future "other" and "commercial" water usage for each of the systems.

The projected future water requirements for the various distribution systems are included in Annexure B. Stellenbosch. Municipality is committed to continue with the metering of the influent at all their WWTWs, the quantity of treated effluent re-used and the quantity of treated effluent returned to the Water Resource Systems.

Water services must be provided in a manner that is consistent with the broader goals of integrated water resources management. There is therefore a need for an integrated planning approach between the development of water services and water resources.

The Infrastructure Leakage Index (ILI) can be used by Stellenbosch Municipality to determine an appropriate benchmark for managing the water losses according to their own specific circumstances. This ILI can also be compared with the averages for other towns within South Africa. The annual water losses within the various towns' distribution networks are therefore important indicators of the performance of the water supply and distribution systems.

Stellenbosch Municipality should conduct an assessment of strategic gaps in their IWA water balance data (See Sections 5.2.1 to 5.2.4) and to record those flows, both water and sewerage, that are strategic in terms of medium to long term planning. A prioritisation of these locations should subsequently follow with budget allocated to improve the availability and accuracy of the IWA water balance data.

Stellenbosch Municipality should continue to update their IWA water balance models on a monthly basis in order to determine the locations of wastage and to enable the Municipality to manage their NRW and Water Losses. The water balance will not directly lead to the reduction of the demand, but is an imperative management tool that will inform the implementation of demand side management initiatives. **All bulk zone water meters need to be recorded on at least a monthly basis (Meters at reservoirs and pump stations). Meters need to be located in lockable meter chambers and the meter chambers need to be cleaned regularly.**

5.2.1 Water Balance for Stellenbosch

The following areas need to be focused on for the IWA water balance of the Stellenbosch system.

- The Swift Analysis needs to be used to inspect the following erven in the Stellenbosch system.
  - Identified potential unmetered erven need to be inspected and water meters need to be installed if the connections are found to be unmetered.
  - Identified erven with water meters, but with zero demand, need to be inspected and new water meters need to be installed if the existing water meters are found to be faulty.
  - Metered erven with very low consumption (<3kl / month) need to be inspected.
  - Metered erven with a drastic increase or decrease in consumption need to be inspected.
- Install bulk water meters at the Idas Valley and Paradyskloof WTWs to measure the final flow supplied from the plants (System Input Volumes).
- Continue with the daily and monthly reading and recording of all bulk water meters (Sources, WTWs, WWTW, Reservoirs and Pump Stations).

5.2.2 Water Balance for Franschhoek

The following areas need to be focused on for the IWA water balance of the Franschhoek system.

- The Swift Analysis needs to be used to inspect the following erven in the Franschhoek system.
  - Identified potential unmetered erven need to be inspected and water meters need to be installed if the connections are found to be unmetered.
  - Identified erven with water meters, but with zero demand, need to be inspected and new water meters need to be installed if the existing water meters are found to be faulty.
  - Metered erven with very low consumption (<3kl / month) need to be inspected.
  - Metered erven with a drastic increase or decrease in consumption need to be inspected.

- All raw water supplied from Franschhoek own water sources needs to be metered and recorded on at least a weekly basis.

- Flow meter needs to be installed to measure the final effluent discharged from the Wemmershoek WWTW.

- Continue with the daily and monthly reading and recording of all bulk water meters (Supply from Wemmershoek, WTW, WWTW, Reservoirs and Pump Stations).

5.2.3 Water Balance for Dwars River

The following areas need to be focused on for the IWA water balance of the Dwars River system.

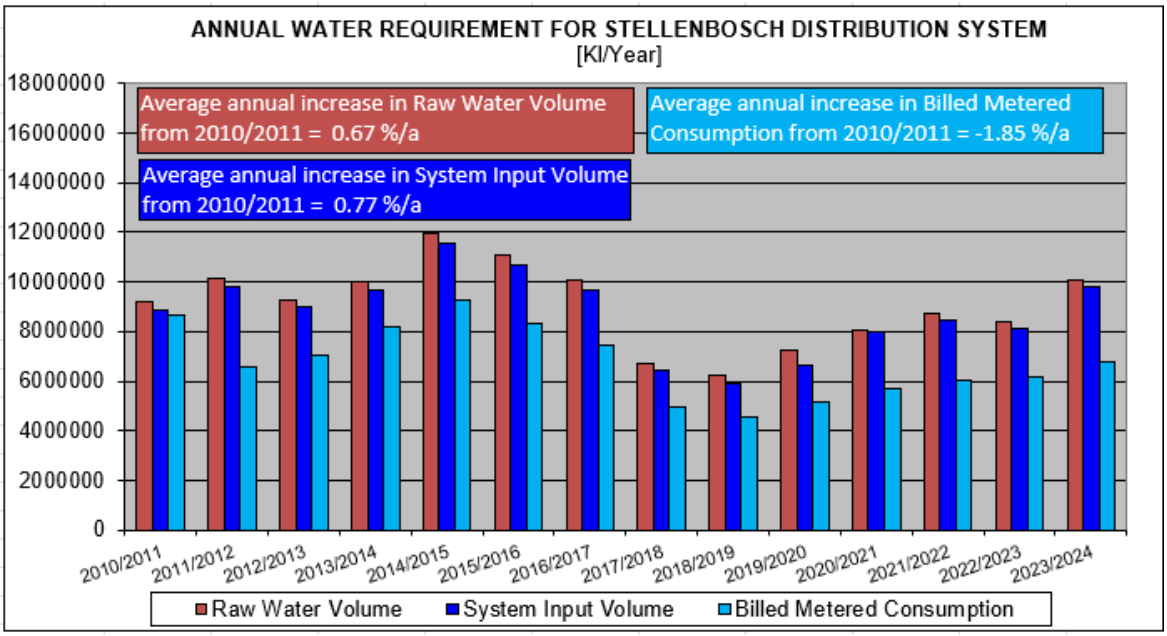
- The Swift Analysis needs to be used to inspect the following erven in the Dwars River system.
  - Identified potential unmetered erven need to be inspected and water meters need to be installed if the connections are found to be unmetered.
  - Identified erven with water meters, but with zero demand, need to be inspected and new water meters need to be installed if the existing water meters are found to be faulty.
  - Metered erven with very low consumption (<3kl / month) need to be inspected.
  - Metered erven with a drastic increase or decrease in consumption need to be inspected.

- Continue with the daily and monthly reading and recording of all bulk water meters (Supply from Wemmershoek, WWTW, Reservoirs and Pump Stations).

5.2.4 Water Balance for Klapmuts

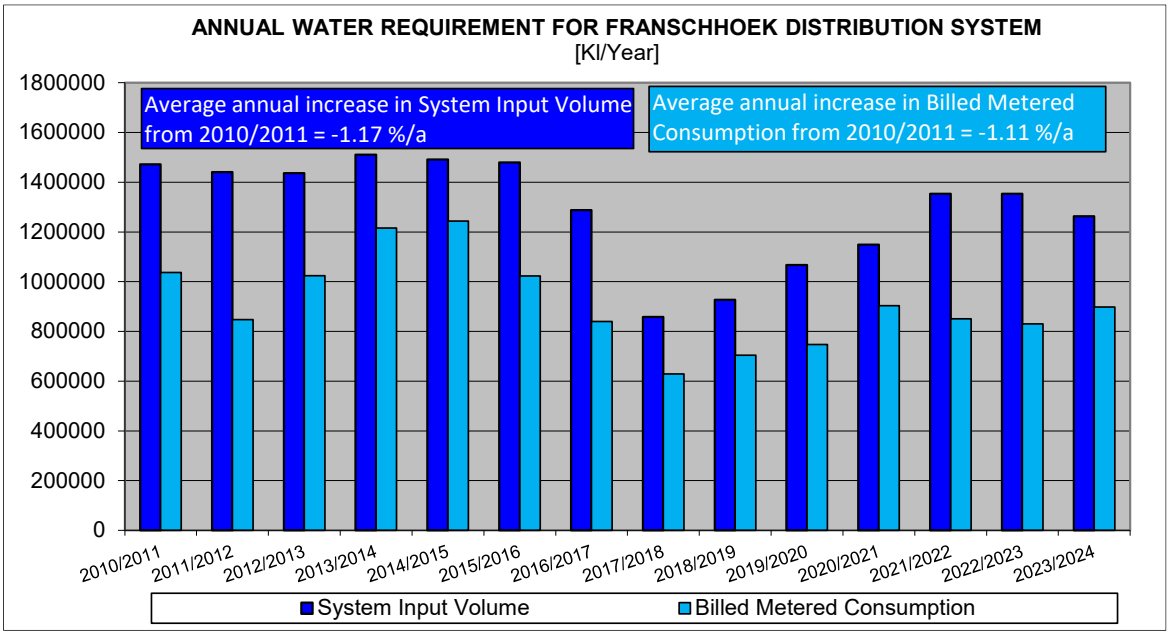
The following areas need to be focused on for the IWA water balance of the Klapmuts system.

- The Swift Analysis needs to be used to inspect the following erven in the Klapmuts system.
  - Identified potential unmetered erven need to be inspected and water meters need to be installed if the connections are found to be unmetered.
  - Identified erven with water meters, but with zero demand, need to be inspected and new water meters need to be installed if the existing water meters are found to be faulty.
  - Metered erven with very low consumption (<3kl / month) need to be inspected.
  - Metered erven with a drastic increase or decrease in consumption need to be inspected.



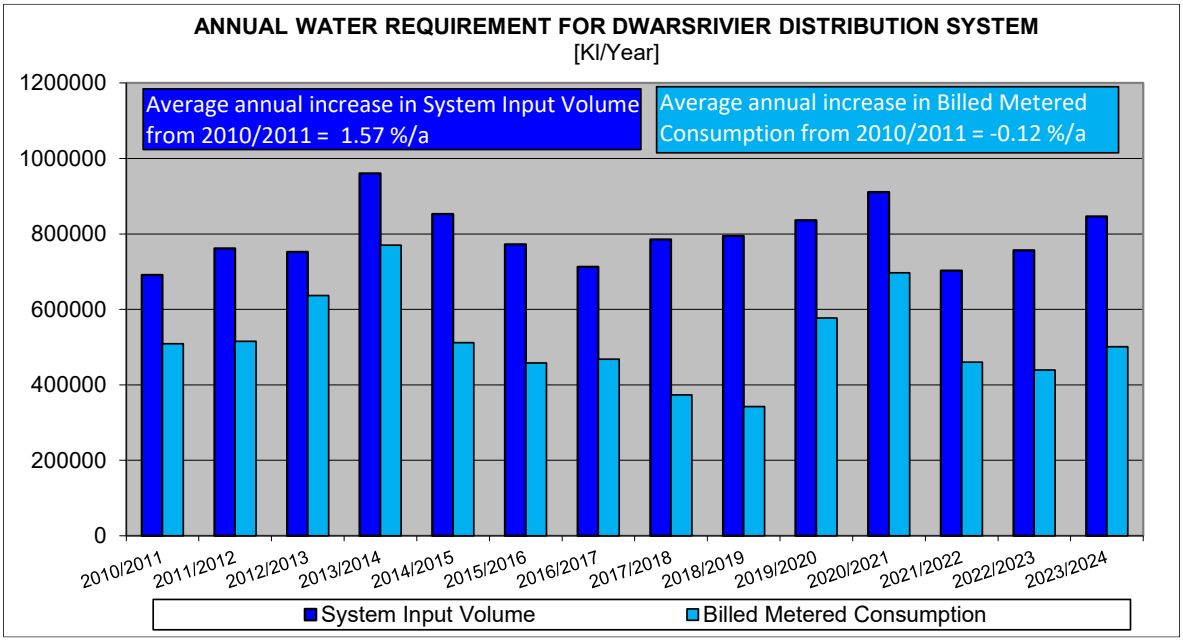
- Continue with the daily and monthly reading and recording of all bulk water meters (Supply from Wemmershoek, WWTW, Reservoirs and Pump Stations).

5.3 WATER LOSSES

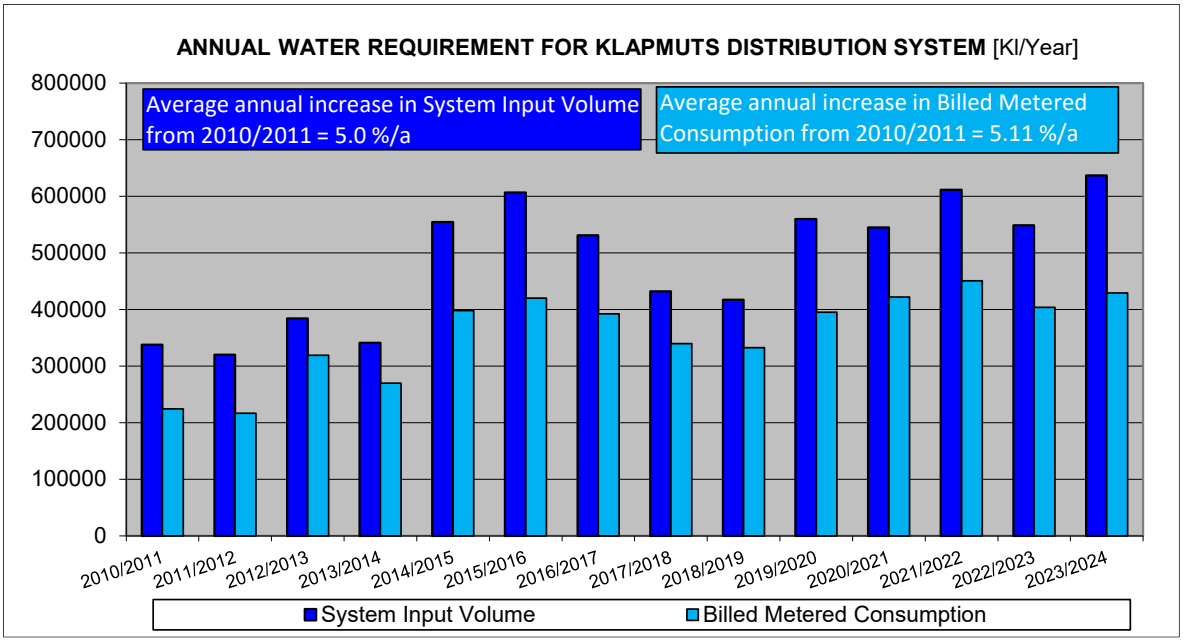


The IWA Water Balances for the various schemes is included in Annexure C of the Administrative, Information and Comprehensive Overview Report. Water losses from distribution systems are inevitable and cannot be completely eliminated. Such losses may be due to infrastructure-related problems, administrative related problems or theft and do have financial implications for Stellenbosch Municipality.

The effective implementation of the proposed WC/WDM Strategy will enable Stellenbosch Municipality to reduce their current NRW and Water Losses for the various distribution systems over the next five years.



Stellenbosch: Two additional bulk water meters need to be installed at the Idas Valley and Paradyskloof WTWs to measure the bulk potable water supplied from these two WTWs and to accurately calculate the treatment losses. The NRW and water losses increased drastically during the last financial year. The NRW is just above DWS's NRW target of 30%. The Municipality needs to work towards a NRW target of 25% and a water losses target of 20%. The ILI of 6.59 indicates a poor management system, which requires attention and the Municipality needs to work towards an ILI of between 2 and 4.



Franschhoek: The NRW and Water Losses decreased by approximately 10% during the last financial year, which are excellent. The current NRW is below DWS's NRW target of 30%. The Municipality needs to continue with the implementation of specific WC/WDM measures to work towards a NRW target of 25% and a water losses target of 20%. The ILI of 4.71 indicates a poor management system, which requires attention and the Municipality needs to work towards an ILI of between 2 and 4.

Dwars River: The NRW and Water Losses were extremely high for the last two financial years and are above DWS's NRW target of 30%. The Municipality needs to continue with the implementation of specific WC/WDM measures to work towards a NRW target of 30% and a water losses target of 25%. The ILI of 7.30 indicates a poor management system, which requires attention and the Municipality needs to work towards an ILI of between 2 and 4.

Klapmuts: The NRW and Water Losses increased drastically during the last financial year. The NRW is above DWS's NRW target of 30%. The Municipality needs to continue with the implementation of specific WC/WDM measures to work towards a NRW target of 25% and a water losses target of 20%. The current ILI value of 3.84 is good and no urgent action is required, but the NRW and Water Losses should however be monitored carefully.

The NRW and Water Losses for all the systems combined increased during the last financial year and the NRW is currently above DWS's NRW target of 30%. The Municipality needs to continue with the implementation of specific WC/WDM measures to work towards a NRW target of 25% and a water losses target of 20% for all the systems combined.

6. WATER RESOURCES

The key water resources strategic messages flowing from the DWS's detailed Reconciliation Strategies can be summarised as follows:

- WC/WDM is extremely important in all areas. South Africa cannot afford to waste any more water, anywhere.
- Groundwater in important, is currently under-valued and is under-used.
- There is huge potential for increasing re-use of waste water, at the coast as well as in inland systems.
- There is limited opportunity for more dams and transfer schemes, but this option is inevitable in certain areas; however, at great cost.
- Desalination:
  - Small-scale seawater desalination is already being used in certain areas;
  - Mine water desalination is becoming more important; and
  - Desalination of seawater on a large scale is imminent.
- Catchment rehabilitation, clearing of invasive alien plants and rainwater harvesting is growing in importance.
- It is possible to make more water available anywhere in the country in the future, but at sharply rising costs.
- The cost of water at the coast will, over the long term, increase and approach the cost of the desalination of seawater. However, it will be very expensive to support the inland areas with desalinated seawater as this option will require significant transfer costs.
- Additional water for increasing irrigation in South Africa is very limited and moving some water from irrigation to other uses is already be considered in certain areas.
- There is a debate about virtual water and importing food from neighbouring countries with high food production. The potential for this option must be broadened. No water should be used to produce bio-fuels under irrigation.

Table 6.1: Master Plan for Water Resources

Section	Master Plan	Yes / No
Current Water Sources	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Additional Sources Available	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Monitoring	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Water Quality	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes
Operation	Is there a Master Plan that addresses this problem?	Yes
	Does this Plan address this problem 100%?	Yes

6.1 SOURCES AND VOLUMES

WSAs have the responsibility to comply with the NWA with regard to water resources management as follows:

- WSAs have the right to use water for any of the uses defined in Section 21 of the NWA, subject to conditions that may be set by the relevant authority (either the DWS or the relevant CMA), including the provision of water services to its constituent.

- WSAs have the responsibility to apply for water use licences for any water use defined in Section 21 of the NWA in accordance with the procedures and requirements defined in the Act, specifically noting the requirements of Section 27 of the NWA.

- Where the provision of water services has been contracted to a WSP in terms of a service delivery agreement or contract, such agreement or contract should specifically determine who is responsible for application of water use licences. If no such provision is made in the agreement or contract, it shall be assumed that this responsibility remains with the WSA.

- As an owner, controller or occupier of land where an installation may cause pollution of a water resource, such as a WWTW and effluent discharge works, the WSA must take all reasonable measure to prevent pollution from occurring, as provided for in Section 19 of the NWA, and must comply with the conditions set in any licence permitting effluent disposal.

Metering of all water supplied is one of the most significant steps in order to properly plan and manage water sources. Without metering no management is possible. Stellenbosch Municipality needs to continue with the monthly reading of all their existing bulk water meters, which is a valuable source of information.

The uncertainty in projected water-related climate change impacts is one of the biggest challenges facing water managers. The managers must understand how this uncertainty influences the management decisions to be made and that decisions must be appropriate to a possible range of scenarios. A critical tool in this regard is adaptive management, in which water resource systems are carefully monitored and management actions are tailored and revised in relation to the measured changes on the ground. One cannot predict climate change impacts with any certainty, and the recognition of this uncertainty must be built into all climate change response strategies.

The Western Cape experienced a severe drought over the period 2015 to 2017, with some relief during the winter months of the following years. The drought over the period 2015 to 2017 reduced the assurance of supply from the WCWSS to Stellenbosch Municipality and also reduced the yield of the Municipality's own existing surface water resources. The Municipality therefore continued with the implementation of specific WC/WDM measures to lower the current water requirements and the planning for the augmentation of the existing water resources. A Bulk Water Resources: Drought Intervention Projects Study was completed in June 2019 for Stellenbosch Municipality. The Study included various recommended future resource augmentation projects for Stellenbosch Municipality.

Future water requirement projection models were developed for each of the towns within Stellenbosch Municipality's Management Area, which are included in Annexure B. The future water requirement projection models include the future projections up to 2048 and were calibrated by using the historical IWA Water Balance data. The percentage of water losses was determined for each of the distribution systems and growth in future water requirement was based on agreed population and growth figures. The projected future water requirements and the yield surplus or shortfalls, based on the WSDP model, are indicated in the table below for each of the systems. The reduction in Water Losses, as indicated in Table 5.1.1.1, was taken into account for the projected future water requirements.

Table 6.1.1: Projected future water requirements and allocation surplus (+) / shortfall (-) based on WSDP model

Distribution System	Projection	PROJECTED FUTURE WATER REQUIREMENTS (Ml/a)				
		2028	2033	2038	2043	2048
Stellenbosch	3.0% Annual Growth	11 662.859	13 520.451	15 673.908	18 170.355	21 064.421
	5.0% Annual Growth	12 840.012	16 387.470	20 915.026	26 693.462	34 068.373
	WSDP Model	11 431.870	12 931.552	14 723.400	16 866.630	19 433.789
	Allocation surplus (+) / shortfall (-)	**+4 821.899**	**+3 322.217**	**+1 530.369**	**-612.861**	**-3 180.020**
Franschhoek	3.0% Annual Growth	1 464.347	1 697.580	1 967.961	2 281.406	2 644.774
	5.0% Annual Growth	1 612.147	2 057.553	2 626.017	3 351.537	4 277.505
	WSDP Model	1 430.378	1 694.049	2 017.789	2 416.034	2 906.795
	Allocation surplus (+) / shortfall (-)	**+1 360.750**	**+1 097.079**	**+773.339**	**+375.094**	**-115.667**
Dwars River	3.0% Annual Growth	981.483	1 137.808	1 319.031	1 529.119	1 772.668
	5.0% Annual Growth	1 080.546	1 379.081	1 760.095	2 246.377	2 867.010
	WSDP Model	850.013	896.870	952.160	1 016.521	1 090.784
	Allocation surplus (+) / shortfall (-)	**+636.003**	**+589.146**	**+533.856**	**+469.495**	**+395.232**

	5.0% Annual Growth	812.914	1 037.507	1 324.150	1 689.989	2 156.902
	WSDP Model	755.506	913.338	1 114.493	1 371.357	1 700.001
	Allocation surplus (+) / shortfall (-)	**+367.566**	**+209.734**	**+8.579**	**-248.285**	**-576.929**

The table below gives an overview of the years in which the annual water requirements are likely to exceed the total allocations from the various resources. The information is also presented on the graphs in the future water requirement projection models included in Annexure B.

Table 6.1.2: Years in which the annual water demand is likely to exceed the total allocations or licence volumes for the various resources

Distribution System	Total Allocation / Licence Volume (Ml/a)	Annual Growth on 2023/2024 Demand (3% growth)	Annual Growth on 2023/2024 Demand (5% growth)	WSDP Projection Model
Stellenbosch	16 253.769 *	2038 (3.0%)	2032 (5.0%)	2041
Franschhoek	2 791.128 *	> 2048 (3.0%)	2039 (5.0%)	2046
Dwars River	1 486.016 *	2041 (3.0%)	2034 (5.0%)	> 2048
Klapmuts	1 123.072 *	2041 (3.0%)	2034 (5.0%)	2038

Note: * Agreement volume of 6 848 000 m³/a split proportional according to the 23/24 System Input Volume from the CCT for the various areas.

A Bulk Water Resources: Drought Intervention Projects Study was completed in June 2019 for Stellenbosch Municipality. The Study included the following recommended future resources for Stellenbosch Municipality.

- Groundwater; ***Licence was received for 2.04 million m³/a, 2019.***
- Wastewater reclamation;
- Increase existing allocations from the CCT (This can only be done after the CCT has increased the reliability of their existing water resources);
- Increase existing allocation from the DWS (from the Theewaterskloof tunnel); ***Agreement was signed with DWS for BRVAS Project for a volume of 1.64 million m³/a, 2023.*** and
- Rainwater harvesting.

Groundwater: The potential future supply from groundwater resources for Stellenbosch Municipality was calculated at 10.042 Ml/d. The future groundwater contributions for each of the water distribution systems were indicated as follows.

- Stellenbosch system: 4.378 Ml/d
- Dwars River system: 1.001 Ml/d
- Franschhoek system: 2.887 Ml/d
- Klapmuts system: 1.296 Ml/d
- Meerlust system: 0.065 Ml/d
- Koelenhof system: 0.415 Ml/d

Wastewater reclamation: It was recommended that the feasibility of reclamation of wastewater as a future bulk water resource be investigated at the Klapmuts, Dwars River, Wemmershoek and the Stellenbosch WWTWs.

CCT Allocation (Short Term): The current allocation of bulk water to Stellenbosch Municipality was indicated at 6 848 Ml/a. It was recommended that the allocation should be increased in the future to supply the future water demand to Stellenbosch Municipality as calculated in the water master plan (after the groundwater and wastewater reclamation projects for Stellenbosch Municipality were implemented).

- Stellenbosch main system: In the Water Master Plan it was proposed that bulk water supply to Stellenbosch town is augmented in the future through a new bulk supply system from the CCT Blackheath WTW to the existing Papegaaiberg reservoir in the Stellenbosch system. This will give Stellenbosch town more redundancy in their bulk supply system and the Stellenbosch system will be able to be supplied with bulk water from three separate sources, i.e. the Idas Valley WTW, the Paradyskloof WTW and the CCT Blackheath WTW. This bulk system will also reinforce the Polkadraai system and enable the Stellenbosch Municipality to develop the Vlottenburg node.

  The Water Master Plan proposed that this new bulk system should have the capacity to supply a peak demand of 5.0 Ml/d of water to the Stellenbosch system. The required annual allocation from the CCT to the Stellenbosch system was calculated at 1 140 Ml/a.

- Other urban and rural systems: The minimum required increase in allocation from the CCT to the other urban and rural systems (Dwars River system, Franschhoek system, Klapmuts system and rural supply areas in Stellenbosch Municipality) was calculated at an additional 502 Ml/a.

Paradyskloof Tunnel Allocation (Short Term): The minimum required increase in allocation from the DWS to the Stellenbosch system, in order to supply the future water demand, was calculated at an additional 627 Ml/a.

Proposed increase in allocation from the CCT and the WCWSS (Long Term): Over the long term it could be more cost effective for Stellenbosch Municipality to utilize the groundwater and the reclamation of wastewater resources during drought periods when surface water is under stress, and utilize the available surface water from the WCWSS on a more permanent basis (especially during times of high rainfall when there is excess water available from surface water resources).

It was therefore proposed that the allocations from the CCT and the WCWSS are increased to allow for a scenario where the available water from groundwater and wastewater reclamation are only utilize during periods when the surface water is under stress (drought conditions).

The proposed increases in the allocations from the CCT and the WCWSS were calculated as follows:

CCT Allocation:

Future demand	=	11 747 Ml/a (Excluding Stellenbosch town)
Minus existing CCT allocations	=	6 848 Ml/a
Minus existing Perdekloof resource	=	901 Ml/a
Minus Pniel surface water resources	=	78 Ml/a (Proposed future project)
Plus Blackheath allocation	=	1 140 Ml/a (Required for Stellenbosch town)
Total	**=**	**5 060 Ml/a**

WCWSS Allocation:

Future demand	=	15 706 Ml/a (For Stellenbosch town)
Minus Jonkershoek resource	=	7 224 Ml/a
Minus existing WCWSS allocation	=	3 000 Ml/a
Minus Blackheath CCT allocation	=	1 140 Ml/a (Proposed at CCT Blackheath WTW)
Total	**=**	**4 342 Ml/a**

It was proposed that the existing WCWSS allocation of 3 0000 Ml/a is increased in two phases (First phase of 2 000 Ml/a and second phase of 2 350 Ml/a) to a total allocation of 7 350 Ml/a.

The DWS is currently busy with the updating of the All Towns Reconciliation Strategies for the Western Cape. The table below gives an overview of the recommended potential future water resources as included in the 2015 All Towns Reconciliation Strategies for the towns in Stellenbosch Municipality.

Table 6.1.3: Potential future water resources for the various towns (Summary of DWS's All Towns Reconciliation Strategies)

Distribution System	Recommended Summary Options
Stellenbosch	**There is not adequate supply for the current water sources to cater for future medium and longer-term water requirements. The following sources have been identified as potential sources to augment the current water supply:** • Full implementation of the WC/WDM measures to reduce non-revenue water and water losses. • Water re-use. • Reallocation of "lei"- water. • Allocation of water from the Berg River Dam. • A share in future schemes for the WCWSS. • Rainwater harvesting. • Groundwater development.
Franschhoek	**The current water sources have adequate water to cater for future water requirements in the medium and longer-term. The following sources have been identified as potential sources to augment the current water supply:**

Table 6.1.3: Potential future water resources for the various towns (Summary of DWS's All Towns Reconciliation Strategies)	
Distribution System	**Recommended Summary Options**
	• Full implementation of the Water Conservation and Water Demand Management Strategy. • Re-use of water. • A further allocation from the Western Cape Water Supply System. • Groundwater development. • Rainwater harvesting.
Dwars River (Pniel, Kylemore & Groot-Drakenstein)	**The following sources are identified as potential sources to augment the water supply (In order of priority and implementation sequence):** • Full implementation of the Water Conservation and Water Demand Management Strategy. • Groundwater development. • Re-use water. • A further allocation from the Wemmershoek Dam (WCWSS). • A water allocation from the Berg River Dam (WCWSS). • Integration of the existing local sources into the bulk water supply. • A water allocation from the Tunnel System (WCWSS). • Rainwater harvesting.
Klapmuts	**Supply from the current water sources is not adequate to cater for the current water requirements and is currently hampering development in the town. The following sources have been identified as potential sources to augment the current water supply:** • Full implementation of the WC/WDM measures to reduce non-revenue water and water losses. • Groundwater development for the new anticipated developments. • Water re-use. • A further allocation from the Wemmershoek Dam.

Re-use of water is becoming more acceptable and feasible because of increasing water shortages, improved purification technology and decreasing treatment costs. Improvements in membrane technologies and their affordability have made a significant contribution in recent years. At present, up to 14% of water use is reused, mostly through wastewater return flows to rivers from which it is abstracted downstream for indirect re-use. Re-use of return flows could be significantly increased, particularly in coastal cities where wastewater ordinarily drains into the sea.

The direct re-use of treated wastewater can pose a risk to public health and safety; must be managed carefully and be subject to water quality management and control. Advanced treatment and proper monitoring of all processes and quality of potable water produced is essential. Public perceptions and opinions vary on the topic of water re-use, specifically as it relates to direct potable water re-use. Public perceptions are strongly informed by the general awareness of the poor operation, maintenance and performance of municipal wastewater treatment plants at present. This poses a significant challenge to building public acceptance of direct water re-use in the current situation. The performance of municipal wastewater and effluent treatment plants nationwide will have to be improved to meet high standards, resulting in consistently good quality discharges to the environment before direct water re-use can be placed on the national water supply agenda.

6.2 MONITORING

6.2.1 Percentage of Water Abstracted Monitored: Surface Water

The surface water supply to the Stellenbosch Municipality's distribution systems are metered and the volumes are recorded monthly by the Municipality, which is a valuable source of information in terms of the IWA water balances for these water distribution systems.

Stellenbosch Municipality is committed to continue with the monitoring of their own surface water sources supplying Franschhoek and Stellenbosch with bulk water. The Municipality can also investigate the possibility of installing Telemetry at each of their bulk water meters, which will allow real-time data collection, immediate alerts to faulty meters and easy manipulation of bulk meter data to synchronize with timings of the Financial Department's consumer readings.

6.2.2 Percentage of Water Abstracted Monitored: Groundwater

Groundwater was utilised only for Stellenbosch over the period 2017/2018 to 2019/2020. Stellenbosch Municipality will continue to meter and record the volume of water abstracted from their Die Braak, Van der Stel sport grounds and Cloetesville sport grounds boreholes when these production boreholes are in use. Monitoring of abstraction and groundwater levels is essential to ensure sustainable management of groundwater sources, by increasing understanding of the available water resource and to inform of any potential aquifer depletion. It will also indicate if an aquifer has potential to store surplus surface water and whether artificial groundwater recharge should be considered.

Stellenbosch Municipality, through their 2017 to 2018 groundwater development program, have rapidly progressed from the point of groundwater "development" to that of "management". The Municipality have developed water supply boreholes throughout the municipal area during this period, in different water catchments and geological settings. These include the development of three wellfields, namely the Wemmershoek Wellfield, the Stellenbosch Wellfield and the Klapmuts Wellfield. Each of these has its own unique characteristics and challenges. Additionally, a spread of boreholes were developed in the Banhoek area (Pniel, Kylemore, Lanquedoc and Meerlust) and at Mariendahl.

Wemmershoek groundwater package plant

Die Braak groundwater package plant

Van der Stel groundwater package plant

Stellenbosch Municipality will carry on with their well field monitoring when the groundwater is used (i.e. abstraction and water levels), which include groundwater quality monitoring on a bi-annual basis or whenever a pump is removed for servicing and maintenance. Water quality indicators are useful tools for predicting stresses in the groundwater system. The key groundwater management functions that need to be implemented by Stellenbosch Municipality are summarised in Table 3.2.1.2.

6.2.3 Percentage of Water Abstracted Monitored: External Sources (Bulk Purchase)

All bulk potable water supply by the CCT to Stellenbosch Municipality is metered and recorded by the CCT, with "check" monitoring by Stellenbosch Municipality. The supply from the WCWSS to the Paradyskloof WTW is also metered and recorded daily at the WTW.

6.2.4 Surface Water Levels

Stellenbosch Municipality will keep on monitoring the rainfall and the water levels of all their own surface water sources.

6.2.5 Groundwater Levels

Stellenbosch Municipality did not utilise groundwater sources over the last number of years. The water level data of the production and observation boreholes will however enable Stellenbosch Municipality to identify the development of "red flag" situations timeously and to take preventative action when the groundwater sources are in use. All boreholes should have two observation pipes installed vertically from the pump depth to the surface. One should be 40mm OD (Class 10) for a water level logger and the other big enough for a manual water level measurement. The pipe must be closed at the bottom and the bottom 10m – 20m slotted.

6.2.6 Water Quality for Formal Schemes

Stellenbosch Municipality is committed to continue with their current Operational and Compliance Water Quality Sampling Programmes for all their formal schemes and to implement the additional recommended sampling as indicated in the WSDP. The Municipality will further continue to load all the compliance sample results for the various distribution systems onto DWS's IRIS on a monthly basis.

It is recommended that raw water quality samples also be collected for each of the production boreholes on at least an annual basis, when the production boreholes are in use.

As safeguard against water borne diseases it is strongly recommended that Stellenbosch Municipality continue to ensure that all water used for human consumption are adequately disinfected by chlorination or other methods.

6.2.7 Water Quality for Rudimentary Schemes

Stellenbosch Municipality is not involved with the water quality monitoring on farms in the rural areas, where farmers utilise their own water sources.

6.2.8 Borehole Abstraction

Stellenbosch Municipality will monitor the abstraction of all their production boreholes and the sustainable yields of the various boreholes, in order to prevent any over abstraction of aquifers and to ensure that the aquifers are managed in a sustainable manner, when they are in use.

To safeguard the boreholes against over-abstraction, low level cut-off switches need to be installed in all production boreholes when in they are put back into operation. The monitoring data needs to be analysed by a geohydrologist on an annual basis in order to assess the effects of abstraction and recharge on the boreholes and aquifer. All production boreholes need to be fitted with a sampling tap and flow volume meter for monitoring purposes.

Stellenbosch Municipality will continue with their groundwater monitoring on at least a monthly basis, when the boreholes are used. Monthly monitoring of water levels, water chemistry and abstraction need to be conducted by the Municipal staff. Stellenbosch Municipality also needs to ensure that all electronic data (i.e. dataloggers) are downloaded quarterly by a geohydrologist.

The above will increase the understanding of the aquifer response to abstraction and the possible interconnections between surface water sources and the aquifers. Furthermore, the monitoring programme serves to detect the impact of natural changes in the hydrological cycle on ecosystems and other water users.

6.3 WATER QUALITY

WATER SAFETY PLAN – IMPROVEMENT

The Water Safety Plan Team of Stellenbosch Municipality needs to meet regularly to review the implementation and all the aspects of the Water Safety Plan, in order to determine whether the field assessments, monitoring results and trend analyses need updates or modifications.

Stellenbosch Municipality needs to implement the Water Safety Plan and specific the Improvement / Upgrade Plans. Data from the verification and validation measures need to be used to evaluate the accuracy of the Water Safety Plan. The evaluation will give an indication whether certain aspects of the risk assessment need to be updated or modified and whether there exists any gaps in the Water Safety Plan.

If the analyses indicates that critical limits are not achieved at critical control points, despite the implementation of control measures and preventative action plans, then it points to:

- risks have been identified incorrectly;
- control measures are insufficient;
- control measures were identified incorrectly; or
- the critical limits are inappropriate

The Water Safety Plan is a dynamic document and should be reviewed:

- every three years;
- after an incident as part of the debriefing;
- after any significant change in the value (production) chain; for example, a new water source is developed, major treatment improvements are planned and brought into use, or after a major water quality incident;
- when a weakness in the Water Safety Plan has been identified; and
- additional information is received that warrant a revised risk level for that system.

Stellenbosch Municipality's Incident Management Protocol (IMP) and Emergency Response Plans should clearly specify responsibilities for co-ordinating measure to be taken, a communication plan to inform / alert users of supply and plans for providing / distributing emergency supplies of water. Key areas to be addressed in emergency response plans include the following:

- Response actions – including increased monitoring.
- Plans for emergency water supplies in order to ensure safe drinking water for the duration of the problem.
- Roles and responsibilities of individuals and organizations are clearly outlined to avoid miscommunication and duplication of effort.
- Communication strategies and protocols including notification procedures to alert and inform users of the supply and other stakeholders, with staff contact details (internal, regulatory body, media, public, emergency services), in order to ensure that all stakeholders are kept fully informed.
- Mechanisms for increased public health surveillance.
- Responsibilities for coordinating measures to be taken in an emergency.
- Training to ensure that employees have the skills and knowledge to effectively manage any potential incident and/or emergency.

- A programme to review and revise documentation as required.

The goal of Water and Safety Management Procedures is to highlight the procedures / protocols implemented and adhered to by Stellenbosch Municipality and forms part of Stellenbosch Municipality's Incident Management Protocol.

The Incident Management Protocol must be aligned to the communication requirements stipulated in the Compulsory National Standards for the Quality of Potable Water under Section 9 of the Water Services Act. The Compulsory National Standards for the Quality of Potable Water states that a Water Services Institution must ensure that a Drinking Water Quality Advisory is issued within 12 hours of confirmation of drinking water quality failure:

- A Drinking Water Quality Advisory must be issued when analysis results indicates a health risk associated with the domestic use of the sampled water. The Drinking Water Quality Advisory must specify the nature of the risk presented; indicate rectification measures taken by the Water Services Institution and indicate risk minimization measure to be taken by the public.

- A Boil Water Notice should be issued when the quality of drinking water poses a risk which can be adequately addressed by boiling the water in accordance with the notice, prior to human consumption.

- A Do Not Use Water Notice should be issued when there is a risk which cannot be adequately mitigated by means of domestic treatment.

It was not necessary for Stellenbosch Municipality to issue any Drinking Water Quality Advisories, as summarised above, for the last number of years. Mechanisms to issue such notices are however in place, should it become necessary to inform the public of any drinking water quality failure.

Stellenbosch Municipality needs to ensure that evidence of adherence to the requirements of this protocol be recorded, preferably in the form of an Incident Register as summarised in Table 6.3.1 below.

Table 6.3.1: Example of Drinking Water Quality Incident Register

Trigger	Sample Point	Nature of Incident	Risk Rating	Corrective Action	Communication of failure	Reference Documents
Laboratory reported E.Coli Failure	High Level Reservoir	9 E.Coli per 100 ml recorded on 24 May 2011	Alert Level 2 – Moderate Risk	Laboratory informed Operations, Water Quality Advisory issued, additional chlorine dosed, resampled on 26, 28 and 30 Jun 2011. All resample results 0 E.Coli per 100 ml	Failure, corrective action and resample results communicated to WSA Manager, DWS and DoH.	Water Quality Advisory and evidence of communicatio n stored on network drive.

Following any incident or emergency, an investigation should be undertaken and all individuals involved in the Water Safety Plan should participate to discuss the performance of the Water Safety Plan and issues or concerns, which must be addressed. The investigation should consider factors such as the following:

- What was the cause of the problem?
- Was the hazard already identified in the Water Safety Plan risk assessment?
- How was the problem first identified or recognised?
- What were the most essential actions required and were they carried out?
- If relevant, was appropriate and timely action taken to warn consumers and protect their health?

- What communication problems arose and how were they addressed?
- What were the immediate and longer-term consequences?
- How well did the emergency response plan function?
- Should documentation be updated or reviewed?

W_2RAP – IMPROVEMENT

The existing W_2RAPs (2021) need to be updated. The W_2RAP Team of Stellenbosch Municipality is committed to meet regularly to review all aspects of the W_2RAPs to ensure that they are still accurate. Operational monitoring results and trends will be assessed. In addition to the regular three year review, the W_2RAPs will also be reviewed when, for example, a new WWTW is developed, major treatment improvements are planned and brought into use, or after a major wastewater incident.

The W_2RAPS considered whether the existing control measures are effective. The table below summarise the priority risks and the proposed control measures, after evaluation of the existing control measures.

Table 6.3.2. Summary of medium and high risks and recommended Improvement Plan as included in the W_2RAPs

Recalculated Priority Risks:	Residual Risk	Recommended Improvement Plan (Proposed Control Measures)
Stellenbosch WWTW and drainage network		
Outfall sewer: Maintenance (Blockage leading to spillage)	High	Implement a preventative maintenance plan to inspect pipework, clear blockages and replace aging pipes. Maintain an Asset Register to record condition and age of pipes. Maintain an Incident Register to record spillage events.
Network and pump stations: Electrical failure (Power failure)	High	Majority of pump stations lack backup power supplies. Backup generators should be provided at all pump stations with priority placed on pump stations close to watercourses.
Network and pump stations: Process failure (Undetected spillages)	High	Determine flows at pump stations during regular routine inspection, ensure that all flow reaches the plant; if not, find the point of loss and repair.
Network and pump stations: Mechanical failure (Lack of scheduled maintenance plan	High	Implement a maintenance schedule and increase staff to meet increasing maintenance demand.
Network and pump stations: Process failure (Network capacity)	Medium	Investigate capacity handling, inventory of pump stations, ultrasonic height meters, retention period.
Pumping Stations: General (No permanent supervision)	High	All pump stations are connected to telemetry and 24 hour staff is available to respond to alarms.
Pumping Stations: Electrical failure (Generator failure)	High	Implement records of maintenance or scheduled start-run tests to ensure that the generators are functional during power failure events; leading to a health and environmental risk in the event of critical equipment not being functional.
Illegal discharge: Management (Illegal discharge)	Medium	-
Inlet Works: Electrical failure (Power failure)	High	Backup generators provided. Generator to have records of maintenance and scheduled start-run tests to ensure that the generators are functional during power failure events.
Inlet Works: Mechanical failure (Screening & grit removal)	Medium	By-pass hand-raked screens provided.
Inlet Works: Process failure (Influent non-compliance)	High	Upgrade to lab provides an improved monitoring of raw wastewater quality trends which enables early detection of non-compliance influent.
Tanker Discharge: Process failure (Unsafe discharge manner)	High	Implement a Tanker Discharge Protocol that include set discharge points.
Tanker Discharge: Process failure (Undetected severe influent)	Medium	Conduct regular analysis of tanker influent quality and monitor trends.

Table 6.3.2. Summary of medium and high risks and recommended Improvement Plan as included in the W_2RAPs		
Recalculated Priority Risks:	**Residual Risk**	**Recommended Improvement Plan (Proposed Control Measures)**
Industrial effluent: Process failure (Undetected non-compliance influent)	High	Conduct regular analysis of industrial influent quality and monitor trends
Inflow monitoring: Process failure (Inaccurate flow recording)	Medium	Implement calibration schedule for all flow meters and continues monitor readings.
Raw wastewater quality: Process failure (Influent non-compliance)	High	Conduct regular analysis of influent quality and monitor trends.
Non optimisation of MBR Plant: Process failure (Inadequate skilled staff)	High	
Clogging of diffusers: Process failure (Clogging of diffuse)	High	Monitor efficiency of aeration system regularly. Establish maintenance and cleaning schedule based on supplier recommendation.
Blower Failure: Maintenance (Mechanical Failure)	Medium	Sufficient redundancy at this stage. Establish maintenance schedule
Wemmershoek WWTW and drainage network		
Inlet Works: Mechanical failure (Screening, grit removal and instrumentation)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure. Conduct regular calibration of equipment.
Inlet Works: Process failure (Influent compliance)	Medium	Conduct regular analysis of influent quality and monitor trends. Implement actions as outlined in the Operational Alert Levels should an alert be triggered.
Genset: Electrical failure (Power failure)	Medium	Conduct routine startup of Generator on site and regular service intervals.
Influent Buffer Tank: Mechanical Failure (Mechanical Failure)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure. Feed pumps are of duty standby. Installation of Mixer to keep effluent in suspension and FOG from forming a crust.
Influent Buffer Tank: Process failure (Raw effluent exceeds design parameters)	High	High loads of COD enter the works and treatment times are limited to the Nereda cycle times. No buffer capacity for substandard effluent to be re-treated. Influent distribution network clogs up.
Compressors: Process failure (Effluent compliance)	Medium	Failure to Open/Close critical valves ensures a delay in the Treatment process.
Blower House: Mechanical Failure (Mechanical Failure)	High	No means of redirecting air flow for a reactor to operate independently.
Blower House: Process failure (Effluent compliance)	High	Low DO per reactor. Not meeting effluent standards.
Nereda Reactors: Mechanical failure (Process equipment failure)	High	Cannot isolate sections within the reactor should failure occur (diffused air system).
Nereda Reactors: Process failure (Effluent compliance)	High	Load to One reactor not sufficient to comply with DWS standards.
Dewatering Plant: Mechanical failure (Mechanical failure)	High	No alternative means of wasting should belt press break. Installation of second press.
Dewatering Plant: Process failure (No wasting)	High	Buildup of sludge within reactors. Drying beds wet in winter periods.
Chlorine Building: Safety (Chlorine leak)	High	Conduct regular servicing on units and implement training schedule for staff - how to deal with leaks.
Chlorine Building: Process failure (Not meeting E.Coli standards)	Medium	Inadequate dosing for effluent during solids carry over (FOG-Scum on surface of reactors). Dose HTH tablets as substitute
Maturation Pond: Structural Failure (Reinforcing/Lining of pond)	Medium	Time for final polishing constraint due to solids build up on surface of CCT.
Maturation Pond: Structural Failure (Power failure)	High	Implement records of maintenance or scheduled start-run tests to ensure that the generator are functional during power failure events. Leading to a health and environmental risk in the event of critical equipment not being functional.
Pniel WWTW and drainage network		

Table 6.3.2. Summary of medium and high risks and recommended Improvement Plan as included in the W_2RAPs		
Recalculated Priority Risks:	**Residual Risk**	**Recommended Improvement Plan (Proposed Control Measures)**
Pumping Stations 1,2 & 3: Electrical failure (Power failure)	High	All pump stations lack backup power supplies. Backup generators should be provided at all pump stations with priority placed on pump stations close to watercourses.
Pumping Stations 1,2 & 3: Mechanical failure (Screening of sewage)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure.
Outfall sewer: Maintenance (Frequent blockages of sewer lines).	High	Implement a preventative maintenance plan to inspect pipework, clear blockages and replace aging pipes. Maintain an Asset Register to record condition and age of pipes. Maintain an Incident Register to record spillage events.
Inlet Works: Mechanical failure (Screening & grit removal)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure.
Inlet Works: Process failure (Influent compliance)	Medium	Conduct regular analysis of influent quality and monitor trends. Implement actions as outlined in the Operational Alert Levels should an alert be triggered.
Biological Reactor: Mechanical failure (Mechanical Failure)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure.
Biological Reactor: Process failure (Non optimisation of process resulting in poor influent)	Medium	Regular training of staff is important and should be continuous.
Ras Pump Station: Process failure (Incorrect recycle ration).	Medium	Continuous training to be provided to process controllers.
Chlorination: Operation (Too high or too low dosing).	Medium	Dosing to be automated.
Chlorination: Safety (Leakage)	Medium	Establish regular servicing of leak detector in time interval recommended by supplier. Staff to be regularly trained on handling a leak event.
Mechanical dewatering facility: Mechanical failure (Mechanical failure)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure.
Power failure: Electrical failure (Power failure)	High	Implement records of maintenance or scheduled start-run tests to ensure that the generator are functional during power failure events; leading to a health and environmental risk in the event of critical equipment not being functional
Klapmuts WWTW and drainage network		
Pumping Stations 1,2 & 3: Electrical failure (Power failure)	High	All pump stations lack backup power supplies. Backup generators should be provided at all pump stations with priority placed on pump stations close to watercourses.
Pumping Stations 1,2 & 3: Mechanical failure (Screening of sewage)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure.
Outfall sewer: Maintenance (Blockage leading to spillage)	High	Implement a preventative maintenance plan to inspect pipework, clear blockages and replace aging pipes. Maintain an Asset Register to record condition and age of pipes. Maintain an Incident Register to record spillage events.
Inlet Works: Mechanical failure (Screening & grit removal)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure.
Inlet Works: Process failure (Influent compliance)	Medium	Conduct regular analysis of influent quality and monitor trends. Implement actions as outlined in the Operational Alert Levels should an alert be triggered.
Biological Reactor: Mechanical failure (Mechanical Failure)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure.

Table 6.3.2. Summary of medium and high risks and recommended Improvement Plan as included in the W_2RAPs		
Recalculated Priority Risks:	**Residual Risk**	**Recommended Improvement Plan (Proposed Control Measures)**
Biological Reactor: Process failure (Non optimisation of process resulting in poor influent)	Medium	Regular training of staff is important and should be continuous.
Biological Reactor: Safety (Shallow section of wall with no railing)	High	Handrailing to be installed ASAP. Currently the reactor section is a safety hazard to stuff working in its vicinity.
Ras Pump Station 1&2: Process failure (Incorrect recycle ration)	Medium	Continuous training to be provided to process controllers.
Ras Pump Station 1&2: Safety (No gantry to remove pumps)	High	Gantry to be installed ASAP. Current setup pose a risk to maintenance staff.
Chlorination: Operation (Too high or too low dosing)	High	System for auto dosing is place and only needs electrical connection. The connection is minor electrical work and should be done ASAP.
Chlorination: Safety (Leakage)	High	Establish regular servicing of leak detector in time interval recommended by supplier. Staff to be regularly trained on handling a leak event.
Mechanical dewatering facility: Mechanical failure (Mechanical failure)	High	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure.
Sludge holding tank: Electrical failure (Power failure)	High	
Sludge holding tank: Mechanical failure (Mechanical failure)	Medium	
Sludge return pump station: Safety (No gantry to remove pumps)	High	Gantry to be installed ASAP. Current setup pose a risk to maintenance staff.
Sludge return pump station: Mechanical failure (Mechanical failure)	High	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure.
Final effluent discharge open channel: General (Blockage of vegetation growth)	Medium	Maintain vegetation growth and clean channel off any obstruction to flow.
Power failure: Electrical failure (Power failure)	High	Implement records of maintenance or scheduled start-run tests to ensure that the generator are functional during power failure events; leading to a health and environmental risk in the event of critical equipment not being functional
Raithby WWTW and drainage network		
Outfall sewer: Maintenance (Blockages leading to spillages)	High	Implement a preventative maintenance plan to inspect pipework, clear blockages and replace aging pipes. Maintain an Asset Register to record condition and age of pipes. Maintain an Incident Register to record spillage events.
Inlet Works: Mechanical failure (Screening, grit removal and instrumentation)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure. Conduct regular calibration of equipment.
Sceptic Tank: Process failures (Sludge accumulation and required mixing)	Medium	Sludge accumulation is monitored and desludging schedule established. There is also a stirring procedure in the O&M Manual that needs to be adhered to.
RBC's: Process failure (Overloading)	High	High loads of COD and TKN enter the works. Allow capital to upgrade the works.
RBC's: Mechanical failure (Mechanical failure)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure; Maintain an Asset Register to record condition and age of infrastructure. Conduct regular calibration of equipment.
Humus Tank: Mechanical failure (Mechanical failure)	Medium	Implement a preventative maintenance plan to inspect and service mechanical infrastructure. Maintain an Asset Register to record condition and age of infrastructure. Conduct regular calibration of equipment.
Chlorination: Safety (Leakage)	High	Establish regular servicing of leak detector in time interval recommended by supplier. Staff to be regularly trained on handling a leak event.

Table 6.3.2. Summary of medium and high risks and recommended Improvement Plan as included in the W_2RAPs		
Recalculated Priority Risks:	**Residual Risk**	**Recommended Improvement Plan (Proposed Control Measures)**
General: Safety (Theft/vandalism)	High	Current fence installation and controlled access gate is sufficient.
General: General (Staff)	High	The current operation of the works is in violation of the Water Act Regulation 17 in terms of staff requirements. Full-time staff required.
Power failure: Electrical failure (Power failure)	High	Implement records of maintenance or scheduled start-run tests to ensure that the generator are functional during power failure events; leading to a health and environmental risk in the event of critical equipment not being functional.

An Improvement / Upgrade Plan was developed, as part of the W_2RAP, for all the existing significant risks where the existing controls were not effective or absent and will be implemented by Stellenbosch Municipality over the next few years. An Incident Response Management Procedure is also in place.

The purpose of the Incident Response Management Protocol is to plan for failures and subsequent methods to address such failures. An incident is any situation where loss of control over the system occurs, or where there is any reason to suspect non-compliance or danger to the environment or a health risk. Significant deviations in the operational monitoring such as where critical limits are exceeded, is also referred to as an “incident”.

Some incident triggers can include the following:

- Non-compliance with operational monitoring criteria;
- Inadequate performance of a sewage treatment plant discharging to source water;
- Spillage of a hazardous substance into source water;
- Sewer losses during reticulation and pumping of wastewater – not arriving at treatment plant;
- Failure of the power supply to an essential control measure;
- Extreme rainfall in a catchment;
- Detection of unacceptable levels of metals, ammonia, etc.;
- Unusual odour or appearance of returned effluent water;
- Detection of microbial indicator parameters, including unusually high faecal indicator densities and unusually high pathogen densities in returned effluent; and
- Public health indicators or a disease outbreak for which water is s suspect vector.

Following any incident or emergency, an investigation should be undertaken involving all concerned staff. The investigation should consider factors such as:

- What was the cause of the problem?
- How was the problem first identified or recognised?
- What were the most essential actions required?
- What communication problems arose and how were they addressed?
- What were the immediate and longer-term consequences?
- How well did the emergency response plan function?
- Did the turnaround plan match the seriousness of the incident?

- Should documentation (e.g. SOPs) be updated or reviewed?

Appropriate documentation and reporting of the incident or emergency should also be established. The Municipality should learn as much as possible from the incident or emergency to improve preparedness and planning for future incidents. Review of the incident or emergency may indicate necessary amendments to existing protocols.

Stellenbosch Municipality understands the importance of documentation and up-dated records of information as it becomes available, because it forms an essential part of their management processes. It enables the municipality to have control over the wastewater treatment systems, notice trends, taking effective corrective actions when non-compliance trends are noticed, etc. It also reduces the amount of work at the end of the operational year when the W_2RAP is reviewed or when Green Drop Assessments takes place.

A set of Compliance Alert Levels, corresponding to the requirements of the Licences and the General Authorisations is in place and monitored on a monthly basis. **The proposed Operational Alert Levels, as included in Table 6.3.2.1, should be used by Stellenbosch Municipality to ensure that the various unit processes in the plants perform optimally.** If these pre-determined Alert Levels are exceeded at any of the control points where samples are taken for operational purposes, specific actions need to be taken to bring the operational parameters back to within the target ranges.

6.3.1 Reporting on Quality of Water Taken From Source: Urban and Rural

Regular sampling and reporting is part of Stellenbosch Municipality's operating procedures and the Municipality is committed to ensure that the results are given through to the DWS. Stellenbosch Municipality realises the importance of good communication with its inhabitants in the various towns to ensure consumer trust and confidence. Total transparency is therefore one of the main objectives when public notifications are distributed. High on the list of priorities in these communications is regular communication on water quality and in particular how efficient the water treatment plants performs and whether the required standards are met.

Stellenbosch Municipality therefore understands the importance of involving community members on a regular basis and not only when there is a crisis. Community Members should be made aware of safe handling of water, hygienic sanitation practices and how to conserve and not misuse water. Good communication ensures consumer trust and confidence.

Stellenbosch Municipality makes their water quality results available to the inhabitants in their Management Area through their annual WSDP Performance and Water Services Audit Report. The water quality notifications or reports can be inserted in one or more of the following media used for communicating with the public: the municipality's website, newsletters accompanying the bills and the local newspapers. Stellenbosch Municipality can also make this information available to the learners at the local schools in the future, so that they can learn about the importance of effective water quality management. Involving the public at every stage means:

- Making monitoring results or summaries available and easily accessible, such as on the Internet or via newsletters and public fora;

- Notifying the public about risks to their health and what the WSA is doing to address the risks;

- Issuing regular reports about drinking water systems, including improvements and areas that need further attention;

- Educating the public on a number of issues, including: the benefits of disinfection over the risks of microbiological contamination and disease, the difference between health-related and aesthetic drinking water quality failures and the true cost of providing safe drinking water;

- Incorporating public consultations into decision-making processes which affect public health, including the development process for new guidelines and regulations, and

- Education about water resource protection and conservation issues.

Percentage compliance to Drinking Water Acceptable Limits:

Stellenbosch. Municipality is committed to continue with the taking of chemical and bacteriological samples on a monthly basis at all sample sites as included in their Water Quality Monitoring Programme. The Municipality will also continue with the loading of the compliance sampling results onto DWS's IRIS on a monthly basis. The updated Water Safety Plan and the required detail WTW Process Audits need to include recommendations to further improve the overall water quality compliance percentages for the various towns, which need to be implemented by the Municipality.

The target towards which Municipality needs to work is 99% Compliance for microbiological results and at least 95% compliance for chemical results. DWS's requirements and penalties for drinking water quality compliance are included in Table 6.3.2 of the Administration, Information and Comprehensive Overview Report.

Number of Monitoring Points for Drinking Water Sufficient:

See Table 8.1.7.2 under Section 8.1.7 of the Administration, Information and Comprehensive Overview Report for the proposed additional water quality samples to be taken by Stellenbosch Municipality.

Stellenbosch Municipality needs to continue with the analysing of the following water quality constituents to optimise treatment processes for drinking water quality.

Table 6.3.1.1: Water quality constituents to be analysed to optimize treatment processes for drinking water quality.

Physico-Chemical	Microbiological (Recommended when physico-chemical constituents indicate a loss of process control)
• pH (Taste, corrosivity) • Turbidity (turbidity indicates poor water treatment, cross-contamination and / or corrosion, and is problematic in that it prevents effective disinfection). • Water treatment residual chemicals and disinfectants (for example, aluminium from aluminium sulphate dosing, free chlorine residual from disinfection via chlorination).	• Total coliforms (evaluation of the efficiency of water treatment processes, microbial growth in the distribution system or post-treatment contamination of drinking water); • Faecal coliforms or E.coli (water is contaminated with faecal waste of human or animal origin).

Stellenbosch Municipality needs to continue with the implementation of the O&M Manuals at all their WTWs. Examples of preventative and corrective actions for which operational procedures should be documented include the following:

- Selection of alternate raw water source if available;
- Altering plant flow rate (for example, by reducing the loading on the works, but managed to ensure ability to supply demand);
- Jar testing for coagulant control and optimisation;
- Altering mixing intensity, changing treatment chemicals;

- Adjusting pH;
- Varying chemical feed rates and feed points;
- Adjusting filtration loading rate and / or operation;
- Adjusting the frequency and manner of backwashing cycles of the filters;
- Implementation of a filter evaluation and maintenance programme;
- Increasing disinfectant dose; secondary / booster disinfection;
- Mains flushing, cleaning and localised disinfection, and
- Developing standard operating procedures for handling leakages and pipe breakages.

It is also important to note that all operational manuals of treatment unit processes such as chemical dosing, coagulation sedimentation, filtration, disinfection etc. should contain operational limits, monitoring programmes, verification procedures and pre-determined corrective actions.

Monitoring data provide important feedback on how the water supply system is working and should be frequently assessed. The strategies and procedures for monitoring the various aspects of the water supply system should always be documented. Monitoring plans should include the following:

- **Parameters to be monitored.**

  Operational and Compliance Monitoring: Parameters included in Stellenbosch Municipality's Sampling Programmes.

- **Sampling location and frequency**

  Operational and Compliance Monitoring: Location and frequency of samples to be taken are included in the Municipality's Operational and Compliance Sampling Programmes.

- **Sampling needs and equipment**

  Operational Monitoring: The Manager Water Treatment ensure that adequate equipment is available at the WTW for the operational monitoring.

  Compliance Monitoring: Samples are analysed by an accredited external laboratory.

- **Schedules for sampling**

  Operational Monitoring: Existing schedules are available at the WTWs and recorded by the Process Controllers.

  Compliance Monitoring: Samples are analysed at an external accredited laboratory and loaded onto DWS's IRIS.

- **Methods for quality assurance and validation of sampling results.**

  Operational Monitoring: The Manager Water Treatment ensures that the correct techniques are used for the operational sampling and that the laboratory equipment is properly calibrated.

  Compliance Monitoring: Service Provider (Accredited external Laboratory is used).

- **Responsibilities and necessary qualifications of staff.**

  Operational Monitoring: The Manager Water Treatment and Process Controllers at each of the WTW are responsible for the operation of the plants and for the taking of the necessary samples.

  Compliance Monitoring: External Accredited Laboratory

- **Requirements for documentation and management of records including how monitoring of results will be recorded and stored.**

  Operational Monitoring: The records are currently documented and managed at each of the WTW, the records are then given through to the Manger Water Treatment, who record and store the data electronically.

  Compliance Monitoring: The records are documented and recorded at the external laboratory and also given through to the Manager Water Treatment in electronic and hard copy format.

- **Requirements for reporting and communication of results.**

  Operational Monitoring: Records are reported and communicated to the Manager Water Treatment by the various Water Treatment Supervisors.

  Compliance Monitoring: Results are reported to the Manager Water Treatment and to the DWS, through the IRIS.

6.3.2 Quality of Water Returned to the Resource: Urban

The municipality does operational and compliance monitoring of the effluent at all their WWTWs according to a comprehensive operational and compliance monitoring program, which meets the minimum requirement of DWS as stipulated in the Green Drop certification criteria. Operational sampling is done on a frequent basis by the treatment plant personnel at the various WWTWs. Compliance sampling is done by Stellenbosch Municipality's own internal laboratory.

To ensure that the WWTWs of Stellenbosch Municipality functions optimally and produces final effluents that comply with the requirements of the Water Act on a continuous basis, it is necessary to ensure that three important aspects are checked on a regular basis:

- Condition of infrastructure
- Correct and sustainable functioning of mechanical and electrical equipment and instrumentation.
- Whether the unit treatment processes are operated within the prescribed operational parameters.

It is therefore recommended that Stellenbosch Municipality undertake the following regular inspections and audits:

- Annual Detailed Audit of Assets, Infrastructure and Wastewater Section Personnel
- Annual Monitoring of the Wastewater Treatment Plants (Treatment Processes)

Annual Detailed Audit of Assets, Infrastructure and Wastewater Section Personnel:

This audit may be carried out by the Municipality's own personnel or external Asset Management Consultants. It comprises a survey and inspection of all the wastewater collection, treatment and disposal infrastructure (civil works, mechanical equipment, buildings, grounds), and updating the existing asset register. Of particular importance is recording the condition of the infrastructure, reassessing the useful life time of the same, and controlling whether the scheduled maintenance tasks have been performed.

The organogram of the wastewater treatment should also be updated, with specific attention being paid to the required number and qualifications of personnel required by DWS at each WWTW under their new Regulation 3630 (June 2023).

The organogram should be aligned with the following two programmes of the municipality:

- Skills Development Programme
- Career Path Planning

Where there are gaps in the organogram related to the DWS requirements, these should be included in the WSDP and Skills Development Programmes of Stellenbosch Municipality.

Annual Monitoring of the Wastewater Treatment Plants:

These monitoring visits should comprise an audit of all the operational practices at the treatment plant, and an assessment of the performance of the different unit processes observations, taking samples at various points in the treatment train, and comparing the results with the target levels set for each process.

Samples are typically taken of the following (and analysed for the parameters indicated in parenthesis):

- Raw sewage (COD, TKN, TP, pH, alkalinity, EC, ammonia, metals (if industrial effluents present)
- After Primary settling (COD, pH, EC)
- After biofilters (COD (filtered), ammonia (filtered), pH)
- After humus tanks (COD, TSS, ammonia, pH)
- In activated sludge reactor (MLSS, VMLSS, DO, DSVI, pH, COD (filtered), ammonia (filtered); nitrate (filtered)
- After secondary settling tanks (COD, ammonia, TSS, DO)
- After maturation ponds (COD, ammonia, pH, TSS)
- Final effluent (COD, ammonia, nitrate, orthophosphate, TSS, pH, EC)

The Annual Process Audits could typically be carried out by a wastewater treatment specialist.

It is further recommended that Stellenbosch Municipality also undertake their own internal process audits from time to time, and the Water Research Commission guideline document Guideline for the Inspection of Wastewater Treatment Works, Boyd and Mbelu, 2008, that was developed to assist municipalities with these inspections. The following is an excerpt from this guideline document, indicating the aims and rationale for various types of inspections as may be required for the various WWTWs in Stellenbosch Municipality's Management Area.

PURPOSE OF THE GUIDELINE DOCUMENT:

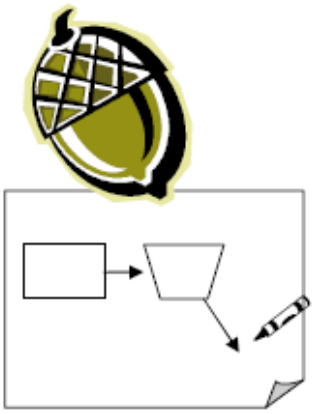
This guideline document deals with the requirements for undertaking an inspection at a WWTW. The purpose of the guideline document is to:

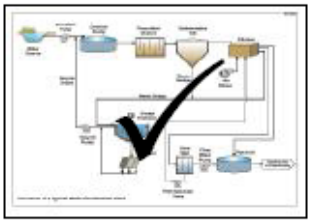
- *Assist the Process Controller to:*
  - *prepare for an inspection at the WWTW; and*
  - *take corrective action where a problem is identified.*
- *Assist the Inspector to:*
  - *undertake an inspection at a WWTW; and*
  - *give guidance where a problem is identified.*

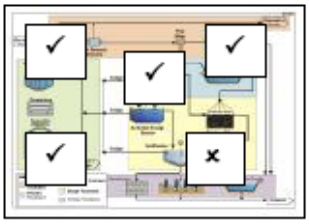
The guideline describes checklists for those unit processes that are most frequently encountered at South African WWTW. A list of proposed additional reading material that every WWTW should have on site is set out in Appendix A of the guideline.

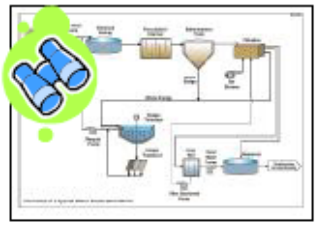
OVERVIEW OF THE GUIDELINE

Part I: Guidelines









Part I of the document sets out a guideline for undertaking an inspection at a WWTW to support the checklists set out in Part II. The guideline sets out the why, what and how of undertaking an inspection for various performance areas and lists performance indicators to guide the Inspector.

This section gives the Inspector, the Process Manager and the Process Controller a better understanding of the importance of the inspection, whether it is a daily visual inspection or a more comprehensive external or internal inspection. It is important to note that this section should be read in conjunction with a reputable handbook, such as those set out in Appendix A, for the operation of a WWTW.

Part II: Checklists

Part II of this document sets out checklists that should be completed at various times throughout the year, depending on the operational status of the WWTW.

The table below sets out the various checklists and when they should be used.

Checklist		When should the checklist be used?
1	*The WWTW in a nutshell* 	This checklist will help the person undertaking the inspection to get an understanding of the unit processes making up the WWTW and should be undertaken with the Process Manager. • All Process Managers and Process Controllers should complete this checklist when commencing employment at the WWTW and again if any upgrades are done to the works. External Inspectors should complete this checklist prior to undertaking an inspection. Examples of flow diagrams of various configurations are set out in Appendix B and C.
2	*Primary Assessment* 	This checklist gives an overall evaluation of the WWTW. • The inspection should be undertaken by an experienced person, preferably external to the WWTW who will make a decision on whether the comprehensive inspection needs to be undertaken or not.
3	*Comprehensive Inspection* 	This checklist includes individual checklists for each unit process. It should be used by the regulators and other Inspectors (both external and internal) when a WWTW has failed the primary assessment i.e all aspects have failed or certain parts of the WWTW have serious failures. This checklist will aid in the identification of the problems and will help to make improvements.
4	*Quarterly Inspection* 	This inspection should be undertaken quarterly once the WWTW has been subjected to a comprehensive inspection and/or primary assessment, and has been deemed to be running optimally. Ideally the regulator should undertake this inspection, however the Process Manager or Process Controller could also undertake this inspection.

Industrial Consumers: Stellenbosch Municipality can promote WDM activities at the wet industrial consumers in order for them to potentially lower their current water demand by means of improved practices or reuse of waste water. The revenue could potentially decrease as a result of re-use practices. It is suggested that a detailed financial analysis should be conducted as part of the investigation into wastewater re-use.

Stellenbosch Municipality can encourage the large users to implement suggested re-use practices by means of incentives, informative billing to communicate monthly water consumption and monitoring and communicating actual savings achieved.

All industries formally apply for the discharge of industrial effluent into the Municipality's sewer system. The quality and volume of industrial effluent discharged into the sewer system are monitored by the Municipality, in order to determine whether the quality comply with the standards and criteria. It is also necessary to consider limits above which volumetric monitoring will be necessary at new industries and existing smaller industries, where expansion is likely to take place. The Municipality needs to continue to ensure that all industrial consumers apply for discharge permits and they must supply and maintain a flow meter measuring the volume of water that is discharged into the sewer system. It is also recommended that the accounts generated by the Municipality include for each cycle a summary of the COD and flow results to enable industries to keep a record and look at ways of improving where possible.

Stellenbosch Municipality is committed to ensure that no industrial effluent is discharged into the sewer system unless it complies with the required standards and criteria.

Percentage compliance to Effluent Release Acceptable Limits:

Stellenbosch Municipality will continue with the implementation of their Operational and Compliance Sampling Programmes at all their WWTWs. The target towards which Stellenbosch Municipality needs to work is at least 90% compliance against critical criteria as included in the license or General Authorisation for the plant. DWS's requirements and penalties for effluent quality compliance are included in Table 6.3.3 of the Administration, Information and Comprehensive Overview Report. The final effluent quality compliance percentages, for the last three financial years, are included in Tables 6.3.2.1 to 6.3.2.3 of the Administration, Information and Comprehensive Overview Module. The Municipality's updated W_2RAPs and the detail WWTW Process Audits need to include recommendations to further improve the overall wastewater quality compliance percentages for the various WWTWs, which need to be implemented by the Municipality.

The purpose of the W_2RAPs and the upgrading of the WWTW are to reduce the CRRs of the WWTWs even further and to improve the quality of the effluent discharged from the various WWTWs.

Number of Monitoring Points for Effluent Release Sufficient:

Stellenbosch Municipality's existing Operational and Compliance Sampling Programmes are included in Tables 8.1.9.2 of the Administration, Information and Comprehensive Overview Report. **The Municipality's existing Operational and Compliance Sampling Programmes are adequate and no additional sampling points are recommended.**

The current Operational Alert Levels should be checked regularly by the municipality in order to ensure that the various unit processes in the plant performs optimally. If these pre-determined Alert Levels are exceeded at any of the control points where samples are taken for operational purposes, then certain actions should be taken to bring the operational parameters back to within the target ranges.

The proposed Operational Alert Levels for the various WWTWs and the corresponding actions that should be taken when these levels are reached or exceeded are included in the table below.

Table 6.3.2.1: Recommended operational alert levels for the various WWTWs

Operational Samples	Alert Level	Actions to be taken
Activated Sludge Systems (Recommended)		
Raw Sewage	COD > 1 000 mg/L Ammonia > 100 mg/L as N 5.5 > pH > 9.5 EC > 150 mS/m Settling Solids > 20 mL/L	• Check for possible illegal industrial effluent discharge. • Do more frequent measurements of DO levels, pH and MLSS in the activated sludge reactor.
At outlet of bioreactor	DO < 0.5 mg/L	• Increase aeration capacity or cycles.
	MLSS < 2 000 mg/L	• Reduce discharge of WAS and allow MLSS levels to increase to 4 000 mg/L.
	MLSS > 6 000 mg/L	• Gradually waste more sludge on a daily basis to reduce the MLSS to 4 000 mg/L.
	pH < 7.0	• Add lime to the inlet works to maintain the pH in the reactor at 7.0 or slightly above. • Check denitrification process.
Secondary settling tank	COD > 75 mg/L	• Check for sludge carry over from secondary settling tanks. • Check RAS recycle rates. • Check for bulking sludge. • Check for rising sludge. **Take action to rectify as appropriate**
Oxidation Pond Systems (Recommended)		
Raw Sewage	COD > 1 000 mg/L Ammonia > 100 mg/L as N 5.5 > pH > 9.5 EC > 150 mS/m Settling Solids > 20 mL/L	• Check for possible illegal industrial effluent discharge.
Tertiary Pond	COD > 400 mg/L Ammonia > 100 mg/L as N 6 > pH > 9 EC > 200 mS/m SAR > 5 Faecal Coliforms > 100 000 per 100ml	• Aerate ponds or provide additional ponds for a total retention period of 25 days.

Samples to be monitored at the WWTWs must include inflow, outflow, process flows, industrial effluent and sludge. Determinants and frequencies as required by the Licence or General Authorisation or as per best practice: Low end techn / small size = 1x / month, medium techn / size = 1x / week and high techn / macro size = 1x / day.

6.3.3 Quality of Water Returned to the Resource: Rural

This function is with the EHPs of the Cape Winelands District Municipality and the quality of the water returned to the Water Resource system in the rural areas is not monitored by Stellenbosch Municipality.

6.3.4 Pollution Contingency Measures Plan

Stellenbosch Municipality will continue to undertake the following measures to prevent pollution of the Water Resource Systems.

- Investigating all sewage pump stations to ensure that emergency storage capacities and backup generators are available at the sewage pump stations, to prevent any possible spillages.
- Timeous upgrading of the WWTWs, to handle both volume and nutrient loading, in order to reduce the risk of spills and sub-standard effluent.
- Regular monitoring of treated effluent discharged to the Water Resource System at all the WWTWs.
- Monthly monitoring of the water quality in the rivers upstream and downstream of WWTW discharge points.
- Enforcing the Water Services By-law.

Stellenbosch Municipality is also committed to regularly update their W_2RAPs, in order to reduce the CRRs of the various WWTWs. The Wastewater Risk Ratings for the various WWTWs, from which the trends can be noted, are included in Table 6.3.7.2.

6.3.5 Quality of Water Taken from Source: Urban – Percentage Monitored by WSA

The raw water quality monitored by Stellenbosch Municipality is indicated in the Water Quality Sampling Programme included in Table 8.1.7.2 under Topic 8 of the Administration, Information and Comprehensive Overview Report. The additional sampling required is also indicated in the table.

6.3.6 Quality of Water Taken from Source: Rural – Percentage Monitored by WSA

Stellenbosch Municipality will not be involved in any water quality monitoring on the farms in the rural areas, where the farmers utilise their own water sources. This function is with the EHPs of the Cape Winelands District Municipality, and they take samples on the farms when requested by the farm owners.

6.3.7 Quality of Water Returned to the Source: Urban – Percentage Monitored by WSA

Stellenbosch Municipality is committed to focus on the timeous upgrading of the WWTWs, to handle both volume and nutrient loading, in order to reduce the risk of spills and sub-standard effluent. The table below gives an overview of the design and operating capacities of the WWTWs as included in DWS's 2022 Green Drop Report, DWS's 2023 Green Drop Progress Report and the design and operating capacities as included in the WSDP.

Table 6.3.7.1: Design and operating capacities of the various WWTWs

WWTW	DWS's 2022 Green Drop Report			DWS's 2023 Green Drop Progress Report			WSDP		
	Hydraulic Capacity	Operating Flow	% Operational / Capacity	Hydraulic Capacity	Operating Flow	% Operational / Capacity	Hydraulic Capacity (Ml/d)	Operating Flow 23/24 (Ml/d)	% Operational / Capacity
	Ml/d	Ml/d	%	Ml/d	Ml/d	%	Ml/d	Ml/d	%
Stellenbosch	35.000	16.100	46%	20.400	Unknown	Unknown	35.000	23.718	67.77%
Wemmershoek	5.000	2.600	52%	5.000	Unknown	Unknown	3.600	4.120	114.44%
Pniel	1.350	1.580	117%	1.350	Unknown	Unknown	4.500	2.347	52.16%
Klapmuts	2.500	1.100	44%	2.500	Unknown	Unknown	2.400	1.537	64.04%
Raithby	0.150	0.062	41%	0.150	Unknown	Unknown	0.150	0.065	43.33%

Note: The Wemmershoek WWTW was originally designed for a hydraulic capacity of 5.0 Ml/d, but due to design errors the current hydraulic capacity of the plant is only 3.6 Ml/d.

The DWS also followed a risk-based regulatory approach that provides early warning signs of WWTWs that contain a certain measure of risk, and in directing the type of intervention required to manage and mitigate the identified risk and move to a more favourable position of compliance and ultimately, excellence. The current Cumulative Risk Ratios (CRR = A*B+C+D) of the WWTWs in Stellenbosch Municipality's Management Area, as calculated by the DWS during 2011, 2013, 2022 and 2023, are indicated in the table below.

Table 6.3.7.2: Cumulative Risk Ratio of the various WWTWs (% Deviation = Actual CRR / Max CRR)

WWTW	2011	2013	2022	2023
Stellenbosch	74.1%	81.8%	55.6%	86.4%
Wemmershoek	58.8%	76.5%	63.3%	82.4%
Pniel	64.7%	82.4%	58.8%	82.4%
Klamputs	58.8%	94.1%	41.2%	70.6%
Raithby	47.1%	76.5%	64.7%	76.5%

Note: Low < 50%, Medium 50% - < 70%, High 70% - < 90%, Critical 90% - 100%

Currently the DWS is working towards a revised Cumulative Risk Ratio which is as follows:

CRRr = CRR * H * I, where

H = Environmental Sensitivity Weighting

I = Effective Management Weighting (Green Drop Score)

Stellenbosch Municipality therefore needs to address the following, in order to reduce their current CRR.

- Forward planning and upgrading / refurbishment of treatment plants to ensure adequate capacity for the flows received;
- Operate and maintain the WWTWs within design- and equipment specifications;
- Have trained, qualified and registered staff in place;
- Get mentoring / coaching contracts in place where there is a great demand for adequately skilled process controllers and supervision;
- Monitoring of flow to- and from the plants;
- Sampling and monitoring of effluent quality;
- Appropriate authorisation in accordance with the National Water Act (36 of 1998); and / or
- Where plant is overloaded, introduce unorthodox methods to ensure enhancement of effluent quality.

Stellenbosch Municipality works towards improving the quality of the treated effluent discharged from their various WWTWs and will update their W_2RAPs for all their WWTWs and sewer drainage networks.

6.3.8 Quality of Water Returned to the Source: Rural – Percentage Monitored by WSA

Stellenbosch Municipality will not be involved in any water quality monitoring on the farms in the rural areas, where water is returned to the Water Resource System. This function is with the EHPs of the Cape Winelands District Municipality.

6.3.9 Water quality results available in electronic format?

Stellenbosch Municipality is committed to ensure that all water quality and final effluent quality sample results are loaded onto DWS's IRIS as required for the Blue and Green Drop Assessment Processes.

6.3.10 Percentage Time (Days) within SANS241 Standards per Year

See Table 8.1.7.5 for the summary of the July to June water quality compliance percentages for the last three financial years for each of the water distribution systems. Stellenbosch Municipality will continue to include their water quality compliance percentages for each financial year in their annual WSDP Performance and Water Services Audit Report.

6.4 OPERATION

Volumes are registered on the DWS's WARMS for the various resources. A Service Level Agreement is also in place with the CCT for the provision of bulk potable water to the various areas. A registered water use however does not guarantee that the water use is accurate or lawful. Validation and verification of the accuracy and lawfulness of the water use is needed to qualify as an Existing Lawful Use. **It is important for the municipality to confirm the correct registration volumes and existing lawful use volumes for all their sources. This information, with the safe yields of the surface and groundwater sources, is critical to accurately determine which sources need to be augmented for the different schemes. Stellenbosch Municipality further needs to continue to ensure that all the individual sources are metered and that the abstraction volumes are recorded on at least a monthly basis.**

7. FINANCIAL PROFILE

One of the goals of the Sector is that all water services providers are accountable, cost-effective, efficient, and viable, and implement appropriate employment and gender equity policies. The WSA can influence the financial viability of water services and water services providers through the following mechanisms:

- Investment choices
- Choices related to the use of the local government equitable share
- Tariff policy and the setting of tariffs
- Credit control policies and revenue management
- The contract (service delivery agreement) between the water services authority and an external water services provider, specifically the service obligations and the financial conditions of the agreement.

Stellenbosch Municipality's 2023/2024 Annual Report list the following Financial Viability Challenges:

- Financial Viability: The traceability of all debtors poses a challenge to the debt collection process. Low economic growth, an increase in unemployment, and above-inflation increases in the cost of water impact the affordability of municipal accounts.
- Revenue Leakage: An integrated revenue enhancement approach was followed to combat revenue leakages.

Stellenbosch Municipality's 2022-2027 IDP, Draft 3rd Review March 2025, list the following key Financial Strategies:

- Financial viability and sustainability through long-term financial planning
  - Long-term financial planning tool, effective implementation and monitoring.
- Clean Audit
  - Audit Action Plan
  - Annual Financial Statement compilation standard operating procedure
  - Monthly Reconciliations
  - Training Sessions
  - Participation in Forums
- Staffing
  - Revised Organogram
  - Fill critical vacancies
- Capital Expenditure
  - Implementation of Project Management System including in-year reporting
- Revenue Enhancement Strategy
  - Implementation of Revenue Enhancement Strategy.
  - Roll-out of WMD and Pre-payment Water Meters.
  - Data cleansing
  - Validity of registered indigent households

- Billing System Enhancement
  - Web-based billing system
  - Review of Municipal Account Layout
  - Investigate payment methods.
- Debt Management
  - Debt Review Committee
  - Quarterly Report on Debt and Possible Debt to be written off.

The following Financial Policies are in place:

- Grant-In-Aid Policy
- Indigent Policy
- Asset Management Policy
- Travel and Subsistence Policy
- Tariff Policy
- Rates Policy
- Non-Financial Asset Management Policy
- Petty Cash Policy
- Irrecoverable Debt Policy
- Credit Control and Debt Collection Policy
- Cash Management and Investment Policy
- Budget Implementation and Monitoring Policy
- Borrowing Policy
- Acting Allowance Policy
- Accounting Policy
- Development Charges Policy
- Special Ratings Area Policy

7.1 EXPENDITURE

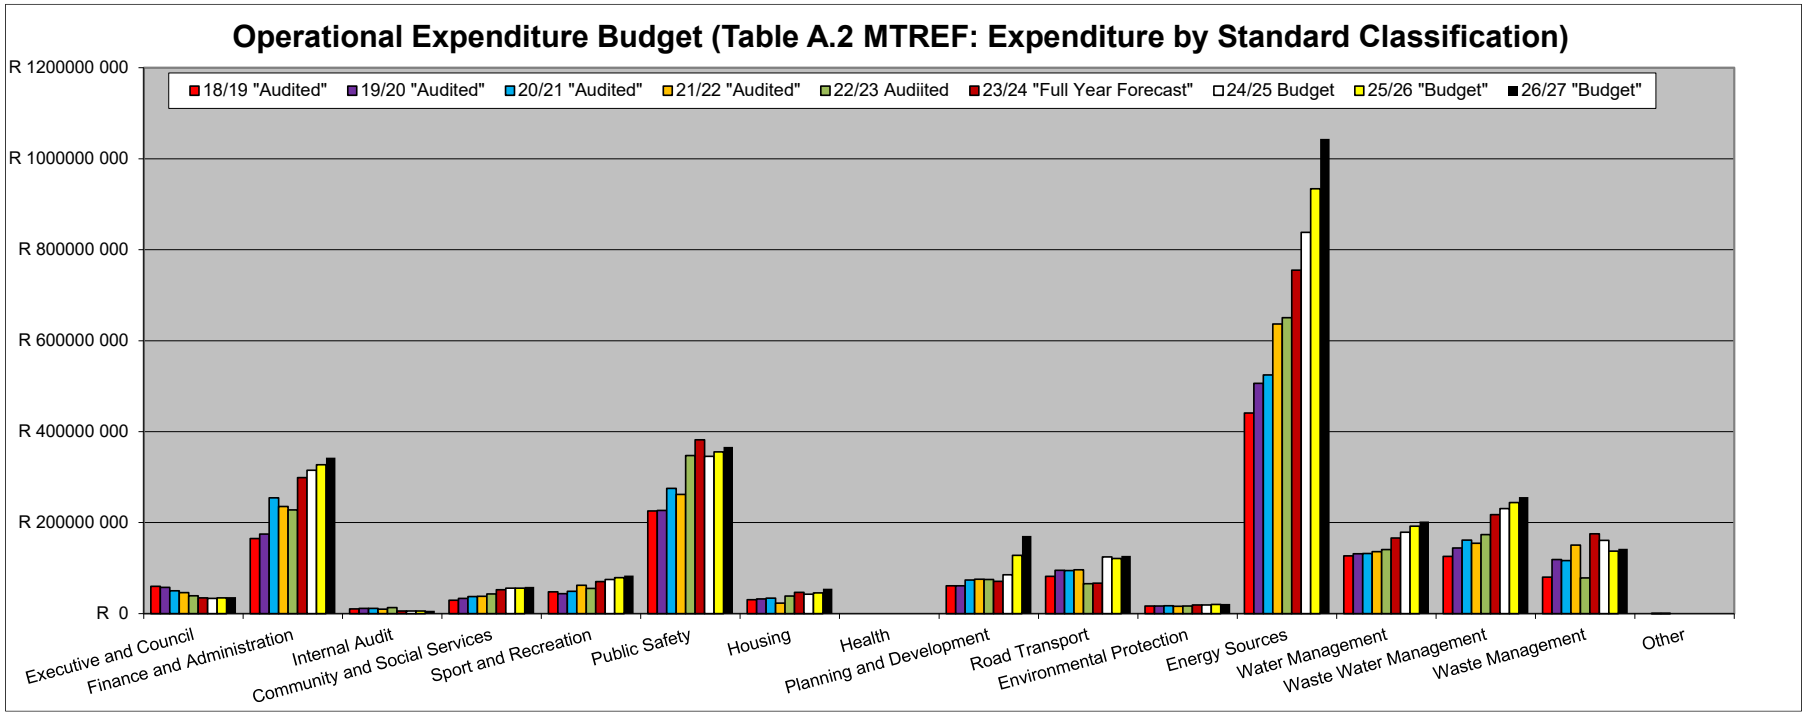
7.1.1 Ratios and Efficacy Indicators

The table below indicates the key financial indicators and ratios as included in the 2024/2025 MTREF Budget.

Table 7.1.1.1: Financial Performance Indicators and benchmarks

Financial Indicator	Basis of Calculation	2023/2024 Pre-Audit Outcome	2024/2025	2025/2026	2026/2027
Borrowing Management					
Capital Charges to Operating Expenditure	Interest & Principal Paid / Operating Expenditure	12.2%	12.5%	12.6%	12.6%
Capital Charges to Own Revenue	Finance charges & repayment of borrowing / Own Revenue	11.3%	15.5%	15.0%	14.6%
Borrowed funding of “own” capital expenditure	Borrowing / Capital expenditure excl. transfers and grants and contributions	0.0%	42.1%	45.5%	46.9%
Safety of Capital					
Gearing	Long Term Borrowing / Funds & Reserves	260.4%	1611.9%	-463.2%	2118.5%
Liquidity					
Current Ratio	Current assets / Current liabilities	2.7	1.6	1.6	1.6
Current Ratio adjusted for aged debtors	Current assets less debtors > 90 days/current liabilities	2.7	1.6	1.6	1.6
Liquidity Ratio	Monetary Assets / Current Liabilities	2.1	1.5	1.5	1.6
Revenue Management					
Annual Debtors Collection Rate (Payment level %)	Last 12 months receipts / Last 12 months billing	0.0%	0.0%	0.0%	0.0%

Table 7.1.1.1: Financial Performance Indicators and benchmarks					
Financial Indicator	**Basis of Calculation**	**2023/2024 Pre-Audit Outcome**	**2024/2025**	**2025/2026**	**2026/2027**
Current Debtors Collection Rate (Cash receipts % of Ratepayer & Other Revenue)		-198.3	143.9%	141.8%	140.4%
Outstanding Debtors to Revenue	Total outstanding debtors to annual revenue	11.6%	2.5%	1.8%	1.2%
Longstanding Debtors Recovered	Debtors > 12 months recovered / Total debtors > 12 months old	0.0%	0.0%	0.0%	0.0%
Creditors Management					
Creditors System Efficiency	% of Creditors paid within terms	98.0%	98.0%	98.0%	98.0%
Creditors to Cash and Investments		-5.9%	64.6%	66.0%	62.0%
Other Indicators					
Electricity Distribution Losses	Total volume losses (kW)	390847902	390847902	390847902	-
	Total cost of losses	27 359	37 359	27 359	27 633
	% Volume (units purchased and generated less units sold/units purchased and generated)	0	0	0	-
Water Distribution Losses	Total volume losses (Kl)	9 418	9 418	9 418	9 512
	Total cost of losses	2 071 992	2071992	2071992	2092712
	% Volume (units purchased and generated less units sold/units purchased and generated)	0%	0%	0%	0%
Employee Costs	Employee costs / (Total Revenue – Capital Revenue)	22.7%	25.9%	24.2%	23.4%
Remuneration	Total remuneration / (Total Revenue – Capital Revenue)	-	26.8%	25.1%	24.2%
Repairs and Maintenance	R&M / (Total Revenue excluding Capital Revenue)	-	4.7%	4.6%	4.7%
Finance Charges & Depreciation	FC&D / (Total Revenue – Capital Revenue)	7.3%	12.8%	12.2%	11.5%
IDP Regulation Financial Viability Indicators					
Debt Coverage	Total Operating Revenue – Operating Grants) / Debt service payments due within financial year)	12.5	16.5	15.9	17.7
O/S Service Debtors to Revenue	Total outstanding service debtors / annual revenue received for services	20.8%	4.3%	3.0%	2.0%
Cost Coverage	(Available cash + Investments) / monthly fixed operational expenditure	-34.3	3.8	4.5	5.4



Source: 2024/2025 Medium Term Revenue and Expenditure Framework for Stellenbosch Municipality: Table SA8 – Performance indicators and benchmarks

7.1.2 Water Balance Cost / Revenue

See Topic 5 for the WC/WDM measures to be implemented by Stellenbosch Municipality in order to reduce the current NRW and Water Losses for the various water distribution systems. The NRW and Water Losses are a direct loss of income for the Municipality. The Municipality's existing seven block step rising residential water tariff structure adequately discourages the wasteful or inefficient use of water.

7.1.3 Operating Cost

The following graph gives an overview of the historical and planned future O&M expenditure budgets of Stellenbosch Municipality.

It is evident from the above graph that the largest portion of the budget is spent on buying electricity from Eskom.

The table below gives a summary of the future planned expenditure by type for Stellenbosch Municipality, as included in the 2024/2025 Budget.

Table 7.1.3.1: Expenditure items by type, as included in the 2024/2025 Budget

Expenditure Items	% of total 2023/2024 Expenditure	2023/2024 Pre-audit Outcome	2024/2025	2025/2026	2026/2027
Employee related costs	31.5%	R393 880 000	R656 455 000	R671 809 000	R713 730 000
Remuneration of Councillors	1.2%	R15 351 000	R23 422 000	R24 828 000	R26 317 000
Bulk Purchases – Electricity	29.5%	R369 607 000	R714 397 000	R805 126 000	R907 377 000
Inventory Consumed	5.0%	R62 772 000	R112 641 000	R119 350 000	R126 520 000
Debt Impairment	0.0%	-	R74 711 000	R78 259 000	R81 975 000

Waste Water Management	R217 269 000	R230 551 000	R243 910 000	R256 276 000

Source: 2024/2025 Medium Term Revenue and Expenditure Framework for Stellenbosch Municipality: Table A2 –Budgeted Financial Performance (Revenue and Expenditure by Functional Classification)

Maintenance activities have been increasingly focused on reactive maintenance as a result of the progressive deterioration and failure of old infrastructure. Consequently, there has been dilution of preventative maintenance of other infrastructure. Expenditure on repairs and maintenance does not keep track with the increase in asset values as well as the ageing of the infrastructure.

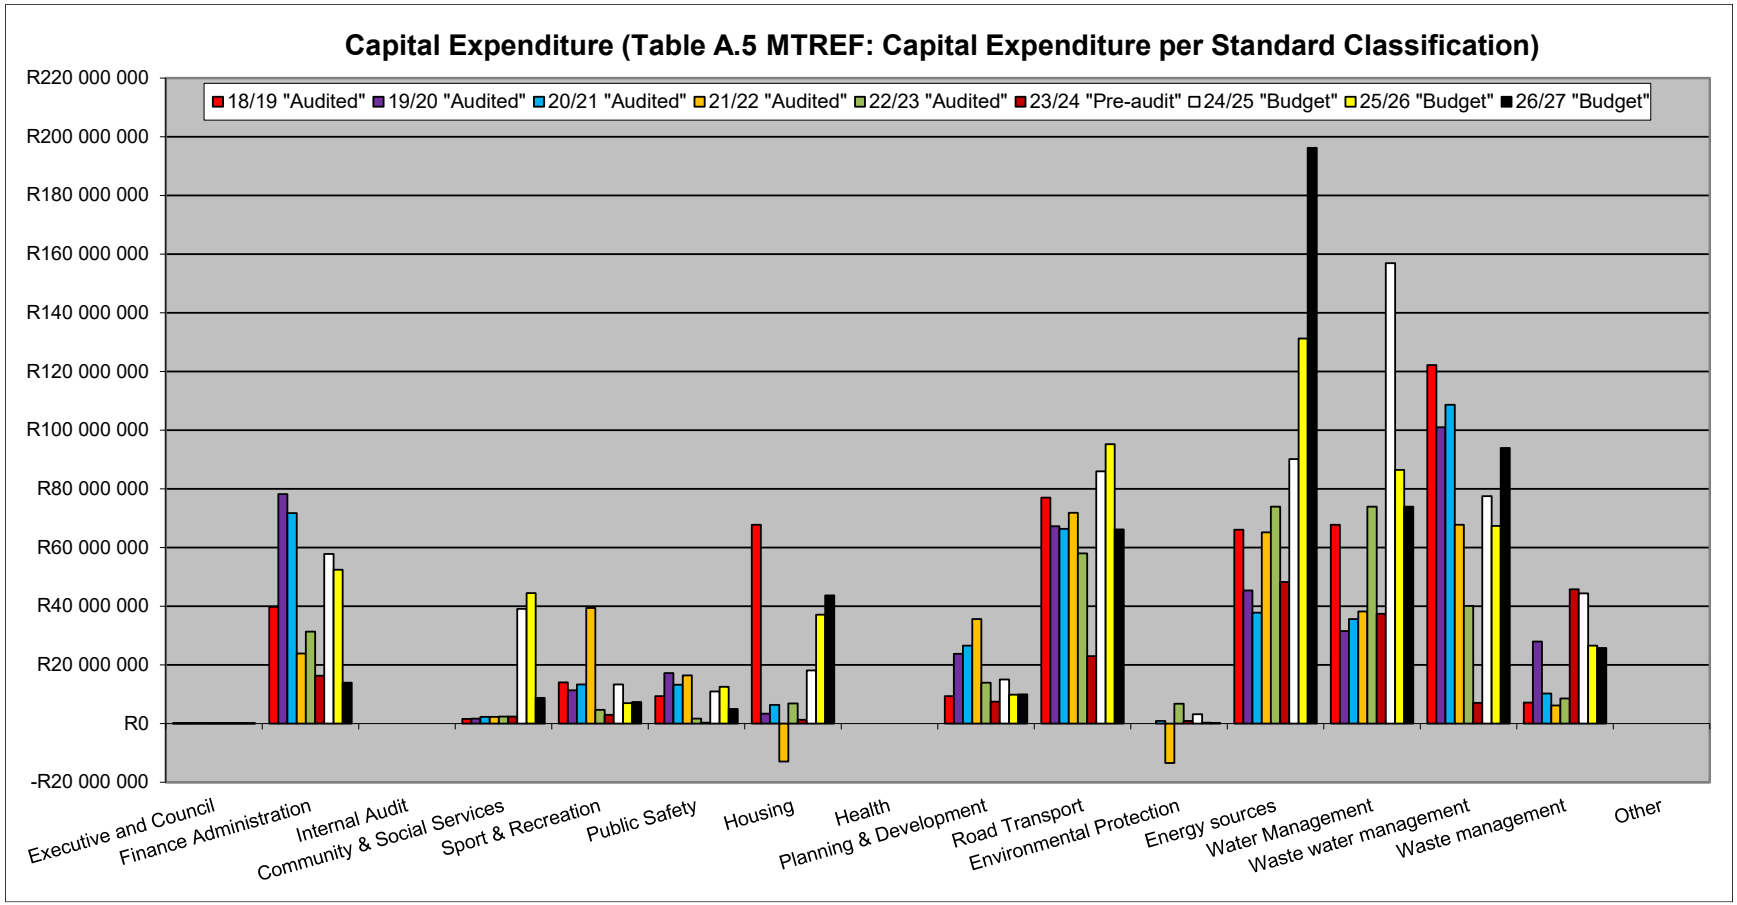
An Integrated Maintenance Plan is necessary that optimises maintenance activities, appropriate to its specific needs and the local environment, and identifies the systems and resources required to support this. A regime of planned preventative maintenance should be established for all infrastructure assets classified as critical and important in the Asset Register. Consideration should be given to the establishment of a maintenance management system to enable Stellenbosch Municipality to better manage its risks, and more effectively plan and prioritise the wave of renewals that are going to be required over the next 20 years.

It is important to note that the maintenance budget requirements are going to increase substantially over the next twenty years in real terms, in line with the envisaged pace of development, and the upgrading of the treatment works. It is estimated that the budget requirements will double over this period.

The recommendations for Stellenbosch Municipality, with regard to their Operational Budgets, are as follows:

- Develop an AMP, which will indicate the real replacement values and service lives of the assets and the funds required to provide for adequate operation and maintenance of the infrastructure. Current gaps include unrealistically low depreciation charges, which have to be rectified and ring-fenced into an asset replacement fund, as well as additional budget requirements above inflation for infrastructure development.

- The new depreciation charges will have to form part of the operating budget and subsequent tariffs, linked to a ring-fenced asset replacement fund.



- It is critical for Stellenbosch Municipality to ensure that sufficient funding is allocated towards an asset replacement fund, in order to ensure adequate rehabilitation and maintenance of the existing water and sewerage infrastructure.

- Water services operational surpluses have to be allocated to essential water services requirements in the future.

- Stellenbosch Municipality needs to continue with the strict enforcement of their Credit Control and Debt Collection Policy and By-law.

7.1.4 Capital Expenditure

The graph below gives an overview of the historical and planned future capital expenditure per Standard Classification for Stellenbosch Municipality.

The future estimated capital expenditure per standard classification are summarised in the table below.

Table 7.1.4.1: Estimated capital expenditure per standard classification of Stellenbosch Municipality's future capital budget

Capital Expenditure: Functional Classification	2023/2024 Pre-audit outcome	2024/2025	2025/2026	2026/2027
Executive and Council	R35 000	R40 000	R40 000	R50 000

Source: 2024/2025 Medium Term Revenue and Expenditure Framework for Stellenbosch Municipality: Table A5 – Capital Expenditure by Vote, Functional and Funding

The Opening Cost of the water and sewerage infrastructure that will need to be replaced over the next five years (RUL < 5 yrs) is R115.251 million. The asset renewal needs for the **water infrastructure assets** over the next 10 years is R21.290 million per year. The reinvestment required is R96.455 million in the first 5 years and R116.446 million in the second 5-year period. The asset renewal needs for the **sewerage infrastructure assets** over the next 10 years is R5.663 million per year. The reinvestment required is R18.795 million in the first 5 years and R37.837 million in the second 5-year period. These values are based on the Opening Cost of the water and sewerage infrastructure currently included in the Asset Register. Table 4.1.10.3 however indicates the required annual budget for the replacement of the old water and sewerage infrastructure and the required annual O&M budget, which is based on the CRC of the water and sewerage infrastructure included in the WSDP.

The extent to which each type of water and sewerage asset portfolio has been consumed are summarised under Topic 3 in the Tables under Section 3.1.1 of the Administration, Information and Comprehensive Overview Report. The infrastructure components with low percentage figures (% Book Value/Opening Cost) need dedicated renewals programmes targeting these assets. If this is not done, there is the risk that the on-going deterioration will escalate to uncontrolled proportions, with considerable impact on consumers, the economy of the area and the service levels that can be provided in Stellenbosch Municipality.

The recommendations for Stellenbosch Municipality, with regard to their Capital Funding, are as follows:

- Take the recommended projects, as identified through the Water and Sewer Master Plans and the WSDP, into account during the planning and prioritization process for new infrastructure. Prioritize from the desired list, those items which can be implemented from available funding in the particular financial year.
- Undertake revised master planning at least every three to five years and use the Master Plans to list the desired infrastructure development requirements and reflect these in the IDP.
- Assign a high priority to the implementation of the WC/WDM Strategy in order to postpone additional capital investment for as long as possible, both from the water availability perspective as well as from the treatment of increased effluent volumes. The costs of physical water loss, the capital requirements for

new water resources infrastructure, and the constraints of poor water availability on water dependent economic growth means that WC/WDM is a critical management priority for stretching the financial resources of the Municipality. WC/WDM is almost always a more cost-effective solution than the implementation of new infrastructure, and no new infrastructure should be developed until unauthorized water has been reduced to manageable volumes.

- To adopt appropriate technology solutions for the water and sewerage infrastructure challenges. Techniques such as value engineering should also be adopted to ensure that investments in infrastructure and other solutions are cost effective over the full life-cycle and designed to be fit for purpose.
- To ensure adequate funding for the full lifecycle cost of the new water and sewerage infrastructure, which will include funds for the operation and maintenance of the infrastructure and regular refurbishment.
- Balance land-use and development planning (SDFs) in accordance with the availability of water and the capacity of WTWs and WWTWs that are in place or that will be implemented.
- To focus strongly on revenue collection, in order to improve the Municipality's own funding sources, over and above the Grants received from National and Provincial Government. The Municipality also needs to actively implement their Credit Control and Debt Collection Policy in order to minimize the percentage of non-payment for municipal services.
- To identify all possible sources of external funding over the next three years to assist Stellenbosch Municipality to address the bulk infrastructure backlogs that exist in the various towns as indicated in the tables under Topic 3.
- Develop IAMPs for all water and sewerage infrastructure, which will indicate the real replacement values, the service life of the assets and the funds required to provide for adequate asset replacement. The renewals burden is set to increase sharply over the next 20 years and it is therefore important for Stellenbosch Municipality to commit to a substantial and sustained programme of capital renewal works. The current level of expenditure on capital renewal is inadequate and there is a critical need for Council to commit to increase the budget for the maintenance and rehabilitation of the existing infrastructure substantially.

7.1.4.1 Capital Expenditure: Water

The future water capital infrastructure projects of Stellenbosch Municipality are summarised in the table below (2024-2027 Adjustments Capital Budget, Aug 2024).

Table 7.1.4.1.1: Future water capital projects as included in the 2024-2027 adjusted capital budget

Project	Adjusted Budget 2024/2025	Budget 2025/2026	Budget 2026/2027

7.2.2 Capital Income

It is important for Stellenbosch Municipality to manage their charges for water and sanitation services and the control of consumer payments effectively, in order to ensure that adequate income is generated to fund their water and sanitation capital projects. The future funding sources of Stellenbosch Municipality's total capital budget are summarised in the table below.

Table 7.2.2.1: Sources of funding for the future capital budgets of Stellenbosch Municipality

Capital Funding Source	2023/2024 Pre-audit	2024/2025	2025/2026	2026/2027
National Government	R43 014 000	R72 056 000	R56 821 000	R59 216 000
Provincial Government	R6 204 000	R27 067 000	R40 656 000	R46 656 000

7.3 TARIFF AND CHARGES

The state of the economy has an adverse effect on the consumers. As a result municipalities' revenues and cash flows are expected to remain under pressure. Furthermore municipalities should carefully consider affordability of tariff increases, especially as it relates to domestic consumers while considering the level of services versus the associated cost. Water tariffs should always be cost reflective and the water tariff structure must therefore ensure that:

- Water tariffs are fully cost-reflective, including the cost of maintenance and renewal of purification plants, water networks and the cost associated with reticulation expansion;
- Water tariffs are structured to protect basic levels of service and ensure the provision of free water to the poorest of the poor (indigent); and
- Water tariffs are designed to encourage efficient and sustainable consumption.

Stellenbosch Municipality's current seven block step water tariff structure for residential consumers adequately promotes the efficient use of water by consumers and discourages the wastage of water. Higher tariffs are charged for the higher consumption blocks. The first 6 kl of water is provided free to residential consumers who qualify for indigent relief. It is expected that this tariff structure will continue to be implemented in the future.

The sustainable supply of potable water is becoming an ever increasing challenge. This scarce commodity has to be optimally managed. The increase in the price of electricity, load shedding and the chemicals for purification has contributed to the cost of delivering the service.

The table below gives some comments on the specific blocks, with regard to Stellenbosch Municipality's residential block stepped water tariff structure, for the various financial years.

Table 7.3.1: Comments on the Municipality's block step tariff structure

Block (kl/month)	20/21	21/22	22/23	23/24	24/25	Comments
0 – 6 kl	R6-06	R6-39	R6-79	R7-19	R7-64	Free Basic Water
> 6 – 12 kl	R9-17	R9-67	R10-27	R10-89	R11-56	Low volume use
> 12 – 20 KL	R15-51	R16-36	R17-37	R18-42	R19-56	Typical use volume, including garden irrigation
> 20 – 25 kl	R27-58	R29-09	R30-90	R32-75	R34-78	
>25 – 40 kl	R38-33	R40-43	R42-94	R45-52	R48-34	Above average use, including garden irrigation
> 40 – 70 kl	R61-24	R64-61	R68-61	R72-73	R77-24	Wasteful use and/or severe garden irrigation
> 70 kl	R95-85	R101-12	R107-39	R113-83	R113-83	Significant waste and/or unnecessary garden irrigation

The Compulsory National Standards (Regulations under section 10 of the Water Services Act) state the following on the supply of water to a household through a water services work or consumer installation designed to provide an uncontrolled volume of water.

1) *A tariff set by a water services institution for the supply of water through a water services work or consumer installation designed to provide an uncontrolled volume of water to a household must include a volume based charge that –*

   a) *support the viability and sustainability of water supply services to the poor;*

   b) *discourages wasteful or inefficient water use; and*

   c) *take into account the incremental cost that would be incurred to increase the capacity of the water supply infrastructure to meet an incremental growth in demand.*

2) *The requirements of sub regulation (1) are deemed to have been met where the tariff is set as a volume based charge that provides for a rising block tariff structure which includes –*

   a) *three or more tariff blocks with the tariff increasing for higher consumption blocks;*

   b) *a consumption level for each block defined as a volume consumed by a household during any 30 day period;*

   c) *a first tariff block or lowest tariff block with a maximum consumption volume of six kilolitres and which is set at the lowest amount, including a zero amount, required to ensure the viability and sustainability of water supply services; and*

   d) *a tariff for the last block or highest consumption block set at an amount that would discourage high water use and that reflects the incremental cost that would be incurred to increase the capacity of the water supply infrastructure to meet an incremental growth in demand.*

The water tariff structure of Stellenbosch Municipality should remain a rising block tariff system, which discourages wasteful or inefficient use of water. The determination of tariff policies should seek to address both commercial and social welfare concerns. The **CAFES**-principles (Sansom et al. 2002) are outlined below:

- **C**onserving. Tariffs should encourage consumers to purchase enough water to meet their needs without being wasteful.

- **A**dequate. Future investment should also be considered when setting the tariffs.

- **F**air. The utility should achieve financial sustainability while maintaining access for poor communities.

- **E**nforceable. Tariffs that cannot be enforced are unlikely to be sustained.

- **S**imple. The tariffs should be easy for the Municipality to administer and easy for customers to understand. Consumers generally show greater willingness to pay water bills that they understand.

Wasteful or inefficient use of water is discouraged through increased tariffs. It is suggested that the following tariff structure characteristics should remain in Stellenbosch Municipality's Structure in order to ensure efficient water use (WDM Strategy):

- Maintain a rising block tariff structure.

- Keep number of blocks in the tariff to a minimum. One block to address free basic water (the first step) and another to address the "cut-off" volume where consumers are discouraged to use water above this monthly volume (highest block) are required. In addition another three blocks could be used to distinguish between low users, typical use of high water use. Six blocks in a tariff often make good sense, as indicated in Table 7.3.1.

- The volumetric steps should be kept the same for all the areas within Stellenbosch Municipality's Management Area.

- The cost of water in the maximum step should severely discourage use in this category. The volumetric use for the highest category could be 60 kl/month, above which residential water use could be considered to be wasteful or unnecessary. Garden use requiring in excess of this volume should be reduced in accordance with xeriscape practices.

The MFMA Circular No.78 of 7 December 2015 stipulated the following w.r.t. the water and sanitation tariff increases:

Municipalities should consider the full cost of rendering the water and sanitation services when determining tariffs related to these two services. If the tariffs are low and result in the municipality not recovering their full costs, the municipality should develop a pricing strategy to phase-in the necessary tariff increases in a manner that spreads the impact on consumers over a period of time.

Municipalities are urged to design an Inclining Block Tariff structure that is appropriate to its specific circumstances, and ensures an appropriate balance between low income consumers and other domestic, commercial and business customers, and the financial interests of the municipality. While considering this structure, municipalities are advised to evaluate if the IBT system will be beneficial to them depending on consumption patterns in their areas.

In light of the current drought being experienced across large parts of the country, and to mitigate the need for water tariff increases, municipalities must put in place appropriate strategies to limit water losses to acceptable levels. In this regard municipalities must ensure that water used by their own operations is charged to the relevant service, and not simply attributed to water losses.

The recommendations for the water and sewerage tariffs of Stellenbosch Municipality are as follows:

- Stellenbosch Municipality can investigate the financial viability of changing the sanitation tariff structure from a fixed monthly amount, which is based on the size of the erven, to a stepped tariff based on water consumption in the future (Financial analysis needs to be done). Volumetric usage for sanitation services, whereby charges are determined according to water usage, with maximum ceilings and charged accordingly. This will need to include a free sanitation bracket, similar for free water, for indigent households. This will also further deter wasteful water use.

- Stellenbosch Municipality will continue to re-evaluate the tariffs they charge for their water and sanitation services on an annual basis in order to put the Municipality in a better financial position and to ensure that all the O&M expenditure for water and sanitation services are recovered through their water and sanitation services income, to address the bulk infrastructure backlogs and to ensure the adequate rehabilitation and maintenance of all existing water and sewerage infrastructure within the various towns.

- The large commercial and industrial consumers could lower their current water demand by means of improved practices or re-use of wastewater. Stellenbosch Municipality should note that revenue could potentially decrease as a result of reuse practices.

- Stellenbosch Municipality will continue to monitor the volume and nutrient loading of all industrial effluent discharged by industrial consumers into the sewer system. A formula for the calculation of the extraordinary treatment cost to industrial consumers for the industrial effluent they discharged into Stellenbosch Municipality's sewer system is in place and form part of the existing tariff structure. The performance of the WWTWs in general can be severely compromised by certain industrial effluent discharges. It is therefore also important for Stellenbosch Municipality to recalculate their treatment costs annually, in order to ensure that there is no under or over recovery of costs from industrial consumers. The charges for wastewater discharged by industrial consumers can also be linked to their water usage in the future.

  Stellenbosch Municipality needs to continue to regularly sample the quality of industrial effluent discharged into the sewer system and all industrial consumers need to be charged according to the quality of the effluent discharged into the Municipality's sewer system.

- The current water tariff codes adequately differentiate between the different type of consumers and their water usage. The Municipality can investigate the possibility to uniquely describe the "Municipal Tariff" water usage with a distinction between the different user types, for example parks, office usage, fire-fighting, etc.

7.4 FREE BASIC SERVICES

Stellenbosch Municipality will keep on using part of their equitable share for the funding of the free basic services to the indigent households. Stellenbosch Municipality only provides free services to the indigent registered households and this service is subsidized from the equitable share allocation.

Stellenbosch Municipality's tariffs support the viability and sustainability of water supply services to the poor through cross-subsidies (where feasible) and discourage the wasteful or inefficient use of water. Free basic water and sanitation services are linked to Stellenbosch Municipality's Indigent Policy and all indigent households receive free basic water and sanitation services. Poor consumers, who are not registered as indigent and who are residing in formal housing, receive no free basic water services.

It is important for Stellenbosch Municipality to enforce their indigent qualification criteria rigorously in order to ensure that those who do not qualify are removed from the allocation list. The Municipality needs to determine whether the current Indigent Policy is not too generous and creates a situation where too many citizens in Stellenbosch Municipality's Management Area are making no monetary contribution toward the cost of delivering services to the community.

Stellenbosch Municipality can investigate the financial viability of changing the fixed sanitation tariff structure to a stepped tariff based on water consumption in the future. This will need to include a free sanitation bracket, similar to free water, for the indigent households. This will also further deter wasteful water use.

7.5 METERING, BILLING AND INCOME

It is important for Stellenbosch Municipality to continue with the reading of all their bulk water meters. The bulk meters and meter chambers also need to be properly maintained and the meters need to be protected from vandalism.

Consumer friendly billing: Stellenbosch Municipality provides consumers with accounts that are clear and easy to understand. A graphical presentation will make the account even more consumers friendly.

Stellenbosch Municipality's Credit Control and Debt Collection By-law provides for credit control procedures which are fair and equitable, provide for warnings and adequate notice, provide for consumer representations, allow alternative payment arrangements, and set out a fair procedure that will be applied in the event of non-payment. Where a consumer continues to fail to pay for services provided after the application of such procedures and a fair warning, Stellenbosch Municipality Credit Control and Debt Collection By-law allows for actions that will limit its financial loss and promote good payment habits.

Stellenbosch Municipality is committed to actively implement their Credit Control and Debt Collection By-law in order to reduce the percentage of non-payment by their consumers even further.

The Engineering Department needs to work with the Financial Department in order to ensure that all water used is metered and billed, which include the free basic water, unbilled metered consumption, unbilled unmetered consumption and also the potable water used for irrigation purposes on the parks. The occupied stands, as included in Tables 5.1.1.4.1 and 5.1.1.5.1 under Topic 5 of the Administration, Information and Comprehensive Overview Report, need to be provided with water meters and the consumers need to be billed according to their monthly water usage.

8. WATER SERVICES INSTITUTIONAL ARRANGEMENTS AND CUSTOMER SERVICES

The primary pieces of legislation for WSAs are as follows:

- The Constitution of the Republic South Africa Act 108 of 1996
- The Water Services Act 108 of 1997
- The Local Government: Municipal Structures Act 117 of 1998
- The Local Government: Municipal Systems Act 32 of 2000 (the Systems Act)
- The Local Government : Municipal Finance Management Act 56 of 2003 (MFMA)

In addition to the key pieces of local government legislation, the following legislation also impact on the role of the WSA:

- The National Water Act 36 of 1998
- The Division of Revenue Act (DORA) (published annually)
- The National Health Act 61 of 2003
- The Disaster Management Act 57 of 2002

8.1 MUNICIPAL STRATEGIC SELF-ASSESSMENT (MuSSA)

8.1.1 Water and Sanitation Services Planning

Sections 12 and 13 of the Water Services Act (Act No 108 of 1997) place a duty on WSAs to prepare and maintain a WSDP, as part of the process of preparing an IDP. The DWS has developed a new eWSDP website to assist WSAs with the WSDP process and to provide a framework for the capturing of the data. The WSDP of Stellenbosch Municipality needs to be updated regularly.

The Municipality will also continue to report annually and in a public way on progress in implementing the plan (WSDP Performance- and Water Services Audit Report), as part of Stellenbosch Municipality's Annual Report, as required in terms of Section 18 of the Water Services Act, 1997 (Act No.108 of 1997), as well as the "Regulations relating to compulsory national standards and measures to conserve water", as issued in terms of Sections 9(1) and 73(1)(j) of the Water Services Act.

The Water Safety Plans for the various WTWs and water distribution systems and the W_2RAPs for the WWTWs and sewer drainage networks need to be updated regularly. Both the existing Water Safety Plans and W_2RAPs need to be updated. WTW and WWTW Process Audits also need to be compiled regularly.

The 2025 Water and Sewer Master Plans of Stellenbosch Municipality summarise the projects (Master Plan Items) necessary in order to cope with the increased future demands and developments within the Stellenbosch Municipality's systems. The Water and Sewer Master Plans need to be updated regularly (At least once every three to five years).

8.1.2 Management Skill Level (Technical)

The required Director Infrastructure Services and the Senior Manager: Water and Waste Water Services positions are filled and Performance Agreements are signed with the Director and various Managers annually. Stellenbosch Municipality is committed to fill any future vacant positions on the approved organogram as soon as possible.

Stellenbosch Municipality is committed to work towards the following compliance, with regard to the Management Skill Levels of the Municipality.

- Approved Technical Management Organisational Organogram which meets the Municipality's water and sanitation business requirements and that key posts are filled (Director Infrastructure Services, Senior Manager: Water and Waste Water Services, etc.).
- Sufficient Technical Management and Technical Support staff.
- Technical management and technical support staff have the correct skills / qualifications and experience as per Job Description requirements.
- Managers and technical support staff regularly attend appropriate water and sanitation services skills development / training to support professionalisation.
- Key technical managers (Section 56 and other Senior Management) have signed and monitored Performance Agreements.

The Revised Compulsory National Water and Sanitation Standards, as published in Government Gazette No.52814 of 6 June 2025, include the following competency requirements for the Head of a WSA and Heads for water and sanitation planning, water and sanitation infrastructure provision and operations and maintenance of water services.

- A person appointed to Head up the WSA function, the Water Services Provision function, Operation and Maintenance function or the Water Services Planning Unit in a Water Services Institution must-
  - Have the necessary competencies; and
  - Comply with the minimum requirements for education qualifications and work experience as set out in the table below:

Qualification, years' experience and Statutory registration requirements for all	
Engineering degree (B Eng / BSc Eng / B-Tech)	
For Category A Municipalities:	15 years post qualification experience in Water and Sanitation Services with registration as a professional engineer / technologist required.
For Category B Municipalities:	10 years post qualification experience in Water and Sanitation Services with registration as a professional engineer / technologist required.
For Category C Municipalities:	10 years post qualification experience in Water and Sanitation Services with registration as a professional engineer / technologist required.

- Should a staff member who was appointed before these Standards came into effect have the necessary qualifications, but not have the necessary competencies or registrations, the Water Services Institution must place the staff member on a programme to acquire the competency requirements as prescribed, if successful completion of such programme will yield achievement of the minimum requirements set within a reasonable time of five years of publication of these Standards.
- Where the staff member does not have the minimum qualifications, the Water Services Institution must, based on a competency assessment, determine an alternative placement for the affected staff member to enable the recruitment of staff members with the necessary competencies within two years of publication of these Standards.

8.1.3 Staff Skill Level (Technical)

A Work Place Skills Plan is in place, which lists the training to be provided during the new financial year. The training of Stellenbosch Municipality's personnel involved in the management of water and sanitation services are the most important factors that determine the ability of Stellenbosch Municipality to deliver safe and reliable water and to treat the effluent at the WWTWs to an acceptable standard. Training of all staff involved in water supply and sanitation services on matters related to treatment processes and quality monitoring and control is essential because their actions (or failure to act) will have a major impact on the well-being of the communities and the environment.

Stellenbosch Municipality can also start to actively focus on in-house training, which requires the identification of trainers (from senior operators / officers / professional ranks) for the development and facilitation of courses which relate to specific organizational knowledge and systems requirements. Stellenbosch Municipality's internal reports such as the Water Safety Plan, W_2RAPs, Operation and Maintenance Manuals and this WSDP have the necessary information on which the in-house courses can be based. This will assist Stellenbosch Municipality's Human Resource Department in general and the skills development facilitator in particular to develop and implement effective workplace skills plans relevant to Human Capacity Development requirements.

WTWs: It is important for Stellenbosch Municipality to classify all WTWs and Process Controllers along the lines of the new Regulation 3630 requirements by establishing a programme for certification of works, operators, technicians and managers. The process will include reviewing the skills needed and aligning resources to these needs as well as reviewing total staff numbers necessary to meet all the objectives in the National Water Act.

It is important for Stellenbosch Municipality to establish a mentoring role for all their operators and ensuring an adequately trained and classified workforce with dedicated training programmes for supervisors and operators. Budgets need to be established to address the shortfall of skilled staff, rethink methods to retain qualified personnel and plan for succession and clear career paths for experienced staff. With such a program a source of specific resources of skilled operators, technicians and managers will be established.

Process Controller registration renewal is conditional on meeting specified training requirements. Stellenbosch Municipality must ensure that every Process Controller employed must complete the required hours of training every year, over the five years between registration renewals.

The following training is required per Process Controller / Supervisor per year.

Table 8.1.3.1: Annual Process Controller and Supervisor training requirements

Class of Process Controller	Unit Standard Credits	Training
Learner	30	Continued Education
Class I	30	
Class II	30	
Class III	30	
Class IV	30	
Class V	10*	Continued Education / Refresher Training
Class VI	10*	

Note: * Professional Credits: From Class V, Process Controllers must register for Professional Process Controller Registration

Process Controller Registration Certificate renewal is also conditional on having at least 6 months operating or related experience within the past five years. The current number of Process Controllers at each of the WTWs and the required number of Process Controllers are included in Table 8.1.3.2 of Topic 8 of the Administration, Information and Comprehensive Overview Report. **The table also indicates whether the current Supervisors and Process Controllers at the WTWs comply with the required number and Class of Supervisors and Process Controllers according to the classification of the plants.**

The Occupational Health and Safety Act contain provisions directing employers to maintain a safe workplace and to minimize the exposure of employees and the public to workplace hazards. It is therefore important for Stellenbosch Municipality to compile a Legal Compliance Audit of their WTWs, which will provide the management Stellenbosch Municipality with the necessary information to establish whether the Municipality is in compliance with the legislation or not. **It is further recommended that Stellenbosch Municipality arrange for chlorine audits to be done at all their disinfection facilities, in order to identify any potential shortcomings.**

WWTWs: It is important for Stellenbosch Municipality to classify all WWTWs and Process Controllers along the lines of the new Regulation 3630 requirements by establishing a programme for certification of works, operators, technicians and managers. The process will include reviewing the skills needed and aligning resources to these needs as well as reviewing total staff numbers necessary to meet all the objectives in the National Water Act.

Stellenbosch Municipality is also committed to manage and operate their sewage pump stations effectively to prevent any possible spillages. It is important for Stellenbosch Municipality to upgrade their WWTWs when necessary, in order to reduce the risk of source contamination. The WWTWs will be managed and operated to comply with the permitted standards.

It is important for Stellenbosch Municipality to establish a mentoring role for all their operators in order to ensure an adequately trained and classified workforce with dedicated training programmes for supervisors and operators. Budgets need to be established to address the shortfall of skilled staff, rethink methods to retain qualified personnel and plan for succession and clear career paths for experienced staff. With such a program a source of specific resources of skilled operators, technicians and managers will be established.

The current number of Process Controllers at each of the WWTWs and the required number of Process Controllers are included in Table 8.1.3.4 of Topic 8 of the Administration, Information and Comprehensive Overview Report. **The table also indicates whether the current Supervisors and Process Controllers at the WWTWs comply with the required number and Class of Supervisors and Process Controllers according to the classification of the plants.**

The Occupational Health and Safety Act contain provisions directing employers to maintain a safe workplace and to minimize the exposure of employees and the public to workplace hazards. It is therefore important for Stellenbosch Municipality to compile a Legal Compliance Audit of their WWTWs, which will provide the management of Stellenbosch Municipality with the necessary information to establish whether the Municipality is in compliance with the legislation or not.

8.1.4 Technical Staff Capacity (Numbers)

All critical water vacant positions as indicated on the approved Organogram needs to be filled as soon as possible. Stellenbosch Municipality needs to review the skills needed at each of the WTWs and WWTWs according to the classification of the plants and the number of shifts at each of the plants and need to align resources to these needs as well as reviewing total staff numbers necessary to meet all the objectives in the National Water Act.

Aligning the career paths to the occupational categories will assist the personnel to understand levels within across teams. Simplification of job titles to conform to respective occupational categories will assist in developing compatible and comparable career paths within the different Departments. Occupational categories will provide differentiation between levels. This approach will allow for more specific job designations in organograms with explicit career path connotations.

8.1.5 Water Resource Management (WRM)

See Topic 6 for the future demand of the water resource management of the municipality.

8.1.6 Water Conservation and Water Demand Management (WC/WDM)

See Topic 5 for the functionality requirements for WC/WDM of the municipality

8.1.7 Drinking Water Safety and Regulatory Compliance

Drinking Water Quality Monitoring Programme: Operational monitoring of process indicators shall comply with the minimum requirement specified in SANS 241:2015 for characterising raw water quality, on-going levels of operational efficiency in a water treatment system and acceptable final water quality to the point of delivery, as summarised in Table 8.1.7.1 below.

Table 8.1.7.1: Minimum monitoring frequency for process risk indicators (SANS241-2:2015: Table 1)

Determinand	Raw Water	Final Water	Distribution System
Conductivity or total dissolved solids	Daily	Daily	Not applicable
pH value	Daily	Once per shift [a]	Fortnightly
Turbidity	Daily	Once per shift [a]	Fortnightly
Disinfectant residuals	Not applicable	Once per shift [a]	Fortnightly
E.Coli (or faecal coliforms) [b]	Not applicable	Weekly	Fortnightly but dependent on population served [d]
Heterotrophic plate count [c]	Not applicable	Weekly	Fortnightly
Treatment chemicals [d]	Not applicable	Monthly	Not applicable

a: A shift is defined as an eight-hour work period.

b: If non-compliant with the numerical limits specified in SANS 241-1, implement corrective action and immediate follow-up sampling at an increased sampling frequency.

c: If non-compliant with the numerical limits specified in SANS 241-1, implement corrective action and follow-up sampling.

d: Includes all risk determinands that are added or formed as a result of the use of treatment chemicals (for example aluminium, iron and chlorine). If non-compliant with the numerical limits specified in SANS 241-1 in the final water, the distribution system monitoring frequencies of Table 3 in SANS241-2:2015 apply.

Table 8.1.7.2 of the Administration, Information and Comprehensive Overview Module indicates the proposed additional samples to be taken by Stellenbosch Municipality.

These requirements may be relaxed to a monthly frequency for groundwater supply systems (due to the reduced variability of groundwater quality), provided that no health-related determinands are detected at levels exceeding the numerical limits in SANS 241-1 during the risk assessment.

The minimum microbiological monitoring frequency (for E.Coli or faecal coliforms) within the distribution system shall comply with the requirements set out in Table 8.1.7.2 (from SANS 241:2015), provided that the water services institution or water services intermediary (or both) is able to provide appropriate guarantee that the water complies with the numerical limits specified in SANS 241-1.

Table 8.1.7.2: Minimum sample numbers for E.Coli (or faecal coliforms) in schemes (SANS 241-2:2015: Table 2)	
Population Served	**Total number of samples per month [a] - Minimum**
< 5 000	2
5 000 – 100 000	1 per 5 000 head of population + 1 additional sample [b]
100 000 – 500 000	1 per 10 000 head of population + 11 additional samples [b]
> 500 000	1 per 20 000 head of population + 36 additional samples [b]
a: During a rainy season, sampling should be carried out more frequently to ensure that all spatial and temporal risks are identified.	
b: See WHO, Guidelines for drinking-water quality.	

The table below indicates the compliance of the monthly E.Coli monitoring frequency in the water distribution systems of Stellenbosch Municipality, in terms of the minimum requirements of SANS:241-2: 2015 (Table 2). The period assessed was for samples taken from July 2023 to June 2024.

Table 8.1.7.3: Stellenbosch Municipality's compliance of the monthly E.Coli monitoring frequency in the water distribution systems in terms of the minimum requirements of SANS 241-2:2015 (Table 2).			
Distribution System	**Population served**	**Required number of monthly samples (SANS 241-2:2015: Table 2)**	**Number of monthly E.Coli samples taken by Municipality during 2023/2024 (According to Sampling Programme)**
Stellenbosch	121 363	24.3	48
Franschhoek	28 044	5.6	14
Dwars River	16 395	3.3	6
Klapmuts	15 500	3.1	2

It can be noted from the above table that the number of monthly E.Coli samples taken according to the Sampling Programme for the 2023/2024 financial year was more than the required number of samples for all the water distribution systems, except for Klapmuts, where one additional sample per month is required. The current compliances were calculated against the Sampling Programme, but the Municipality needs to measure their future compliance against the actual number of samples taken in each financial year for each of the systems.

The purpose of a Water Quality Compliance Risk Assessment is to obtain an overview of the ability of Water Services Institutions to meet the numerical limits specified in SANS 241-1 on a sustained basis. Pending the nature of any hazards / risks identified, adequate monitoring of the identified hazards / risks needs to be maintained while the Water Services Institutions also puts in place the necessary corrective and verification measures. This is not a once-off process since the nature of risks could very as social, economic and environmental activities are subject to constant change.

It is therefore required under the Blue Drop Certification Programme that a Water Quality Compliance Risk Assessment is done on an annual basis; requiring that Monitoring Programmes would require amendment as informed by the Water Safety Planning Process.

The Water Quality Compliance Risk Assessment plan should therefore include at least one full SANS 241 analysis per year and if any changes in the environment or process or delivery (or all) occur, at least monthly drinking water quality monitoring from source, through treatment and distribution, to the end user. The outcome of the risk assessment and the objectives of the monitoring programmes should further influence the design and implementation of the monitoring programmes.

Risk defined monitoring programmes require additional monitoring of all determinands identified in the risk assessment that might result in non-compliance with the numerical limits specified in SANS241-1. To verify that ongoing optimized operations of water treatment and distribution systems are sustained, determinands exceeding the numerical limits specified in SANS241-1 shall be monitored in the following manner:

- Raw water non-compliance – risk defined monitoring on raw and final waters;
- Final water non-compliance – risk defined monitoring on raw, final and critical distribution system sampling points; and
- Distribution water non-compliance – risk defined monitoring on the critical distribution system sampling points at the minimum frequencies indicated in Table 8.1.7.4 below.

Table 8.1.7.4: Frequency of analysis for determinands identified during the risk assessment exceeding the numerical limits in SANS 241-1 (SANS 241-2:2015: Table 3)

Risk	Frequency		
	Raw water	Final water	Critical distribution system points
Acute health bacteriological risk determinands	Table 8.1.7.1	Table 8.1.7.1	Table 8.1.7.2
Protozoan parasite risk determinands.	Not applicable	Monthly	Not applicable
Acute health chemical risk determinands	Weekly	Weekly	Monthly
Chronic health risk determinands	Monthly	Monthly	Monthly
Aesthetic risk determinands	Monthly	Monthly	Quarterly
Operational risk determinands [a]	Weekly	Weekly	Monthly
a: Aluminium should be monitored on the final water in accordance with Table 8.1.7.1 and monthly on the distribution system			

The monitoring frequencies given in Table 8.1.7.4 above also apply to determinands that deteriorate between the points of delivery (input points to contracted bulk customers and the distribution delivery points to customers) to the extent that the determinands exceed the numerical limits specified in SANS 241-1.

Monitoring for all determinands included in the risk informed monitoring programme shall continue until such time that the water services institution or water services intermediary (or both) can substantiate that the identified determinand no longer constitutes an unacceptable risk.

The Drinking Water Quality Compliance Risk Assessment may be interpreted as follows:

- If the determinand exceeds the numerical limit specified in SANS241-1 in both the raw and final water, it implies that the existing treatment system or operation thereof is not removing the determinand.
- If the determinand that exceeds the numerical limit in the raw water is removed to the extent that it complies with SANS 241-1 in the final water, it implies that the installed infrastructure is adequate to deal with the problem.
- If both raw and final water comply with the numerical limits specified in SANS241-1, risks are deemed within acceptable limits.

- Drinking water treatment chemicals can contribute to the risks present in treated waters. Aluminium, iron, disinfectant residuals and ammonia are examples of determinands that can be impacted by operational processes. The treatment process shall be optimized and these determinands shall be included in the prescribed monitoring programme if determinands exceed the limits specified in SANS241-1. Determinands, such as trihalomethanes, that may form between the input points to contracted bulk customers and the distribution delivery points to the extent that they exceed the numerical limits given in SANS241-1, shall be included as part of the risk defined monitoring programme.

- If enteric viruses are detected in source waters or if there is any evidence that source waters are affected by human faecal pollution then evidence of the efficacy of treatment barriers should be obtained. Demonstrations of the effective operation of these barriers within the water treatment system includes the maintenance of data records of determinands for final water as given in Table 8.1.7.1.

- Although the monitoring for viruses in the final water is not compulsory, such analysis currently provide the only direct indication of the overall efficacy of a treatment plant to remove viruses and should be included wherever possible.

The water quality compliance sample results for the 2023/2024 financial year are included in Annexure E for each of the water distribution systems. The overall percentage of compliance of the water quality samples taken over the period July to June for the last three financial years is summarised in the table below per distribution system.

Table 8.1.7.5: Percentage compliance of the water quality samples for the last three financial years per performance indicator

Performance Indicator	Performance Indicator categorised as unacceptable Yes / No (Table 4 of SANS 241-2:2015)			% Sample Compliance according to SANS 241-2015 Limits		
	2021/2022	2022/2023	2023/2024	2021/2022	2022/2023	2023/2024
Stellenbosch System (Above 100 000 persons)						
Acute Health Microbiological	No (Excellent)	No (Good)	Yes (Unacceptable)	99.28%	97.24%	96.21%
Acute Health Chemical	No (Excellent)	No (Good)	No (Excellent)	100.00%	97.72%	100.00%
Chronic Health	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	99.78%	100.00%
Aesthetic	No (Excellent)	No (Excellent)	No (Excellent)	97.99%	97.61%	96.12%
Operational Efficiency	Yes (Unacceptable)	Yes (Unacceptable)	Yes (Unacceptable)	92.23%	91.69%	86.51%
Blackheath System (Above 100 000 persons)						
Acute Health Microbiological	Yes (Unacceptable)	Yes (Unacceptable)	No (Excellent)	92.31%	96.00%	100.00%
Acute Health Chemical	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Chronic Health	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Aesthetic	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	99.40%
Operational Efficiency	No (Good)	Yes (Unacceptable)	No (Good)	93.10%	88.10%	93.18%
Faure System (Below 100 000 persons)						
Acute Health Microbiological	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	98.57%	100.00%
Acute Health Chemical	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Chronic Health	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Aesthetic	No (Excellent)	No (Excellent)	No (Excellent)	99.77%	98.61%	99.77%
Operational Efficiency	No (Excellent)	No (Excellent)	No (Excellent)	97.93%	96.89%	96.14%
Franschhoek System (Below 100 000 persons)						
Acute Health Microbiological	No (Excellent)	No (Excellent)	No (Good)	97.67%	100.00%	96.80%
Acute Health Chemical	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Chronic Health	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Aesthetic	No (Excellent)	No (Excellent)	No (Excellent)	97.84%	100.00%	97.78%
Operational Efficiency	No (Excellent)	No (Excellent)	No (Excellent)	93.44%	95.35%	94.09%

Table 8.1.7.5: Percentage compliance of the water quality samples for the last three financial years per performance indicator

Performance Indicator	Performance Indicator categorised as unacceptable Yes / No (Table 4 of SANS 241-2:2015)			% Sample Compliance according to SANS 241-2015 Limits		
	2021/2022	2022/2023	2023/2024	2021/2022	2022/2023	2023/2024
Wemmershoek System (Below 100 000 persons)						
Acute Health Microbiological	No (Excellent)	Yes (Unacceptable)	Yes (Unacceptable)	97.07%	90.63%	93.13%

Operational Efficiency	No (Good)	Yes (Unacceptable)	No (Good)	90.35%	85.04%	92.40%

The table below gives an overview of the four categories under which the risks posed by micro-organism, physical or aesthetic property or chemical substance of potable water is normally classified.

Table 8.1.7.6: Four categories under which the risks posed by micro-organism, physical or aesthetic property or chemical substance of potable water is normally classified

Category	Risk
Acute Health	Determinand that poses an immediate unacceptable health risk if present at concentration values exceeding the numerical limits specified in this part of SANS 241.
Aesthetic	Determinand that taints water with respect to taste, odour and colour and that does not pose an unacceptable health risk if present at concentration values exceeding the numerical limits specified in SANS 241.
Chronic Health	Determinand that poses an unacceptable health risk if ingested over an extended period if present at concentration values exceeding the numerical limits specified in SANS 241.
Operational	Determinand that is essential for assessing the efficient operation of treatment systems and risks from infrastructure

It is also important to note that all operational manuals of treatment unit processes such as chemical dosing, coagulation sedimentation, filtration, disinfection etc. should contain operational limits, monitoring programmes, verification procedures and pre-determined corrective actions. Corrective actions identified for each control measure need to be adhered to as soon as critical limits have been exceeded. The corrective actions are an important component of the management aspects of the Water Safety Plan and should be effective in restoring performance to acceptable levels when critical limits are exceeded.

Corrective actions must be supported by a contingency plan. This plan is a detailed management response to failures and will identify individual responsibilities and a time constraint for remedy. The corrective actions identified by the Water Safety Plan Team should also include long term actions designed to prevent non-compliance and reduce the need for contingency plans to be re-actioned.

Monitoring data provide important feedback on how the water supply system is working and should be frequently assessed. Regularly assessed monitoring records are a necessary element of the Water Safety Plan as they can be reviewed, through external and internal audit, to identify whether the controls are adequate and also to demonstrate adherence of the water system to the water quality targets. The strategies and procedures for monitoring the various aspects of the water supply system should be documented.

Monitoring plans should include the following:

- Parameters to be monitored.
- Sampling location and frequency
- Sampling needs and equipment
- Schedules for sampling

- Methods for quality assurance and validation of sampling results.
- Responsibilities and necessary qualifications of staff.
- Requirements for documentation and management of records including how monitoring of results will be recorded and stored.
- Requirements for reporting and communication of results.

The parameters selected by Stellenbosch Municipality for operational monitoring should

- reflect the effectiveness of each control measure;
- provide a timely indication of performance;
- be readily measure; and
- provide opportunity for an appropriate response.

Drinking Water Sample Analysis (Credibility): Stellenbosch Municipality should continue and improve the level and frequency of regular sampling (Operational and Compliance Monitoring) and reporting on water quality.

The knowledge, skills, motivation and commitment of staff involved in the management of drinking water quality are the most important factors that determine the ability of Stellenbosch Municipality to deliver safe and reliable water. Training of all staff involved in water supply services on matters related to treatment processes and quality monitoring and control is essential because their actions (or failure to act) will have a major impact on the well-being of the communities.

It is important for the Process Controllers to check all sampling equipment every time before use, in order to ensure that test results are reliable and not “contaminated” by faulty instruments. All field instruments used for checking physical properties must also be calibrated in accordance with the manufacturer’s manual before any water sample is collected. Buffer solutions are required for correct calibration to ensure accuracy of measurements.

Blue Drop Status: Stellenbosch Municipality is committed to work with the DWS and the other role-players in order to further improve Stellenbosch Municipality’s 2023 Blue Drop Score for the various water distribution systems. Stellenbosch Municipality will regularly compile detail WTW Process Audits for all the WTWs and the Municipality and will ensure that the Operation and Maintenance Manuals for the WTWs are used by the Process Controllers. The existing outdated Water Safety Plan for the WTWs and water distribution systems will be updated. Stellenbosch Municipality is committed to implement the Preventative Actions and Control Measures identified as part of the Water Safety Plan, once it is updated, in order to address the potential risks identified through the Water Safety Plan process.

8.1.8 Basic Sanitation

See Topic 2 for the future requirements for the basic sanitation facilities of the municipality.

8.1.9 Waste Water / Environmental Safety and Regulatory Compliance

Waste Water Quality Monitoring Programme: Regular sampling (Operational and Compliance Monitoring) and reporting on quality of treated sewage effluent discharged from the WWTWs is part of Stellenbosch Municipality’s monitoring procedures, as indicated in Table 8.1.9.2 of the Administration, Information and Comprehensive Overview Module.

The following requirements from the DWS should also be adhered to, as part of the ongoing monitoring of the various WWTWs:

- What is the current condition of the Works?
- Does the Works comply with the license agreement?
- Is there monitoring and recording of the final effluent quality?
- Is there monitoring and recording of incoming sewage to the Works?
- Are monitoring records available on site?
- Is there compliance to the monitoring frequency?
- Are the monitoring results and records submitted to DWS?
- Does an external consultant visit the Works on a regular basis (Process Audit)?
- How is the sludge managed and disposed?
- Is the plant fenced off with proper entrance gate?
- Is the O&M manual up to date according to the operation of the Works?

Accurate and full records of all aspects of the operation and maintenance of the WWTWs should always be kept. The Process Controllers on site should keep a pocket book in which they should note any significant event on the works, such as a peculiar colour of the water, failure of equipment or strange smells and they must record the date and time at which these events occur. All incidents also need to be recorded in an Incident Register.

The Process Controllers at the WWTW will continue to implement the control measures included in Table 6.3.2.1 under Topic 6 in order to ensure that the various unit processes at the WWTWs performs optimally. If these predetermined Alert Levels are exceeded at any of the control points where samples are taken for operational purposes, specific actions are taken to bring the operational parameters back to within the target ranges.

Waste Water Sample Analysis (Credibility): Stellenbosch Municipality should continue and further improve the level and frequency of regular sampling (Operational and Compliance Monitoring) and reporting on wastewater quality.

The knowledge, skills, motivation and commitment of staff involved in the management of waste water quality are the most important factors that determine the ability of Stellenbosch Municipality to comply with the quality of treated effluent discharge from the WWTWs. Training of all staff involved in sanitation services on matters related to treatment processes and quality monitoring and control is essential because their actions (or failure to act) will have a major impact on the environment.

It is important for the Laboratory to check all sampling equipment every time before use, in order to ensure that test results are reliable and not “contaminated” by faulty instruments. All field instruments used for checking physical properties must also be calibrated in accordance with the manufacturer’s manual before any effluent sample is collected. Buffer solutions are required for correct calibration to ensure accuracy of measurements.

Green Drop Status: Stellenbosch Municipality is committed to work with the DWS and the other role-players in order to further improve on their 2022 Green Drop Scores for the various WWTWs and to get the Municipality ready for the next round of assessments. Stellenbosch Municipality will update their W_2RAPs as necessary in order to reduce the current CRRs of the various WWTWs even further.

The following processes will also further assist the Municipality in the process of reducing the CRRs for their WWTWs.

- Forward planning and upgrading / refurbishment of treatment plants to ensure adequate capacity for the flows received;
- Operate and maintain the WWTWs within design- and equipment specifications;
- Have trained, qualified and registered staff in place;
- Get mentoring / coaching contracts in place where there is a great demand for adequately skilled process controllers and supervision;
- Monitoring of flow to - and from the plants;
- Sampling and monitoring of effluent quality;
- Appropriate authorisation in accordance with the National Water Act (36 of 1998); and / or
- Where plant is overloaded, introduce innovative methods to ensure enhancement of effluent quality.

8.1.10 Infrastructure Asset Management (IAM)

See Topic 3, Section 3.1.1. for the future demand requirements for Asset Management.

8.1.11 Operation and Maintenance of Assets

See Topic 4 for the future demand requirements for the operation and maintenance of the water and sewerage infrastructure assets of the municipality.

8.1.12 Financial Management

See Topic 7 for the future financial management functionality requirements.

8.1.13 Revenue Collection

See Topic 7 for the future revenue collection functionality requirements.

8.1.14 Financial Asset Management

See Topic 3, Section 3.1.1. for the future demand requirements for the financial asset management of the municipality.

8.1.15 Information Management (IT)

Stellenbosch Municipality's ICT's mission is to deliver cost-effective ICT infrastructure and ICT business solution services that will provide the most enabling environment to assist the Stellenbosch Municipality in delivering sustainable services that are operationally efficient and cost-effective to all its stakeholders and communities, which includes (5th Generation IDP 2022 – 2027, 2nd Review May 2024):

- Cost-effective solutions;
- Quality Service Delivery;
- Ongoing performance monitoring; and
- Aligned to business processes.

The vision of the ICT Department is to become a trusted and reliable information and communication technology partner to enable Stellenbosch Municipality's management and end-users to build a better town using cutting-edge ICT technology solutions.

The Department: ICT will continue to strive to achieve its goals of closing the gap between the municipality and the community by improving services and engagement. These goals include:

- Understanding the needs of the community;
- Always deliver a consistent and quality service; and
- Manage the relationships with vendors and stakeholders providing a service to the public.

Stellenbosch Municipality's Implementation Plan for their ICT Strategy includes the following key activities / projects / programmes and initiatives:

- Implementation of a Desktop Refreshment Policy and Hardware Standardisation over three years.
- Completion of a Business Case for System Integration (Collaborator, Ignite, SAMRAS, IMQS, GIS, etc.)
- Drafting of a Smart City Framework.
- Development of a 3-year Public Wi-Fi Strategy.
- Upgrading of the ICT Infrastructure Network (Cameras and high sites and Hardware replacement).
- Implementation of the Corporate GIS modules plus aerial photography (Customer Care, Asset Management, etc.)
- Development of a 3-year Fibre Strategy for the Stellenbosch Municipality.
- Implement a 3-year Cabling Maintenance Solution for all ICT needs.
- Upgrading of the audio and visual equipment in the Council Chambers, Stellenbosch.
- Implementation of a Digital Employee Management Solution.

8.1.16 Organisational Performance Monitoring

Stellenbosch Municipality has a comprehensive Performance Management System in place. The performance indicators as included in the SDBIP are regularly reviewed in order to promote a culture of performance management among its political structures, political office bearers and councillors and in its administration and administer its affairs in an economical, effective, efficient and accountable manner.

The future water and sanitation KPIs and targets, as included in the 5th Generation IDP 2022 – 2027, 2nd Review May 2024, are summarised in the table below.

Table 8.1.16.1: Future water and sanitation KPIs (SDBIP)

Ref.	Indicator	Unit of Measurement	2024/2025	2025/2026	2026/2027
KPI022	Wastewater quality measured i.t.o. the Department of Water and Sanitation's License Conditions for physical and micro parameters	Percentage of wastewater quality Compliance as per the analysis certificate, measured quarterly.	70%	70%	70%
KPI027	Installation of new standpipes	Number of new standpipes installed by 30 June.	50	50	50
KPI028	Provision of waterborne toilet facilities in informal settlements as identified by the Department: Integrated Human Settlements.	Number of waterborne toilet facilities provided in Informal settlements as identified by the Department: Integrated Human Settlements by 30 June	25/annum	30/annum	50/annum

Table 8.1.16.1: Future water and sanitation KPIs (SDBIP)					
Ref.	**Indicator**	**Unit of Measurement**	**2024/2025**	**2025/2026**	**2026/2027**
KPI030	Water quality measured quarterly i.t.o. the SANS 241 physical and micro parameters.	Percentage of water quality level as per the analysis certificate, measured quarterly.	90%	90%	90%
KPI031	Limit unaccounted water to less than 25%.	Percentage of average unaccounted water, measured by 30 June.	<25%	<25%	<25%
KPI032	Registered indigent formal households with access to free basic water (NKPI Proxy - MSA, Reg. S10(a), (b)).	Percentage of registered indigent formal households with access to free basic water, measured quarterly.	100%	100%	100%
KPI035	Registered indigent formal households with access to free basic sanitation (NKPI Proxy - MSA, Reg. S10(a), (b)).	Percentage of registered indigent formal households with access to free basic sanitation, measured quarterly.	100%	100%	100%
KPI036	Formal households with access to water (NKPI Proxy - MSA, Reg. S10(a))	Number of formal households with access to water, measured quarterly	27 000	27 000	27 000
KPI039	Formal households with access to sanitation (NKPI Proxy - MSA, Reg. S10(a)).	Number of formal households with access to sanitation, measured quarterly.	27 000	27 000	27 000
KPI055	Submission of the revised Wastewater Master Plan to the Municipal Manager.	Number of revised Wastewater Master Plans submitted to the Municipal Manager by 30 June.	1	1	1

8.1.17 Water and Sanitation Service Quality

Access to safe drinking water is essential to health and is human right. Safe drinking water that complies with the SANS:241 Drinking Water specifications do not pose a significant risk to health over a lifetime of consumption, including different sensitivities that may occur between life stages. Stellenbosch Municipality is therefore committed to ensure that their water quality always complies with SANS241:2015 limits.

Both the Water Safety Plan and the W_2RAPs of Stellenbosch Municipality needs to updated and must include Improvement / Upgrade Plans for the residual medium and high risks. The purpose of the Improvement / Upgrade Plans is to address the existing significant risks where the existing controls are not effective or absent. Detail WTW and WWTW Process Audits also need to be compiled for the treatment plants.

Barriers implemented by Stellenbosch Municipality against contamination and deteriorating water quality include the following:

- Participate in catchment management and water source protection initiatives.
- Protection at points of abstraction such as river intakes and dams (Abstraction Management).
- Correct operation and maintenance of the WTWs (Coagulation, flocculation, sedimentation and filtration).
- Protection and maintenance of the distribution systems. This includes ensuring an adequate disinfectant residual at all times, rapid response to pipe bursts and other leaks, regular cleaning of reservoirs, keeping all delivery points tidy and clean, etc.

Three other important barriers implemented by Stellenbosch Municipality against poor quality drinking water that are a prerequisite to those listed above are as follows:

- A well-informed Council and municipal managers that understand the extreme importance of and are committed to providing adequate resources for continuous professional operation and maintenance of the water supply system.

- Competent managers and supervisors in the technical department who are responsible for water supply services lead by example and are passionate about monitoring and safeguarding drinking water quality.

- Well-informed community members and other consumers of water supply services that know how to protect the water from becoming contaminated once it has been delivered, that have respect for water as a precious resource and that adhere to safe hygiene and sanitation practices.

8.1.18 Customer Care (CRM)

Stellenbosch Municipality is committed to maintain the existing high level of customer service in their urban areas and to record all the necessary information for the WSDP on an annual basis. The present Customer Services and Complaints Management System allows for the recording and management of all water and sanitation related complaints. The Municipality is committed to ensure that all water and sanitation related complaints are recorded and that the complaints are addressed within the required time period.

9.1 EXISTING NEEDS PERSPECTIVE

The table below gives an overview of the Existing Needs Perspective for Stellenbosch Municipality.

Table 9.1.1: Existing Needs Perspective for Stellenbosch Municipality

Section	Interpret Situation Assessment	Intervention Required?	%	Solution Description	%	Is there an existing project / activity addressing this problem?	%	Project Reference	Does this current listed project / activity address the problem totally?	%	Project / Activity approved by Council as part of WSDP database?	%	Approved by Council in project / activity database and part of 5 yr IDP cycle projects?	%	Project / Activity listed in 3 yr MTEF Cycle?	%	Total Points	Current Demand Overall Scoring %
Topic 1: Settlement Demographics and Public Amenities																		
Settlements summary	Various Spatial Planning and Housing challenges	No	100	Continue with the implementation of the spatial and non-spatial proposals for the various areas as included in the SDF of 2023 and Stellenbosch Municipality's Housing Pipeline and ensure that all new developments are aligned with these proposals.	100	Yes	100	Various	Partially	50	Yes	100	Yes	100	Yes	100	650	78.6
	Insufficient infrastructure capacity to accommodate new developments. Bulk water and sewerage infrastructure need to be aligned with the Water and Sewer Master Plans and housing projects can only continue once the required bulk water and sewerage infrastructure are in place.	No	100	All resources, especially surface water resources, need to be re-evaluated, especially where demand is close to the safe one in twenty year yields. Establish assurance of supply levels of all water sources. Ensure that the provision of bulk water and sewerage infrastructure are aligned with the Housing Pipeline and that housing projects only continue once the required bulk water and sewerage infrastructure are in place, as indicated in the Water and Sewer Master Plans and this WSDP.	100	Yes	100	Various	Partially	50	Yes	100	Yes	100	Yes	100	650	78.6
Summary by settlement group	Adequate	No	100	-	100	-	100	-	-	100	-	100	-	100	-	100	700	100
Assessment score by settlement type	Adequate	No	100	-	100	-	100	-	-	100	-	100	-	100	-	100	700	100
Amenities summary	Adequate	No	100	-	100	-	100	-	-	100	-	100	-	100	-	100	700	100
Topic 2: Service Levels Profile																		
Direct Backlog: Water	There are still 2 623 households in the informal areas without interim water supply services.	Yes	100	Install communal water services for the informal areas in order to ensure that the ratio of number of households per facility complies with the target of 25 or less households per tap.	100	Yes	100	SB2526003	Partially	50	Yes	100	Yes	100	Yes	100	650	78.6
	There are still an estimated 212 households on the farms in the rural areas without basic water supply services.	Yes	100	Assist private landowners as far as possible with the provision of basic water services to all the households in the Municipality's Management Area with existing water service levels below basic water supply services.	100	No	0	SB2526001	Yes	100	Yes	100	No	0	No	0	400	57.1
Direct Backlog: Sanitation	There are still 6 320 households in the informal areas without interim sanitation services.	Yes	100	Install communal sanitation services for the informal areas in order to ensure that the ratio of number of households per facility complies with the target of 5 of less households per toilet facility.	100	Yes	100	SB2526004	Partially	50	Yes	100	Yes	100	Yes	100	650	78.6
	There are still an estimated 1 270 households on the farms in the rural areas without basic sanitation services.	Yes	100	Assist private landowners as far as possible with the provision of basic sanitation services to all the households in the Municipality's Management Area with existing sanitation service levels below basic sanitation services	100	No	0	SB2526002	Yes	100	Yes	100	No	0	No	0	400	57.1

Topic 3: Water Services Asset Management																		
General information	Asset Management Plan is not in place.	Yes	100	Develop an Asset Management Plan.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	No	0	No	0	450	64.3
	Groundwater Monitoring Programme not yet fully implemented.	No	100	Implement Groundwater Management Plan for all production boreholes (Water levels, abstraction volumes and water quality).	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Partially	50	Partially	50	550	78.6
Operation	Shortcomings were identified in the Water Safety Plans and WTW Process Audits.	No	100	Implement recommendations from the Water Safety Plans and WTW Process Audits. Implement proposed interim solutions for improving the operation of the WTW, as well as proposed refurbishment and upgrade and extension work. Ensure adequate budget is allocated for the future upgrading and refurbishment work.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
	Shortcomings were identified in the W_2RAPs and WWTW Process Audits.	No	100	Implement recommendations from the W_2RAPs and WWTW Process Audits. Implement proposed interim solutions for improving the operation of the WWTW, as well as proposed refurbishment and upgrade and extension work. Ensure adequate budget is allocated for the future upgrading and refurbishment work.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
Functionality observation	Inadequate capacity of existing water and sewerage infrastructure to meet future requirements	No	100	Provide additional reservoir storage capacity for the towns with inadequate storage capacity. Upgrade existing water pump stations and provide new water pump stations for the identified areas. Upgrade existing WTWs and WWTWs as recommended. Upgrade existing sewer pump stations and provide new sewer pump stations for the identified areas.	100	Partially	50	Various	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
Asset assessment spectrum	Insufficient funds to support maintenance of existing infrastructure. Deteriorated water and sewerage infrastructure. Inadequate O&M allocation for the replacement of old water and sewerage infrastructure and the operation and maintenance of the existing infrastructure.	No	100	Increase O&M budget for repairs and maintenance of infrastructure. A budget of approximately 2% of the total asset value per annum should be allocated towards the replacement of the existing water and sewerage infrastructure (Best Practice). In the case of operations and maintenance of the system, a budget of approximately 1% to 2% of the value of the system is typically required to ensure that the system remains in good condition (Best Practice).	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
Water and Sanitation schemes	Inadequate capacity of existing water and sewerage infrastructure to meet future requirements	No	100	Upgrade sections of the water reticulation network and sewer drainage network as proposed in the Water and Sewer Master Plans.	100	Partially	50	Various	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
Topic 4: Water Services Operation and Maintenance																		
O&M Plan Is there an O&M Plan?	O&M tasks and O&M Schedules for the various water and sewerage infrastructure components not all in place	No	100	Operation and Maintenance tasks for the various water and sewerage infrastructure components, as indicated under Sections 4.1.1 to 4.1.10 of the "Future Demand and Functionality Requirements" WSDP Master Plan should be implemented. Ensure the required O&M schedules are in place and signed off.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Partially	50	Partially	50	550	78.6
Resources	Inadequate O&M allocation for the replacement of old water and sewerage infrastructure and the operation and maintenance of the existing infrastructure.	No	100	A budget of approximately 2% of the total asset value per annum should be allocated towards the replacement of existing water and sewerage infrastructure (Best Practice). In the case of operations and maintenance of the system, a budget of approximately 1% to 2% of the value of the system is typically required to ensure that the system remains in good condition (Best Practice).	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Yes	100	650	92.9
	Insufficient process controllers for the	No	100	Stellenbosch Municipality needs to ensure that the	100	Partially	50	Part of O&M	Yes	100	Yes	100	Partially	50	Partially	50	550	78.6

Table 9.1.1: Existing Needs Perspective for Stellenbosch Municipality

Section	Interpret Situation Assessment	Intervention Required?	%	Solution Description	%	Is there an existing project / activity addressing this problem?	%	Project Reference	Does this current listed project / activity address the problem totally?	%	Project / Activity approved by Council as part of WSDP database?	%	Approved by Council in project / activity database and part of 5 yr IDP cycle projects?	%	Project / Activity listed in 3 yr MTEF Cycle?	%	Total Points	Current Demand Overall Scoring %
	WTWs and WWTWs			number of process controllers at each of the WTWs and WWTWs and the class of process controller complies with the required number of process controllers and class of process controller per plant (New Regulation 3630).				Budget										
Information	All incidents at the WTWs and WWTWs to be recorded and Incident Management Protocols to be followed.	No	100	All incidents at the WTWs and WWTWs and on the water reticulation networks and sewer drainage networks need to be recorded and Incident Management Protocols, as included in the Water Safety Plans and W_2RAPs, need to be followed after an incident.	100	Yes	100	Part of O&M Budget	Yes	100	Yes	100	Partially	50	Partially	50	600	85.7
	Required O&M Manuals are not in place for all infrastructure.	No	100	Ensure that the required O&M Manuals are in place for all the water and sewerage infrastructure.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Partially	50	Partially	50	550	78.6
Activity control and management	O&M tasks and O&M Schedules for the various water and sewerage infrastructure components not all in place.	No	100	Groundwater: Implement recommended daily, weekly, monthly and six monthly O&M activities for the boreholes.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
		No	100	Surface water infrastructure: Implement preventative maintenance procedures.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
		No	100	Bulk and water reticulation networks and fittings: Compile daily, weekly, monthly and annual maintenance checklists for the maintenance activities for the water reticulation networks and fittings.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
		No	100	WTWs: Evaluate the existing O&M schedules for the WTWs against the recommended O&M tasks and ensure all required activities are adequately monitored and recorded.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
		No	100	Water PSs: Compile weekly and monthly maintenance checklists for the recommended activities for all the water PSs and all PSs need to be inspected on at least a weekly basis.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
		No	100	Reservoirs: Compile maintenance checklists for the recommended reservoir maintenance activities and document all inspections.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
		No	100	Remote monitoring and Control Systems: Ensure adequate maintenance is carried out on the SCADA systems and compile maintenance checklists for the recommended activities.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
		No	100	Sewer PSs: Compile weekly and quarterly maintenance checklists for the recommended activities for all the sewer PSs and all centrifugal pump stations need to be inspected on at least a weekly basis.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
		No	100	Bulk and sewer drainage networks: Annual, monthly and weekly schedules for maintenance should be drawn up for the bulk and sewerage networks. Regular cleaning of sewer lines and all blockages and their precise locations should be recorded.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
		No	100	WWTWs: Evaluate the existing O&M schedules for the WWTWs against the recommended O&M tasks and ensure all required activities are adequately monitored and recorded.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
Topic 5: Conservation and Demand Management: Water Resource Management																		
Reducing unaccounted for water and water inefficiencies	2023/2024 NRW 31.3% and Water Losses 28.1%	No	100	Implement the proposed WC/WDM Strategy and the 25 WC/WDM items. Ensure adequate budget is allocated under the Capital and Operational budgets towards the implementation of the WC/WDM initiatives.	100	Partially	50	SB2526039 SB2526040 SB2526041	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
	Identify all large water users (AADD > 20 kl/d).	No	100	Set up meeting with the Large Water Users to discuss water consumption status, potential water saving volumes and to cultivate a water saving awareness within each large water user.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
Leak and meter repair programmes	Leak Repair and Assistance Programmes are required for the low cost housing developments.	No	100	Implement a Leak Repair and Assistance Programme that investigates and repairs leaks at all domestic households in low cost housing developments and poor areas with consumption above 15 kl/month. An exercise could also be initiated to check for visual leakage at public buildings, using more than 60 kl/month.	100	No	0	SB2526039 SB2526040 SB2526041	Yes	100	Yes	100	Yes	100	No	0	500	71.4
	Old water reticulation networks result in regular pipe bursts and add to the NRW and water losses.	No	100	Continue with the implementation of the pipeline replacement programme. The location of pipe failures should in the future be recorded preferably with accurate GPS coordinates. This improves the integrity of the output of the pipe failure model. If a longer and	100	Partially	50	SB2526038	Yes	100	Yes	100	Yes	100	Yes	100	650	92.9

Table 9.1.1: Existing Needs Perspective for Stellenbosch Municipality

Section	Interpret Situation Assessment	Intervention Required?	%	Solution Description	%	Is there an existing project / activity addressing this problem?	%	Project Reference	Does this current listed project / activity address the problem totally?	%	Project / Activity approved by Council as part of WSDP database?	%	Approved by Council in project / activity database and part of 5 yr IDP cycle projects?	%	Project / Activity listed in 3 yr MTEF Cycle?	%	Total Points	Current Demand Overall Scoring %
				more comprehensive pipe failure record could be established, the integrity of the output could be further enhanced. Pipes with the highest PRP values should be considered to be replaced first.														
	Use the February 2023 Swift analysis to inspect the potential unmetered connections.	No	100	Install water meters at all the unmetered erven and inspect metered erven with zero consumption.	100	Partially	50	SB2526042	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
Consumer / End use demand management: Public information and Education programmes	WDM measures not yet implemented at all schools	Yes	100	At least once a year, a schools education programme on water conservation should be undertaken. The Municipality should assist the school(s) with the monitoring (water audit) of their water consumption. Stellenbosch Municipality can also focus on the implementation of an extensive schools WDM programme, which can include annual competitions between schools (Say with a prize for the lowest consumption, the lowest per capita consumption and for the best WDM Strategy poster design, etc.). A schools WDM programme should receive a high priority.	100	Partially	50	SB2526039 SB2526040 SB2526041	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
	Informative billing and consumer education material is needed.	Yes	100	Continue to focus on the installation of water saving devices (specific water efficient toilets) and raising awareness regarding conservation projects and the installation of these products in order to reduce water demand. The use and installation of these fittings should be included as a condition for the approval of building plans as well as provided for in the Water Services By-law.	100	Partially	50	SB2526039 SB2526040 SB2526041	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
Conjunctive use of surface and groundwater	Adequate	No	100	-	100	-	100	-	-	100	-	100	-	100	-	100	700	100
Working for Water	Adequate	No	100	-	100	-	100	-	-	100	-	100	-	100	-	100	700	100
Topic 5: Conservation and Demand Management: Water Balance																		
IWA Water balances	Shortcomings were identified with regard to the current bulk water metering for the various schemes and the flows at the WWTWs.	No	100	Ensure that the volume of water supplied from all water resources are metered (each individual source separately), the raw water and final water at the WTWs and the volume of water supplied to the various zones (at Reservoirs). The inflow at the WWTWs, the volume of treated effluent re-used and the volume of treated effluent returned to the water resource system also need to be metered at all the WWTWs.	100	Partially	50	SB2526039 SB2526040 SB2526041	Yes	100	Yes	100	Yes	100	Partially	50	600	85.7
Topic 6: Water Resources																		
Current water sources	Confirm existing lawful use and registration volumes for all systems.	No	100	Ensure the required authorisations (licences) are in place for all the water resources, as well as the required registrations.	100	Yes	100	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Yes	100	700	100.0
Additional sources available	Augmentation of the existing water resources in order to increase assurance of supply.	Yes	100	Continue with investigations of the augmentation of the existing bulk water sources for the various towns.	100	Partially	50	Various	Partially	50	Yes	100	Yes	100	Yes	100	600	85.7
Monitoring	Continue with the implementation of the Groundwater Monitoring Programme.	No	100	Ensure that the key groundwater management functions are implemented. The monitoring data must be analysed by a geohydrologist on an annual basis in order to assess the effects of abstraction and recharge on the boreholes and aquifer. Groundwater monitoring must continue on at least a monthly basis. Monthly monitoring of water levels, water chemistry and abstraction must be conducted by the Municipal staff. Stellenbosch Municipality needs to ensure that all electronic data (i.e. dataloggers) are downloaded once quarterly by a geohydrologist. Monitoring data must be annually reviewed by a geohydrologist.	100	Partially	50	Part of O&M Budget	Yes	100	Yes	100	Partially	50	Partially	50	550	78.6
Water quality	Adequate	No	100	-	100	-	100	-	-	100	-	100	-	100	-	100	700	100.0
Operation	Continue with the monitoring of all industrial consumers to be monitored w.r.t. the quality of effluent discharge into the Municipality's sewer system.	No	100	The current approach adopted by Stellenbosch Municipality in which the various parameters at all industrial consumers are monitored should be continued, as well as volumetric monitoring at the larger users. Adaptation of the current procedures must be undertaken in accordance with any changes to the wastewater discharge criteria set by DWS. It will also be necessary to consider limits above which volumetric monitoring will be necessary at new industries and existing smaller industries, where expansion is likely to take place.	100	Yes	100	Part of O&M Budget	Yes	100	Yes	100	Yes	100	Yes	100	700	100.0

9.2 WATER MASTER PLAN PERSPECTIVE

The table below gives an overview of the Water Master Plan Perspective for Stellenbosch Municipality.

Table 9.2.1: Water Master Plan Perspective

Question	Yes / No	Score
Is there a Water Master Plan that addresses future requirements with regard to the following?		
Existing needs that will take more than 5 years to resolve?	Yes	80%
Resource Development Plan for a 5, 10 and 15 year scenario?	Yes	80%
Infrastructure Development Plan for a 5, 10 and 15 year scenario?	Yes	80%
Functionality Needs Prediction for a 5, 10 and 15 year scenario?	Yes	60%
Did Council approve any projects that should have started this current year that address the following?		
Existing needs that will take more than 5 years to resolve?	Yes	80%
Resource Development Plan for a 5, 10 and 15 year scenario?	Yes	80%
Infrastructure Development Plan for a 5, 10 and 15 year scenario?	Yes	80%
Functionality Needs Prediction for a 5, 10 and 15 year scenario?	Yes	60%
Are these future projects included in the next 5 year IDP programme for the following?		
Existing needs that will take more than 5 years to resolve?	Yes	80%
Resource Development Plan for a 5, 10 and 15 year scenario?	Yes	80%
Infrastructure Development Plan for a 5, 10 and 15 year scenario?	Yes	80%
Functionality Needs Prediction for a 5, 10 and 15 year scenario?	Yes	60%
Taking into consideration the current financial and institutional capacity of the WSA, score the probability scenario of the timeous implementation of these projects in relation to:		
Existing needs that will take more than 5 years to resolve?	Yes	80%
Resource Development Plan for a 5, 10 and 15 year scenario?	Yes	80%
Infrastructure Development Plan for a 5, 10 and 15 year scenario?	Yes	80%
Functionality Needs Prediction for a 5, 10 and 15 year scenario?	Yes	60%
Average		**75%**

Stellenbosch Municipality's approved 2025/2026 Capital Budget list the following major water and sewerage infrastructure projects (Value above R5 million over the three years), which are planned for the short term (Next three years).

- Implementation of water and sewer pipeline replacement programmes.
- Bulk water supply pipeline and reservoir for Stellenbosch.
- Bulk water supply pipeline and pump stations for Franschhoek.
- Bulk water supply pipeline Cloetesville / Idas Valley
- New reservoir and pipeline Vlottenburg.
- Upgrade and replacement of water meters.
- Implementation of Water Conservation and Water Demand Management measures.
- Water Telemetry upgrade.
- Upgrade of Idas Valley WTW.
- Upgrade Wemmershoek and Klapmuts WWTWs.
- Extension of Stellenbosch WWTW.
- Refurbish plant and equipment: Raithby WWTW.
- Construction of new Dwars River sewer pump station.
- Sewer pump station and telemetry upgrade.
- Specialised vehicles for Sanitation.

The NWRS 2 list the following steps to raise the water profile in development planning:

- Water must be placed at the center of integrated planning and decision-making, with a specific aim to respond to and support the achievement of national development and sector goals.
- Current budgets need to adequately provide for water, which might mean they have to be doubled to cater for the present needs.
- Current financial values need to appreciate water as a scarce resource and should thus reflect the real value of water. This requires a new value system across all sectors and stakeholders.
- Water efficiency and curbing water losses should be high on the agenda of each individual and institution in the country.
- Water management must be formally embedded in the sector businesses with associated accountability.

The DWS will insist in the future that all water infrastructure which they fund is value engineered against the life-cycle cost with a specific emphasis on energy costs. Evidence will be required that the technical design is appropriate for the nature of the resource and that operation and maintenance of the assets is reasonably within the capability of the responsible institution. New water resources infrastructure will also not be developed or authorized unless effective WC/WDM interventions have been put in place in the affected area.

The identification of projects necessary to ensure the provision of adequate levels of water and sanitation services is based primarily on the findings of the Water and Sewer Master Plans. Master Planning is typically based on a forward planning horizon of 20 years, but is usually updated every three to five years, taking into account improved water demand estimates and subsequent infrastructure developments which may have taken place. The recommended projects from the Stellenbosch Master Plans were incorporated into the WSDP.

The Master Plans represent the ideal infrastructure development required to meet projected future water requirements over the next few years, while realistic capital investment in infrastructure projects is determined by budget availability. As a result, prioritization of projects is necessary to identify what can be done within the available and projected budget constraints. The prioritization of projects is done through the IDP and annual budget planning process.

Recommended infrastructure projects for implementation in the future by Stellenbosch Municipality will be based on the following plans and processes:

- Water and Sewer Master Plans and Water and Waste Water Treatment Works Master Plans;
- Infrastructure replacement needs (Asset Register);
- Budget proposals; and
- Asset Management Plans.

The future master plan items for the water and sewerage infrastructure are included under Topics 3. The future water and sewerage capital infrastructure projects for Stellenbosch Municipality included in the WSDP-IDP Water Sector Input Report (Executive Summary of WSDP). The future master plan items for the water and sewer networks are included in the tables in Annexure A.

9.3 OVERALL TOPIC STRATEGIES

The table below gives an overview of the Strategies and Objectives for Stellenbosch Municipality

Table 9.3.1: Strategies, Objectives and Key Performance Indicators for Stellenbosch Municipality

Nr	Objective / Strategy	Key Performance Indicator	Baseline 2023/2024	Linked Project	FY2024/25	FY2025/26	FY2026/27	FY2027/28	FY2028/29
Topic 1: Settlement Demographics & Public Amenities									
	Implemented by other Department								
Topic 2: Service Levels									
KPI027	Installation of new standpipes	Number of new standpipes installed by 30 June.	-	Part of O&M Budget	50	50	50	Future targets still to be set	Future targets still to be set
KPI028	Provision of waterborne toilet facilities in informal settlements as identified by the Department: Integrated Human Settlements.	Number of waterborne toilet facilities provided in Informal settlements as identified by the Department: Integrated Human Settlements by 30 June	-	Part of O&M Budget	25 / annum	30 / annum	50 / annum	Future targets still to be set	Future targets still to be set
KPI032	Registered indigent formal households with access to free basic water (NKPI Proxy - MSA, Reg. S10(a), (b)).	Percentage of registered indigent formal households with access to free basic water, measured quarterly.	-	Part of O&M Budget	100%	100%	100%	Future targets still to be set	Future targets still to be set
KPI035	Registered indigent formal households with access to free basic sanitation (NKPI Proxy - MSA, Reg. S10(a), (b)).	Percentage of registered indigent formal households with access to free basic sanitation, measured quarterly.	-	Part of O&M Budget	100%	100%	100%	Future targets still to be set	Future targets still to be set
KPI036	Formal households with access to water (NKPI Proxy - MSA, Reg. S10(a))	Number of formal households with access to water, measured quarterly	-	Part of O&M Budget	27 000	27 000	27 000	Future targets still to be set	Future targets still to be set
KPI039	Formal households with access to sanitation (NKPI Proxy - MSA, Reg. S10(a)).	Number of formal households with access to sanitation, measured quarterly.	-	Part of O&M Budget	27 000	27 000	27 000	Future targets still to be set	Future targets still to be set
New	*Compile a Water and Sanitation Service Level Policy*	*Water and Sanitation Service Level Policy in place.*	-	*Part of O&M Budget*	-	-	*1*	-	-
New	*Ensure all households on the farms are provided with at least basic water services and complying with basic water service requirements as included in Gazette 52814 of 6 June 2025.*	*Support all applications received for basic water services on the farms (Subject to availability of financial resources and sustainability of type of service).*	-	*Part of O&M Budget*	-	-	*80% of applications received are supported (Subject to availability of funding and sustainability of type of service)*	*90% of applications received are supported (Subject to availability of funding and sustainability of type of service)*	*100% of applications received are supported (Subject to availability of funding and sustainability of type of service)*
New	*Ensure all households on the farms are provided with at least basic sanitation services and complying with basic sanitation service requirements as included in Gazette 52814 of 6 June 2025.*	*Support all applications received for basic sanitation services on the farms (Subject to availability of financial resources and sustainability of type of service).*	-	*Part of O&M Budget*	-	-	*80% of applications received are supported (Subject to availability of funding and sustainability of type of service)*	*90% of applications received are supported (Subject to availability of funding and sustainability of type of service)*	*100% of applications received are supported (Subject to availability of funding and sustainability of type of service)*
Topic 3: Water Services Asset Management									
D1838	Update of Infrastructure Asset Register.	Number of updates to the Infrastructure Asset Register submitted to the Portfolio Committee as a preventative maintenance tool by 31 March	Target: 1 Actual: 0	Part of O&M Budget	1	1	1	1	1
New	*Ensure adequate storage capacity*	*Ensure adequate storage capacity for all towns (At least 48hrs AADD)*	-	*Various Projects*	-	-	*All towns with storage capacity above 48 hrs AADD*	*All towns with storage capacity above 48 hrs AADD*	*All towns with storage capacity above 48 hrs AADD*
New	*Implement projects included in the Water Master Plan*	*Ensure adequate water pump station and water reticulation capacity.*	-	*Various Projects*	-	-	*Upgrade existing water pump stations and provide new pump stations as identified in the Water Master Plan. Upgrade water reticulation networks as proposed in the Water Master Plan.*	*Upgrade existing water pump stations and provide new pump stations as identified in the Water Master Plan. Upgrade water reticulation networks as proposed in the Water Master Plan.*	*Upgrade existing water pump stations and provide new pump stations as identified in the Water Master Plan. Upgrade water reticulation networks as proposed in the Water Master Plan.*
New	*Implement projects included in the Sewer Master Plan*	*Ensure adequate sewer pump station and sewer drainage network capacity.*	-	*Various Projects*	-	-	*Upgrade existing sewer pump stations and provide new pump stations as identified in the Sewer Master Plan. Upgrade sewer drainage networks as proposed in the Sewer Master Plan.*	*Upgrade existing sewer pump stations and provide new pump stations as identified in the Sewer Master Plan. Upgrade sewer drainage networks as proposed in the Sewer Master Plan.*	*Upgrade existing sewer pump stations and provide new pump stations as identified in the Sewer Master Plan. Upgrade sewer drainage networks as proposed in the Sewer Master Plan.*
Topic 4: Water Services Operation and Maintenance									
D2180	Waste water quality managed and measured i.t.o. the DWS's License conditions for physical and micro parameters	Percentage waste water quality compliance as per analysis certificate measured quarterly	Target: 70% Actual: 48.67%	Part of O&M Budget	70%	70%	70%	70%	70%

Table 9.3.1: Strategies, Objectives and Key Performance Indicators for Stellenbosch Municipality

Nr	Objective / Strategy	Key Performance Indicator	Baseline 2023/2024	Linked Project	FY2024/25	FY2025/26	FY2026/27	FY2027/28	FY2028/29
D2190 / KPI030	Water quality measured quarterly i.t.o. the SANS 241 physical and micro parameters	Percentage water quality level as per analysis certificate measured quarterly.	Target: 90% Actual: 95.25%	Part of O&M Budget	90%	90%	90%	90%	90%
New	*Implement recommendations from detail WTW Technical Process Audits.*	*% Of recommendations, as included in the WTW Process Audits, implemented.*	-	*Various Projects*	-	-	*50% of recommendations implemented*	*70% of recommendations implemented*	*90% of recommendations implemented*
New	*Implement recommendations from detail WWTW Technical Process Audits.*	*% Of recommendations, as included in the WWTW Process Audits, implemented.*	-	*Various Projects*	-	-	*50% of recommendations implemented*	*70% of recommendations implemented*	*90% of recommendations implemented*
New	*Implement recommendations as included in the Improvement / Upgrade Plan of the Water Safety Plan*	*% Of recommendations, as included in the Improvement / Upgrade Plan of the Water Safety Plan, implemented.*	-	*Various Projects*	-	-	*50% of recommendations implemented*	*70% of recommendations implemented*	*90% of recommendations implemented*
New	*Implement recommendations as included in the Improvement / Upgrade Plan of the W_2RAPs.*	*% Of recommendations, as included in the Improvement / Upgrade Plan of the W_2RAPs, implemented.*	-	*Various Projects*	-	-	*50% of recommendations implemented*	*70% of recommendations implemented*	*90% of recommendations implemented*
New	*Water Quality sampling programme complies with requirements.*	*Water Quality Sampling Programme complies with the minimum SANS241:2015 monitoring frequency for process indicators.*	-	*Part of O&M Budget*	-	-	*90%*	*95%*	*100%*
New	*Ensure adequate budget for the O&M of the existing water and sewerage infrastructure*	*Ensure a budget of at least 1.5% of the total value of the water and sewerage assets is allocated towards the annual O&M of the systems.*	-	*Part of O&M Budget*	-	-	*A budget of 1.5% or more of the value of the water and sewerage assets is allocated towards the O&M of the systems.*	*A budget of 1.5% or more of the value of the water and sewerage assets is allocated towards the O&M of the systems.*	*A budget of 1.5% or more of the value of the water and sewerage assets is allocated towards the O&M of the systems.*
New	*Ensure adequate budget for the replacement of old water and sewerage infrastructure*	*Ensure a budget of at least 2% of the total value of the water and sewerage assets is allocated towards the replacement of existing infrastructure per annum.*	-	*Various Projects*	-	-	*A budget of 2% or more of the value of the water and sewerage assets is allocated towards the replacement of existing infrastructure.*	*A budget of 2% or more of the value of the water and sewerage assets is allocated towards the replacement of existing infrastructure.*	*A budget of 2% or more of the value of the water and sewerage assets is allocated towards the replacement of existing infrastructure.*
New	*Reporting on water quality and wastewater quality compliance percentages*	*Annually report on the percentage of water quality and wastewater quality compliance.*	-	*Part of O&M Budget*	-	-	*At least annual publication of water quality and wastewater quality compliance percentages.*	*At least annual publication of water quality and wastewater quality compliance percentages.*	*At least annual publication of water quality and wastewater quality compliance percentages.*
Topic 5: Conservation and Demand Management (Topic 5.1: Water Resources)									
D2191 / KPI031	Limit unaccounted water to less than 25%	Percentage of average unaccounted water measured by 30 June	Target: 25% Actual: 7.83%	Part of O&M Budget	<25%	<25%	<25%	<25%	<25%
D1812	Implement Water Demand Management measures	Number of Water Demand Management Devices installed by 30 June	Target: 200 Actual: 427	Part of O&M Budget	-	Future targets still to be set	Future targets still to be set	Future targets still to be set	Future targets still to be set
D3329	Implementation of the pipe replacement programme	Number of meters of pipe replaced in the pipe replacement programme, measured per quarter	Target: 1 000 Actual: 2 734	Part of O&M Budget	-	Future targets still to be set	Future targets still to be set	Future targets still to be set	Future targets still to be set
D1815	Implementation of the indigent household water leak repair programme	Number of indigent household water leaks repaired by 30 June.	Target: 80% Actual: 80%	Part of O&M Budget	-	Future targets still to be set	Future targets still to be set	Future targets still to be set	Future targets still to be set
D1814	Repair burst pipes within 5 hours from receiving the complaint	Percentage of burst pipes repaired within 5 hours from receiving the complaint.	Target: 80% Actual: 200%	Part of O&M Budget	-	Future targets still to be set	Future targets still to be set	Future targets still to be set	Future targets still to be set
Topic 5: Conservation and Demand Management (Topic 5.2: Water Balance)									
New	*Detail IWA Water Balances for all the systems and monthly WTW flows for all the treatment plants.*	*Ensure all bulk water is metered at source, at WTW (incoming and outgoing) and at all bulk storage reservoirs and the meters are read and recorded on at least a monthly basis.*	-	*Part of O&M Budget*	-	-	*100% Compliance*	*100% Compliance*	*100% Compliance*
New	*Monthly WWTW flows for all the treatment plants.*	*Ensure all incoming flow and outgoing flow at WWTWs are metered, as well as final effluent re-used for irrigation purposes and that meters are read and recorded on at least a monthly basis.*	-	*Part of O&M Budget*	-	-	*80% Compliance*	*90% Compliance*	*100% Compliance*
Topic 6: Water Resources									
D1840	Submission of a revised Water Resources Master Plan to the Director: Infrastructure Services	Number of revised Water Resources Master Plans submitted to the Director: Infrastructure Services by 30 June	Target: 1 Actual: 0	Part of O&M Budget	-	Future targets still to be set	Future targets still to be set	Future targets still to be set	Future targets still to be set
D2175 / KPI055	Submission of the revised Wastewater Master Plan to the Municipal Manager	Number of revised Wastewater Master Plans submitted to the Municipal Manager by 30 June	Target: 1 Actual: 1	Part of O&M Budget	1	1	1	Future targets still to be set	Future targets still to be set
New	*Implementation of Groundwater Management Programme*	*Ensure groundwater management programme for boreholes are implemented and raw water quality is monitored at least annually.*	-	*Part of O&M Budget*	-	-	*Implement Groundwater Management Programme and monitor raw water quality at least annually.*	*Implement Groundwater Management Programme and monitor raw water quality at least annually.*	*Implement Groundwater Management Programme and monitor raw water quality at least annually.*
New	*All water sources are authorised.*	*% of Abstraction from sources registered and authorised by the DWS.*	-	*Part of O&M Budget*	-	-	*95% Compliance*	*100% Compliance*	*100% Compliance*

Table 9.3.1: Strategies, Objectives and Key Performance Indicators for Stellenbosch Municipality

Nr	Objective / Strategy	Key Performance Indicator	Baseline 2023/2024	Linked Project	FY2024/25	FY2025/26	FY2026/27	FY2027/28	FY2028/29
New	*Ensure adequate yield and allocations from water resources to meet the projected future water requirements.*	*Ensure yields and allocations are adequate to meet the projected five year water requirements for all systems.*	-	*Part of O&M Budget*	-	-	*100% Adequate supply to meet water requirements for all systems*	*100% Adequate supply to meet water requirements for all systems*	*100% Adequate supply to meet water requirements for all systems*
New	*Monitoring of industrial consumers.*	*% Monitoring of effluent discharged by industrial consumers (Quantity and Quality) and charged according to the quality of effluent discharged by them.*	-	*Part of O&M Budget*	-	-	*80% Of all Industrial Consumers monitored w.r.t. quality and quantity of effluent discharged by them*	*90% Of all Industrial Consumers monitored w.r.t. quality and quantity of effluent discharged by them*	*100% Of all Industrial Consumers monitored w.r.t. quality and quantity of effluent discharged by them*
Topic 7: Financial									
D1828	Spend the Department: Water and Wastewater Services approved Capital Budget	Percentage of approved Capital Budget of the Department: Water and Wastewater Services actually spent by 30 June	Target: 90% Actual: 97.06%	Part of O&M Budget	90%	90%	90%	90%	90%
D1799	Spend the Section: Wastewater Treatment approved Capital Budget	Percentage of approved Capital Budget of the Section: Wastewater Treatment actually spent by 30 Jun	Target: 90% Actual: 42.0%	Part of O&M Budget	90%	90%	90%	90%	90%
D1846	Spend the Section: Water Treatment approved Capital Budget	Percentage of approved Capital Budget of the Section: Water Treatment actually spent by 30 June	Target: 90% Actual: 60%	Part of O&M Budget	90%	90%	90%	90%	90%

Water Master Plan Stellenbosch Municipality

GLS Infrastructure planning

Figure SW 6.4g

Future distribution zones - Koelenhof & Muldersvlei

LEGEND

- Existing network pipes
- Existing bulk supply pipeline
- Existing Raw water pipes
- Existing CoCT bulk water pipeline
- Existing reservoirs / towers
- Existing pumping station
- Existing zone valve
- Existing non-return valve
- Existing pressure reducing valve
- Existing Water Treatment Plant (WTP)
- Existing flow control valve
- Master plan item
- Future network pipes
- Future reservoir
- Future pumping station
- Future PRV
- Future zone valve
- Future flow control valve
- Future WTP
- Future sump
- Future borehole
- Groundwater augmentation scheme
- New borehole
- Booster PS (Groundwater)
- Package plant (Groundwater)

Future Development Areas

- Affordable housing
- Affordable housing (HD)
- Affordable housing (MD)
- Agricultural
- Apartments (VHD)
- Business/Commercial
- Cemetery
- Densification (BCI)
- Densification (Res)
- Educational
- Flats
- Group housing 20 - 30
- Group housing 30 - 40
- Group housing 40 - 60
- Industrial
- Informal upgraded
- Mixed
- Other
- Public facilities
- Res 500
- Res 1000
- Res 1500
- Res 2000
- Res >2000
- Urban edge (2019)

COST ESTIMATES AND PHASING OF THE REQUIRED WORKS

Item No.	Description	Estimated cost * (R'yr 2024/25 value)	Time Related Phasing	Comments	Project no.
Stellenbosch Town					
Distribution System Items					
SSW1.3	246 m x 315 mm ! Pipe to install	1 011 000	2035	Required to improve network conveyance when future area 576 develops	PRJ-SSW-003
SSW1.4	242 m x 200 mm ! Pipe to install	522 000	2027	Required when future areas 577 to 579 develop	PRJ-SSW-002
SSW1.5	237 m x 160 mm ! Pipe to install	397 000	2027	Required when future areas 577 to 579 develop	PRJ-SSW-002
SSW1.6	153 m x 160 mm ! Pipe to install	297 000	2035	Required to improve network conveyance when area 574 develops	PRJ-SSW-003
SSW1.7	1007 m x 160 mm ! Pipe to install	1 698 000	2035	Required to improve network conveyance when area 574 develops	PRJ-SSW-003
SSW1.8	685 m x 200 mm ! Pipe to install	990 000	2040	Required when future area 579 develops	PRJ-SSW-002
SSW1.9a	192 m EGL 100 mm ! Pressure Reducing Valve to install	291 000	2030	Close PRV when new reservoir has been commissioned	PRJ-SSW-003
SSW1.9b	14 m x 200 mm ! Pipe to install	95 000	2030	Inter-connector	PRJ-SSW-003
SSW1.10	1 x 160 mm ! Valve to open		2030	Required to improve network conveyance	PRJ-SSW-003
SSW2.1	283 m x 200 mm ! Pipe to install	601 000	2055	Required when future area 566 & 567 develop (Outside urban edge, potential longer term item)	PRJ-SSW-005
SSW2.2	402 m x 160 mm ! Pipe to install	642 000	2055	Required when future area 567 develops (Outside urban edge, potential longer term item)	PRJ-SSW-005
SSW2.3	289 m x 160 mm ! Pipe to install	476 000	2055	Required when future area 566 develops (Outside urban edge, potential longer term item)	PRJ-SSW-005
SSW3.2a	106 m x 200 mm ! Pipe to install	4 184 000	2030	Required when future area 556 & 557 develop	PRJ-SSW-007
SSW3.2b	192 m EGL 100 mm ! Pressure Reducing Valve to install	291 000	2030	Required as interim connection until supply from Adam Tas corridor development is constructed	PRJ-SSW-007
SSW3.3	312 m x 200 mm ! Pipe to install	1 028 000	2030	Required when future areas 556 & 557 develop	PRJ-SSW-007
SSW3.4	1110 m x 200 mm ! Pipe to install	2 155 000	2030	Required when future area 558 develops	PRJ-SSW-007
SSW3.5	682 m x 200 mm ! Pipe to install	1 500 000	2035	Required to improve network redundancy	PRJ-SSW-006
SSW3.6	161 m EGL 100 mm ! Pressure Reducing Valve to install	291 000	2035	Required to reduce high pressure in Techno Park	PRJ-SSW-006
SSW4.1	443 m x 700 mm ! Pipe to install	9 189 000	2026	Required to improve network conveyance	PRJ-SSW-008
SSW4.2	956 m x 550 mm ! Pipe to install	14 082 000	2026	Required to improve network conveyance (item can be implemented earlier with item SPW B7)	PRJ-SSW-008
SSW4.3	10 m x 355 mm ! Pipe to install	383 000	2026	Inter-connection pipe	PRJ-SSW-008
SSW4.4	6 m x 250 mm ! Pipe to install	119 000	2026	Inter-connection pipe	PRJ-SSW-008
SSW4.5	173 m x 500 mm ! Pipe to install	2 256 000	2026	Required to improve network conveyance (item can be implemented earlier with item SPW B7)	PRJ-SSW-008
SSW4.6	503 m x 400 mm ! Pipe to install	6 164 000	2040	Required when future area 549 - 552, 555, 557 & 558 develop	PRJ-SSW-009
SSW4.7	1087 m x 160 mm ! Pipe to install	1 669 000	2040	Required when future areas 550 & 552 develop	PRJ-SSW-009
SSW4.8	196 m x 315 mm ! Pipe to install	804 000	2040	Required when future area 551, 555, 557 & 558 develop	PRJ-SSW-009
SSW4.9	838 m x 250 mm ! Pipe to install	2 307 000	2040	Required when future area 551, 555, 557 & 558 develop	PRJ-SSW-009
SSW4.10	501 m x 250 mm ! Pipe to install	1 349 000	2030	Required when future area 556 develops	PRJ-SSW-009
SSW4.11	768 m x 200 mm ! Pipe to install	1 512 000	2045	Required when future areas 555, 557 & 558 develop	PRJ-SSW-009
SSW4.12	812 m x 160 mm ! Pipe to install	1 250 000	2045	Required when future area 554 develops	PRJ-SSW-009
SSW4.14	1095 m x 200 mm ! Pipe to install	2 904 000	2030	Required to improve network conveyance to future area 551	PRJ-SSW-051
SSW4.15	191 m x 200 mm ! Pipe to install	316 000	2030	Required when future area 5115 and 5133 develop	PRJ-SSW-009
SSW4.17	195 m x 110 mm ! Pipe to install	236 000	2030	Required when future area 5115 develops	PRJ-SSW-009
SSW4.18	1194 m x 355 mm ! Pipe to install	5 909 000	2028	New supply pipe to supply Plankenburg from Papegaaiberg reservoir	PRJ-SSW-030
SSW4.19	528 m x 315 mm ! Pipe to install	2 214 000	2028	Network upgrade to improve network conveyance to area	PRJ-SSW-030
SSW4.20	110 m x 200 mm ! Pipe to install	299 000	2045	Network upgrade to improve network conveyance to area	PRJ-SSW-043
SSW4.21	119 m x 160 mm ! Pipe to install	241 000	2045	Network upgrade to improve network conveyance to area	PRJ-SSW-043
SSW4.22a	4 m x 160 mm ! Pipe to install	53 000	2028	Inter-connection pipe	PRJ-SSW-030
SSW4.22b	1 x 150 mm ! Valve to close		2028	Required to supply Plankenburg from Papegaaiberg reservoir	PRJ-SSW-030
SSW4.22c	1 x 100 mm ! Valve to close		2028	Required to supply Plankenburg from Papegaaiberg reservoir	PRJ-SSW-030
SSW4.23a	1 x 160 mm ! Valve to close		2028	Required to supply Plankenburg from Papegaaiberg reservoir	PRJ-SSW-030
SSW4.23b	1 x 110 mm ! Valve to close		2028	Required to supply Plankenburg from Papegaaiberg reservoir	PRJ-SSW-030
SSW4.24	1 x 160 mm ! Valve to close		2028	Required to supply Plankenburg from Papegaaiberg reservoir	PRJ-SSW-030
SSW5.1	252 m x 250 mm ! Pipe to install	720 000	2040	Required to improve network conveyance	PRJ-SSW-042
SSW5.2	294 m x 200 mm ! Pipe to install	803 000	2040	Required to improve network conveyance	PRJ-SSW-042
SSW5.3	342 m x 160 mm ! Pipe to install	554 000	2030	Required when future area 5131 develops	PRJ-SSW-009
SSW6.1	25 m x 200 mm ! Pipe to install	119 000	2026	Inter-connection pipe to improve network conveyance in Central zone	PRJ-SSW-035
SSW6.2	21 m x 200 mm ! Pipe to install	110 000	2026	Inter-connection pipe to improve network conveyance in Central zone	PRJ-SSW-035
SSW6.3	577 m x 200 mm ! Pipe to install	1 199 000	2026	Network upgrade to improve network conveyance to area (Replace existing 90)	PRJ-SSW-035
SSW6.4	226 m x 160 mm ! Pipe to install	392 000	2026	Network upgrade to improve network conveyance (Replace existing 160)	PRJ-SSW-035
SSW6.6	260 m x 160 mm ! Pipe to install	473 000	2026	Replace existing 75! pipe to improve fire flow capacity	PRJ-SSW-035
SSW6.8a	238 m x 450 mm ! Pipe to install	1 950 000	2026	Required to augment supply from Idas Valley to Papegaaiberg	PRJ-SSW-029
SSW6.8b	1566 m x 400 mm ! Pipe to install	11 296 000	2026	Required to improve network conveyance	PRJ-SSW-034
SSW6.11	445 m x 315 mm ! Pipe to install	1 892 000	2026	Required to improve network conveyance	PRJ-SSW-034
SSW6.12	174 m x 200 mm ! Pipe to install	432 000	2030	Required to improve network conveyance	PRJ-SSW-034
SSW7.5	368 m x 110 mm ! Pipe to install	435 000	2030	Required when future area 536 develops	PRJ-SSW-012
SSW8.1	431 m x 160 mm ! Pipe to install	686 000	2030	Required when higher lying erven of future area 534 develops	PRJ-SSW-014
SSW8.2	452 m x 110 mm ! Pipe to install	572 000	2030	Required when higher lying erven of future area 534 develops	PRJ-SSW-014
SSW11.1	371 m x 250 mm ! Pipe to install	1 024 000	2055	Required when future areas 5101 and 5102 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW11.2	615 m x 250 mm ! Pipe to install	1 629 000	2055	Required when future areas 5101 and 5102 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW12.1	181 m EGL 150 mm ! Pressure Reducing Valve to install	376 000	2055	Required when future areas 5101 and 5102 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW12.2	80 m x 200 mm ! Pipe to install	145 000	2055	Required when future areas 5101 and 5102 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW12.3	380 m x 160 mm ! Pipe to install	609 000	2055	Required when future areas 5101 and 5102 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW12.4	100 m x 110 mm ! Pipe to install	142 000	2055	Required when future areas 5101 and 5102 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW13.1	126 m x 315 mm ! Pipe to install	652 000	2025	Supply pipe to network	PRJ-SSW-038
SSW13.6	56 m x 200 mm ! Pipe to install	1 547 000	2055	Required when future areas 5101 and 5102 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW13.7	1 x 200 mm ! Valve to insert and close	194 000	2055	Required when future areas 5101 and 5102 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW13.9a	269 m x 110 mm ! Pipe to install	354 000	2030	Required when future area 55 develops	PRJ-SSW-019
SSW13.9b	85 m x 110 mm ! Pipe to install	134 000	2030	Required when future area 55 develops	PRJ-SSW-019
SSW13.10	178 m x 110 mm ! Pipe to install	280 000	2030	Required when future area 51 & 52 develop	PRJ-SSW-019
SSW13.11	131 m x 160 mm ! Pipe to install	260 000	2030	Required when future area 51 & 52 develop	PRJ-SSW-019
SSW13.15	164 m x 110 mm ! Pipe to install	252 000	2030	Required when future area 5120 develops (Replace existing 75!)	PRJ-SSW-019
SSW13.16	122 m x 160 mm ! Pipe to install	246 000	2030	Required to improve network conveyance (Replace existing 110l)	PRJ-SSW-017
SSW14.1	39 m x 160 mm ! Pipe to install	111 500	2025	Required to improve network conveyance when new 7.5 ML reservoir is commissioned	PRJ-SSW-038
SSW15.3	260 m x 200 mm ! Pipe to install	614 000	2028	Network upgrade to improve network conveyance to area (Replace existing 150! AC pipe)	PRJ-SSW-021
SSW15.4	16 m x 160 mm ! Pipe to install	72 000	2028	Network upgrade to improve network conveyance to area (Replace existing 50! pipe)	PRJ-SSW-021
SSW15.5	406 m x 200 mm ! Pipe to install	919 000	2028	Network upgrade to improve network conveyance to area (Replace existing 160! pipe)	PRJ-SSW-021
SSW15.6	55 m x 160 mm ! Pipe to install	136 000	2028	Network upgrade to improve network conveyance to area (Replace existing 110! pipe)	PRJ-SSW-021
SSW15.7	228 m x 160 mm ! Pipe to install	389 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 75l and 100! AC pipe)	PRJ-SSW-022
SSW15.8	1 x 110 mm ! Valve to open		2028	Required to improve network conveyance	PRJ-SSW-021
SSW15.10	297 m x 200 mm ! Pipe to install	628 000	2030	Required when Kayamandi A develops	PRJ-SSW-022
SSW15.11	1 x 150 mm ! Valve to open		2028	Required to improve network conveyance	PRJ-SSW-021
SSW15.12	123 m x 160 mm ! Pipe to install	248 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 75 & 110l)	PRJ-SSW-022
SSW15.13	133 m x 200 mm ! Pipe to install	558 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 50l and 75l)	PRJ-SSW-022
SSW15.14	76 m x 200 mm ! Pipe to install	229 000	2030	Inter-connection pipe required to accommodate Kayamandi town centre redevelopment	PRJ-SSW-022
SSW16.1	293 m x 160 mm ! Pipe to install	526 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 75l)	PRJ-SSW-022
SSW16.2	312 m x 160 mm ! Pipe to install	558 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 50l and 75l)	PRJ-SSW-022
SSW16.3	403 m x 160 mm ! Pipe to install	707 000	2040	Required when future area 514 develops	PRJ-SSW-022
SSW18.1	203 m x 400 mm ! Pipe to install	1 436 000	2030	Required when future areas 515, 517, 580 & 582 develop	PRJ-SSW-023
SSW18.2	206 m x 400 mm ! Pipe to install	1 453 000	2030	Required when future areas 515, 517, 580 & 582 develop	PRJ-SSW-023
SSW18.3	451 m x 200 mm ! Pipe to install	1 669 000	2030	Required when future area 517, 581 & 582 develop	PRJ-SSW-023
SSW18.4	113 m x 355 mm ! Pipe to install	818 000	2030	Required when future area 515 and 599 develop	PRJ-SSW-023
SSW18.5	537 m x 250 mm ! Pipe to install	2 152 000	2030	Required when future area 515 and 599 develop	PRJ-SSW-023
SSW18.6	998 m x 200 mm ! Pipe to install	1 921 000	2030	Required when future area 515, 517, 580 & 582 develop	PRJ-SSW-023
SSW18.7	331 m x 160 mm ! Pipe to install	538 000	2030	Required when future area 515, 517, 580 & 582 develop	PRJ-SSW-023
SSW18.9	185 m EGL 100 mm ! Pressure Reducing Valve to install	291 000	2045	Required when future area 599.1 develops	PRJ-SSW-023
SSW19.1a	206 m EGL 200 mm ! Pressure Reducing Valve to install	489 000	2030	Require to reduce high static pressures	PRJ-SSW-023
SSW19.1b	206 m EGL 150 mm ! Pressure Reducing Valve to install	376 000	2030	Require to reduce high static pressures	PRJ-SSW-023
SSW19.2	442 m x 250 mm ! Pipe to install	1 201 000	2030	Required when future area 515 and 599 develop	PRJ-SSW-023
SSW19.3	171 m EGL 150 mm ! Pressure Reducing Valve to install	376 000	2030	Required when future area 515 develops	PRJ-SSW-023
SSW19.4	243 m x 250 mm ! Pipe to install	706 000	2030	Required when future area 515 and 599 develop	PRJ-SSW-023
SSW20.1	96 m x 160 mm ! Pipe to install	142 000	2030	Required when future area 581 develops	PRJ-SSW-023
SSW20.2	7 L/s @ 30 m Pump Station to construct	2 843 000	2030	Required when future area 581 develops	PRJ-SSW-023
SSW20.3	1 x 110 mm ! Valve to close		2045	Required to split Kayamandi reservoir and Kayamandi Northern booster zones	PRJ-SSW-023
SSW20.4	1 x 110 mm ! Valve to close		2045	Required to split Kayamandi reservoir and Kayamandi Northern booster zones	PRJ-SSW-023
SSW20.5	1 x 110 mm ! Valve to close		2045	Required to split Kayamandi reservoir and Kayamandi Northern booster zones	PRJ-SSW-023
SSW20.6	1 x 160 mm ! Valve to close		2045	Required to split Kayamandi reservoir and Kayamandi Northern booster zones	PRJ-SSW-023
SSW21.1	7 L/s @ 30 m Pump Station to construct	2 843 000	2030	Required when future area 517 and 582 develop	PRJ-SSW-023
SSW22.1	182 m x 160 mm ! Pipe to install	317 000	2055	Required when higher lying areas of future areas 596 & 597 develop	PRJ-SSW-024
SSW22.2	435 m x 200 mm ! Pipe to install	945 000	2035	Required to improve network conveyance (Replace existing 150! AC pipe)	PRJ-SSW-038
SSW22.3	266 m x 200 mm ! Pipe to install	590 000	2035	Required to improve network conveyance (Replace existing 150! AC pipe)	PRJ-SSW-038
SSW23.1	53 m x 110 mm ! Pipe to install	227 000	2028	Required existing network pipe (Existing pipe reported to be in disrepair)	PRJ-SSW-040
Sub-totals Distribution System Items		**125 064 000**			
Bulk Supply Items					
SSW.B6	1500 m @ 222.5 m TWL Reservoir to construct	8 255 000	2056	Additional reservoir capacity at Paradyskloof 2 (Potential longer term upgrade)	PRJ-SSW-025
SSW.B8	37 m x 400 mm ! Pipe to install	601 000	2025	Required to augment supply to Paradyskloof no. 2 reservoir	PRJ-SSW-026
SSW.B10a	170 L/s @ 71 m Pump Station to construct	10 323 000	2028	Required to augment supply to Paradyskloof 2 reservoir	PRJ-SSW-027
SSW.B10b	80 L/s @ 15 m Pump Only to install	1 191 000	2028	80 L/s to Rozendal reservoir	PRJ-SSW-027
SSW.B11	1088 m x 450 mm ! Pipe to install	10 707 000	2028	Dedicated bulk supply pipe to Uniepark and Helshoogte reservoirs	PRJ-SSW-028
SSW.B13	90 L/s 200 mm ! Flow Control Valve to install	489 000	2025	Required to control inflow into reservoir	PRJ-SSW-028
SSW.B14	7000 mℓ @ 187.5 m TWL Reservoir to construct	15 306 000	2025	Additional reservoir capacity at Cloetesville	PRJ-SSW-028
SSW.B16	1062 m x 160 mm ! Pipe to install	2 801 000	2055	Required when future areas 5201 and 5202 develop (Outside urban edge, potential longer term item)	PRJ-SSW-018
SSW.B17	16 L/s 100 mm ! Flow Control Valve to install	291 000	2055	Required to control inflow into reservoir (Outside urban edge, potential longer term item)	PRJ-SSW-018
SSW.B18	1500 m @ 200 m TWL Reservoir to construct	8 255 000	2028	Required to augment bulk supply to Somerset West (Outside urban edge, potential longer term item)	PRJ-SSW-027
SSW.B19	30000 mℓ @ 258 m TWL Reservoir to construct	79 170 000	2028	Required to augment bulk supply to Stellenbosch	PRJ-SSW-027
SSW.B20a	4582 m x 450 mm ! Pipe to install	45 218 000	2026	Dedicated supply from Idas Valley to Papegaaiberg	PRJ-SSW-029
SSW.B20b	1500 m x 450 mm ! Pipe to install	9 933 000	2028	Supply pipe from Helshoogte reservoir to Papegaaiberg system	PRJ-SSW-027
SSW.B21	20000 mℓ @ 148 m TWL Reservoir to construct	58 290 000	2028	Additional reservoir storage capacity for Papegaaiberg zone (20.0 ML as first phase, additional 20.0 ML required in future)	PRJ-SSW-032
SSW.B22	20000 mℓ @ 148 m TWL Reservoir to construct	58 290 000	2045	Additional reservoir storage capacity for Papegaaiberg zone (Phase 2)	PRJ-SSW-032
SSW.B23a	150 L/s @ 135 m Pump Station to construct (in progress)	Construction in process	2025	Project in progress (pump from Papegaaiberg reservoir to Papegaaiberg Upper reservoir)	PRJ-SSW-033
SSW.B23b	150 L/s @ 90 m Pump Only to install (in progress)	Construction in process	2025	Project in progress (pump from Idas Valley reservoir to Kayamandi Upper reservoir)	PRJ-SSW-033
SSW.B23c	150 L/s @ 30 m Pump Only to install (in progress)	Construction in process	2025	Project in progress (pump from Helshoogte reservoir to Kayamandi Upper reservoir)	PRJ-SSW-033
SSW.B26	50 L/s @ 35 m Pump Only to install	4 132 000	2030	Required to augment bulk supply to Polkadraai (Pumps only)	PRJ-SSW-031
SSW.B30	3119 m x 450 mm ! Pipe to install (in progress)	Construction in process	2025	Project in progress	PRJ-SSW-033
SSW.B31	10000 mℓ @ 245 m TWL Reservoir to construct (in progress)	Construction in process	2025	Project in progress	PRJ-SSW-033
SSW.B32	1500 mℓ @ 280 m TWL Reservoir to construct	8 255 000	2055	Additional reservoir storage capacity for Brandwacht zone	PRJ-SSW-036
SSW.B33	63 m x 315 mm ! Pipe to install (in progress)	Construction in process	2025	Project in progress (Supply pipe to Kayamandi Lower reservoirs)	PRJ-SSW-033
SSW.B35	687 m x 450 mm ! Pipe to install	4 698 000	2028	Required to augment supply from Helshoogte to Rozendal	PRJ-SSW-027
SSW.B36	48 m x 450 mm ! Pipe to install	824 000	2028	Inter-connection pipe to Uniepark reservoirs	PRJ-SSW-027
SSW.B37	238 m x 400 mm ! Pipe to install	2 341 000	2028	Required to augment bulk supply to Rozendal reservoir	PRJ-SSW-027
SSW.B38	19 m x 315 mm ! Pipe to install	238 000	2028	Inter-connection pipe to Arbeidslus supply	PRJ-SSW-027
Sub-totals Bulk Supply Items		**339 192 000**			
Water Demand Management					
SSW3.1	160 lit EGL 150 mm ! Pressure Reducing Valve to install	291 000	2027	Required to reduce high pressure in Techno Park	PRJ-SSW-041
SSW3.8	144 m EGL 150 mm ! Pressure Reducing Valve to reset		2027	Reset to reduce pressure in the Welgelegen PRV zone	PRJ-SSW-039
SSW7.1	160 m EGL 150 mm ! Pressure Reducing Valve to install	291 000	2027	Required to reduce high static pressures in Uniepark

LEGEND

- Existing network pipes
- Existing bulk supply pipeline
- Existing Raw water pipes
- Existing CoCT bulk water pipeline
- Existing reservoirs / towers
- Existing pumping station
- Existing zone valve
- Existing non-return valve
- Existing pressure reducing valve
- Existing Water Treatment Plant (WTP)
- Existing flow control valve
- Master plan item
- Future network pipes
- Future reservoir
- Future pumping station
- Future PRV

COST ESTIMATES AND PHASING OF THE REQUIRED WORKS

Item No.	Description	Estimated cost * (R-yr 2024/25 value)	Time Related Phasing	Comments	Project no.
Dwars River					
Distribution System Items					
SDW1.1	416 m x 200 mm ⌀ Pipe to install	851 000	2040	Required when future areas DR3 & DR5 develop	PRJ-SDW-012
SDW2.4	33 m x 160 mm ⌀ Pipe to install	95 000	2035	Required to improve network redundancy when future area DR4 develops	PRJ-SDW-008
SDW3.1	260 m EGL 200 mm ⌀ Pressure Reducing Valve to reset	-	2025	Close supply but maintain for emergencies	PRJ-SDW-020
SDW5.1	447 m x 160 mm ⌀ Pipe to install	709 000	2035	Required to improve network conveyance	PRJ-SDW-014
SDW8.0	536 m x 400 mm ⌀ Pipe to install	3 114 000	2028	New supply pipe from Lanquedoc reservoir	PRJ-SDW-002
SDW8.1	1116 m x 355 mm ⌀ Pipe to install	4 972 000	2028	New supply pipe from Lanquedoc reservoir	PRJ-SDW-002
SDW8.2	699 m x 315 mm ⌀ Pipe to install	2 570 000	2028	New supply pipeline to Boschendal Village	PRJ-SDW-003
SDW8.3	625 m x 200 mm ⌀ Pipe to install	1 244 000	2030	New supply pipeline to Lanquedoc	PRJ-SDW-020
SDW8.4	452 m x 160 mm ⌀ Pipe to install	716 000	2030	New supply pipeline to Lanquedoc	PRJ-SDW-020
SDW8.5	499 m x 200 mm ⌀ Pipe to install	1 007 000	2030	New supply pipeline to Lanquedoc	PRJ-SDW-020
SDW8.6	306 m x 160 mm ⌀ Pipe to install	548 000	2030	New supply pipeline to Lanquedoc	PRJ-SDW-020
SDW8.7	615 m x 200 mm ⌀ Pipe to install	1 224 000	2040	Required when future areas DR13 & DR25 develop	PRJ-SDW-004
SDW9.1	191 m x 110 mm ⌀ Pipe to install	241 000	2027	Required to improve network conveyance	PRJ-SDW-015
SDW10.1	246 m EGL 200 mm ⌀ Pressure Reducing Valve to install	489 000	2028	New Lanquedoc PRV	PRJ-SDW-003
SDW10.2	1616 m x 315 mm ⌀ Pipe to install	5 725 000	2028	New supply pipeline to Boschendal Village	PRJ-SDW-003
SDW10.3	774 m x 315 mm ⌀ Pipe to install	2 826 000	2028	New supply pipeline to Boschendal Village	PRJ-SDW-003
SDW10.4	174 m x 160 mm ⌀ Pipe to install	304 000	2045	Required when future area DR29 develops	PRJ-SDW-004
SDW10.5	326 m x 200 mm ⌀ Pipe to install	937 000	2045	Required when future areas DR27, DR28 and DR31 develop	PRJ-SDW-004
SDW10.6	51 m x 160 mm ⌀ Pipe to install	122 000	2045	Required when future area DR28 develops	PRJ-SDW-004
SDW10.7	275 m x 160 mm ⌀ Pipe to install	454 000	2045	Required when future area DR27 develops	PRJ-SDW-004
SDW10.8	366 m x 200 mm ⌀ Pipe to install	756 000	2030	Required when future areas DR14 & DR20 develop	PRJ-SDW-004
SDW10.9	603 m x 160 mm ⌀ Pipe to install	940 000	2030	Required when future area DR14 develops	PRJ-SDW-004
SDW10.10	440 m x 200 mm ⌀ Pipe to install	898 000	2028	Required when future area DR19 - 21 & DR27 - 29 develop	PRJ-SDW-003
SDW10.11	586 m x 200 mm ⌀ Pipe to install	1 371 000	2028	Required when future areas DR19 - 21 & DR27 - 29 develop	PRJ-SDW-003
SDW10.13	381 m x 110 mm ⌀ Pipe to install	450 000	2040	Required when future area DR15 develops	PRJ-SDW-004
SDW10.14	389 m x 200 mm ⌀ Pipe to install	800 000	2040	Required when future areas DR16 - 18 & DR21 develop	PRJ-SDW-004
SDW10.15	265 m x 110 mm ⌀ Pipe to install	322 000	2040	Required when future area DR16 develops	PRJ-SDW-004
SDW10.16	407 m x 160 mm ⌀ Pipe to install	650 000	2040	Required when future areas DR17, DR18 & DR21 develop	PRJ-SDW-004
SDW10.17	382 m x 160 mm ⌀ Pipe to install	613 000	2040	Required when future area DR21 develops	PRJ-SDW-004
SDW10.18	294 m x 160 mm ⌀ Pipe to install	482 000	2045	Required when future area DR31 develops	PRJ-SDW-004
Sub-totals Distribution System Items		**35 228 000**			
Bulk Supply Items					
SDW.B4	8 m x 300 mm ⌀ Pipe to install	143 000	2026	Repalce existing 250l PS inlet manifold	PRJ-SDW-001
SDW.B5	3500 m@ 285 m TWL Reservoir to construct	15 149 000	2028	Reservoir storage capacity for Lanquedoc reservoir development area (3.5 ML as phase 1; 5.0 ML as phase 2)	PRJ-SDW-002
SDW.B6	70 L/s @ 70 m Pump to upgrade	1 847 000	2026	Required to augment bulk supply to Pniel & Johannesdal	PRJ-SDW-001
SDW.B7	14 m x 300 mm ⌀ Pipe to install	157 000	2026	Required to improve flow through the PS outlet manifold	PRJ-SDW-001
SDW.B8	99 m x 315 mm ⌀ Pipe to install	440 000	2028	Emergency connection from Lanquedoc reservoir to Kylemore PS 3	PRJ-SDW-002
SDW.B9	246 m EGL 200 mm ⌀ Pressure Reducing Valve to install	489 000	2028	Emergency connection from Lanquedoc reservoir to Kylemore PS 3	PRJ-SDW-002
SDW.B11	66 L/s @ 60 m Pump Only to install	2 144 000	2026	Required to augment bulk supply to Pniel & Johannesdal	PRJ-SDW-001
SDW.B15	12 L/s @ 77 m Pump Only to install	413 000	2035	Required when existing pump station reaches capacity	PRJ-SDW-014
SDW.B16	1500 m@ @ 377 m TWL Reservoir to construct	8 255 000	2035	Additional reservoir capacity for future areas	PRJ-SDW-014
SDW.B17a	50 m@ @ 253 m TWL Tank/Reservoir to construct	-	2030	Required bulk supply to Founders reservoir (cost to developer)	PRJ-SDW-018
SDW.B17b	2 L/s @ 139 m Pump Station to construct	-	2030	Required bulk supply to Founders reservoir (cost to developer)	PRJ-SDW-018
SDW.B18	1651 m x 75 mm ⌀ Pipe to install	-	2030	Required when Founders reservoir is constructed (Cost to developer)	PRJ-SDW-018
SDW.B19	200 m@ @ 386 m TWL Reservoir to construct	-	2030	Reservoir storage capacity for Founders reservoir development areas (Cost to developer)	PRJ-SDW-018
SDW.B20	45 m x 400 mm ⌀ Pipe to install	670 000	2026	Repalce existing 150 t CCT connection	PRJ-SDW-001
SDW.B21	2887 m x 400 mm ⌀ Pipe to install	16 872 000	2040	Repalce existing 300l supply pipeline when it reaches capacity or reaches end of operational life	PRJ-SDW-005
SDW.B22	64 L/s @ 155 m Pump Station to construct	7 371 000	2028	Required bulk supply to Lanquedoc reservoir	PRJ-SDW-002
SDW.B23	3238 m x 250 mm ⌀ Pipe to install	9 114 000	2028	Required bulk supply to Lanquedoc reservoir	PRJ-SDW-002
SDW.B24	5000 m@ @ 285 m TWL Reservoir to construct	19 575 000	2040	Additional reservoir storage capacity for Lanquedoc reservoir development areas (Longer term)	PRJ-SDW-019
SDW.B25	15 L/s 150 mm ⌀ Flow Control Valve to reset(Investigate first)	-	2026	Confirm type of flow control	PRJ-SDW-001
SDW.B26	14 L/s 150 mm ⌀ Flow Control Valve to reset(Investigate first)	-	2026	Confirm type of flow control	PRJ-SDW-001
SDW.B27	1000 m@ @ 308.1 m TWL Reservoir to construct	6 192 000	2027	Additional reservoir capacity for Pniel area	PRJ-SDW-015
SDW.B28	5 L/s @ 12 m Pump Only to install	839 000	2027	Required when existing pump station reaches capacity	PRJ-SDW-015
SDW.B29	124 m x 110 mm ⌀ Pipe to install	181 000	2027	Replace existing supply to Pniel Upper reservoir	PRJ-SDW-015
Sub-totals Bulk Supply Items		**89 851 000**			
Water Demand Management					
SDW6.1	281 m EGL 100 mm ⌀ Pressure Reducing Valve to install	291 000	2028	Required to reduce high static pressures	PRJ-SDW-017
SDW6.2	1 x 110 mm ⌀ Valve to insert and close	114 000	2028	Required to rezone network	PRJ-SDW-017
SDW6.3	33 m x 160 mm ⌀ Pipe to install	95 000	2028	Required to improve network conveyance	PRJ-SDW-017
SDW6.4	152 m x 110 mm ⌀ Pipe to install	198 000	2028	Required to improve network conveyance	PRJ-SDW-017
SDW7.1	267 m x 160 mm ⌀ Pipe to install	442 000	2028	Required to improve network conveyance	PRJ-SDW-017
SDW7.2	220 m x 160 mm ⌀ Pipe to install	373 000	2028	Required to improve network conveyance	PRJ-SDW-017
SDW.M1	Telemetry at reservoirs, PRVs and bulk water meters (Telemetry at 6x existing reservoir sites, 1 new reservoir site (Lanquedoc), 2 proposed PRVs (Pniel Lower & supply to Boschendal) & install 2x bulk water meters at supply to Pniel & Johannesdal & at supply to Kylemore).	580 000	Next 3 years	Required to improve quality of water balances for Dwars River system in order to prioritise WDM interventions	
Sub-totals Water Demand Management		**2 093 000**			
Bulk Water Resources					
SDW.B32	144 m@ @ 287 m EGL Borehole to construct	-	2025	Equped existing borehole with pumps and incorporate into system	PRJ-SDW-023
SDW.B33	52 m x 110 mm ⌀ Pipe to install (Investigate first)	-	2025	Confirm extents with as-built information	PRJ-SDW-023

SSW11.1	371 m x 250 mm Ø Pipe to install	1 024 000	2055	Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW11.2	615 m x 250 mm Ø Pipe to install	1 629 000	2055	Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW12.1	181 m EGL 150 mm Ø Pressure Reducing Valve to install	376 000	2055	Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW12.2	40 m x 200 mm Ø Pipe to install	145 000	2055	Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW12.3	380 m x 160 mm Ø Pipe to install	609 000	2055	Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW12.4	100 m x 110 mm Ø Pipe to install	142 000	2055	Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW13.1	126 m x 315 mm Ø Pipe to install	652 000	2025	Supply pipe to network	PRJ-SSW-028
SSW13.6	56 m x 200 mm Ø Pipe to install	1 547 000	2055	Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW13.7	1 x 200 mm Ø Valve to insert and close	194 000	2055	Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	PRJ-SSW-016
SSW13.9a	269 m x 110 mm Ø Pipe to install	354 000	2030	Required when future area S5 develops	PRJ-SSW-019
SSW13.9b	85 m x 110 mm Ø Pipe to install	134 000	2030	Required when future area S5 develops	PRJ-SSW-019
SSW13.10	135 m x 110 mm Ø Pipe to install	180 000	2030	Required when future areas S1 & S2 develop	PRJ-SSW-019
SSW13.11	131 m x 160 mm Ø Pipe to install	260 000	2030	Required when future areas S1 & S2 develop	PRJ-SSW-019
SSW13.15	184 m x 110 mm Ø Pipe to install	252 000	2030	Required when future area S120 develops (Replace existing 75Ø)	PRJ-SSW-019
SSW13.16	122 m x 160 mm Ø Pipe to install	246 000	2030	Required to improve network conveyance (Replace existing 110Ø)	PRJ-SSW-017
SSW14.1	39 m x 160 mm Ø Pipe to install	111 000	2025	Required to improve network conveyance when new 7.0 ML reservoir in constructed	PRJ-SSW-028
SSW15.3	260 m x 200 mm Ø Pipe to install	614 000	2028	Network upgarde to improve network conveyance to area (Replace existing 150Ø AC pipe)	PRJ-SSW-021
SSW15.4	16 m x 160 mm Ø Pipe to install	72 000	2028	Network upgarde to improve network conveyance to area (Replace existing 50Ø pipe)	PRJ-SSW-021
SSW15.5	406 m x 200 mm Ø Pipe to install	919 000	2028	Network upgarde to improve network conveyance to area (Replace existing 160Ø pipe)	PRJ-SSW-021
SSW15.6	55 m x 160 mm Ø Pipe to install	136 000	2028	Network upgarde to improve network conveyance to area (Replace existing 110Ø pipe)	PRJ-SSW-021
SSW15.7	228 m x 160 mm Ø Pipe to install	389 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 75Ø and 100Ø AC	PRJ-SSW-022

SSW15.8	1 x 110 mm Ø Valve to open	-	2028	Required to improve network conveyance	PRJ-SSW-021
SSW15.10	297 m x 200 mm Ø Pipe to install	628 000	2030	Required when Kayamandi A develops	PRJ-SSW-022
SSW15.11	1 x 150 mm Ø Valve to open	-	2028	Required to improve network conveyance	PRJ-SSW-021
SSW15.12	123 m x 160 mm Ø Pipe to install	248 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 50Ø and 75Ø)	PRJ-SSW-022
SSW15.13	233 m x 200 mm Ø Pipe to install	558 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 50Ø and 75Ø)	PRJ-SSW-022
SSW15.14	76 m x 200 mm Ø Pipe to install	229 000	2030	Inter-connection pipe required to accommodate Kayamandi town centre redevelopment	PRJ-SSW-022
SSW16.1	293 m x 160 mm Ø Pipe to install	526 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 75Ø)	PRJ-SSW-022
SSW16.2	312 m x 160 mm Ø Pipe to install	558 000	2030	Required to accommodate Kayamandi town centre redevelopment (Replace existing 50Ø and 75Ø)	PRJ-SSW-022
SSW16.3	403 m x 160 mm Ø Pipe to install	707 000	2040	Required when future area S14 develops	PRJ-SSW-022
SSW18.1	203 m x 400 mm Ø Pipe to install	1 436 000	2030	Required when future areas S15, S17, S80 & S82 develop	PRJ-SSW-023
SSW18.2	206 m x 400 mm Ø Pipe to install	1 453 000	2030	Required when future areas S15, S17, S80 & S82 develop	PRJ-SSW-023
SSW18.3	851 m x 200 mm Ø Pipe to install	1 669 000	2030	Required when future areas S17, S81 & S82 develop	PRJ-SSW-023
SSW18.4	115 m x 355 mm Ø Pipe to install	818 000	2030	Required when future areas S15 and S99 develop	PRJ-SSW-023
SSW18.5	827 m x 250 mm Ø Pipe to install	2 152 000	2030	Required when future areas S15 and S99 develop	PRJ-SSW-023
SSW18.6	986 m x 200 mm Ø Pipe to install	1 921 000	2030	Required when future areas S15, S17, S80 & S82 develop	PRJ-SSW-023
SSW18.7	331 m x 160 mm Ø Pipe to install	538 000	2030	Required when future areas S15, S17, S80 & S82 develop	PRJ-SSW-023
SSW18.9	185 m EGL 100 mm Ø Pressure Reducing Valve to install	291 000	2045	Required when future area S99.1 develops	PRJ-SSW-023
SSW19.1a	206 m EGL 200 mm Ø Pressure Reducing Valve to install	489 000	2030	Require to reduce high static pressures	PRJ-SSW-023
SSW19.1b	206 m EGL 150 mm Ø Pressure Reducing Valve to install	376 000	2030	Require to reduce high static pressures	PRJ-SSW-023
SSW19.2	443 m x 250 mm Ø Pipe to install	1 201 000	2030	Required when future areas S15 and S99 develop	PRJ-SSW-023
SSW19.3	171 m EGL 150 mm Ø Pressure Reducing Valve to install	376 000	2030	Required when future area S15 develops	PRJ-SSW-023
SSW19.4	243 m x 250 mm Ø Pipe to install	706 000	2030	Required when future areas S15 and S99 develop	PRJ-SSW-023
SSW20.1	66 m x 160 mm Ø Pipe to install	143 000	2030	Required when future area S81 develops	PRJ-SSW-023
SSW20.2	7 L/s @ 30 m Pump Station to construct	2 843 000	2030	Required when future area S81 develops	PRJ-SSW-023
SSW20.3	1 x 110 mm Ø Valve to close	-	2045	Required to split Kayamandi reservoir and Kayamandi Northern booster zones	PRJ-SSW-023
SSW20.4	1 x 110 mm Ø Valve to close	-	2045	Required to split Kayamandi reservoir and Kayamandi Northern booster zones	PRJ-SSW-023
SSW20.5	1 x 110 mm Ø Valve to close	-	2045	Required to split Kayamandi reservoir and Kayamandi Northern booster zones	PRJ-SSW-023
SSW20.6	1 x 160 mm Ø Valve to close	-	2045	Required to split Kayamandi reservoir and Kayamandi Northern booster zones	PRJ-SSW-023
SSW21.1	7 L/s @ 30 m Pump Station to construct	2 843 000	2030	Required when future areas S17 and S82 develop	PRJ-SSW-023
SSW22.1	182 m x 160 mm Ø Pipe to install	317 000	2055	Required when higher lying areas of future areas S66 & S67 develop	PRJ-SSW-024
SSW22.2	435 m x 200 mm Ø Pipe to install	945 000	2035	Required to improve network conveyance (Replace existing 150Ø AC pipe)	PRJ-SSW-038
SSW22.3	266 m x 200 mm Ø Pipe to install	590 000	2035	Required to improve network conveyance (Replace existing 150Ø AC pipe)	PRJ-SSW-038
SSW23.1	163 m x 110 mm Ø Pipe to install	227 000	2028	Repalce existing network pipe (Existing pipe reported to be in disrepair)	PRJ-SSW-040

RKW.B5	150 L/s @ 30 m Pump Station to construct	7 328 000	2045	New Koelenhof bulk PS	PRJ-RKW-006
RKW.B6a	4143 m x 560 mm Ø Pipe to install	57 387 000	2028	Required to augment bulk supply to Koelenhof area	PRJ-RKW-002
RKW.B6b	1154 m x 560 mm Ø Pipe to install	16 541 000	2045	Dedicated bulk supply to Koelenhof	PRJ-RKW-006
RKW.B7	150 L/s 300 mm Ø Flow Control Valve to install	797 000	2035	Required to control flow into the Kriekbult sump	PRJ-RKW-004
RKW.B8	100 m³ @ 150 m TWL Pumping Sump to construct	1 408 000	2035	New sump for Kriekbult pump station	PRJ-RKW-004
RKW.B9	90 L/s @ 76 m Pump Station to construct	6 874 000	2035	Required when Kriekbult reservoir is constructed	PRJ-RKW-004
RKW.B10	1446 m x 315 mm Ø Pipe to install	5 777 000	2035	Bulk supply pipeline to Kriekbult reservoir	PRJ-RKW-004
RKW.B11	4000 m³ @ 210 m TWL Reservoir to construct	16 762 000	2035	Required to augment bulk supply to Koelenhof	PRJ-RKW-004
RKW.B12	45 L/s @ 100 m Pump to upgrade	2 327 000	2026	Upgrade/refurbish Sonop and Devon Valley pumps (Sonop pumps currently not operational)	PRJ-RKW-010
RKW.B13	500 m³ @ 303.1 m TWL Reservoir to construct	3 886 000	2030	Additional reservoir storage capacity for Devon Valley (replace old Devon Valley tank)	PRJ-RKW-009
RKW.B14	7578 m x 355 mm Ø Pipe to install	35 885 000	2040	Inter-connection bulk pipeline between Koelenhof and Kayamandi systems	PRJ-RKW-005
RKW.B15	60 L/s @ 120 m Pump Only to install	3 252 000	2040	Required to supply bulk water from the Koelenhof system to the Kayamandi system	PRJ-RKW-005
RKW.B16	1 x 250 mm Ø Valve to insert and close	239 000	2045	Required to isolate the bulk supply from existing Koelenhof system	PRJ-RKW-006
Sub-totals Bulk Supply Items		**176 382 000**			
Water Demand Management					
SRW.M1	Telemetry at reservoirs, PRVs and bulk water meters (Telemetry at 3x existing reservoir sites, 1 new reservoir site (Kriekbult), 1 existing PRV (Sonop) & install 3x bulk water meters at supply to Elsenburg, Muldersvlei & Koelenhof.	700 000	Next 3 years	Required to improve quality of water balances for Stellenbosch system in order to prioritise WDM interventions	
Sub-totals Water Demand Management		**700 000**

COST ESTIMATES AND PHASING OF THE REQUIRED WORKS

Item No. (Ref. Fig. SS6.4g)	MP item Type	Description	Estimated cost * (R-yr 2024/25 value)	Time Related Phasing	Comments	Project no.
Raithby						
Distribution system items						
SRS1.1	FM	171 m x 160 mm l New Gravity	429 000	2030	Required when future area R5 develops	PRJ-SRS-001
Pumping stations & rising mains						
None	-	-	0	-	-	-
Other						
SRS.T1	MP	Upgrade/install telemetry (measure sewage inflow at WWTP).	100 000	Next 3 years	Measure sewage flow at inlet works in order to calibrate hydraulic sewer model for Raithby system	
TOTALS			**529 000**			

*** Costs include P&G's, Contingencies & Fees, but exclude EIA studies, registration of servitudes and/or land acquisition and VAT.**

Note :
FM = Future main - New gravity outfall sewer, rising main, pump station, diversion structure or WWTP
MP = Master Plan Items which reinforce the existing system
MPa = Master Plan Items which are eliminated
MPi = Master Plan investigate - Upgrades for existing facilities, where there is uncertainty over e.g. actual diameters, actual slopes or actual pump capacities. The existing facilities
MPp = Master Plan items in progress, with no associated cost.
MPs = Master Plan Items of which the existing full flow velocity < 0,6 m/s (investigate)

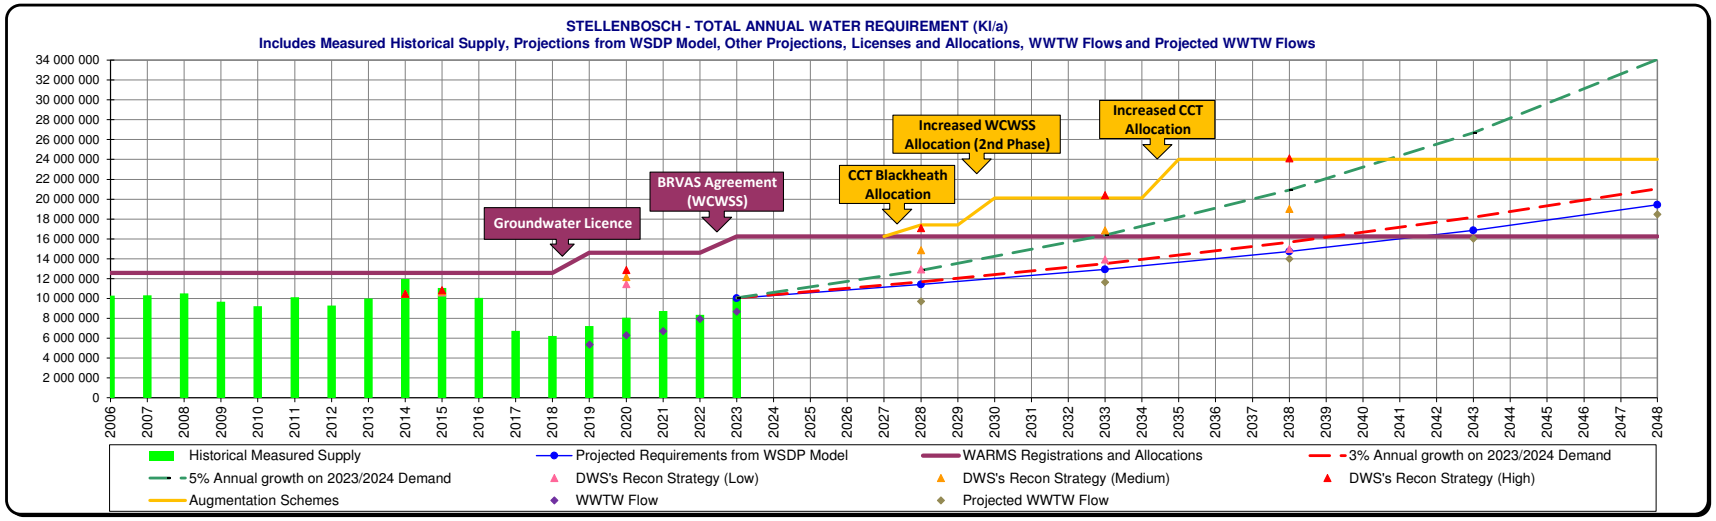
References:

(A) - Projected population for 2023/2024 is based on the Census 2011 data and the estimated future population growth, as agreed with the Municipality during January 2014.

(B) - Residential unit demands estimated.

(C) - Water Losses: Calculated water losses from July 2023 to June 2024. Estimated further reduction of 2.5% in water losses over the next five years.

(D) - Business: Calculated Billed Metered consumption data for the period July 2023 to June 2024 for all "Business" consumers.



(E) - Others: Calculated Billed Metered consumption data for the period July 2023 to June 2024 for all "Other" consumers.

(F) - Peak Month Factor: Maximum value calculated from July 2019 to June 2024 data.

(G) - Peak Day Factor : Estimated

12.2	**REQUEST FOR COUNCIL APPROVAL FOR THE UTILISATION OF BLOEMHOF PARKING AREA FOR THE INSTALLATION OF NPK BUILDING SOLAR PHOTOVOLTAIC (PV) AND BATTERY ENERGY STORAGE SYSTEM (BESS) PROJECT**

Collaborator No:
IDP KPA Ref No: Green & Sustainable Valley
Meeting Date: 27 May 2026

1. SUBJECT: REQUEST FOR COUNCIL APPROVAL FOR THE UTILISATION OF BLOEMHOF PARKING AREA FOR THE INSTALLATION OF NPK BUILDING SOLAR PHOTOVOLTAIC (PV) AND BATTERY ENERGY STORAGE SYSTEM (BESS) PROJECT

2. PURPOSE

To request Council's approval for the utilisation of the Bloemhof Parking Area, for the proposed NPK Building PV and BESS project as part of the Stellenbosch Municipality's Alternative Energy Generation (AEG) Programme.

3. DELEGATED AUTHORITY

Municipal Council.

4. EXECUTIVE SUMMARY

Stellenbosch Municipality is implementing a range of Alternative Energy Generation (AEG) initiatives under the Council-approved AEG Programme to enhance energy security, ensure business continuity at municipal critical facilities, and reduce reliance on Eskom supply. These initiatives include the installation of Solar Photovoltaics (PV) and Battery Energy Storage Systems (BESS) at identified municipal critical buildings.

The NPK Building was identified as one of the buildings for the installation of PV and BESS. However, due to insufficient roof space for the required PV capacity at the NPK building, the nearby Bloemhof Parking Area was identified as a technically suitable alternative location based on proximity to the building and infrastructure integration requirements. Kindly note that the installation of the solar PV will be on structures above ground and not on the ground itself, thus it is envisaged that only four parking bays will be lost for the equipment installation etc. The remainder of the parking lot will not be affected by the solar installation.

During a meeting held on 26 November 2025 with the Municipality's Heritage Department, the Heritage Department indicated that the parking area is located within a designated heritage site, and as such, the proposed project is subject to statutory heritage compliance processes, such as a Visual Impact Assessment Report. The Heritage Department also requested confirmation of Council's position regarding the intended use of the site. We now confirm that the Visual Impact Report has been completed **(Annexure B)** and the Heritage Department has approved the site for the project **(Annexure A).**

This report therefore seeks approval for the utilisation of the Bloemhof Parking Area for the implementation of the proposed NPK Building PV and BESS project.

5. RECOMMENDATIONS

That Council:

(a) approves the utilisation of the Bloemhof Parking Area for the proposed installation of the NPK Building PV and BESS as part of the Municipality's AEG Programme;

(b) notes that:

- A Visual Impact Assessment (VIA) for the proposed development has been completed by an appointed heritage specialist and submitted to the Heritage Department.
- Formal heritage approval for the proposed development was obtained on 11 May 2026.

6. DISCUSSION / CONTENTS

6.1 Background

The Municipality's AEG Programme is aligned with national legislative reforms that allow municipalities to generate electricity and procure power from sources other than Eskom. The programme focuses on renewable energy generation, energy resilience and business continuity at municipal critical facilities.

Feasibility assessments identified the NPK Building as suitable for PV and BESS installation. However, due to roof space limitations at the NPK Building, the Bloemhof Parking Area was identified as the most viable alternative site due to its proximity to the NPK building and technical suitability for energy generation and storage infrastructure.

6.2 Discussion

The Department: Electrical Services arranged stakeholder engagement meetings during November 2025 with various departments including the Heritage Department to discuss the detailed design of the project; it was during these meetings that it was discovered that the parking is in a heritage site. The Heritage Department indicated that they were not consulted during the site selection process for the proposed project, and that had such consultation occurred, they would have informed the Department at an early stage that the site is located within a designated heritage area.

The Heritage Department advised that the project will be subject to the full heritage approval process in terms of applicable heritage legislation. A key requirement identified by the Heritage Department was the appointment of a suitably qualified specialist to undertake a VIA to evaluate the visual impact of the proposed PV and BESS infrastructure.

The Department since made an appointment of a sub-consultant heritage specialist who performed the VIA as required. The VIA report was completed and submitted to the Heritage Department for review. Formal heritage approval for the proposed development was obtained on 11 May 2026.

It should further be noted that the existing parking bays will remain usable, as the PV panels will be installed above the parking area as part of a carport structure. As per the VIA report, proposals will prioritise single-post cantilever or Y- structures; refer to the pictures below for examples.

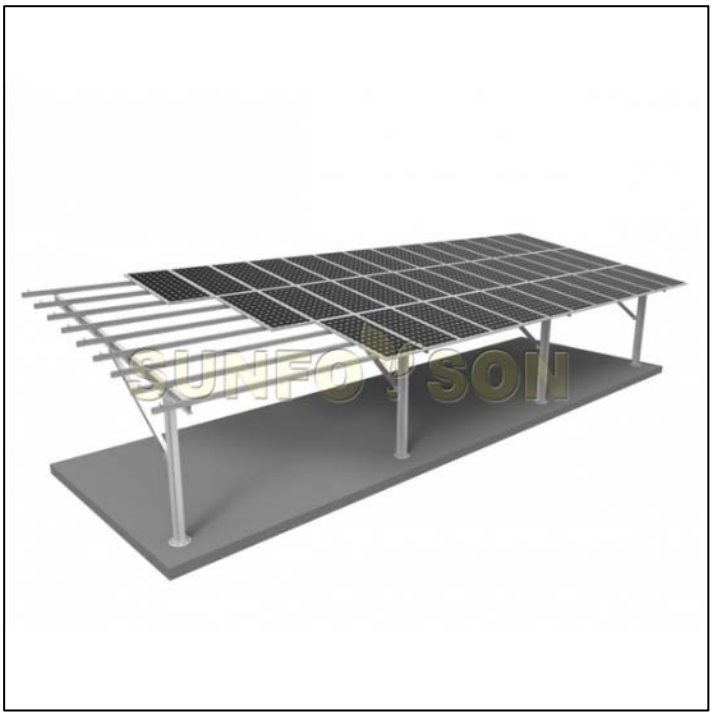

Figure 1: Example of single-post cantilever solar PV carport

Figure 2: Example of Y structure solar PV carport

Four parking bays will be affected by the placement of the BESS container and associated infrastructure as indicated in the picture below.

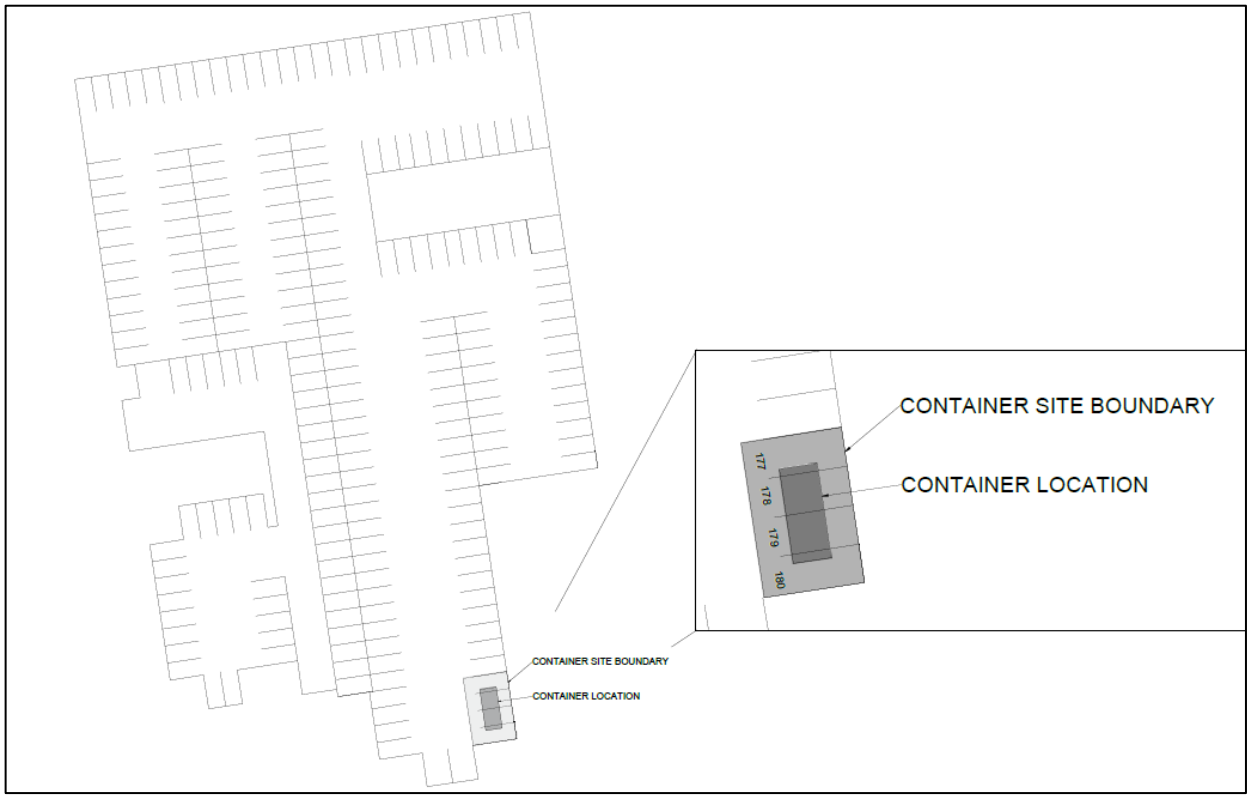

Figure 3: Parking bays (177-180) to be affected by BESS container

Figure 4: BESS Container approved colour

The Heritage Department further advised that Council's confirmation of the intended use of the Bloemhof Parking Area is required, as there may be other current or future municipal projects planned for the site.

Accordingly, the Department is requesting Council approval for the utilisation of Bloemhof Parking Area to enable the project to proceed with the finalisation of tender documentation and implementation processes.

Also note that it is not required to public participate such a project, but should Council deem it necessary, a courtesy public participation process may be undertaken to inform stakeholders and provide an opportunity for comment on the proposed project prior to implementation.

It should however be noted that such a process was not originally included in the project programme and will therefore result in time and schedule implications, including potential delays to the finalisation of tender documentation and commencement of construction.

6.3 Financial Implications:

The current consultant fees to the amount of R396 253 are budgeted for in the Financial Year 2025/2026. The rest of the financial costs including the appointment of the contractor and the construction fees for the financial year 2026/2027 amount to R 5 452 298.00 and have been allowed for in the draft capital budget 2026-2029.

Construction monitoring services will be undertaken by a separate consultant, who is yet to be appointed. Provision for the associated professional fees has also been made in the draft capital budget.

6.4 Legal Implications

All Legal requirements have been adhered to for the project.

6.5 Staff Implications

The implementation of this project will not necessitate the appointment of any additional staff.

6.6 Previous/ Relevant Council Resolutions

None

6.7 Risk Implications

None

6.8 COMMENTS FROM SENIOR MANAGEMENT

6.8.1 Director: Infrastructure Services

Proponent of the Item.

Attachments: 25187E-206 - NPK CONTAINER-A1-TB.pdf

Good afternoon Rendani,

This is a much better solution than the previous one.
The Heritage Section supports the revised container colour and the proposed fence.

Good afternoon Rendani,

I have gone through the VIA; it is comprehensive and covers all aspects. We just need to finalize the exact position of the container to ensure that it will not be visible from the road and not be positioned over any of the archaeological ruins.

Kind regards,
Katherine Robinson

QUALITY AND REVISION RECORD

	CAPACITY	NAME	SIGNATURE
Author	Senior Environmental Assessment Practitioner (EAPASA Reg: 2019/1319, IAIAsa Reg 7799)	Nadine Duncan	

Specialist Qualifications and Experience

Nadine Duncan is a Senior Environmental Assessment Practitioner with 20 years' professional experience in environmental impact assessment, landscape assessment and visual impact assessment across South Africa. She holds a Bachelor of Science in Landscape Architecture and a Bachelor of Science (Honours) in Geography, both from the University of Pretoria, providing a strong foundation in landscape character assessment, visual sensitivity analysis, spatial analysis and environmental planning.

She is a registered Environmental Assessment Practitioner with EAPASA (Reg. No. 2019/1319) and has extensive experience leading and authoring Environmental Impact Assessments for large-scale infrastructure, energy, mining, transport, housing and coastal developments. Her professional background includes senior roles within multidisciplinary consulting teams, where she has been responsible for specialist coordination, GIS-based spatial analysis, report compilation, quality control and regulatory compliance.

Ms Duncan has direct and demonstrable experience in Visual Impact Assessment, having authored and contributed to numerous VIA reports for linear infrastructure, renewable energy facilities, mining operations and major energy projects, including power stations and large-scale solar and wind developments. Her combined expertise in landscape architecture, GIS, environmental legislation and impact assessment methodology enables her to objectively assess visual sensitivity, landscape character, visual exposure and cumulative visual impacts, and to develop practical, defensible mitigation measures aligned with best practice.

EXECUTIVE SUMMARY

This Visual Impact Assessment (VIA) evaluates the proposed installation of a carport-based photovoltaic (PV) solar system at the existing Bloemhof parking area in Stellenbosch, Western Cape. The project aims to integrate renewable energy generation into an established functional space, providing dual utility by shading vehicles while generating between 200 kWp and 250 kWp of solar power.

The town of Stellenbosch is a highly sensitive visual environment, defined by its rich cultural heritage, historic Cape Dutch architecture, and mature tree-lined streets. The project site is situated within a dense institutional and academic precinct, bordered by the NPK building and other multi-storey structures. The baseline study identifies that while the area has a Medium to High receptor sensitivity due to the presence of students, heritage tourists, and residents, it also possesses a Moderate to High Visual Absorption Capacity (VAC). This is due to the "enclosure effect" created by surrounding buildings and the extensive screening provided by an established canopy of mature oak trees.

The assessment concludes that the primary zone of visual influence is highly contained, with meaningful visibility limited to the immediate vicinity of the parking area and the NPK building. Carport structures will maintain a low vertical profile of under 3.0 metres, ensuring they remain subservient to the surrounding architectural scale and do not break the town's broader skyline. Temporary construction impacts such as dust, soil disturbance, and visual clutter are rated as Low to Very Low with standard site management and rapid reinstatement of paved surfaces. Long-term operational impacts are rated as Low (Negative), as the introduction of geometric PV arrays is consistent with existing utilitarian land use and is likely to be perceived as a sustainable energy resilience improvement.

To ensure the facility integrates sensitively into the historic urban fabric, the VIA establishes several mandatory design specifications for the tender process. Only "All-Black" PV modules featuring black cells, frames, and back-sheets with Anti-Reflective Coating (ARC) are permitted. All structural steelwork must be finished in Dark Charcoal (RAL 7016) or Slate Grey (RAL 7015) in a matte or satin finish. Furthermore, no mature trees may be removed or topped, and any required security lighting must utilise 3000K warm-white LEDs that are fully shielded and downward-facing to prevent light spill.

With the implementation of the recommended mitigation and design measures, the development will not result in unacceptable visual or aesthetic impacts. The project is supported from a visual perspective, as it represents a contextually appropriate and visually sensitive addition to the Stellenbosch townscape that aligns with both University and Municipal sustainability goals.

1. INTRODUCTION

Visual and aesthetic impacts are among the most immediate and easily perceived environmental effects associated with infrastructure developments. Unlike many biophysical impacts, which may require technical interpretation, visual change is experienced directly by observers and can strongly influence public perception and acceptability of a project. This is particularly relevant within urban environments of high cultural and heritage value, where the character, identity, and sense of place are closely tied to the visual quality of the built and natural environment.

The town of Stellenbosch is widely recognised for its rich cultural heritage, historic urban fabric, and distinctive landscape setting. The visual environment is characterised by a strong architectural identity, mature tree-lined streets, and a coherent sense of place that is highly valued by residents, institutions, and visitors. Developments within such contexts require careful consideration to ensure that new infrastructure integrates sensitively with the existing environment and does not result in visual intrusion or erosion of local character.

This Visual Impact Assessment (VIA) has been prepared for the proposed installation of a carport based photovoltaic (PV) solar system at the Bloemhof parking area in Stellenbosch. The purpose of the VIA is to evaluate the extent to which the proposed development may alter the existing visual environment, how such changes may be perceived by different visual receptors, and whether these changes are acceptable within the context of the receiving environment.

In addition, the VIA is specifically intended to inform a forthcoming tender process for the appointment of a suitably qualified service provider to undertake the detailed design and installation of the PV carport structures. As such, the VIA provides clear visual and aesthetic guidance to inform the design response, ensuring that tenderers develop solutions that are not only technically and economically feasible, but also visually appropriate. Particular emphasis is placed on ensuring that the proposed structures are compatible with the surrounding urban and institutional character, respect the cultural and historical context of Stellenbosch, and reinforce the existing sense of place, rather than detract from it.

1.1. Objectives of the VIA

The objectives of this VIA are to:

- Describe the existing visual environment and landscape character of the site and surrounding area.
- Identify key visual receptors and evaluate their sensitivity to visual change.
- Determine the extent and nature of visual exposure associated with the proposed development.
- Assess visual impacts during the construction, operational phases.

- Evaluate the significance of visual impacts before and after mitigation.
- Recommend practical mitigation measures to reduce negative visual effects.
- Provide clear visual and aesthetic design guidelines to inform the forthcoming tender process, ensuring that the appointed service provider develops a solution that is contextually appropriate, visually sensitive, and aligned with the cultural heritage and sense of place of Stellenbosch.
- Guide the design of the proposed carport PV structures to ensure they integrate with the existing urban and institutional environment and avoid visual intrusion.

2. PROJECT DESCRIPTION AND VISUAL CONTEXT

The proposed development comprises the installation of a carport-based photovoltaic (PV) solar system within the existing Bloemhof parking area in Stellenbosch (Figure 1). The project is intended to utilise existing parking infrastructure to support renewable energy generation without requiring additional undeveloped land.

The development will consist of PV panels mounted on purpose-designed carport structures above existing parking bays. This integrated approach allows for dual land use, maintaining the primary function of the site while introducing energy-generating infrastructure in a manner that is both space-efficient and contextually appropriate (Figure 2).

The estimated capacity of the PV system is anticipated to range between approximately 200 kWp and 250 kWp, depending on the final selection of solar panel technology and the structural configuration of the carport system. The conceptual layout has been developed with consideration for the retention of existing mature trees within the parking area, which contribute significantly to the visual character of the site and provide natural screening.

Key Project Components:

- The proposed development will include the following components:
- Carport-mounted PV panel arrays above existing parking bays
- Structural support systems (various carport configurations)
- Underground electrical cabling connecting the PV system to the NPK building
- A containerised inverter and associated power conversion equipment
- Ancillary electrical infrastructure, including distribution boards and protection systems

Carport Structural Configurations:

A range of carport structural typologies may be considered by the appointed contractor, including:

- Four-post single bay
- Single-post single bay
- Ballasted single bay
- Single-post double bay

The final structural solution will be determined through the tender process. However, all configurations are expected to maintain a low vertical profile, minimise visual bulk, and align with the scale and function of the existing parking environment.

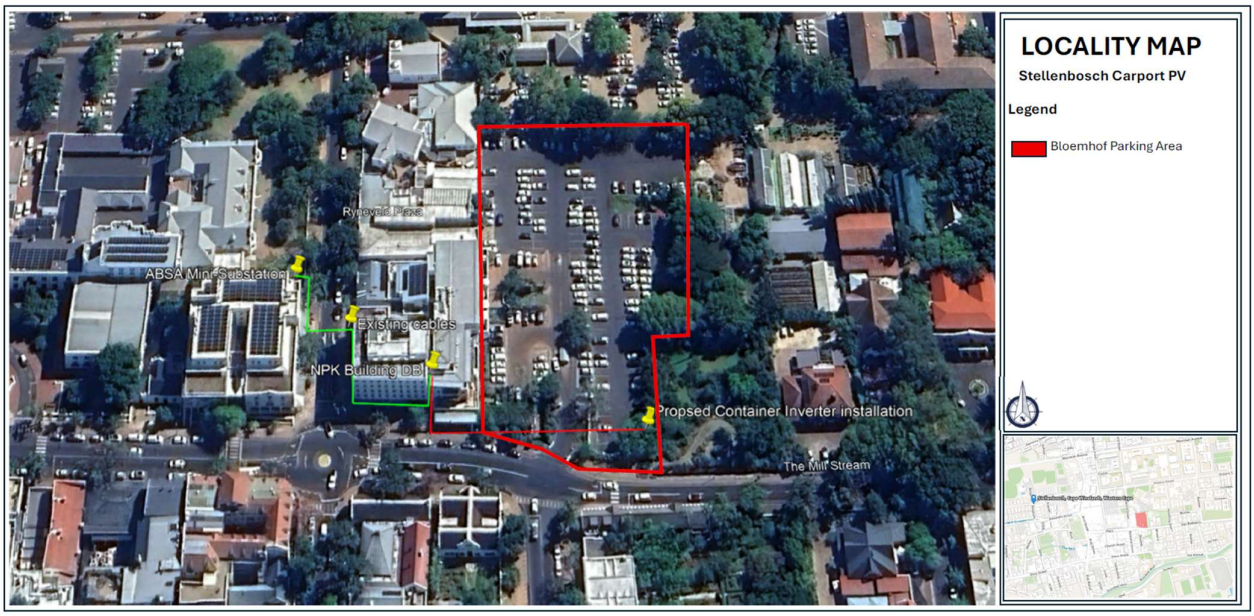

Figure 1: Locality Map showing location of carport and cable installation

Power Conversion Infrastructure and Cable Routing:

The PV system will incorporate a containerised inverter solution housed within a standard shipping container, which will accommodate inverter equipment and potentially battery storage, depending on the final design. This containerised installation represents a visually distinct element within the development and will require careful consideration in terms of placement, orientation, colour treatment, and screening to minimise visual intrusion.

Electrical connection to the NPK building will be achieved via underground AC cabling routed along the municipal sidewalk, thereby avoiding the introduction of overhead infrastructure and reducing potential visual clutter.

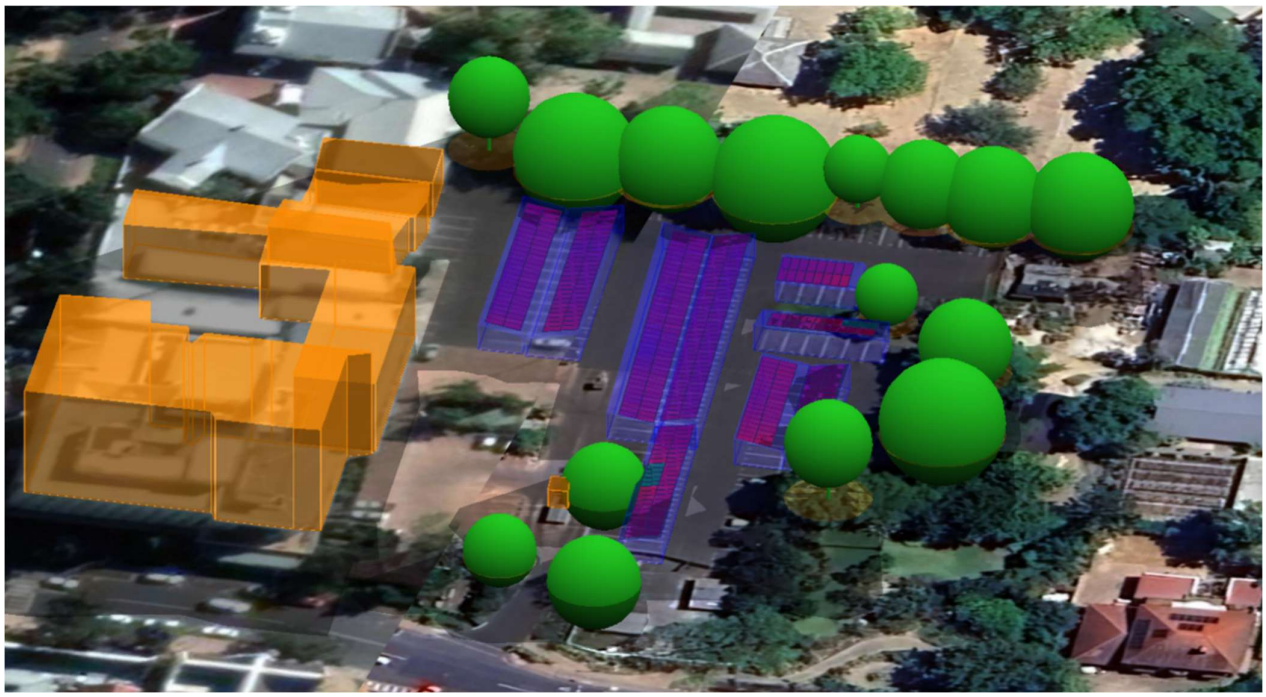

Figure 2: Proposed carport and cable installation (Lyners)

3. LEGISLATION, POLICIES AND GUIDELINES

The VIA has been informed by the following legislative and policy framework:

- National Environmental Management Act (NEMA) (Act 107 of 1998), which requires that environmental impacts, including visual and aesthetic considerations, be assessed as part of sustainable development decision making.
- Environmental Impact Assessment Regulations, 2014 (as amended), which require identification and assessment of visual impacts where relevant.
- Western Cape DEA&DP (2006): Guidelines for Involving Visual and Aesthetic Specialists in EIA Processes.
- Relevant municipal Spatial Development Frameworks (SDFs) and land use planning instruments.

These instruments collectively recognise visual quality as an environmental resource and require that development proposals be evaluated in relation to landscape character, receptor sensitivity, cumulative change and long term visual consequences.

4. METHODOLOGY

The Visual Impact Assessment (VIA) for the proposed Bloemhof carport-based photovoltaic (PV) installation in Stellenbosch has been undertaken following a structured, multi-step methodology consistent with South African EIA practice and international best practice for visual assessment. The methodology combines desk-based analysis, site appraisal, professional judgement, and design-informed evaluation to assess potential visual impacts associated with the proposed development.

In addition to assessing visual impacts across the project lifecycle, the methodology has been adapted to support the project's dual purpose of impact assessment and design guidance. As such, it not only evaluates the potential extent and significance of visual change but also informs appropriate design responses for the proposed carport structures and associated infrastructure, including the containerised inverter installation. This ensures that visual considerations are integrated into the design process and provides a framework to guide the forthcoming tender, with a focus on achieving a contextually appropriate, visually sensitive, and non-intrusive outcome within the Stellenbosch urban environment.

4.1. Approach

Given the urban, culturally sensitive context of Stellenbosch, the approach extends beyond conventional visual impact assessment to include a design-informed evaluation. This ensures that the assessment not only identifies and evaluates potential visual impacts but also informs appropriate architectural and aesthetic responses to guide the detailed design and tender process.

Key components of the approach include:

- Baseline Analysis

  Describing the existing visual environment, including urban character, landscape elements, architectural context, and the role of mature vegetation in defining the sense of place.

- Identification of Visual Receptors

  Identifying individuals and groups likely to experience views of the development, including pedestrians, road users, adjacent land uses, and institutional users, and evaluating their sensitivity within a culturally significant urban setting.

- Assessment of Visual Exposure

Evaluating the extent to which the proposed development, including carport structures and the containerised inverter installation, will be visible from key viewpoints, taking into account screening by buildings and trees.

- Impact Assessment

  Assessing the nature, extent, duration, intensity, and significance of visual impacts during the construction, operational, and decommissioning phases, with particular focus on visual integration within an established urban environment.

- Design and Mitigation Integration

  Developing practical mitigation measures and visual design guidelines to avoid, minimise, and manage visual impacts. This includes informing the aesthetic treatment, siting, scale, and materiality of the proposed infrastructure to ensure contextual compatibility.

- Cumulative and Contextual Consideration

  Assessing how the proposed development integrates with existing infrastructure and contributes to the overall visual character of the area, ensuring that it reinforces rather than detracts from the established sense of place.

4.2. Baseline Assessment

The baseline assessment establishes the existing visual environment and landscape character, providing a reference point against which potential impacts are measured. This includes:

1. Regional Landscape Context – including topography, vegetation, land uses, and existing infrastructure.
2. Site Specific Landscape Character – detailing the ridge area on which the facility will be located, its prominence, natural features, and existing modifications.
3. Visual Quality and Aesthetic Value – identifying key scenic elements, colour palettes, patterns, textures, and the overall aesthetic character of the landscape.
4. Lighting Conditions – evaluating natural light conditions, seasonal variation, and night-time visibility.
5. Photographic Documentation – capturing representative viewpoints, including panoramic photographs and site sketches.

4.3. Identification of visual Receptors

Visual receptors are individuals or groups who may be affected by changes to the visual environment. For the proposed Bloemhof carport-based PV development in Stellenbosch, key visual receptors include:

- Students, staff, and visitors associated with adjacent institutional and educational facilities
- Pedestrians moving through and around the parking area and surrounding streets
- Road users on adjacent and nearby streets
- Nearby residents and occupants of surrounding buildings
- Maintenance and operational staff within the site

These receptors typically experience the area at close range and over varying durations, with some (such as pedestrians and institutional users) having prolonged or repeated exposure to the site. Given the location within Stellenbosch, which is characterised by a strong sense of place and cultural identity, certain receptors may exhibit a higher sensitivity to visual change, particularly where it affects the perceived quality and coherence of the built environment.

The assessment considers both receptor sensitivity (rated as high, medium, or low) and receptor susceptibility, being the extent to which viewers are likely to notice and respond to visual changes within this contextually sensitive urban environment.

4.4. Assessment of Visual Exposure

Visual exposure determines how prominently the proposed facility will be seen. For the Bloemhof carport-based PV installation, this involves:

Viewshed Analysis: Mapping confirms that the primary zone of visual influence is highly contained within the immediate urban fabric of Stellenbosch. Meaningful visibility is limited to the immediate vicinity of the Bloemhof parking area and the NPK building.

Elevation and Terrain Consideration: The development is situated within a relatively flat, built-up urban environment. The carport structures are designed to maintain a low vertical profile (generally <3 m) that aligns with the existing parking environment, preventing significant skyline intrusion.

Distance and Angle of View: The highest potential visual exposure is concentrated at close range (within 0–500 m) for receptors such as pedestrians and institutional users. At these distances, the structures are clearly perceptible, but their scale remains consistent with surrounding institutional buildings.

Screening and Obstructions: Visual exposure is significantly reduced by the presence of existing mature trees within the parking area, which provide natural screening. Additionally, surrounding multi-storey institutional buildings act as physical barriers, shielding the development from more distant urban receptors.

4.5. Impact Assessment Criteria

The VIA evaluates visual impacts based on several standard criteria:

Criterion	Description
Nature	Positive or negative change to the visual environment
Extent	Spatial area over which the impact will be experienced (Site, Local, Regional)
Duration	Time period over which the impact will occur (Short-term, Medium-term, Long-term, Permanent)
Intensity/Magnitude	Strength of visual change (Low, Medium, High)
Probability	Likelihood of the impact occurring (Unlikely, Possible, Probable, Definite)
Reversibility	Ability to restore the visual environment post-impact (Low, Medium, High)
Significance	Overall importance of the impact combining all criteria (Low, Low–Medium, Medium, High)

Impacts are assessed pre- and post-mitigation to determine residual effects.

Assessment of visual impacts relies on a combination of:

- Field observations and photographic evidence
- Expert interpretation of landscape character and visual sensitivity
- Scoring against criteria in Section 4.5 using qualitative descriptors, supported by narrative explanation.

4.6. Mitigation Integration

Mitigation measures are proposed in line with the avoid–minimise–rehabilitate hierarchy:

1. Avoidance – locating infrastructure to reduce visual prominence and avoid sensitive viewpoints.
2. Minimisation – use of non-reflective materials, muted colours, and low-profile structures.
3. Rehabilitation – progressive restoration of disturbed areas to reinstate natural textures and colours.

Residual impacts after mitigation are reassessed to provide realistic expectations of visual change.

4.7. Cumulative Visual Impact Assessment

Cumulative impacts are considered in the context of:

Existing Urban Infrastructure: Evaluating how the PV carports integrate with the existing built environment, including the NPK building and surrounding institutional architecture.

Planned and Approved Developments: Considering other renewable energy or infrastructure projects within the Stellenbosch municipal area that may contribute to a changing "sense of place."

Aggregate Visual Change: Assessing the long-term shift from a traditional open parking area to an energy-generating landscape, ensuring that the combined visual effect reinforces rather than detracts from the town's historic and cultural character.

This ensures that the Bloemhof Carport PV project's visual contribution is understood within the broader context of Stellenbosch's evolving urban and heritage landscape.

5. VISUAL STUDY AREA

The Visual Study Area represents the geographical area from which the proposed PV facility may potentially be visible. The extent of the Visual Study Area is influenced by a combination of factors, including urban grain, building heights, mature vegetation cover, and the town's unique topographical setting within the Eerste River Valley.

The proposed facility is located within the established Bloemhof parking area, characterised by relatively flat terrain surrounded by multi-storey institutional and commercial buildings. Unlike open field developments, visibility here is primarily governed by the "enclosure effect" of the surrounding built environment. Terrain analysis indicates that the development is tucked within a dense urban fabric, which naturally limits long distance views and prevents the structures from breaking the broader skyline of Stellenbosch.

Visual exposure is further moderated by:

Existing Mature Tree Canopies: The presence of large, established trees within and around the parking area providing significant vertical screening.

Built Form Obstructions: The NPK building and adjacent structures which physically block lines of sight from various directions.

Urban Scale: The low profile design of the carports, which ensures they remain subservient to the surrounding architectural scale.

For the purposes of this VIA, the Visual Study Area is defined by the immediate urban viewshed, with the most pronounced visual impacts anticipated within 500 m of the site. Beyond this distance, the development is expected to be largely absorbed into the complex visual background of the Stellenbosch townscape.

6. Receiving environment and landscape character

6.1. Regional Landscape Context

The broader regional landscape is situated within the Cape Winelands, a region world renowned for its high scenic, cultural, and heritage value. The landscape is defined by the dramatic topography of the Stellenbosch Mountains which create a visually enclosed valley setting. The regional character is a mosaic of historic vineyards, Cape Dutch architecture, and a well-defined urban core. Unlike open plains, this landscape is experienced as a highly structured, "settled" environment where the visual quality is a critical asset for tourism and local identity.

6.2. Local Landscape Character

At a local scale, the site is defined by the institutional and historic fabric of the Stellenbosch town centre. The Bloemhof parking area is an established functional space, yet it exists within a sensitive visual context characterised by:

Architectural Identity: The site is bordered by significant structures like the NPK building, reflecting a mix of contemporary and traditional academic/institutional architecture.

Mature Vegetation: Unlike sparse shrubland, the local character is defined by large, mature trees (including oaks and other established species) that provide a high degree of vertical interest and natural screening.

Urban "Sense of Place": The area is a high-activity zone for students, staff, and pedestrians. The landscape is already modified as a functional parking facility, meaning the introduction of carports is consistent with the existing utilitarian use of the site, provided the design respects the surrounding historic scale.

7. VISUAL RECEPTORS AND SENSITIVITY ANALYSIS

Visual receptors are defined as individuals or groups of people who may experience views of the proposed development. Receptor sensitivity is influenced by land use, activity type, duration of view, and expectations regarding scenic and heritage quality.

Key identified visual receptors include:

- Institutional Users: Students, academic staff, and administrative personnel at the NPK building and surrounding university facilities.
- Pedestrians and Commuters: Individuals using the municipal sidewalks and traversing the Bloemhof parking area.
- Local Businesses and Residents: Occupants of adjacent commercial properties and nearby residential areas within the Stellenbosch urban core.
- Heritage Tourists: Visitors exploring the historic town centre, for whom the visual and aesthetic quality of the townscape is a primary expectation.

Sensitivity Assessment

Unlike a remote industrial setting, these receptors experience the landscape in a highly sensitive cultural and educational context. Views are often prolonged (for institutional users) or associated with a high expectation of aesthetic coherence (for tourists and residents).

As a result, receptor sensitivity is assessed as Medium to High. The presence of the Stellenbosch Historic Core and the town's status as a premier tourism destination mean that any visual change must be carefully integrated to avoid detracting from the established "sense of place."

8. VISUAL ABSORPTION CAPACITY

Visual Absorption Capacity (VAC) refers to the ability of a landscape to accommodate visual change without significant degradation of visual quality.

The VAC of the receiving environment is assessed as Moderate to High. This is primarily driven by the following factors:

- Existing Built Form: The presence of multi-storey institutional buildings, such as the NPK building, provides substantial physical screening and a complex architectural backdrop that can easily absorb new structures of a similar scale.
- Mature Vegetation: The established tree canopy within the Bloemhof parking area and along adjacent municipal sidewalks acts as a natural visual buffer, softening the geometric lines of the PV arrays and carports.
- Functional Compatibility: Since the site is already an asphalt-surfaced parking lot with existing vehicles and lighting infrastructure, the introduction of carports is consistent with the established utilitarian land use.

- Low Vertical Profile: The proposed carport structures are designed to remain below the height of the surrounding buildings, ensuring they do not compete with the broader skyline or the iconic mountain views of the Stellenbosch valley.

Consequently, the local urban landscape has a high capacity to integrate the proposed development without a fundamental change to its character or "sense of place."

9. PHOTOGRAPHIC VIEWPOINTS AND PHOTO MONTAGE

A photographic record has been compiled to support this VIA. Viewpoints were selected to represent typical receptor locations within the Stellenbosch urban fabric, areas of highest visibility, and a range of viewing distances from the Bloemhof parking area and surrounding municipal streets.

The photo montage demonstrates the high degree of visual containment provided by existing multi-storey institutional buildings and the NPK building. It further illustrates the role of mature tree canopies in screening the site and softening the proposed structures. The selection of viewpoints confirms that the development will primarily be experienced as a localised urban change at street level, rather than a prominent element within the broader Stellenbosch landscape or mountain skyline.

Photo 1: Entrance to parking area – Existing trees offer screening

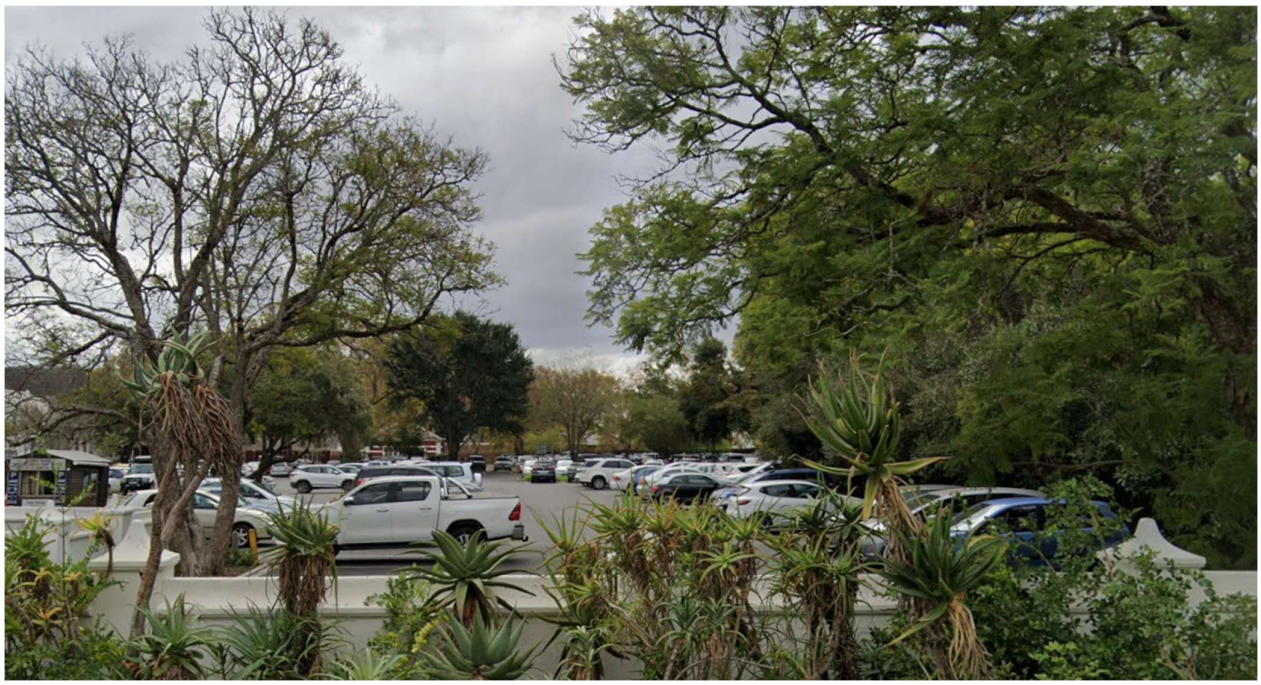

Photo 2: View from pedestrian sidewalk towards the parking area

Photo 3: View from Drostdy Street towards Parking area shows visual absorption of the area

Photo 4: View west towards site showing tree screen – structures will not be visible

Photo 5: View east towards site – Structures will not be visible.

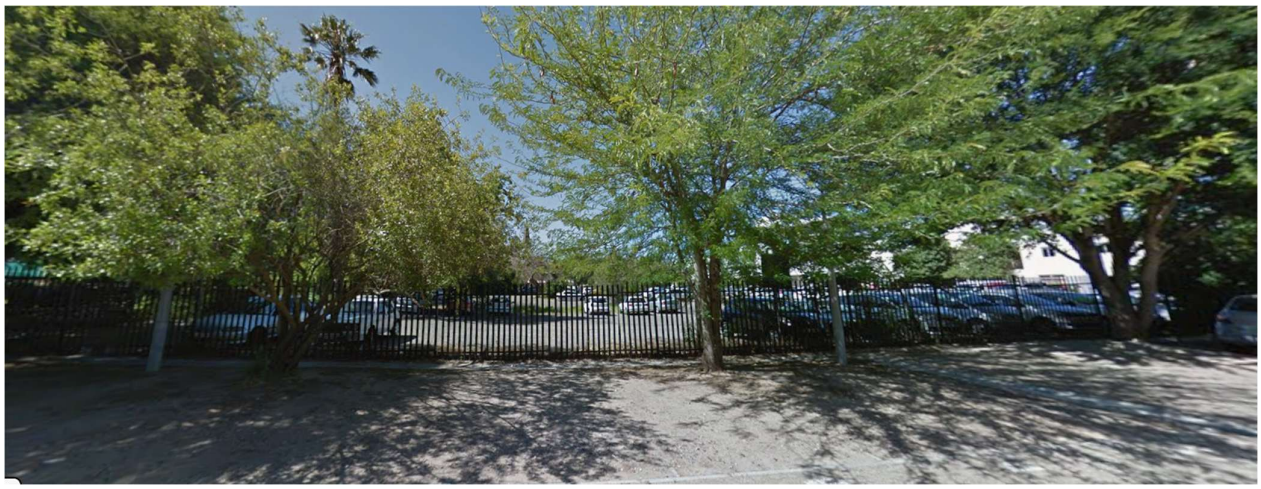

Photo 6: View from Art Museum Parking – Trees will screen the structure to an extent

Photo 7: View towards the site from the Botanical Garden (GoogleEarth) – screened by trees

Photo 8: View from art museum towards site (GoogleEarth)

Photo 9: Structures will be visible from adjacent buildings(red). The site is screened from adjacent areas by trees (Green).

9.1. Comparative Case Study

To further evaluate potential visual impacts, the recent microgrid and solar carport installation at Mediclinic Milnerton Hospital serves as a direct urban benchmark. This project is particularly relevant as it represents the first hospital in its group to implement such a system in a sensitive coastal and residential urban setting

Key findings from the Milnerton hospital site include:

- Scale and Profile: The carport structures maintain a low vertical profile consistent with the hospital's existing infrastructure, ensuring they do not dominate the local skyline.
- Visual Absorption in Healthcare Settings: The case study demonstrates that in institutional environments (like hospitals and universities), carports are perceived as a functional and sustainable upgrade. They provide dual utility, shading vehicles while generating power which balances their visual presence.
- Environmental Sensitivity: The use of non-reflective panels at the hospital site successfully mitigated concerns regarding glare for nearby residents and motorists.

Findings applied to Bloemhof: The Milnerton hospital benchmark confirms that the Bloemhof installation is likely to result in a Low-Negative visual impact. Given that the Bloemhof site is already a functional parking area, the introduction of similar solar carports is consistent with established land use and will likely be perceived as an "energy resilience" improvement (Figure 3 and 4).

Figure 3: Street view of Mediclinic Solar Carport – minimal visual instruction (GoogleEarth)

Figure 4: Street view of Mediclinic Solar Carport – minimal visual instruction against skyline (GoogleEarth)

Viewshed Analysis:

The viewshed analysis for the proposed Bloemhof Carport PV installation indicates that the primary zone of visual influence is highly contained within the immediate urban fabric of Stellenbosch. While a GIS-based line-of-sight perspective might suggest broader theoretical visibility, the actual visual impact is governed by the dense "enclosure effect" of the surrounding built environment.

A 500 m to 1 km buffer was applied to define the zone of highest potential visual influence, as the project is situated within a relatively flat, built-up institutional area. The analysis confirms the following:

Urban Containment: Meaningful visibility is limited almost exclusively to the immediate vicinity of the Bloemhof parking area and the NPK building. Surrounding multi-storey institutional buildings act as significant physical barriers, effectively shielding the development from more distant urban receptors.

Natural Screening: Visual exposure is further moderated by the presence of existing mature tree canopies (including established oaks) within and around the parking area. These provide substantial vertical screening and soften the geometric lines of the PV structures.

Skyline Integrity: Because the carport structures maintain a low vertical profile (generally <3 m), they remain subservient to the surrounding architectural scale and do not break the broader Stellenbosch skyline or obstruct iconic views of the Eerste River Valley and surrounding area.

Receptor Context: While sensitive receptors; including students, pedestrians, and heritage tourists are present within the 500 m zone, the development is consistent with the site's existing functional use as a parking facility. Consequently, it is likely to be perceived as a localised "energy resilience" improvement rather than a visual intrusion.

In conclusion, although the viewshed technically extends to nearby street level observers, the development is largely absorbed into the complex visual background of the Stellenbosch townscape. The high Visual Absorption Capacity (VAC) of the site ensures that the project's visual footprint remains localised and carries no significant impact beyond the immediate institutional precinct.

10. VISUAL IMPACT ASSESSMENT AND SIGNIFICANCE RATING

This section provides a detailed, phase-specific assessment of the potential visual impacts associated with the proposed Stellenbosch Bloemhof Carport PV project. Impacts are assessed before mitigation (worst-case scenario) and after mitigation (residual impact).

The following significance criteria are applied:

- Nature: Positive / Negative
- Extent: Site / Local / Regional
- Duration: Short-term / Medium-term / Long-term / Permanent
- Intensity (Magnitude): Low / Medium / High
- Probability: Unlikely / Possible / Probable / Definite
- Reversibility: Low / Medium / High

Overall significance is expressed qualitatively as Low, Low–Medium, Medium or High.

10.1. Construction Phase Visual Impact Assessment

10.1.1. EARTHWORKS AND SOIL DISTURBANCE

Nature of Impact: Temporary visual change due to exposed surfaces and localised construction activity.

Impact Description: Minor excavation for carport foundations and cable trenching to the NPK building will create temporary surface disturbances. Unlike large-scale greenfield projects, these activities occur within an already paved and modified urban parking area. Visual impacts are concentrated at close range for pedestrians and institutional users. Effective phasing and immediate reinstatement of paved surfaces ensure these impacts are short-term and localised.

Table 1: Earthworks and Soil Disturbance

EARTHWORKS AND SOIL DISTURBANCE: Disturbance of soil and topography; visual contrast with surrounding vegetation	
Criterion	**Assessment**

Nature	Negative
Extent	Local (Immediate site vicinity)
Duration	Short-term (construction period only)
Intensity	low
Probability	Definite
Reversibility	High
Visual Sensitivity of Area	Medium - High
Pre-Mitigation Significance:	**Low (Negative)**
Post-Mitigation Significance:	**Very Low (Negative)**
Mitigation Measures: • Limit construction activities strictly to the approved parking bay footprints and cable routes; • Ensure rapid reinstatement of asphalt or surface treatments following trenching; and • Shield active excavation areas from primary pedestrian thoroughfares where feasible.	

10.1.2. CONSTRUCTION CAMPS AND LAYDOWN AREAS

Nature of Impact: Temporary visual intrusion from equipment storage and human activity.

Impact Description: The storage of carport steelwork, PV panels, and contractor vehicles within the Bloemhof parking area will introduce temporary "industrial" elements into a sensitive institutional setting. By utilising existing screened corners of the parking lot and minimising the duration of onsite storage, the visual intrusion to students and the NPK building occupants can be managed.

Table 2: Construction Camps and Laydown Areas

CONSTRUCTION CAMPS AND LAYDOWN AREAS: Temporary structures visible on skyline; human activity.	
Criterion	**Assessment**
Nature	Negative
Extent	Local (Immediate site vicinity)
Duration	Short-term (construction period only)
Intensity	Medium
Probability	Definite
Reversibility	High
Visual Sensitivity of Area	Medium to High
Pre-Mitigation Significance:	**Low–Medium (Negative)**
Post-Mitigation Significance:	**Low (Negative)**
Mitigation Measures: • Locate laydown areas in the least visually prominent sections of the parking area; • Avoid blocking established pedestrian sightlines or access to the NPK building; and • Screen storage areas with temporary high-quality shade cloth if duration exceeds four weeks.	

10.1.3. DUST GENERATION

Nature of Impact: Temporary reduction in visual clarity and local amenity.

Impact Description: Minor dust may be generated during trenching and foundation drilling. In a high-traffic urban core like Stellenbosch, dust is highly noticeable to pedestrians and can settle on adjacent institutional buildings. Standard urban dust suppression and the existing paved nature of the site significantly limit the potential for visible plumes.

Table 3: Dust Generation

DUST GENERATION: Temporary reduction in visual clarity and aesthetic quality.	
Criterion	**Assessment**
Nature	Negative
Extent	Local (Immediate site vicinity)
Duration	Short-term (construction period only)
Intensity	Low
Probability	Possible
Reversibility	High
Visual Sensitivity of Area	Medium to High
Pre-Mitigation Significance:	**Low (Negative)**
Post-Mitigation Significance:	**Very Low (Negative)**
Mitigation Measures: • Implement localised dust suppression (dampening) during drilling or trenching; and • Ensure all soil stockpiles are covered or removed promptly.	

10.1.4. TEMPORARY STRUCTURES

Nature of Impact: Short-term visual clutter.

Impact Description: Temporary scaffolding, safety fencing, and portable toilets create a visual contrast with the historic and institutional character of the surroundings. Given the high "sense of place" in Stellenbosch, disorganised construction equipment can be perceived as high-impact clutter. Compact and organised site management is essential to maintain visual order.

Table 4: Temporary Structures

DUST GENERATION: Temporary reduction in visual clarity and aesthetic quality.	
Criterion	**Assessment**
Nature	Negative
Extent	Local (Immediate site vicinity)
Duration	Short-term (construction period only)

Intensity	Medium
Probability	Definite
Reversibility	High
Visual Sensitivity of Area	Medium to High
Pre-Mitigation Significance:	**Low–Medium (Negative)**
Post-Mitigation Significance:	**Low (Negative)**
Mitigation Measures: • Remove all temporary fencing and scaffolding immediately upon completion of structural works; and • Ensure safety signage is professionally presented to avoid an "abandoned" site appearance.	

10.1.5. VISUAL CLUTTER AND WASTE

Nature of Impact: Localised reduction in visual quality due to untidy site conditions.

Impact Description: Construction debris (packaging from PV panels, cable offcuts) can quickly degrade the aesthetic of the institutional precinct if not managed. Regular housekeeping is critical to prevent wind-blown litter from entering the municipal sidewalks or surrounding gardens.

Table 5: Visual clutter and waste

VISUAL CLUTTER AND WASTE: Localised reduction in visual quality due to untidy site conditions.	
Criterion	**Assessment**
Nature	Negative
Extent	Local (Site only)
Duration	Short-term (construction period only)
Intensity	Low
Probability	Probable
Reversibility	High
Visual Sensitivity of Area	Medium to High
Pre-Mitigation Significance:	**Low (Negative)**
Post-Mitigation Significance:	**Very Low (Negative)**
Mitigation Measures: • Maintain a "clean site" policy with daily waste removal; and • Secure all lightweight packaging (plastic/cardboard) to prevent it from becoming wind-blown litter.	

10.2. Operational Phase Visual Impact Assessment

10.2.1. PV ARRAY LAYOUT

Nature of Impact: Permanent alteration of the urban parking lot character and geometric pattern.

Impact Description: The installation of structured PV arrays over existing parking bays introduces a new geometric layer to the Bloemhof precinct. While the layout is regular and uniform, it follows the existing "human-

made" logic of the parking area. The impact is localised and does not compete with the natural topography of the surrounding area.

The visual impact is moderated by:

- Low Vertical Profile: Structures generally remain below 3 m, aligning with the height of nearby structures.
- Urban Containment: Multi-storey buildings (NPK Building) and mature trees physically block broader views.
- Functional Synergy: The carports provide dual utility (shading and power), which is a common and accepted feature in modern institutional environments.
- Baseline Context: The site is already a high-activity, modified utilitarian space.

Table 6: PV Array Layout

PV ARRAY LAYOUT Large-scale geometric pattern altering landform appearance	
Criterion	**Assessment**
Nature	Negative
Extent	Local (Site and immediate streets)
Duration	Long-term (operational life of project)
Intensity	Low
Probability	Definite
Reversibility	Medium (Structures can be removed)
Visual Sensitivity of Area	Medium to High
Pre-Mitigation Significance:	**Low- Medium (Negative)**
Post-Mitigation Significance:	**Low- (Negative)**
Mitigation Measures: • Design structures to maintain the lowest feasible height; • Ensure the layout respects and preserves all existing mature trees; and • Use non-reflective solar panels to prevent glint and glare for occupants of adjacent multi-storey buildings.	

10.2.2. VISUAL CONTRAST

Nature of Impact: Permanent difference in colour, texture, and reflectivity within the urban fabric.

Impact Description: PV panels and steel supports contrast with the traditional brick and plaster of the Stellenbosch historic core. However, the use of muted, dark-toned frames and non-reflective glass ensures the facility integrates with the existing asphalt and shaded parking environment rather than standing out as a bright or discordant element.

Table 7: Visual Contrast

VISUAL CONTRAST Panels creating visual difference with natural vegetation	
Criterion	**Assessment**
Nature	Negative
Extent	Local (Immediate vicinity)
Duration	Long-term
Intensity	Low-Medium
Probability	Definite
Reversibility	Medium
Visual Sensitivity of Area	Medium to High
Pre-Mitigation Significance:	**Low- Medium (Negative)**
Post-Mitigation Significance:	**Low (Negative)**
Mitigation Measures: • Use muted, neutral colours (e.g., dark grey) for all structural steelwork; and • Select panels with anti-reflective coating.	

10.2.3. INFRASTRUCTURE HEIGHT AND CONTAINERISED INVERTER

Nature of Impact: Potential skyline intrusion and localised visual bulk.

Impact Description: While the carports are low-profile, the containerised inverter represents a distinct visual element. If poorly placed, it could create visual clutter. By siting the container so that it is screened with vegetation/fencing, its impact on the urban skyline is negated.

Table 8: Skyline Intrusion

SKYLINE INTRUSION Tall structures potentially breaking skyline	
Criterion	**Assessment**
Nature	Negative
Extent	Local (Site only)
Duration	Long-term (operational life of project)
Intensity	Low
Probability	Definite
Reversibility	Medium
Visual Sensitivity of Area	Medium to High
Pre-Mitigation Significance:	**Low- Medium (Negative)**
Post-Mitigation Significance:	**Low- (Negative)**
Mitigation Measures: • Siting the containerized inverter solution away from primary pedestrian sightlines; and • Using screening for the container to blend with adjacent buildings **or** paint the container Dark Charcoal (RAL 7016) or Slate Grey (RAL 7015) in a matte or satin finish.	

10.2.4. NIGHT-TIME LIGHTING

Nature of Impact: Intermittent visual disturbance or glare.

Impact Description: Security lighting for the carports could contribute to light pollution in an otherwise sensitive historic town centre. By using shielded, downward-facing LEDs and avoiding floodlighting, the "dark sky" character of the night-time landscape is preserved.

Table 9: Night-time Lighting

NIGHT-TIME LIGHTING Glare or visibility at night	
Criterion	**Assessment**
Nature	Negative
Extent	Local (Site vicinity)
Duration	Long-term (operational life of project)
Intensity	Low
Probability	Possible
Reversibility	High
Visual Sensitivity of Area	Medium to High
Pre-Mitigation Significance:	**Low (Negative)**
Post-Mitigation Significance:	**Very Low (Negative)**
Mitigation Measures: • Limit lighting to essential safety requirements; and • Use directional, shielded fixtures to prevent light spill into adjacent residential or academic windows.	

10.3. Cumulative Visual Impact Assessment

Nature of Impact: Incremental shift from traditional parking to an "energy-generating" urban landscape.

Impact Description: The project adds to the growing presence of renewable energy infrastructure within the Stellenbosch municipal area. However, because it utilises existing built footprints (parking bays), it does not contribute to urban sprawl or the loss of green space. It reinforces a modern, sustainable institutional character that is consistent with the University and Town's sustainability goals.

Table 10: Cumulative Impacts

Criterion	**Assessment**
Nature	Positive (in terms of sustainability perception) / Negative (visual change)
Extent	Local
Duration	Long-term
Intensity	Low
Probability	Probable
Reversibility	Medium

Visual Sensitivity of Area	Medium
Cumulative Impact Significance:	**Low (Negative)**

10.4. Summary Impact Table

The table below provides a consolidated summary of the visual impact significance ratings for all project phases, before and after the implementation of mitigation measures. This table is intended to provide decision-makers with a clear, high-level overview of the visual implications of the proposed development.

Table 11: Summary of Visual Impact Significance Ratings

IMPACT	EXTENT	DURATION	INTENSITY	PROBABILITY	REVERSIBILITY	PRE-MITIGATION SIGNIFICANCE	MITIGATION MEASURES	POST-MITIGATION SIGNIFICANCE
CONSTRUCTION PHASE								
Earthworks and soil disturbance	Local	Short-term	Low	Definite	High	Low	Limit construction activities strictly to the approved parking bay footprints and cable routes; Ensure rapid reinstatement of asphalt or surface treatments following trenching; Shield active excavation areas from primary pedestrian thoroughfares where feasible.	Very Low
Construction camps and laydown areas	Local	Short-term	Medium	Definite	High	Low–Medium	Locate laydown areas in the least visually prominent sections of the parking area; Avoid blocking established pedestrian sightlines or access to the NPK building; and Screen storage areas with temporary high-quality shade cloth if duration exceeds four weeks.	Low
Dust generation	Local	Short-term	Low	Possible	High	Low	Implement localised dust suppression (dampening) during drilling or trenching; and Ensure all soil stockpiles are covered or removed promptly.	Very Low
Temporary structures	Local	Short-term	Medium	Definite	High	Low–Medium	Remove all temporary fencing and scaffolding immediately upon completion of structural works; and Ensure safety signage is professionally presented to avoid an "abandoned" site appearance.	Low
Visual clutter and waste	Local	Short-term	Low	Probable	High	Low	Maintain a "clean site" policy with daily waste removal; and Secure all lightweight packaging (plastic/cardboard) to prevent it from becoming wind-blown litter.	Very Low
Operational Phase

11. VISUAL AND AESTHETIC DESIGN SPECIFICATIONS

This section defines the mandatory mitigation and design measures that must be incorporated into the detailed design and installation proposals for the Stellenbosch Bloemhof Carport PV Facility. These requirements are established to ensure the development integrates sensitively with the historic, institutional, and high-value urban character of Stellenbosch.

11.1. Core Design Principles

Design must demonstrate adherence to the following principles:

- Subservience: The infrastructure must remain visually subservient to the adjacent NPK building and surrounding mature tree canopy.
- Minimalism: Structural bulk must be minimised to maintain visual transparency at the pedestrian (eye) level.
- Chromatic Integration: Use of a specific, dark-neutral colour palette to reduce visual contrast against the existing asphalt and shaded environment.

11.2. Construction Phase Requirements (Site Management)

Service providers are responsible for managing the visual impact of the installation process:

- Demarcation: All construction activity, including cable trenching to the NPK building, must be strictly contained within the approved parking bay footprints.
- Screening: If on-site storage of steelwork or panels exceeds 14 days, laydown areas must be screened with high-quality, dark-green or black shade cloth (minimum 80% opacity).
- Reinstatement: Any asphalt or paved surfaces disturbed during trenching or foundation works must be reinstated to match the original texture and colour immediately upon completion of the specific section.

11.3. Technical Specifications: Structures and Materiality

The following specifications are mandatory for all proposed solutions:

Structural Typology and Profile:

- Preferred Typology: Proposals should prioritise Single-post cantilever or "Y-frame" structures (supporting either single or double bays). Heavy four-post or "portal frame" systems are discouraged as they create excessive visual "clutter" and impede sightlines.
- Maximum Height: The maximum height of any portion of the structure (including the tilt of the PV panels) must not exceed 3.0 metres from the finished ground level.
- Tree Integration: The design must accommodate all existing mature trees. No trees may be removed or significantly pruned to make way for PV arrays. Proposals must show micro-siting of structures to respect the drip lines of established oaks and other species.

Mandatory Colour Palette and Finishes:

To ensure the facility is absorbed into the urban background, the following finishes are required:

- Support Structures: All structural steelwork (pillars, beams, and purlins) must be finished in Dark Charcoal (RAL 7016) or Slate Grey (RAL 7015). A matte or satin powder-coated finish is required; high-gloss or "galvanised silver" finishes are not permitted.
- PV Modules: Only "All-Black" modules (black cells with black back-sheets and black frames) are permitted. Standard silver-framed modules are prohibited.
- Glint and Glare: All panels must feature a high-performance Anti-Reflective Coating (ARC) to prevent solar glint for occupants of the multi-storey NPK building and adjacent properties.
- Ancillary Equipment: All visible electrical conduits, cable trays, and junction boxes must be painted or powder-coated to match the structural steel (Dark Charcoal/Slate Grey).

Inverter and Power Conversion Housing:

- Housing: The containerised inverter/battery solution must be treated as an architectural element. It must be painted Dark Charcoal (RAL 7016) or Slate Grey (RAL 7015) in a matte or satin finish **or** screened using a high-quality vertical timber slat system.
- Placement: The unit must be sited away from primary pedestrian thoroughfares and shielded by existing or new perimeter landscaping where possible.

Lighting and Signage:

- Lighting: Any required security or safety lighting must consist of warm-white (3000K) LEDs. Fixtures must be fully shielded and downward-facing to ensure zero light spill into the windows of adjacent buildings or the sky.

- Signage: No commercial branding or advertising is permitted on the carport structures. Only essential safety and high-voltage warning stickers (of minimum required size) are allowed.

11.4. Operational Phase Design and Maintenance Requirements

The appointed Service Provider shall be responsible for ensuring the facility maintains the following visual standards throughout the operational lifespan of the project:

Infrastructure Integrity and Cleaning:

- Module Maintenance: Regular cleaning of the PV panels is mandatory. The accumulation of dust, bird droppings, or "whitening" of the panels significantly increases visual contrast against the dark frames. A cleaning schedule must be provided.
- Structural Coating: The Dark Charcoal (RAL 7016) or Slate Grey (RAL 7015) powder coating/paint must be inspected annually for UV degradation, chalking, or chipping. Any rusted or faded sections must be recoated to match the original specification immediately to prevent an "industrial decay" appearance.
- Signage Control: No unauthorised third-party signage, advertising, or corporate branding may be attached to the structures at any time. Only mandatory safety/technical labelling is permitted, and must be kept in good, legible condition.

Vegetation and Screening Management:

- Tree Protection Zone: The Service Provider is prohibited from "topping" or significantly pruning the existing mature trees to increase solar yield. The system must be managed to coexist with the trees as they continue to grow.
- Landscape Integration: Where timber slats or vertical greenery have been used to screen the containerised inverter solution, these must be maintained in a neat condition. Dead plants must be replaced, and timber must be treated against silvering or rot every 24 months.

Lighting and Night-time Impact:

Warm-White Guarantee: If any LED fixtures are replaced during the operational life, they must strictly match the 3000K Warm-White colour temperature originally specified.

Access and Cable Management:

- Cable Integrity: All conduits and cable trays must remain securely fastened to the structural steel. Any sagging cables or detached conduits that create "visual clutter" must be repaired during routine maintenance visits.
- Surface Reinstatement: Should any future repairs require trenching (e.g., for cable faults), the Service Provider is contractually bound to reinstate the asphalt or paving to match the original surrounding surface within 7 days of the repair.

Refer to Visual and Aesthetic Compliance Checklist below:

Ref	Design Requirement	Compliance (Yes/No)
1.0	**STRUCTURAL SPECIFICATIONS**	
1.1	Maximum Height: Total structure height (including PV tilt) does not exceed 3.0m from ground level.	
1.2	Typology: Proposal prioritises Single-post (cantilever/Y-frame) design to maintain eye-level transparency.	
1.3	Tree Integration: Layout ensures zero removal of mature trees and respects existing drip lines.	
2.0	**COLOUR & MATERIALITY**	
2.1	Steelwork Finish: All structural steel is powder-coated/painted in Dark Charcoal (RAL 7016) or Slate Grey (RAL 7015).	
2.2	PV Modules Only "All-Black" modules (black cells, frames, and back-sheets) are specified.	
2.3	Anti-Glare: All modules include Anti-Reflective Coating (ARC) to protect NPK building occupants.	
2.4	Ancillary Equipment: All conduits, trays, and boxes are colour-matched to the dark grey structural steel.	
3.0	**POWER CONVERSION & HOUSING**	

3.1	Inverter Housing: Containerised solution is painted Dark Charcoal (RAL 7016) or Slate Grey (RAL 7015) in a matte or satin finish **or** screened with timber slats.	
3.2	Cable Routing: All AC/DC cabling between carports and the NPK building is underground (no overhead lines).	
4.0	**LIGHTING & SITE MANAGEMENT**	
4.1	Lighting Tone: Security lighting is restricted to Warm-White (3000K); cool-white/blue tones are prohibited.	
4.2	Light Spill: All fixtures are fully shielded and downward-facing to ensure zero light spill.	
4.3	Reinstatement: Commitment to immediate reinstatement of asphalt/paving to original match following trenching.	

12. CONCLUSION

The proposed Stellenbosch Bloemhof Carport PV facility will be minimally visible due to its contained location within a dense, multi-storey institutional precinct. The development is characterised by a low vertical profile (under 3 m), significant screening from mature tree canopies, and a design that is fundamentally compatible with the existing utilitarian use of the parking area. These factors ensure that the visual influence remains localized and the "enclosure effect" of the surrounding urban fabric prevents any wider impact on the Stellenbosch townscape.

Despite its proximity to sensitive receptors including students, institutional staff, and heritage tourists, the project is guided by core design principles of subservience and minimalism. The infrastructure is specifically designed to remain subservient to the adjacent NPK building and surrounding historic architectural scale. By integrating the carports into the established asphalt environment, the project avoids the introduction of discordant elements into the town's sensitive historic core.

With the implementation of the mandatory mitigation measures specifically the use of an "All-Black" module aesthetic, a dark-neutral (RAL 7016/7015) colour palette for structural steel, and shielded, downward-facing warm-white (3000K) LEDs, potential visual impacts are reduced to low or very low significance. These measures,

combined with the high Visual Absorption Capacity (VAC) of the site, ensure that the facility is perceived as a sustainable "energy resilience" improvement rather than a visual intrusion.

Ultimately, the development is considered acceptable within the context of the receiving environment and aligns with Stellenbosch's sustainability goals. With the specified visual and aesthetic design requirements strictly adhered to, the development will not result in unacceptable impacts and is fully supported from a visual perspective.

12.3	**USE OF MUNICIPAL PROPERTY LOCATED AT DEVON VALLEY (PAPPLAAS), REMAINDER FARM 183, STELLENBOSCH FOR THE CONSTRUCTION OF KENNELS FOR THE NEW MUNICIPAL K9 UNIT**

Collaborator No:
Files
IDP KPA Ref No: Good governance and compliance
Meeting Date: 27 May 2026

1. SUBJECT: USE OF MUNICIPAL PROPERTY LOCATED AT DEVON VALLEY (PAPPLAAS), REMAINDER FARM 183, STELLENBOSCH FOR THE CONSTRUCTION OF KENNELS FOR THE NEW MUNICIPAL K9 UNIT

2. PURPOSE

To request Council to:

1. Retract the in-principal approval of the establishment of a K9 Unit facility at Mountain Breeze Caravan Park.

2. Utilise the old Law Enforcement animal pound at Devon Valley (Papplaas) Remainder Farm 183, Stellenbosch for the establishment of the new K9 Unit Deployment Facility and Tactical Response Unit Training Facility.

3. The construction of:

    - Purpose-built kennels
    - A canine dip tank
    - A service dog training area
    - A Tactical Response Unit training area
    - A deployment office

4. The connection and utilisation of municipal services (water, sewage and electricity).

5. The phased establishment of a municipal service dog breeding programme to support internal capacity and other municipal K9 units.

3. DELEGATED AUTHORITY

Council

4. EXECUTIVE SUMMARY

Council previously granted in principle approval **(39TH COUNCIL MEETING: 2026-03-31: ITEM 10.1.3)** for the establishment of a K9 Unit and Tactical Response Unit facility at the Mountain Breeze Caravan Park. Subsequent financial and operational assessments have identified the Devon Valley (Papplaas) municipal property, Remainder Farm 183, Stellenbosch as a more financially viable and sustainable alternative, primarily due to reduced site preparation requirements and the proximity of municipal services.

The Municipality continues to experience increasing operational demands relating to:

- Theft and vandalism of municipal infrastructure
- Drug-related activity
- Public order incidents
- High-risk law enforcement operations
- Illegal occupation, trespassing and rural crime

The K9 Unit and Tactical Response Unit remain critical operational resources in addressing these challenges. The relocation of the proposed facility to Devon Valley (Papplaas), Remainder Farm 183 will allow the Municipality to achieve the same operational objectives already approved by Council, while doing so in a manner that is more cost-effective, practical and sustainable.

It is therefore proposed that the in-principle approval granted for the location of the units at Mountain Breeze be rescinded and replaced with this report, with no reduction in operational scope, service delivery outcomes or strategic intent.

The Department has followed up with the planning department to obtain previous approved land use application for the said property as it was allocated and used as a K9 unit and animal pound many years ago by Law Enforcement, but they could not find anything on file. We are in the process of submitting a land use application to the Planning Department to ensure compliance and continue use of the applicable portion identified for the Canine Unit Kennels zoned as Agricultural and Rural Zone, which provides for a “kennel” as a Consent Use.

5. RECOMMENDATIONS

It is recommended that Council:

1. Rescinds the in-principle approval granted for the establishment of the K9 Unit facility at Mountain Breeze Caravan Park.
2. Approves the use of the Devon Valley (Papplaas) municipal property, Remainder Farm 183, Stellenbosch for the establishment of the K9 Unit Deployment Facility and the Tactical Response Unit training facility.
3. Approves the construction of kennels, a canine dip tank, a service dog training area, a tactical response training area and a K9 deployment office at Devon Valley (Papplaas), Remainder Farm 183.
4. Approves the utilisation and connection of adjacent municipal water, sewage and electricity services to the site.
5. Supports the phased implementation of a municipal service dog breeding programme to strengthen internal capacity and long-term sustainability.

6. DISCUSSION

6.1 BACKGROUND

Council previously granted in-principal approval for the establishment of the K9 Unit facility at Mountain Breeze Caravan Park. Subsequent cost assessments indicated that the Mountain Breeze site would require high capital investment, particularly in relation to service installations (sewage, water, electricity), site preparation and mitigation measures.

The Devon Valley (Papplaas) municipal property, Remainder Farm 183, Stellenbosch was subsequently assessed as an alternative location and was found to offer significantly better financial feasibility, particularly with regard to the availability of adjacent service installations for connection, while still meeting all operational, spatial and training requirements of both the K9 Unit and the Tactical Response Unit**.**

Four (4) detection canines will be delivered to the municipality on the 4th of August 2026 and will require kennels and a training area. The procurement of kennels is underway as additional funding were received from the Police Oversight and Community Safety Department (POCS).

The Department followed up with the planning department to obtain previous approved land use application for the said property as it was allocated and used as a K9 unit and animal pound many years ago by Law Enforcement but informed us there was nothing in the file. The department are in the process of submitting a land use application to the Planning Department to ensure compliance and continue use of the applicable portion identified for the Canine Unit Kennels zoned as Agricultural and Rural Zone, which provides for a "kennel" as a Consent Use.

6.2 STRATEGIC LOCATION

Devon Valley (Papplaas) municipal property, Remainder Farm 183 offers:

- Municipal ownership and appropriate land use
- Adequate space for operational infrastructure and training area
- Reduced infrastructure and service-related costs
- A semi-rural environment conducive to tactical and canine training
- Zero impact on surrounding communities

6.3 INFRASTRUCTURE REQUIREMENTS

The proposed facility will include:

6.3.1 Kennels
- Secure and hygienic accommodation for service dogs
- Compliance with animal welfare standards

6.3.2 Dip Tank
- Essential parasite control
- Maintenance of canine health
- Prevention of operational downtime

6.3.3 Service Dog Training Area
- Obedience training
- Detection and scent-work exercises
- Scenario-based simulations
- Continuous operational readiness

6.3.4 Tactical Response Training Area
- Crowd management drills
- Tactical formation exercises
- High-risk scenario training
- Joint K9/TRU integration exercises

6.3.5 K9 Deployment Office
- Command and control point
- Equipment storage
- Administrative and K9 management functions

6.4 MUNICIPAL SERVICES CONNECTION

Municipal services are adjacent to the Devon Valley (Papplaas) municipal property which can be connected to.

Adjacent services include:

- Water supply
- Sewage infrastructure
- Electricity supply

The proximity of these services significantly improves the financial feasibility of the project compared to the Mountain Breeze site and supports efficient implementation.

6.5 CANINE BREEDING PROGRAMME

Upon full establishment, the facility will enable the development of a structured municipal service dog breeding programme.

This initiative will:

- Reduce external procurement costs
- Ensure suitable genetic selection for operational needs
- Improve sustainability of the K9 Unit
- Provide service dogs for procurement or donation to other municipal K9 units, as discussed and requested by POCS
- Position the Municipality as a regional Centre of Excellence in municipal canine development.

7. FINANCIAL IMPLICATIONS

The relocation of the project from Mountain Breeze to Devon Valley (Papplaas), Remainder Farm 183 results in:

- Lower site preparation costs
- Reduced service-related capital expenditure
- Reduced long-term operational and maintenance expenditure
- Improved cost sustainability of the Canine Unit

Long-term cost savings are anticipated through:

- Lower external canine procurement costs
- Reduced reliance on external training facilities

8. LEGAL IMPLICATIONS

The establishment of this facility falls within the Municipality's constitutional mandate relating to:

- Municipal public safety
- Municipal law enforcement
- Protection of municipal assets
- Crime prevention within municipal jurisdiction

Council is empowered to amend or rescind previous resolutions and approve alternative municipal property use where justified.

All development will comply with applicable planning legislation, building regulations, occupational health and safety requirements, and animal welfare legislation.

9. STAFF IMPLICATIONS

- One (1) Kennel hand to clean kennels and feed K9's
- Existing K9 handlers and Tactical Response Unit members will operate from the facility

10. PREVIOUS / RELEVANT COUNCIL RESOLUTIONS

Council granted in-principle approval for the use of Mountain Breeze Caravan Park as a K9 facility - **39TH COUNCIL MEETING: 2026-03-31: ITEM 10.1.3**

11. RISK IMPLICATIONS

Failure to establish a dedicated facility may result in:

- No kennel facility to accept delivery of the 4 canines scheduled for 4 August 2026.
- Delay in the operational readiness of the K9 Unit
- Limiting the expansion capacity of specialised units for drug detection, explosives, etc.

ANNEXURE A

12.4	**WRITE-OFF OF IRRECOVERABLE AND PRESCRIBED INDIGENT DEBT OLDER THAN 90 DAYS**

Collaborator No:
Files
IDP KPA Ref No:
Meeting Date: 27 May 2026

1. SUBJECT: WRITE-OFF OF IRRECOVERABLE AND PRESCRIBED INDIGENT DEBT OLDER THAN 90 DAYS

2. PURPOSE

To obtain approval from Council to write-off irrecoverable debt older than 90 days, including prescribed indigent debt, as per Section 3(1) (i) of the Irrecoverable Debt Policy.

3. DELEGATED AUTHORITY

Council to approve in terms of Section 1 and 3(1)(i) of the Irrecoverable Debt Policy.

4. EXECUTIVE SUMMARY

Indigent consumers' debt increases constantly, although it is periodically written off. This is mainly due to new indigent applications, financial distress of indigent consumers, lack of enforceability and other challenges that the administration experience during the debt collection process. The municipality cannot restrict the electricity supply in areas where Eskom is the service provider. Excessive and uncontrollable water consumption also contributes to the huge outstanding debt. In addition, debt associated with indigent consumers often accumulates, despite the support measures, resulting in administrative burdens and distortion of the debtor's book.

The installation of Water Management Devices (WMD's) will provide relief to above-mentioned challenges, and it will also prevent the indigent consumers from building up huge arrears on their municipal accounts. The Finance Department, together with the Engineering Department is in the process to source and install the water management devices to prevent excessive water consumption. The finance department already identified properties with high water consumptions and Indigent consumers. Listings have been submitted to the Engineering Department for installation and 675 WMD's have been already installed. Currently new listings are prepared and will also be sent to the Engineering Services Department for installation.

The attached Appendix 1 contains outstanding indigent debt older than 90 days and debt that has prescribed due to various reasons and circumstances. Therefore, in terms of legislation, the outstanding debt is no longer recoverable, is not financially viable to collect or to continue with further litigation. Same will also be extremely costly, time consuming and ineffective.

In order to ensure prudent financial management, compliance with accounting standards, improve accuracy of the Municipality's financial position and to prevent the municipality from incurring further expenditure that may be regarded as wasteful, it is recommended that the outstanding balances as per Appendix 1 (**R 29 175 879.74**), plus any costs/interest levy after date of this report, be written off as irrecoverable. It must be noted that the administration simultaneously is strengthening internal controls and enforcement mechanisms.

5. RECOMMENDATIONS

(a) that the Accounts listed in Appendix 1 are regarded as irrecoverable and that the total outstanding balances of **R 29 175 879.74**, at the time of drafting the report, plus any interest or costs levied after this report, be written off;

(b) that the Engineering Department, in conjunction with the Finance Department, continues with the installation of Water Management Devices as a matter of urgency, for all households as per Appendix 1;

(c) that all the eligible consumers be issued with a formal notice before installation;

(d) that all leaks will be repaired by the Engineering Department, and that such meters be capped at a maximum of 12 kiloliters per month as per Council's Credit Control and Debt Collection Policy;

(e) that should consumers fail to pay the allocated 12 kiloliters, the WMD's be further restricted to the subsidized 6 kiloliters of water as per Council's Credit Control and Debt Collection Policy;

(f) that in cases where consumers refuse that WMD's are installed, the reasons for the refusal be recorded and that the arrear debt be collected as per the Credit Control and Debt Collection Policy of Council;

(g) that administration continues with ongoing verification and review of indigent status of consumers;

(h) that the administration continues with measures to prevent abuse of the indigent support system;

(i) that the administration continues with regular reassessments as per the Indigent Policy of Council;

(j) that the write-off of outstanding debt be reversed and immediately recovered through the normal legal processes, if the administration discovers any irregularities with an indigent application; and

(k) that the write-off of arrear debt on a property be reversed if the property is sold within 24 months from the date when the write-off took place.

6. DISCUSSION / CONTENTS

6.1 Background

Debt that is older than three years has prescribed by law and is no longer considered to be legally recoverable. The approved Irrecoverable Debt Policy allows for the debt of special cases where all applicable credit control and debt collection actions were impossible/impractical to implement, to motivate same for consideration for write-off.

Although the indigent consumers are subsidized for water, electricity, sanitation, refuse and monthly rental, the accumulated debt on these accounts did not decline but instead, it increased monthly. This is mainly due to socio-economic challenges which make it impossible for the indigent consumers to settle their accounts. Another contributing factor is the high-water consumption levels of the Indigent consumers, due to leakages which they cannot afford to repair by themselves.

The Revenue Department together with the Engineering Department is in the process to repair all the leakages of these Indigent consumers and to replace the conventional meters with a Water Management Device, capped at 12 kilolitres per month. There are also Indigent consumers who in the past did not pay rent in respect of the Council's Rental Agreements of which some of the consumers have been evicted and others could not be evicted due to national legislation not allowing same. Due to the non-

eviction of consumers in rental properties, rental amounts increased to an amount consumers cannot afford.

All the indigent consumers as per the attached Appendix 1 meet the criteria as set out in the Indigent Policy and they are regarded as the poorest of the poor.

These matters were submitted to the Chief Financial Officer, and it was agreed that the matters be submitted to Council for write-off.

6.2 Discussion

6.2.1 The attached list with balances as per Appendix 1 (**R 29 175 879.74**) at the time of this report, contains details of indigent customer accounts where normal credit control and debt collection measures and processes will not be successful in recovering the full outstanding debt. Further attempts to recover the debt will also not be cost effective. Some of these debts are also older than three years and have therefore prescribed in terms of Section 11 of the Prescription Act, 69 of 1969.

There are two main challenges faced by the municipality that hamper the efforts and processes at the credit control and debt collection section.

(i) Firstly, there are several areas where the municipality does not provide electricity to the community. Eskom is the service provider in these areas, and the blocking or restriction of the electricity supply is not possible.

(ii) Secondly, indigent consumers tend to have high water consumption, due to leakages, a high number of occupiers on the property or in some extreme cases due to wasteful behaviour. This results in high water accounts that these consumers are unable to pay.

A list with a total of **R 29 175 879.74** arrear debt as per Appendix 1 are submitted to be written off.

The Table below gives an indication of the outstanding debt per Geographical area.

SUBURB	TOTAL OF DEBT OLDER THAN 90+ DAYS
Landquedoc	R 6 359 408.96
Stellenbosch Flats	R 514 659.43
Cloetesville	R 1 117 775.77
Idas Valley	R 625 238.27
Johannesdal	R 84 383.36
Franschhoek	R 641 173.47
Greenoaks	R 153 940.25
Jamestown	R 912 777.85
Kayamandi	R 5 892 514. 85
Kylemore	R 2 754 091.13
Klapmuts	R 6 202 700.74
La Motte	R 3 113 387.68
Pniel	R 166 087.96
Raithby	R 99 209.97
Wemmershoek	R 538 530.05
TOTAL	R 29 175 879.74

6.3 Financial Implications

Irrecoverable debt of **R 29 175 879.74** has been provided for in the Provision for Bad Debts, hence there is no real loss for the municipality.

Further implications include the reduction in the total outstanding debtor's book, improving the accuracy and credibility of the financial statements and potential improvement in future collection/restriction of services through strengthened controls

6.4 Legal Implications

The proposed write-offs must comply with the MFMA, and applicable Accounting Standards and the Municipality's Credit Control and Debt Collection Policy must be adhered to.

6.5 Staff Implications

None.

6.6 Previous / Relevant Council Resolutions:

None.

6.7 Risk Implications

Risk of non-compliance or abuse if controls are not strictly enforced.

6.8 Comments from Senior Management:

6.8.1 Director: Corporate Services:

6.8.1 Chief Financial Officer:

Supports the Item.

6.8.2 Municipal Manager:

Supports the Item.

12.5	WRITE-OFF OF IRRECOVERABLE AND PRESCRIBED DEBT THAT IS OLDER THAN 90 DAYS

Collaborator No:
Files
IDP KPA Ref No:
Meeting Date: 27 May 2026

1. SUBJECT: WRITE-OFF OF IRRECOVERABLE AND PRESCRIBED DEBT THAT IS OLDER THAN 90 DAYS

2. PURPOSE

Council to approve the write-off of irrecoverable and prescribed debt as discussed below.

3. DELEGATED AUTHORITY

Council to approve in terms of Par 1 and 3(1)(i) of the Irrecoverable Debt Policy.

4. EXECUTIVE SUMMARY

The attached Appendix 1 contains instances where:

- Outstanding debt has prescribed due to various reasons and circumstances and is therefore, in terms of legislation, no longer recoverable.
- It will be no longer be financially viable to continue with further litigation to recover these outstanding debt as it will be extremely costly, time consuming and ineffective.

Debt could become uneconomical or irrecoverable to collect due to one of the following reasons:

1. Debt prescribed (older than three years).
2. Consumer could not be traced.
3. Consumer went overseas.
4. Arrear amounts is not cost effective to collect.
5. Liquidation/Insolvent consumer.

To prevent the municipality from incurring further expenditure that may be regarded as wasteful, it is recommended that the outstanding balances as per Appendix 1) (R110 783 482.96), plus any costs/interest levied after the date of this report, be written off as irrecoverable.

The write-off of these debts could be financed from the Provision for Bad Debts.

5. RECOMMENDATION

It is hereby recommended:

that the accounts listed in APPENDIX 1 be regarded as irrecoverable and that the total outstanding balances of R110 783 482.96 at the time of drafting the report, plus any interest or costs levied after this report, be written off against the Provision for Bad Debts.

6. DISCUSSION / CONTENTS

6.1 Background

Debt that is older than three years prescribes by law and is no longer considered to be legally recoverable. The approved Irrecoverable Debt Policy allows for debt in special cases to be written off, where the applicable credit control and debt collection actions were impossible/impractical to be implemented.

The Credit Control Section is monitoring and analysing outstanding debt on a regular basis to make sure that it is still recoverable. During these processes they identified historic debt that are not recoverable. This includes debt of indigent consumers as well as other categories of consumers.

Although indigent consumers are subsidized for water, electricity, sanitation and refuse monthly, the accumulated debt on these accounts does not decline. Instead, it increases on a monthly basis. This is mainly due to socio-economic challenges which make it impossible for the consumers to settle their accounts. Another contributing factor is the high-water consumption levels of the Indigent consumers, due to leakages which they cannot afford to repair by themselves. They also identified debt in areas where Eskom is the service provider for the provision of electricity and where it is very challenging to perform credit control actions.

These matters were reported to the Chief Financial Officer, and it was agreed that the irrecoverable debt that was identified, should be submitted to Council for approval to be written off.

6.2 Discussion

6.2.1 The attached balances as per Appendix 1 (R110 783 482.96) at the date of the report, contains details of indigent customer accounts as well as other categories of consumers, where all applicable actions have been executed/implemented and normal credit control and debt collection measures and processes have not been successful in recovering the full outstanding debt. Further attempts to recover the debt will also not be cost effective.
Some of these debts are also older than three years and have therefore prescribed in terms of Section 11 of the Prescription Act, Act 69 of 1969.

6.3 Financial Implications

Sufficient provision has been made in the Provision for Bad Debts to write-off the irrecoverable debt amount of **R 110 783 482.96**, hence there is no real loss for the municipality.

Benefits derived from the write off of irrecoverable debt includes;

1. A reduction in the total outstanding debtor's book amount.

2. Improvement in the accuracy and credibility of the financial statements

3.The potential improvement in future collection/restriction of services strategies.

4. It will also improve the credit rating of the municipality.

6.4 Legal Implications

The proposed write-offs must comply with the MFMA, and applicable Accounting Standards and the Municipality's Irrecoverable Debt Policy and the Credit Control and Debt Collection Policy must be adhered to.

6.5 Staff Implications

None.

6.6 Previous / Relevant Council Resolutions:

None.

6.7 Risk Implications

None.

6.8 Comments from Senior Management:

6.8.1 Director: Corporate Services:

***6.8.1* Chief Financial Officer:**

Compiled the Item.

***6.8.2* Municipal Manager:**

Supports the item

12.6	APPROVAL OF DEBT AGREEMENT

Collaborator No:
Files
IDP KPA Ref No: Good Governance and Compliance
Meeting Date: 27 May 2026

1. SUBJECT: APPROVAL OF DEBT AGREEMENT

2. PURPOSE

To obtain Council's approval for the raising of an external loan in terms of Section 46 (2) of the Municipal Finance Management Act (Act No 56 of 2003).

3. DELEGATED AUTHORITY

Council

4. EXECUTIVE SUMMARY

During April 2026, an advertisement was placed in the newspaper "Die Burger", Eikestaad nuus, the e-portal and municipal website, inviting interested parties to make submissions regarding the financing of the proposed loan of R198 019 488.

Submissions were received from four authorized financial institutions:

(a) ABSA Bank

(b) Nedbank

(c) Standard Bank

(d) First National Bank (FNB)

After due process, in terms of the municipality's approved Supply Chain Management Policy, the offer of *Nedbank for the term of 15 years*, was adjudicated by the Bid Adjudication Committee and approved by the Municipal Manager as being the most favorable for Council.

5. RECOMMENDATIONS

(a) that Council approves the debt agreement as stipulated in **ANNEXURE A**;

(b) that the community input and written submissions, as well as Provincial- and National Treasury letters received, attached as **ANNEXURE B,** be noted; and

(b) that the Municipal Manager be mandated to enter into a loan agreement with Nedbank.

6. DISCUSSION

6.1 Background

That Council specifically note and considers the need to take up an external loan, needed for investment in income generating infrastructure to the amount of R198 019 488.

6.2 Purpose of funding

The following infrastructure projects, as included in the capital budget and approved by Council on 30 May 2025, requires external loan funding, but it can possibly be used on other capital items as well:

PROJECT NAME	IDP OBJECTIVE
Expansion of the landfill site (New cells)	Green and Sustainable Valley
Bien don 66/11kV substation new	Valley of Possibility
Electricity Network: Pniel	Valley of Possibility
Jan Marais Upgrade: Remove Existing Tx and replace with 20MVA	Valley of Possibility
Kayamandi new substation 11 kV switching station	Valley of Possibility
Network Cable Replace 11 Kv	Valley of Possibility
SCADA Implementation	Green and Sustainable Valley
Streetlights R304	Dignified Living
Switchgear Substation Groendal	Valley of Possibility
Switchgear Substation Merriman Z	Valley of Possibility
System Control Centre & Upgrade Telemetry:	Dignified Living
Upgrade transformers at Main substation 7.5MVA to 20MVA	Dignified Living
Bulk Water Supply Pipe and Reservoir: Stellenbosch	Valley of Possibility
Bulk Water Supply Pipe Line & Pumpstations: Franschhoek	Valley of Possibility
Waterpipe Replacement	Dignified Living
Refurbish Plant & Equipment - Raithby WWTW	Dignified Living
Sewerpipe Replacement	Dignified Living
Upgrade of WWTW Wemmershoek	Dignified Living

6.3.1 Financial Implications

The total estimated cost of the borrowing over the repayment period is disclosed in the table below.

DESCRIPTION	15 YEAR TERM
Capital	R198 019 488
Interest	R176 741 132
Total	**R 374 760 620**

6.4 S46 (3) MFMA Written Comments

Objection and comments were received from Mr. Booysen who raised concerns regarding infrastructure implementation, borrowing levels, affordability, and grant utilisation. Mr Booysen's written submission is included in **Annexure "B"** as well as the Municipality's response.

It is important to note that the municipality's borrowing capacity and infrastructure capital projects are informed by the Capital Expenditure Framework which includes the Long-term financial plan and affordability envelope over a ten-year horizon.

The Western Cape Provincial Treasury provided written comments on the borrowing proposal and based on its assessment concluded inter alia that the municipality has the fiscal capacity to borrow money and service the loan. However, The Provincial Treasury advises that the municipality should continue to carefully manage any potential risks due to economic uncertainties, capital project implementation, affordability criteria and the municipality's solvency.

The comment from National Treasury is outstanding at the time of the council item submission.

6.5 Legal Implications

In terms of Section 160(2) of the Constitution, a Council may not delegate the function to raise a loan. Section 160(3) stipulates that any decision regarding the raising of a loan must be taken by Council with the supporting vote of the majority of its members.

The procedures to be followed to raise a loan, are stipulated in Section 46 of the Municipal Finance Management Act (MFMA). According to Section 46 of the MFMA, the following procedures must be followed:

s.46(2)(a) A Council resolution must be obtained to approve the debt agreement. The Mayor must then sign such a resolution.

s.46(3)(a) The Accounting Officer (Municipal Manager) must sign the Debt Agreement.

s.46(3)(a) An information statement must be made public 21 days prior to the Council meeting. The public, National Treasury and the Provincial Treasury, must be invited to submit written comments in respect of the proposed loan.

A copy of the information statement is attached as **ANNEXURE "C"** and was published in the newspapers, "Eikestadnuus" and "Die Burger". In the information statement the public was invited to submit written comments in respect of the proposed loan.

National Treasury and the Provincial Treasury were invited by letter to submit their comments in respect of the proposed loan.

MFMA Section 46(3)(b) requires that the information statement be submitted to the Council at least 21 days before the Council meeting where the Council is to consider taking up the loan. Therefore, the information statement, along with other supporting documentation, was distributed to each individual councilor on 22 April 2026.

The closing date for comments was 15 May 2026, and all comments are included in **ANNEXURE "B**", except for the comment from the National Treasury, which is outstanding at the time of the council item submission.

6.6 Staff Implications

This report has no staff implications to the Municipality.

6.7 Previous / Relevant Council Resolutions

Council approved the external loan funding at the Council meeting held on 30 May 2025.

6.8 Risk Implications

This report has no risk implications for the Municipality.

6.9 Comments from Senior Management

6.9.1 *Municipal Manager:*

Agree with the recommendations

1. **DEFINITIONS AND INTERPRETATION**

1.1. In this Agreement unless clearly inconsistent with or otherwise indicated by the context the following expressions shall bear the meanings ascribed to them hereunder and cognate expressions shall bear corresponding meanings -

1.1.1. "**Accounting Officer**" will have the meaning ascribed thereto in the MFMA;

1.1.2. "**Advance Date**" means 26 June 2026

1.1.3. "**Agreement**" means the agreement set out in this document;

1.1.4. "**Applicable Laws**" means and includes common or customary law and any constitution, decree, judgement, legislation, order, ordinance, statute, treaty or other legislative measure applicable to any of the Parties and includes any present or future directive, regulation, guideline, practice, concession, instruction, request or requirement issued by any national, regional or local government or any governmental, administrative, fiscal, judicial or government owned body, department, agency, public or regulatory authority, corporation or commission, court or tribunal or any person having jurisdiction within the Republic of South Africa, whether or not government owned or controlled and howsoever constituted;

1.1.5. "**Applicable Public Sector Legislation**" means legislation applicable to the public sector, including but not limited to the Municipal Finance Management Act No. 56 of 2003 ("**MFMA**"), the Treasury Regulations promulgated in terms of section 76 of the PFMA, the Borrowing Powers of Provincial Governments Act No. 48 of 1996, the MFMA, Local Government: Municipal Systems Act No. 32 of 2000, the Preferential Procurement Policy Framework Act No. 5 of 2000 ("**PPPFA**") and the Preferential Procurement Regulations promulgated in terms of section 5 of the PPPFA;

1.1.6. "**Amortising Schedule**" means the amortisation schedule contained in schedule 1, indicating the repayment amounts, consisting of Capital and interest, payable in bi-annual instalments in arrears on the respective Interest and Capital Payment Dates, in terms of this Agreement, to be provided on the Interest Rate Quotation Date;

1.1.7. "**Basic Municipal Service**" will have the meaning given to it in the MFMA;

1.1.8. "**Banks Act**" means the Banks Act No. 94 of 1990;

1.1.9. "**Base Rate**" means the fixed rate, expressed as an NACS rate;

Base Rate	8,09% (eight comma zero nine Percent) Indicative

The Base Rate will be quoted on the Disbursement Date.

1.1.10. "**Basis Point**" means 1/100 (One Hundredth) of 1 (One) percentage point;

1.1.11. "**Borrower**" means Stellenbosch Municipality;

1.1.12. "**Borrower Account**" means the Borrower's bank account as advised to Nedbank in writing by the Borrower;

1.1.13. "**Breakage Costs**" means the aggregate of all loss, premiums, penalties, fees, costs, charges, expenses and disbursements incurred or suffered by Nedbank or successful claims made against Nedbank in closing out, settling or unwinding any hedging arrangements, including, *inter alia,* any loan, swap, forward interest rate agreement, foreign exchange contract or other financial instrument relating directly or indirectly to the financing in terms of the Agreement;

1.1.14. "**Breakage Gains**" means the aggregate of all gains, premiums, penalties, fees, costs, charges, expenses and disbursements saved by Nedbank in closing out, settling or unwinding any hedging arrangements, including, *inter alia*, any loan, swap, forward interest rate agreement, foreign exchange contract or other financial instrument relating directly or indirectly to the financing of the Loan;

1.1.15. "**Business Day**" means any day other than a Saturday, Sunday or an official public holiday in the Republic of South Africa;

1.1.16. "**Capital**" means an amount of R198,019,488.00 (one hundred and ninety eight million, nineteen thousand, four hundred and eighty eight rand);

1.1.17. "**Capital Budget**" shall have the meaning ascribed to it in the MFMA, as approved in terms of Section 5, 16, 17, 19 and 24;

1.1.18. "**Capital Outstanding**" means that portion of the Capital that is at any time outstanding, reduced in accordance with any repayment thereof made in terms of this Agreement;

1.1.19. "**Capital Projects**" means the Borrowers capital projects for the 2026/2027 financial year, as contemplated in the Capital Budget;

1.1.20. "**Capital Project Assets**" means the assets that will be acquired by the Borrower as identified in the Capital Project;

1.1.21. "**Capital Repayments**" means the bi-annually repayments of the Capital Outstanding as per the Amortising Schedule;

1.1.22. "**Companies Act**" means the Companies Act No. 71 of 2008;

1.1.23. "**Confidential Information**" shall have the meaning set out in clause 23;

1.1.24. "**Cross Default**" means any material Indebtedness or obligation or any loan, debt or guarantee constituting Indebtedness of the Borrower becomes due and payable prior to its specified maturity by reason of any default, or is not paid when due, whether or not the Bank is concerned therewith or any creditor of the Borrower becomes entitled to declare any indebtedness cancelled or suspended or due and payable prior to its specified maturity

1.1.25. "**Default Interest Rate**" means the applicable Interest Rate plus 300 (Three Hundred) Basis Points per annum expressed as a NACS rate;

1.1.26. "**Dispose**" means to sell, transfer, cede, assign, lease, alienate, donate, renounce, surrender, waive, relinquish, exchange or otherwise dispose of;

1.1.27. "**Encumbrance**" means any mortgage, pledge, hypothecation, lien, lease, option restriction, right of first refusal, right of pre-emption, right of retention, right of set-off, right of consolidation or merger (excluding any right of set-off, consolidation or merger arising in favour of Nedbank by operation of law) third party right or interest, assignment, title extension, trust arrangement, cession, security interest or any kind or any other encumbrance or any other type of preferential arrangement having the effect of creating a security interest or right of retention;

1.1.28. "**Event of Default**" means any of the events described in clause 14;

1.1.29. "**Final Repayment Date**" means 1 July 2041 as stipulated in the Amortising Schedule.

1.1.30. "**Going Concern**" means that should the Auditor-General raise a going concern issue with regards to this Borrower, the repayment of the outstanding capital and accrued interest will be accelerated.

1.1.31. "**GRAP**" means Generally Recognised Accounting Practice;

1.1.32. "**Indebtedness**" shall be construed as widely as possible so as to include any obligation (whether incurred as principal, guarantor or surety) for the payment or repayment of money, whether present or future, actual or contingent and shall include, without limitation –

1.1.32.1. monies borrowed or raised;

1.1.32.2. the outstanding principal amount of any bond, note, loan stock, debenture or similar instrument;

1.1.32.3. any amount raised pursuant to any issue of shares which are expressed to be redeemable; and

1.1.32.4. deferred payments for assets or services acquired;

1.1.33. "**Integrated Development Plan**" will have the meaning given to it in Chapter 5 of the Local Government: Municipal Systems Act No. 32 of 2000;

1.1.34. "**Interest Rate**" means 9,44% (nine comma four four Percent), being a fixed rate option equal to the Base Rate plus the all-in margin rate of 1,35% (expressed as an NACS rate);

1.1.35. "**Interest Rate Quotation Date**" means the day on which Nedbank advises the Borrower of the Interest Rate applicable to the Loan;

1.1.36. "**Interest Period**" means –

1.1.36.1. the period commencing on the Advance Date and ending on the first Repayment Date thereafter;

1.1.36.2. each period after the period described in clause 1.1.36.1 commencing on the previous Repayment Date and ending on the next Repayment Date, inclusive of the final Interest Period commencing on the last Repayment Date and ending on the Final Repayment Date;

1.1.37. "**JIBAR**" means, on any applicable date and in respect of the relevant period described in this Agreement –

1.1.37.1. the arithmetic mean (rounded, if necessary, to the nearest 3rd (Third) decimal place) of the mid-market rates for Rand deposits for the relevant period as they appear on the Reuters display page designated as "SAFEY" (or such other page as may replace such page on such service) at or about 11:00am Johannesburg time on such date; or

1.1.37.2. if no such service is available, "JIBAR" shall mean the arithmetic mean (rounded, if necessary, to the third decimal place and excluding (to the extent applicable) the 2 (Two) highest rates and the 2 (Two) lowest rates) of the mid-market deposit rates, as supplied to Nedbank and confirmed by Nedbank to the Borrower in reasonably sufficient detail, quoted by the JIBAR Reference Banks in the ordinary course of business in the Johannesburg interbank market at or about 11:00am (Johannesburg time) on such date for Rand deposits for the relevant period, provided that if any of the JIBAR Reference Banks shall be unable or otherwise fail to supply such rate by 11:00am (Johannesburg time) on the required date, JIBAR for the relevant period shall be determined, on the basis of the quotation(s) of the remaining JIBAR Reference Bank(s), on the same basis, to the extent possible, as set out above;

1.1.38. "**JIBAR Reference Banks**" means the principal Johannesburg offices of the banks that quote deposit rates to the South African Futures Exchange from time to time, it being recorded that as at the Signature Date the JIBAR Reference Banks are Standard Bank of South Africa Limited, First National Bank of Southern Africa Limited, Absa Bank Limited and Investec Bank Limited;

1.1.39. "**Loan**" means the term loan in an amount equal to the Capital which is made available by Nedbank to the Borrower in terms of this Agreement;

1.1.40. "**Margin**" means 1,35% (one comma three five Percent) per annum expressed as an NACS rate;

1.1.41. "**Market Disruption Event**" means an event or circumstance specified as such in clause 8.

Commented [MP1]: Rate to be confirmed on disbursement date.

1.1.42. "**Market Disruption Premium**" means the difference between the Nedbank Liquidity Premium on the Interest Rate Quotation Date and the Nedbank Liquidity Premium on the Advance Date;

1.1.43. "**Material Adverse Change**" means an event, circumstance or matter or combination of events, circumstances or matters, including but not limited to:

1.1.43.1. Serious Financial Problems
The criteria for determining serious financial problems shall be those stipulated in section 138 of the MFMA, singularly or in combination occurs or the criteria for determining serious or persistent material breach of financial commitments occurs as contemplated in section 140 of the MFMA.

1.1.43.2. Provincial Intervention
It is necessary for a provincial intervention in terms of section 136 of the MFMA, whether it is a discretionary intervention (section 137) or a mandatory provincial intervention (section 139).

1.1.43.3. Financial Recovery Plan
A financial recovery plan, as contemplated in Chapter 13 of the MFMA, is in relation to the Borrower.

1.1.43.4. Stay of Legal Proceedings
If the Borrower applies for an order to stay legal proceedings and/or for extraordinary relief, as contemplated in Chapter 13 of the MFMA.

which has not been disclosed in writing to Nedbank prior to the signing of the loan agreement and which, in the reasonable opinion of Nedbank, will have or would be likely to have a material adverse effect on –

1.1.43.5. the business, operations, property, assets, condition (financial or otherwise) or prospects of the Borrower; or

1.1.43.6. the ability of the Borrower to deliver services and conduct its business in the normal, regular and ordinary course; or

1.1.43.7. the ability of the Borrower to perform its obligations under this Agreement; or

1.1.43.8. the legality, validity or enforceability of this Agreement;

without derogating from the foregoing, "**Material Adverse Change**" will also include any significant change in the MFMA and/or other Applicable Laws;

1.1.44. "**Mayor**" will have the meaning given to it in the MFMA;

1.1.45. "**MFMA**" means the Local Government Municipal Finance Management Act No. 56 of 2003;

1.1.46. "**NACS**" means nominal, annual, compounded bi-annually in arrears on the first day of the month immediately following the calendar period in which the interest has accrued;

1.1.47. "**Nedbank**" means Nedbank Limited, (registration number 1951/000009/06), a company registered and incorporated in accordance with the Companies Act and registered as and conducting the business of a bank in terms of the Banks Act;

1.1.48. "**Nedbank Liquidity Premium**" means, at 9h00 on a specified date, the difference between the 1 (One) year NCD rate as quoted on the Reuters NEDMM screen, as a nacq (nominal annual compounded quarterly) rate and the 1 (One) year swap rate as quoted on the Reuters NDIRS screen, as a nacq (nominal annual compounded quarterly).

1.1.49. "**Outstanding Capital**" means the balance of the Capital from time to time as it is reduced in terms of clauses 10 and 11;

1.1.50. "**Outstandings**" means at any given time, and from time to time, the aggregate of –

1.1.50.1. the Outstanding Capital;

1.1.50.2. any other amounts due from time to time under this Agreement which have not been paid; and

1.1.50.3. any unpaid interest accrued or capitalised on the amounts described in clauses 1.1.50.1 and 1.1.50.2 in terms of this Agreement;

1.1.51. "**Parties**" means Nedbank and the Borrower;

1.1.52. "**Permitted Encumbrances**" means any encumbrance which is existing prior to the advance date of the Agreement and which has been disclosed to Nedbank prior to the advance date or provided for in the audited annual financial statements of the Borrower;

1.1.53. "**Permitted Indebtedness**" means –

1.1.53.1. indebtedness accruing from capital and operational expenditure, incurred in implementation of approved budgets of the Borrower; and

1.1.53.2. indebtedness which complies in all respects with the provisions of the MFMA and other Applicable Laws;

1.1.54. "**Potential Event of Default**" means any event which may become (with the passage of time, the giving of notice, the making of a determination hereunder or any combination thereof) an Event of Default;

1.1.55. "**Prepayment Date**" shall have the meaning set out in clause 10.1.2;

1.1.56. "**Repayment Dates**" means, with the exception of the Final Repayment Date, the date on which the Borrower has the obligation to make payment of Capital plus interest as specified in the Amortising Schedule, provided that where such dates fall on a date which is not a Business Day, the relevant Repayment Date shall be the immediately preceding Business Day;

1.1.57. "**Signature Date**" means the date on which this Agreement is signed by the Party signing last in time;

1.1.58. "**Suspensive Conditions**" means the suspensive conditions described in clause 2;

1.1.59. "**Taxes**" means any tax, charge, impost, duty, deduction, withholding, fee or levy of any kind whatsoever (or any amount payable on account of or as security for any of the foregoing) levied, imposed, collected, withheld or assessed, or which may after the Signature Date become levied, imposed, collected, withheld or assessed by any central, provincial or local government body or other organ of state on any other person, whether under the Income Tax Act, 58 1962 or any other present or future legislation, including any interest, additions, fines, surcharges or other penalties imposed by the applicable body in respect thereof, and "**Tax**" shall have a corresponding meaning;

1.1.60. "**Term**" means the period of 15 (Fifteen) years commencing on the Advance Date and terminating on the Final Repayment Date or such earlier date on which this Agreement is otherwise terminated in accordance with its terms;

1.1.61. "**Unpaid Sum**" means any sum due and payable but unpaid by the Borrower under this Agreement;

1.1.62. "**VAT**" means value added tax levied in terms of the Value Added Tax Act 89 of 1991; and

1.1.63. "**Warranties**" shall have the meaning set out in clause 12.

1.2. any reference to a statute or statutory provision includes a reference to that statute or statutory provision as amended, extended or re-enacted and to any regulation, order, instrument or subordinate legislation under such statute or statutory provision;

1.3. any reference to any other agreement, document or instrument shall be to that agreement, document or instrument as amended, varied, novated or replaced from time to time;

1.4. words and expressions defined in any clause shall, notwithstanding that they are not defined in clause 1.1, bear the meanings assigned to such words and expressions in such clause wherever they are used in this Agreement;

1.4.1. when any number of days is prescribed, such number shall be calculated inclusively of the first and exclusively of the last day;

1.4.2. any reference to days (other than a reference to Business Days), months or years shall be a reference to calendar days, months or years, as the case may be;

1.4.3. where any act is to be performed on a day which is not a Business Day, such act shall be performed on the next Business Day save for Repayment Dates;

1.5. words importing the singular shall include the plural and vice versa;

1.6. words referring to one gender shall include a reference to the other genders;

1.7. any reference to a person shall include a reference to an individual, a firm, a body corporate, a trust, an unincorporated association, government or a partnership and that person's legal representatives and successors;

1.8. if any provision in clause 1.1 is a substantive provision conferring rights or imposing obligations on any Party, effect shall be given to that provision as if it were a substantive provision in the body of this Agreement;

1.9. clause headings have been inserted for convenience only and shall not be taken into account in its interpretation;

1.10. the rule of construction that a contract or any term thereof shall be interpreted against the party responsible for the drafting of or preparation of that contract or term, shall not apply; and

1.11. the use of the word "including" followed by a specific example shall not be construed as limiting the meaning of the general wording preceding it.

2. SUSPENSIVE CONDITIONS

2.1. The rights and obligations of the Parties under this Agreement (other than those set out in this clause 2, and clauses 16 and 19 to 24, which shall be of immediate force and effect) are subject to and conditional upon the fulfilment of the following Suspensive Conditions on or before the Advance Date ("**Fulfilment Date**") or such later date as may be determined in terms of clause 2.3–

2.1.1. Nedbank has been provided with a certified copy of a resolution of the Municipal Council, signed by the Mayor approving the Transaction contemplated by this Agreement and authorising the Accounting Officer, on its behalf, to sign this Agreement and all documents and notices to be signed by it under or in connection with this Agreement;

2.1.2. receipt by Nedbank of a specimen of the signature of each person authorised by the resolution referred to in clause 2.1.1;

2.1.3. written confirmation by the Borrower that it has complied with the requirements of the MFMA and all other Applicable Laws in so far as it relates to the Agreement inclusive of copies of:

2.1.3.1. an information statement, setting out the particulars of the debt, the amount, the purpose of the debt and that the public, the national treasury and the provincial treasury has been invited to submit written

comments to the council, has been made public 21 (Twenty-One) days prior to the meeting of the council;

2.1.3.2. a copy of the information statement has been submitted to the municipal council 21 (Twenty-One) days prior to the meeting together with particulars of the repayment terms, the anticipated payment schedule and the anticipated total costs.

2.1.4. execution of necessary legal documentation relating to the funding by all parties;

2.1.5. the Borrower having complied with all requests for information made by Nedbank in terms of the Financial Intelligence Centre Act, No. 38 of 2001, the Prevention of Organised Crime Act No. 121 of 1988, the Banks Act and any other money laundering legislation applicable at the time such requests are made;

2.1.6. written confirmation by the Borrower that no Event of Default or Potential Event of Default or Material Adverse Change has occurred and is continuing.

2.2. The Borrower shall use its best endeavours to procure the fulfilment of the Suspensive Conditions.

2.3. The Suspensive Conditions are stipulated to be for the benefit of Nedbank, which shall, by written notice to the Borrower to that effect given by not later than the Fulfilment Date, be entitled to waive some or all of the Suspensive Conditions and/or to extend the date by which some or all of the Suspensive Conditions are to be fulfilled.

2.4. If any of the Suspensive Conditions are not fulfilled (and fulfilment thereof is not waived in terms of clause 2.3) on or before the Fulfilment Date, this Agreement will terminate and be of no further force or effect and, to the extent that this Agreement may have been partially implemented, the Parties shall be restored as nearly as may be possible to the positions in which they would have been had this Agreement not been entered into and neither Party shall have any claim against the other Party as a result of the failure of the Suspensive Conditions, save for such claim as may arise out of a breach of this clause 2 or under any clause which remains in force and effect.

3. **PURPOSE**

The Loan shall be used by the Borrower to finance its Capital Projects for the 2026/2027 financial year. Without prejudice to the foregoing obligations of the Borrower, Nedbank shall be entitled but shall not be obliged to ascertain whether or not the Borrower has applied the Loan for the aforesaid purposes.

4. **ADVANCE**

4.1. Nedbank, relying upon each of the representations, undertakings and Warranties included in this Agreement, hereby agrees to lend and advance to the Borrower, which agrees to borrow, an amount equal to the Capital.

4.2. On the Advance Date, Nedbank shall advance the Capital to the Borrower by paying to the credit of the Borrower Account an amount equal to R198,019,488.00 (one hundred and ninety eight million, nineteen thousand, four hundred and eighty eight rand.

4.3. The payment by Nedbank of this amount as aforesaid shall discharge the obligation of Nedbank to make the advance described in clause 4.1.

4.4. Against payment by Nedbank of the Capital in terms of clause 4.2 Nedbank shall be deemed to have advanced the entire Loan to the Borrower.

4.5. The aggregate of the Capital will be disbursed in full on the Advance Date. No terms pertaining to the separate drawdowns of the Capital will be allowed.

5. **INTEREST**

5.1. Interest shall be calculated on the Outstandings at the Interest Rate during each Interest Period in accordance with clause 5.2.

5.2. Interest shall accrue daily, on the basis of actual days elapsed and a 365 (Three Hundred and Sixty Five) day year, irrespective of whether such year is a leap year or not.

5.3. Interest shall be due and payable by the Borrower to Nedbank on each Repayment Date and the Final Repayment Date.

5.4. Interest shall be calculated and levied on a NACS basis.

6. **AMENDMENT OF TYPE OF INTEREST RATE**

6.1. Variable to fixed: The Borrower is entitled to exercise the option to amend a variable rate to a fixed rate subject thereto that-

6.1.1. such amendment may not occur within 90 days after disbursement date;

6.1.2. the Bank is provided with 7 business days' written notice of a request to amend such rate;

6.1.3. the Bank will quote the fixed base rate based on Nedbank's Internal Funding curve at the point of fixing the rate and in addition an all-in margin to be determined on the date of fixing applies.

6.2. Fixed to variable: The Borrower is entitled to exercise the option to amend the fixed rate to a variable rate subject thereto that-

6.2.1. such amendment may not occur within 90 days after disbursement date;

6.2.2. the Bank is provided with 7 business day's written notice of a request to amend such rate;

6.2.3. the Bank will quote a variable rate based on the JIBAR rate at that point in time and in addition an all-in margin to be determined on the date of change.

6.2.4. The Borrower will in addition be liable for penalties and breakage costs.

7. **INTEREST RATE INCREASE**

7.1. Each time during the term of this Loan that the long-term local rating attributed by the Global Credit Rating Company Proprietary Limited (or any other rating agency registered with the Financial Services Board) which is currently **[**BB**] (**ZA), to the Sovereign is lowered in aggregate by two notches, then the Lender shall be entitled to review the interest rate applicable to the Loan and shall notify the Borrower in writing (**the New Interest Rate**) of the revised interest rate (**the New Interest Rate**) by no later than 28 Business Days after becoming aware of such rating downgrade.

7.2. If the Borrower:

7.2.1. accepts, in writing, the rate prescribed by the Lender as constituting the New Interest Rate (the New Interest Rate Acceptance Notice) by not later than 28 (twenty eight) Business Days after receipt of the New Interest Rate Notice, then the New Interest Rate shall be effective from the date which is 90 (ninety) days after the most recent Interest Period or, if such 90 (ninety) day period has elapsed, the first day of the next Interest Period, together with any Breakage Costs that may be applicable; or

7.2.2. fails to accept in writing the rate prescribed by the Lender as constituting the New Interest Rate by not later than 28 (twenty eight) Business Days after receipt of the New Interest Rate Notice, then the Lender may, on prior written notice to the Borrower, cancel the Facilities and declare all Outstanding Amounts (including, for the avoidance of doubt, any contingent liabilities), together with accrued interest, Breakage Costs and all other amounts accrued under the Loan due and payable within 180 (one hundred and eighty) days, whereupon the Facility will be cancelled and all such outstanding amounts will become due and payable within 180 (one hundred and eighty) days.

7.3. Should the long-term rating referred to in clause 1 above increase in aggregate by two notches immediately after any two notch downgrade (and the Lender has elected to impose the Interest Rate increase as a result of that two-notch downgrade), then the Lender shall return the Interest Rate to the Interest Rate applicable prior to the relevant two notch downgrade by sending a notice to the Borrower by no later than 28 (twenty eight) Business Days after becoming aware of such rating increase. The revised Interest Rate shall similarly be effective from 90 days after the most recent Interest Period.

7.4. The rights afforded to Nedbank in terms of this clause are in addition to the rights stipulated in clause 17 below.

8. **MARKET DISRUPTION**

8.1. A Market Disruption Event is deemed to have occurred if:

8.1.1. because of circumstances affecting the Johannesburg interbank market generally, reasonable and adequate means do not exist for ascertaining JIBAR and less than 2 of the Reference Banks quote JIBAR for the relevant period; or

8.1.2. matching deposits are not available to Nedbank in the Johannesburg interbank market in the ordinary course of business to fund the Loan; or

8.1.3. Nedbank advises the Borrower before close of business in Johannesburg on the Advance Date, that the cost to Nedbank of obtaining matching deposits in the Johannesburg interbank market would be in excess of the JIBAR; or

8.1.4. if for the period between the Interest Rate Quotation Date and the Advance Date, the Market Disruption Premium is in excess of 25 (twenty five) Basis Points; or

8.1.5. at or about noon on the quotation day for the relevant Interest Period the screen rate is not available and none or only one of the reference banks supplies a rate to determine JIBAR for the relevant Interest Period.

8.2. If, for any Interest Period, a Market Disruption Event occurs in respect of the Loan then the Interest Rate shall be the percentage rate which is the sum of:

8.2.1. the rate notified to the Borrower by Nedbank as soon as practicable and in any event before interest is due to be paid in respect of that Interest Period, to be that which expresses as a percentage rate per annum the cost to Nedbank of funding its participation in that loan from whatever source it may reasonably select;

8.2.2. mandatory costs (cost of funds plus liquid asset cost); and

8.2.3. the all-in Margin.

8.3. If a Market Disruption Event occurs in terms of clause 8.1.4 then the Margin will be increased by the Market Disruption Premium.

8.4. Notwithstanding anything to the contrary contained in this Agreement, the Market Disruption provisions may only be applied in the event that the Interest Rate Quotation Date is a date other than the Advance Date.

9. **CAPITAL REPAYMENTS**

9.1. The Outstandings in respect of the Loan shall be repaid by the Borrower to Nedbank, in the amounts and on the Repayment Dates set out in the Amortising Schedule. The Repayment Dates will be bi-annually.

9.2. Once the whole or any part of the Capital has been repaid in accordance with this clause 9, Nedbank will not be obliged to re-advance any such repaid amount.

9.3. Notwithstanding the provisions of clause 9.1, the Borrower shall ensure that all Outstandings in respect of the Loan, have been repaid in full by no later than the Final Repayment Date.

9.4. Should any payment of the Outstanding Capital or Interest as set out in the Amortising Schedule not be made on a Repayment Date or Final Repayment Date, the Interest Rate shall be amended to the Default Interest Rate, which shall be calculated and levied in the same manner as the Interest Rate until date of payment of any amounts due which have not been paid ("the arrears"). After the arrears have been settled, the Default Interest Rate will be amended to the Interest Rate.

10. **PREPAYMENT OR EARLY SETTLEMENT**

10.1. **Prepayment**

10.1.1. Subject to the clauses hereunder, the Borrower shall be entitled to prepay any part of the Outstandings not then due for payment.

10.1.2. Should the Borrower wish to prepay any part of the Outstandings it shall, not less than 1 (One) month prior to the date on which it wishes to prepay any part of the Outstandings, furnish Nedbank with written notice to that effect and shall specify the date on which any part of the Outstandings shall be prepaid ("**Prepayment Date**") and the amount of its intended prepayment. Once such written notice of prepayment has been issued by the Borrower, it shall be irrevocable, and the amount stipulated in such notice shall be due and payable on the Prepayment Date specified therein.

10.1.3. No amount shall be deemed to have been prepaid unless and until Nedbank has irrevocably received payment of all amounts due but not paid in terms of this Agreement.

10.1.4. The Borrower shall be entitled to prepay any part of the Outstandings subject to the payment of a prepayment penalty of-

10.1.4.1. 2% (Two Percent) of the amount prepaid if the prepayment is made within 12 (Twelve) months from the Advance Date; and

10.1.4.2. 1% (One Percent) of the amount prepaid if the prepayment is made on a date which falls within the period which is more than 12 (Twelve) months from the Advance Date but less than the full Term of the Loan.

10.1.5. In addition to the prepayment penalty contemplated in clause 10.1.4, the Borrower will be liable for such Breakage Costs as Nedbank may have incurred or will incur as a consequence of such prepayment, whilst Nedbank shall pass on any Breakage Gains to the Borrower. Within 10 (ten) Business Days of receipt by Nedbank of any notice in terms of clause 10.1.2, Nedbank shall certify in writing to the

Borrower the amount of any Breakage Costs, or Breakage Gains, as the case may be, arising in respect of the prepayment so notified.

10.2. **Settlement**

10.2.1. Subject to the clauses hereunder, the Borrower shall be entitled to settle the whole of the Outstandings not then due for payment.

10.2.2. Should the Borrower wish to settle the whole of the Outstandings it shall, not less than 1 (one) month prior to the date on which it wishes to settle the whole of the Outstandings, furnish Nedbank with written notice to that effect and shall specify the date on which the whole of the Outstandings shall be settled ("**Settlement Date**"). Once such written notice of settlement has been issued by the Borrower, it shall be irrevocable and the settlement amount in such notice shall be due and payable on the Settlement Date specified therein.

10.2.3. No amount shall be deemed to have been settled unless and until Nedbank has irrevocably received payment of all amounts due but not paid in terms of this Agreement.

10.2.4. The Borrower shall be entitled to settle the Outstandings subject to the payment of a settlement penalty of -

10.2.4.1. 2% (Two Percent) of the settlement amount if the settlement is made within 12 (Twelve) months from the Advance Date; or

10.2.4.2. 1% (One Percent) of the settlement amount if the settlement is made on a date which falls within the period which is more than 12 (Twelve) months from the Advance Date but less than the full Term of the Loan.

10.2.5. In addition to the settlement penalty contemplated in clause 10.2.4, the Borrower will be liable for such Breakage Costs as Nedbank may have incurred or will incur as a consequence of such settlement, whilst Nedbank shall pass on any Breakage Gains to the Borrower. Within 10 (Ten) Business Days of receipt by Nedbank of any notice in terms of clause 10.2.2, Nedbank shall certify in writing to the Borrower the amount of any Breakage Costs, or Breakage Gains, as the case may be, arising in respect of the settlement so notified.

11. **PAYMENTS**

11.1. Any payments to be made by the Borrower in terms of this Agreement shall be made before 12h00 on due date to the credit of the following Nedbank account number 1979373078, branch code: 198605, [IB Lending Settlement Account], Reference: Stellenbosch Municipality; or in such other manner as Nedbank may timeously notify the Borrower in writing from time to time.

11.2. Any payment made by the Borrower under this Agreement shall be made free of exchange or right of deferment, avoidance or set-off and without deduction for or on account of any Tax unless the Borrower is, under law, required to make such payment subject to the deduction or withholding of Tax, in which case the amount payable by the Borrower in respect of which such deduction or withholding is required to be made shall be increased to the extent necessary to ensure that, after the making of the required deduction or withholding, Nedbank receives and retains (free from any liability in respect of such deduction or withholding) a net amount equal to the amount which it would have received and so retained had no such deduction or withholding been required to be made.

11.3. All amounts received in terms of this Agreement shall be appropriated, first to the payment of costs (including Breakage Costs) and any other amounts other than Capital and interest outstanding in terms of this Agreement, then towards the payment of interest (whether interest or default interest) and thereafter in reduction of the Outstanding Capital.

11.4. The Borrower's obligation to repay the Outstandings in accordance with this Agreement shall be unconditional (except as otherwise expressly provided herein or prohibited by law) irrespective of any contingency whatsoever including, but not limited to –

11.4.1. any right of set-off, counterclaim, recoupment, defence or other right unless and to the extent that the law entitles such right to be exercised;

11.4.2. any insolvency, bankruptcy, administration, judicial management, reorganisation, arrangement, readjustment of debt, dissolution, liquidation or similar proceedings by or against Nedbank;

11.4.3. any invalidity or unenforceability of any part of this Agreement, or lack of due authorisation of any signatory to this Agreement,

11.5. Once the whole or any part of the Outstandings has been repaid or prepaid in terms of this Agreement, Nedbank shall not be obliged to re-advance any such repaid or prepaid amount.

11.6. While the funds drawn down by the Borrower in terms of this Agreement are to be used solely for the purpose of funding the Borrower's Capital expenditure programme, Nedbank's recourse in terms of this facility is to be to the Borrower and is in no way limited by the success or progress of the Integrated Development Plan.

12. REPRESENTATIONS AND WARRANTIES

12.1. The Borrower represents and warrants on a continuous basis from the Signature Date for the duration of the Term to Nedbank that –

12.1.1. **Status:** It is a Municipality, as contemplated in section 155 of the Constitution of the Republic of South Africa Act no. 108 of 1996**.**

It is compliant with the terms of the Financial Intelligence Centre Act No. 38 of 2001 and to the best of its knowledge, all Applicable Laws and Applicable Public Sector Laws.

The obligations assumed by it in terms of this Agreement are legal and valid obligations binding upon it and enforceable against it in accordance with the terms hereof;

12.1.2. **Non-conflict with other Obligations**

12.1.2.1. The entry into and performance by it of and the transactions contemplated by this Agreement to which it is a party do not and to the best of its knowledge, will not -

12.1.2.1.1. conflict with or result in a breach of any of the terms or provisions of, constitute a default under any agreement, deed, mortgage, bond or other instrument or treaty to which it is a party or which is binding upon it or any of its assets or revenues; and/or

12.1.2.1.2. does not and to the best of its knowledge, will not conflict with any Applicable Laws, including, without limitation, the MFMA.

12.1.3. **Power and Authority:** It has taken all necessary action and has complied with Applicable Laws and relevant applicable procedures to authorise, and has obtained all necessary authorisations in respect of its entry into, performance and delivery of this Agreement and the transactions contemplated by this Agreement.

12.1.4. **Long-term debt:** The Borrower undertakes to incur long term debt in accordance with the provisions of the MFMA and such long term debt shall be raised after approval by the Borrower's bid adjudication committee and a resolution by the Borrower's Municipal Council signed by the Mayor passed at a duly constituted meeting approving the debt agreement.

12.1.5. **No Proceedings pending or threatened:** No litigation, arbitration or administrative proceedings are presently current or pending against the Borrower or, to the knowledge of the Borrower, threatened against it which, if adversely determined, would result in a Material Adverse Change.

12.1.6. **No Misleading Information**

12.1.6.1. All of the information supplied by it in connection with this Agreement is true, complete and accurate in all material respects.

12.1.6.2. It has disclosed to Nedbank any and all material information relating to the Borrower as well as such other information within its personal knowledge which, in the reasonable opinion of Nedbank would have affected Nedbank's decision to advance the Loan.

12.1.6.3. Nedbank can rely on any representation made by any person on behalf of the Borrower that has interacted with Nedbank for the purpose of this Agreement and disclosed information, as being true and correct and has furnished such information with the due authorisation.

12.1.7. ***Pari Passu* Ranking:** Its payment obligations under this Agreement rank at least *pari passu* with the claims of all its other unsecured and unsubordinated creditors, save those whose claims are preferred solely by insolvency liquidation or other similar laws of general application.

12.1.8. **Assets:** As at the Signature Date and subsequent to such date, it has not sold or otherwise disposed of its assets which disposal may directly or indirectly impact on the Borrower's ability to operate as a going concern, save as are disclosed in writing to Nedbank prior to the Signature Date, or as may be disposed of in the ordinary course of its operations, the nature of which it shall fully disclose to Nedbank.

12.1.9. **Financial Statements:** Its financial statements will be prepared in accordance with GRAP and in line with the National Treasury guidelines (as updated from time to time) for the 2022/2023 financial year and thereafter.

12.1.10. **Compliance with Laws:** It has complied in all material respects with all Applicable Laws to the extent that a failure to comply would result in the Borrower not being able to comply with its payment obligations to Nedbank in terms of this Agreement.

12.1.11. **Compliance with MFMA:** Notwithstanding anything to the contrary contained herein, it has complied with the MFMA in respect of the provisions pertaining to the conclusion and enforceability of this Agreement.

12.1.12. **Indebtedness:** All Indebtedness incurred by the Borrower shall constitute Permitted Indebtedness.

12.1.13. **Serious Financial Problems:** As at the Signature Day, none of the factors contained in sections 138 and 140 of the MFMA, indicating serious financial problems and/or persistent material breach of financial commitments, has occurred in relation to the Borrower.

12.1.14. **Provincial Intervention:** As at the Signature Date, no steps have been taken to bring about any provincial intervention whatsoever in relation to the Borrower, whether or not discretionary or mandatory, as contemplated in Chapter 13 of the MFMA.

12.1.15. **Financial Recovery Plan:** As at the Signature Date, no financial recovery plan, as contemplated in Chapter 13 of the MFMA, is being prepared in relation to the Borrower.

12.1.16. **Stay of Legal Proceedings:** As at the Signature Date, the Borrower has not applied for an order to stay legal proceedings and/or for extraordinary relief, as contemplated in Chapter 13 of the MFMA.

12.1.17. **No Default**

12.1.17.1. No Event of Default or Potential Event of Default has occurred and is continuing or might reasonably be expected to result from any utilisation of the Loan.

12.1.17.2. No other event or circumstance is outstanding which constitutes a default under any other agreement or instrument which is binding on it or to which its assets are subject which might result in a Material Adverse Change.

12.1.18. **Withdrawal of Municipal Bank Accounts:** Any withdrawal from the Borrower's bank accounts for the purpose of payment in terms of this Agreement, complies with section 11 of the MFMA in that the official withdrawing the money is duly authorised and that such withdrawal is for an authorised purpose.

12.1.19. **Approved Expenditure:** The expenditure incurred for the payment in terms of this Agreement has been incurred in terms of an approved budget and within the limits of the amounts appropriated for the different votes in an approved budget.
The long-term debt is consistent with the Borrower's Capital Budget as stipulated in its annual budget.

12.1.20. **Proceeds of the Agreement:** The proceeds of the Agreement is solely to be spent on Capital Projects that have been approved in compliance with section 19 of the MFMA.

12.1.21. **Maintenance of Systems:** The Accounting Officer has taken all reasonable steps to ensure compliance with subsection 63(2)(a), (b) and (c) (the maintaining of information systems, the correct valuation of the Borrower's assets and liabilities and the maintaining of internal control of assets and liabilities) of the MFMA.

12.1.22. **Encumbrance:** No Encumbrance exists in respect of Capital Project Assets except for permitted Encumbrances.

12.1.23. **Integrated Development Plan:** The Borrower will at all times, act in accordance with its Integrated Development Plan.

12.2. Each of the Warranties and representations ("**Warranties**") given by the Borrower in terms of clause 12.1 shall –

12.2.1. *prima facie* be deemed to be a Warranty of fact inducing Nedbank to enter this Agreement;

12.2.2. insofar as any of the Warranties is promissory or relates to a future event, be deemed to have been given as at the due date for the fulfilment of the promise or the happening of the event, as the case may be; and

12.2.3. be a separate Warranty and in no way limited or restricted by reference to or influence from the terms of any other Warranty.

13. **UNDERTAKINGS**

In addition to such other undertakings as the Borrower may have made elsewhere in this Agreement, the Borrower hereby irrevocably agrees and undertakes to Nedbank from Signature Date for so long as any amount is due and payable under this Agreement that it shall-

13.1. **Financial Statements**

The Borrower shall supply to Nedbank:

13.1.1. as soon as the same are available (and in any event by the end of October each year) its unaudited annual consolidated financial statements; and

13.1.2. the audited annual consolidated financial statements within 6 (Six) months after the end of its financial year; and

13.1.3. such material information as Nedbank may from time to time require in respect of the financial condition of the Borrower within 30 (Thirty) calendar days of request being made therefore, or such earlier date as agreed in writing between Nedbank and the Borrower.

13.2. **Covenants**

The Borrower shall maintain the following covenants:

13.2.1. Debt to income ratio of < 45% (forty five percent) with debt to income calculated as follows: Total interest-bearing Debt (Short term borrowing + Bank overdraft + Short term lease + Long term borrowing + Long term lease) / (Total operating revenue – Operating Conditional Grant);

13.2.2. Debtor collection rate not to deteriorate below 85% (eighty five percent). The collection rate is calculated as follows: Gross Debtors Opening Balance + Billed Revenue – Gross Debtors Closing Balance – Bad Debts written Off) / Billed Revenue x 100.

13.3. **Compliance with Applicable Laws**

In as far as the Borrower needs to fulfil its obligations in terms of this Agreement, the Borrower undertakes to comply at all times in full, with all relevant Applicable Laws, including, without limitation, the MFMA.

13.4. **Proof of Compliance**

Forthwith upon request by Nedbank, the Borrower shall provide Nedbank with such proof as Nedbank may reasonably require indicating compliance by the Borrower with all Applicable Laws, including, without limitation, the MFMA.

13.5. **Capital Budget**

The Borrower shall at all times comply with the Borrower's approved Capital Budget and/or approved adjustment budget as contemplated in section 28 of the MFMA ("Adjustment Budget") and shall provide Nedbank, forthwith after it has become available, with a copy of the Capital Budget and Adjustment Budget as the case may be.

13.6. **Notification of Default**

Forthwith upon becoming aware thereof the Borrower shall inform Nedbank in writing of any occurrence of which it becomes aware which may result in any Event of Default or Potential Event of Default or any Material Adverse Change and will, from time to time, if so requested by Nedbank, confirm to Nedbank in writing that, save as otherwise stated in such confirmation, no such Event of Default or Potential Event of Default or Material Adverse Change has occurred and/or is continuing.

13.7. **Information: Miscellaneous**

13.7.1. The Borrower shall forthwith inform Nedbank if legal proceedings which will or may materially and adversely affect the Borrower's ability to perform its obligations in terms of this Agreement (including, without limitation, arbitration proceedings) are instituted or threatened against it in an amount to the excess of R10,000,000 (ten million rand).

13.7.2. The Borrower shall forthwith upon becoming aware thereof inform Nedbank in writing of any occurrence of which it becomes aware which will or may adversely affect the Borrower's ability to perform or observe its obligations in terms of this Agreement.

13.8. **Authorisations**

The Borrower shall obtain, comply with the terms of and do all that is necessary to maintain in full force and effect all authorisations, approvals, licences and consents required in or by the Applicable Laws and regulations of South Africa to enable it lawfully to enter into and perform its obligations under this Agreement and to conduct its business and affairs, including, without limitation any authorisations, approvals and consents required by the MFMA.

13.9. **Disposals**

The Borrower shall not, contrary to the provisions of the MFMA and in any event to the detriment of Nedbank, or in contravention of its obligations, whether express or implied herein, dispose of, whether by one or more transactions or series of transactions any of the Capital Project Assets.

13.10. **Positive Undertakings**

The Borrower undertakes for the duration of the Agreement to do the following:

13.10.1. to make provision in its budgets for the payment of its financial obligations in terms of this Agreement, including Capital and interest;

13.10.2. to retain revenues, other charges, fees or funds at a level sufficient to meet its financial obligations in terms of the Agreement;

13.10.3. to ensure that the Accounting Officer furnishes a copy of a report written to the municipal council (in compliance with section 70 of the MFMA) in respect of impending shortfalls, overspending and overdrafts to Nedbank;

13.10.4. to furnish Nedbank by no later than 10 (Ten) working days after the end of each month with a copy of a statement in the prescribed format (as prescribed in section 71 in respect of monthly budget statements) on the state of the Borrower's budget;

13.10.5. to furnish Nedbank with a copy of the midyear budget and performance assessment (in compliance with section 72 of the MFMA);

13.10.6. to furnish Nedbank with the information that must be placed on the website as referred to in section 21(A) of the Municipal Systems Act within 5 (Five) days after its tabling in the council or on the date on which it must be made public, whichever occurs first as contemplated in section 75 of the MFMA;

13.10.7. to furnish Nedbank with an annual report in accordance with Chapter 12 of the MFMA and within 7 (Seven) days after the adoption of the oversight report in respect of aforementioned annual report, furnish Nedbank with same;

13.10.8. to notify Nedbank, prior to encumbering any of the Capital Project Assets as security for its creditors, that the Borrower intends to do so.

14. **EVENTS OF DEFAULT**

Each of the following events or circumstances is an Event of Default –

14.1. **Non-Payment:** The Borrower fails to pay any amount due by it in terms of this Agreement on the due date for payment therefore, unless the failure to pay is solely due to technical or administrative reasons and the relevant amount is duly paid within 3 (Three) Business Days of its due date.

14.2. **Misrepresentation:** A representation, warranty, statement made or deemed to be made or repeated, or undertaking given in connection with this Agreement or in any document delivered by or on behalf of the Borrower under or in connection with this Agreement, is or proves to have been incorrect or misleading in any material respect when made or deemed to be made or repeated or given and as a consequence results in a Material Adverse Change.

14.3. **Material Adverse Change:** Any event (or any series of events) or circumstance occurs (or any existing circumstance continued) which will result in a Material Adverse Change provided that such Material Adverse Change will have or would be likely to have a material adverse effect on the Borrower's ability to perform its obligations under this Agreement.

14.4. **Cessation of Delivery of Minimum Level of Basic Municipal Services :** The Borrower becomes unable or ceases, for any reason whatsoever, to deliver a minimum level of Basic Municipal Services, or any material part thereof, as contemplated in section 73(1)(c) of the Local Government: Municipal Systems Act, No. 32 of 2000, in an ordinary and regular manner provided that such cessation will have or would be likely to have a material adverse effect on the Borrower's ability to perform its obligations under this Agreement..

14.5. **Repudiation:** The Borrower repudiates this Agreement or does or causes to be done any act or thing evidencing an intention to repudiate this Agreement.

14.6. **Cross Default:** Any material Indebtedness or obligation or any loan, debt or guarantee constituting Indebtedness of the Borrower becomes due and payable prior to its specified maturity by reason of default, or is not paid when due, whether or not Nedbank is concerned therewith or any creditor of the Borrower becomes entitled to declare any Indebtedness due and payable prior to its specified maturity.

14.7. **Judgements and writs of execution:** Any judgement to the value of R500 000,00 (Five Hundred Thousand Rand) or more, of any court or arbitration awarded against the Borrower, respectively, remains unsatisfied for a period of 10 (Ten) Business Days after a writ of execution was served on the Borrower, respectively, and has not been the subject of an application for rescission or review or appealed against within the period allowed for such rescission, review or appeal, which in each instance is diligently pursued and, in the event of such application, review or appeal being unsuccessful, the Borrower, respectively, fail to make immediate payment thereof.

14.8. **Unlawfulness:** It be or become unlawful for the Borrower to perform or comply with any or all of their obligations under this Agreement or any of the obligations of the Borrower not be or cease to be legal, valid, binding and enforceable.

14.9. **Adverse Determination by the Auditor General:** If the Auditor General or its successor after performing its audit on the Borrower raises a going concern issue with regards to the affairs of the Borrower.

14.10. **Other Obligations:** The Borrower does not comply with any provision of this Agreement (including for the avoidance of doubt, any of the undertakings set out in clause 13 of this Agreement).

In the event the Borrower fails to comply with the undertakings set out in clause 13, and fails to provide a written proposal to Nedbank setting out the remedial action to be taken in respect of such non-compliance within 10 (Ten) Business Days after delivery by Nedbank to the Borrower of a written notice requiring the Borrower to provide such a proposal and in the event that such a proposal is received by Nedbank within the stated period, the Borrower failing to remedy such non-compliance within the period stipulated in the Borrower's written proposal or such other period as may be agreed by the Parties.

14.11. **Additional Default Events**

It would be an Event of Default if:

14.11.1. the municipal council of the Borrower has not approved the annual budget by the start of the budget year or any revenue raising measures necessary to give effect to the budget;

14.11.2. the national treasury stops the transfer of funds to the Borrower as contemplated in section 38(1) of the MFMA (funds due to the Borrower as its share of the local government's share or transfer of funds due to the Borrower as an allocation referred to in section 214(1)(c) of the Constitution;

14.11.3. the Borrower faces any serious financial problems as contemplated in section 54(2) of the MFMA, in terms of which the Mayor must respond to and initiate steps;

14.11.4. the Accounting Officer fails to submit financial statements to the auditor general in accordance with section 126(1) or (2) of the MFMA or if the Mayor fails to table the annual report of the Borrower in accordance with section 127(2).

14.11.5. during the term, the covenants listed in clause 13.2 above are not met (after receipt of a 10-day notification to do so).

14.12. Default by Nedbank:

14.12.1. If Nedbank is in default of any of the terms of the Agreement the Borrower may, after 7 (seven) Business days written notice with no rectification from Nedbank, proceed to demand specific performance and/or to terminate this agreement.

14.12.2. In the event that the Borrower has to incur legal fees for the enforcement of the Agreement, Nedbank will be held liable for payment of these legal fees on an attorney and client scale, including costs of counsel.

15. **ACCELERATION**

On or at any time after the occurrence of an Event of Default, Nedbank shall, in addition to and without prejudice to any rights it may have in terms of this Agreement or in law, including its rights to claim damages, be entitled to, with notice of 7 days to the Borrower, and in the event that the Borrower does not rectify the default, to –

15.1. cancel the Loan; and/or

15.2. re-price the Loan; and/or

15.3. immediately claim and recover from the Borrower –

15.3.1. the Outstandings; and/or

15.3.2. Breakage Costs arising on the Event of Default; and/or

15.3.3. any other charges, costs or expenses incurred by Nedbank and/or payable in terms of this Agreement, including but not limited to arrear payments and any default interest; and/or

15.4. subject to clause 9.4, levy finance charges calculated in accordance with the Default Interest Rate, if the Borrower does not remedy a breach within 20 (Twenty) days of written notice to do so;

15.5. enforce compliance with the terms and conditions of all or part this Agreement and claim such damages as Nedbank may have suffered as a result of the Event of Default.

16. **INDEMNITIES**

16.1. Without prejudice to the other remedies of Nedbank under this Agreement and/or in law, the Borrower hereby irrevocably indemnifies and holds Nedbank harmless against any costs, claim, loss, expense (including legal fees on the scale as between attorney and own client) or liability, together with any VAT thereon, which may be suffered or incurred by Nedbank as a result of the occurrence of any Event of Default or the operation of clause 14, unless the default was caused by Nedbank.

16.2. For the purposes of this clause, "loss" shall include (but not be limited to) any amounts of Capital, interest, fees, Break Costs or other sums whatsoever paid or payable on account of any funds borrowed by Nedbank in order to enable Nedbank to advance the Loan to the Borrower.

16.3. The rights of Nedbank in respect of the indemnities contained in this clause 16 shall continue in full force and effect in favour of Nedbank for a period terminating on the 3rd (Third) anniversary of the last day of the Term.

17. **CHANGE IN COSTS**

17.1. If, at any time during the Term, there occurs –

17.1.1. any adoption, amendment, variation, replacement or change in interpretation of any of the Applicable Laws or of any authorisation with which commercial banks generally in the Republic of South Africa are required to comply or any change in circumstances occurs or any duties are imposed on such commercial banks at any time after the Signature Date; and/or

17.1.2. any directive, requirement, request or guidance (whether or not having the force of law but if not having the force of law, one which applies generally to a class or category of financial institutions and/or financial service companies directly or indirectly) of any central bank or any other fiscal, monetary, regulatory or other authority in the Republic of South Africa; and/or

17.1.3. any change in banking practice, as it affects or is applied generally to or by any financial institution directly or indirectly in the Republic of South Africa; and/or

17.1.4. a requirement by any statutory or monetary authority in the Republic of South Africa, to –

17.1.4.1. pay levies or any other amounts whatsoever or to maintain special deposits or reserve assets, in addition to those paid or maintained or reserved by Nedbank as at the Signature Date; or

17.1.4.2. comply with any reserve, cash ratio, special deposit or liquid requirements (or any other similar requirements) in respect of this Agreement in addition to those anticipated by Nedbank at the Signature Date; or

17.1.4.3. to pay any Tax; and/or

17.1.5. any compliance by Nedbank with any capital adequacy, reserve, cash ratio, special deposit, liquidity or similar requirements of a statutory or monetary authority, howsoever arising in South Africa in respect of this Agreement, including any increase in the amount of the Capital to be allocated by Nedbank to the amount advanced under this Agreement or a change of weighting of the commitment under this Agreement; or

17.1.6. any compliance by Nedbank with "International convergence of capital measure and capital standards, a revised framework" published by the Basel Committee on banking supervision in June 2004 in the form existing hereof (Basel II) or any other law or regulation which implements Basel II (whether such implementation, application or compliance is by government, regulator or Nedbank but excluding any

increases as would ordinarily be excluded), incurred by it in making, maintaining or funding its obligations under the Agreement arising by reason of a change in law or the interpretation thereof, or compliance with any central bank or similar request occurring after the Interest Rate Quotation Date ; or

17.1.7. any other event attributable to a statutory or monetary authority which is beyond control of Nedbank, with the result that –

17.1.7.1. Nedbank is subjected to any Tax, duty or other charge in respect of the Loan or a change in the basis of taxation of Nedbank in respect of amounts payable to Nedbank in terms of this Agreement; or

17.1.7.2. any reserve, special deposit or similar requirement is imposed against the assets or deposits with or for the account of, or credit extended by Nedbank; or

17.1.7.3. any other obligation or condition directly affecting the cost of Nedbank is imposed on Nedbank of maintaining or funding its commitment under this Agreement; or

17.1.7.4. the cost to Nedbank of making or maintaining the Loan is increased or any amounts received or receivable by Nedbank under this Agreement are reduced; or

17.1.7.5. Nedbank's rate of return on its capital is reduced by reason only of change in the manner in which it is required to allocate capital resources to its obligations under this Agreement; or

17.1.7.6. Nedbank is required to make a payment or forego the return on any amount received or receivable by it under this Agreement;

17.1.8. And the result of any of the above is to increase the net after Tax cost to Nedbank of maintaining or funding its commitment under this Agreement or reduces the net after Tax return to Nedbank in respect of maintaining or funding its commitment under this Agreement, the Parties shall consult in relation to the manner in which such increased costs or the reduction of the return to Nedbank may be recovered, to place Nedbank in the same position in which it would have been if such increase or reduction had not taken place.

Nedbank will promptly notify the Borrower of such increased costs or reduction, disclose the event giving rise to such increased costs or reduction and certify the calculation of such amount to the Borrower. The Borrower shall have the right to have such amount verified by the auditors of Nedbank. The Parties will meet to discuss means of reducing the impact of any increased costs or aforesaid reduction on the Borrower.

If no solution is found within 30 (Thirty) days after receipt of the written notification, the Borrower has the choice between paying the additional costs, provided they could not have been avoided by Nedbank, and repaying the Loan.

17.2. This clause does not apply to any increased cost arising in terms of clause 17.1–

17.2.1. on account of Tax payable on any income, profits or gains of Nedbank to the extent arising from amendments or changes which affect corporate taxpayers generally; or

17.2.2. resulting from any breach or violation by Nedbank of, or breach by Nedbank of any limits imposed by, any provision of any law, ruling, regulation or practice by any relevant monetary or fiscal authority or court or competent official, arising as a consequence of any action or omission by Nedbank after the introduction of such provision and/or imposition of such limits or after the relevant change in the

interpretation thereof has become known to Nedbank and/or generally known amongst banks operating in the Republic of South Africa.

17.3. If Nedbank is entitled to any tax benefit by reason of any circumstance in respect of which the Borrower has paid the fee as contemplated in clause 17.1, Nedbank shall pay to the Borrower such amount, limited to the maximum of the fee paid by the Borrower as aforesaid, as will leave Nedbank with the same net after Tax return as it would have received in respect of maintaining or funding its commitment under this Agreement had the tax benefit not been granted. Payment of such sum shall be made within 10 (Ten) Business Days of Nedbank becoming entitled to such tax benefit.

17.4. If any of the events or circumstances envisaged in clause 17.1 occur with the result that the net after Tax cost to Nedbank of maintaining or funding its commitment under this Agreement reduces or the net after Tax return to Nedbank in respect of maintaining or funding its commitment under this Agreement increases, then Nedbank shall pay to the Borrower such fee as would be necessary to place Nedbank in the same position in which it would have been if such increase or reduction had not taken place, which fee shall be payable within 10 (Ten) Business Days of receipt by Nedbank of a written demand from the Borrower, and accompanied by the requisite documentation to substantiate the Borrower's entitlement to such fee.

18. ILLEGALITY

18.1. Nedbank Illegality

18.1.1. If, at any time, it becomes unlawful, or contrary to any request from or requirement of any fiscal, monetary or other similar authority compliance with which is in accordance with the general practice of persons to whom such request or requirement is intended to apply, for Nedbank to make, fund or allow to remain outstanding all or any of the Outstandings then Nedbank shall, as soon as reasonably practicable after becoming aware of the same, deliver to the Borrower a certificate to that effect and if Nedbank so requires, the Borrower shall on such date as Nedbank shall have specified repay all the Outstandings. The Borrower shall be liable for any Breakage Costs arising as a consequence of such prepayment, which Breakage Costs the Borrower shall be required to pay to Nedbank within 10 (ten) days of receipt of such certificate.

18.1.2. If Nedbank becomes entitled to give notice pursuant to clause 18.1.1, it will endeavour to avoid the circumstances therein referred to, but nothing in this clause 18.1.2 shall oblige Nedbank to incur any costs or expenses or to take or refrain from taking any action where, in its reasonable opinion, to take or refrain from taking (as the case may be) such action would be materially prejudicial to its interests.

18.2. Borrower Illegality

18.2.1. If at any time it is or becomes unlawful for the Borrower to perform or comply with any or all of its obligations hereunder the Borrower shall as soon as reasonably possible notify Nedbank in writing. If the Borrower is unable, within 10 (Ten) days of the aforesaid notice of the performance becoming unlawful, to procure that a replacement Borrower is substituted for it on such terms as may be reasonably acceptable to Nedbank, then Nedbank shall, after the expiry of such 10 (Ten) day period be entitled to deliver to the Borrower a notice requiring the Borrower to repay all Outstandings on a date

specified in such notice and the Borrower shall on such date as Nedbank shall have specified repay all Outstandings together with any Breakage Costs arising as a result of the early termination.

18.2.2. If Nedbank becomes entitled to give notice pursuant to clause 18.2, it will endeavour to avoid the circumstances therein referred to, but nothing in this clause 18.2.2 shall oblige it to incur any costs or expenses or to take or refrain from taking any action where, in its reasonable opinion, to take or refrain from taking (as the case may be) such action would be materially prejudicial to its interests.

19. **CERTIFICATE OF INDEBTEDNESS AND OTHER NOTICES**

19.1. A certificate signed or purporting to be signed by a manager or director of Nedbank (whose appointment it shall not be necessary to prove) shall be *prima facie* proof of –

19.1.1. the amount of any debt owing by the Borrower to Nedbank (including, without limitation, accrued interest and default interest) in terms of this Agreement;

19.1.2. the due dates of performance in respect of any obligations of the Borrower in terms of this Agreement;

19.1.3. any Interest Rate; or

19.1.4. the fact that the debts are due and owing and have not been paid or otherwise discharged.

19.2. In addition to and in application of the provisions of clause 19.1, any schedule, certificate or other document provided by Nedbank in terms of this Agreement shall, if signed by any manager or director of Nedbank, be deemed to be *prima facie* proof of the correctness of its contents.

20. **ASSIGNMENT**

20.1. This Agreement shall be binding upon and enure to the benefit of each Party and its or any subsequent successors-in-title.

20.2. The Borrower shall not be entitled to cede, delegate or assign (as the case may be) all or any of its rights, benefits and obligations under this Agreement to any person, without the prior written consent of Nedbank.

20.3. Nedbank may, at any time after the Advance Date, sell down all (and not part) of the Outstandings, and assign its corresponding rights and obligations under this Agreement, provided that such transfer will not result in any increased costs to the Borrower in terms of clause 17. Nedbank shall promptly notify the Borrower of any such intended assignment (including the identity, address and contact number for notices and the *domicilium citandi et executandi* of the assignee) and shall obtain the written consent of the Borrower before making such assignment.

21. **DOMICILIUM CITANDI ET EXECUTANDI**

21.1. The Parties choose the addresses set out opposite their names below as their *domicilium citandi et executandi* (whether in respect of notices, court processes or any other documents or communications of whatsoever nature) for all purposes of this Agreement:

21.1.1. Nedbank

Physical Address:	135 Rivonia Road Sandown, Sandton 2196
Per email:	levfin@nedbank.co.za
Attention:	Team Manager

21.1.2. the Borrower:

Physical Address:	Plein Street Stellenbosch 7600
Per email:	Kevin.Carolus@stellenbosch.gov.za
Attention:	Chief Financial Officer

21.2. Any notice or communication required or permitted to be given in terms of this Agreement shall be valid and effective only if in writing. It shall be acceptable to give notice by email provided that proof of such email transmission is provided to the Party to whom notice is addressed and physical copies of the notice or communication are delivered to the aforesaid address of the Party to whom such notice is addressed within 3 (three) Business Days of such email transmission.

21.3. Any Party may by written notice to the other Parties change its chosen address to another physical address, provided that the change shall become effective on the 7th (Seventh) day after delivery of such notice to the addressee.

21.4. Any notice to a Party contained in a correctly addressed envelope and delivered by hand to a responsible person during ordinary business hours at its chosen address shall be deemed to have been received, unless the contrary is proved, on the first Business Day after delivery.

21.5. Notwithstanding anything to the contrary contained in this clause 21, a written notice or communication actually received by a Party shall be an adequate written notice or communication to it, notwithstanding that it was not sent to or delivered at its chosen address.

22. COSTS AND EXPENSES

22.1. Each Party shall be responsible for its own costs of negotiating, drafting and implementing this Agreement.

22.2. The guilty party shall on demand, reimburse the innocent party, for all reasonable costs and expenses (including legal fees on the attorney and client scale and cost of counsel) incurred as a result of its unremedied breach of this Agreement by the guilty party.

23. CONFIDENTIAL INFORMATION

23.1. The Parties acknowledge that for the duration of this Agreement information will be required and furnished in terms of this Agreement.

23.2. The Parties undertake to utilise such information solely for the purpose of the administration of this Agreement.

23.3. This undertaking will be effective for the duration of this Agreement and will survive the termination of this Agreement. It will be irrespective for what reason the Agreement is terminated.

24. MISCELLANEOUS

24.1. **Partial Invalidity:** The illegality, invalidity or unenforceability of any provision of this Agreement under the law of any jurisdiction will not affect its legality, validity or enforceability under the law of any other jurisdiction nor the legality, validity or enforceability of any other provision.

24.2. **Waivers and Remedies Cumulative:** Unless condoned in writing, no failure to exercise, and no delay in exercising on the part of either Party, of any right, power or privilege under this Agreement shall operate as a waiver thereof, nor shall any single or partial exercise of any right, power or privilege preclude any other or further exercise thereof, or the exercise of any other right, power or privilege. No waiver by either Party shall be effective unless it is in writing and duly executed by the Party granting such waiver.

24.3. **Entire Contract:** This Agreement contains all the express provisions agreed on by the Parties with regard to the subject matter of the Agreement and the Parties waive the right to rely on any alleged express provision not contained in this Agreement.

24.4. **Duration:** This Agreement shall endure for the Term.

24.5. **No Partnership:** Nothing in this Agreement shall be deemed to constitute a partnership, or establish a relationship of principal and agent or any other relationship of a similar nature between any of the Parties or, unless expressly provided, entitle either Party to commit or bind the other Party in any manner.

24.6. **No Representations:** A Party may not rely on any representation or warranty which allegedly induced it to enter into this Agreement, unless the representation or warranty is recorded in this Agreement.

24.7. **Variation, Cancellation and Waiver:** No contract varying, adding to, deleting from or cancelling this Agreement, and no waiver of any right under this Agreement, shall be effective unless reduced to writing and signed by or on behalf of the Parties.

24.8. **Indulgences:** The grant of any indulgence by a Party under this Agreement shall not constitute a waiver of any right by the grantor or prevent or adversely affect the exercise by the grantor of any existing or future right of the grantor.

24.9. **Severability:** Any provision in this Agreement which is or may become illegal, invalid or unenforceable in any jurisdiction affected by this Agreement shall, as to such jurisdiction, be ineffective to the extent of such prohibition or unenforceability and shall be treated *pro non scripto* and severed from the balance of this Agreement without invalidating the remaining provisions of this Agreement or affecting the validity or unenforceability of such provision in any other jurisdiction.

24.10. **Applicable Law:** This Agreement is to be interpreted and implemented in accordance with the law of the Republic of South Africa.

24.11. **Counterparts:** This Agreement may be executed in any number of counterparts and all of such counterparts taken together shall be deemed to constitute one and the same instrument.

24.12. **Independent Advice:** The Parties hereby acknowledge and agree that they have been free to secure independent legal and other professional advice (including legal, financial and taxation advice) as to the nature and effect of the provisions of this Agreement and the Security Documents and that they have either taken such independent advice or has dispensed with the necessity of doing so.

24.13. **Ranking of documents**: Should there be any conflict between the provisions of this agreement and the tender document BSM78/24, then the tender document provisions shall prevail.

(**For attention**: Ms G Mettler)

WESTERN CAPE PROVINCIAL TREASURY COMMENTS ON THE LONG-TERM BORROWING PROPOSAL FOR THE STELLENBOSCH MUNICIPALITY

Provincial Treasury (PT) has considered the long-term borrowing proposal of Stellenbosch Municipality and herewith provides comments based on compliance with the legislative requirements in terms of the Local Government: Municipal Finance Management Act (Act No. 56 of 2003) (MFMA) and the affordability of the proposed long-term borrowing proposal. These comments are required to be tabled in the Municipal Council.

Compliance Assessment

1. The Municipality released a statement of information detailing the proposed external financing for its capital programme.

2. PT notes that the Municipality has submitted the required information as per MFMA Circulars 26 & 42.

3. The Municipality has set its goals in accordance with section 152 of the South African Constitution (Act No. 108 of 1996) and has ensured compliance with the MFMA and Municipal Supply Chain Management Regulations, based on the information that has been supplied to PT.

Table 1 indicates the relevant sections in relation to the National Treasury (NT) Circulars which provide the necessary legislative guidelines and information required to make the needed comments as stated in section 46(3)(a) of the MFMA.

Table 1:Compliance with MFMA in relation to MFMA Treasury Circular 26, 42 & 115 as issued by National & *Provincial Treasury*

MFMA/ Treasury Circulars	***Details***	***Compliance Yes/No***
S46(3)(a)(i) and (ii)	The information statement and media advertisements were made public in the local newspaper, as well as in libraries, on notice boards of the Municipality and the Municipal Website on 23 April 2026	Yes
S46(3)(b)(i) and (ii)	The loan funds will be sourced from financial institutions accredited in terms of the Banks Act.	Yes
S46(6), S17(2), S19	The long-term loan is consistent with its Capital budget as referred to in section 17(2) of the MFMA. The total loan amount is for R198.02 million.	Yes
S46(5)	This section is not applicable, because the borrowing (debt) purpose is not for refinancing existing long-term borrowing (debt).	N/A
S19(1)(d)	The sources of the funding have been considered, are available and have not been committed for other purposes.	Yes
MFMA National Treasury Circular No.26/2005	A schedule of all long-term borrowing (debt) obligations in the format of the QBMR showing principal and interest payments for the life of all loans and any associated investments set up as sinking funds etc.	Yes
MFMA Provincial Treasury Circular No. 42/2010	The Long-Term Debt Certification to be dated and signed by the Municipal Manager (Accounting Officer) and the Executive Mayor/Chairperson of the Board.	Yes
S 18 of MFMA, Reg 22 of MBRR & MFMA National Treasury Circular 115	The Annual Budget may only be funded by realistically anticipated revenues to be collected, cash-backed accumulated funds from previous years' surpluses not committed for other purposes, and borrowed funds, but only for capital budget referred to in section 17(2) of the MFMA. An adjustments budget of a Municipality must be appropriately funded.	Yes

Affordability Assessment

4. The following affordability assessment is based on the 2023/24 and 2024/25 Audited Annual Financial Statements (AFS); the in-year monitoring (IYM) operating and capital expenditure reports for the 2025/26 financial year as at 31 March 2026; the cash flow actual performance for the same period; and the Municipality's approved 2025/26 Integrated Development Plan (IDP).

5. The purpose of the external loan is to raise R198.02 million from a financial institution over a fifteen-year period to finance approved capital projects aimed at improving Council's service delivery through critical infrastructure investment. The proposed borrowing will support key infrastructure upgrades across electrical, water, wastewater and solid waste management services, including the expansion of the landfill site and wastewater treatment related infrastructure. These projects are aligned to the Municipality's Integrated Development Plan (IDP) objectives and form part of the

Municipality's strategic priority areas to enhance service delivery, environmental sustainability and long-term revenue generation.

6. The interest rate applicable to the loan is currently set at 9.44 per cent, which is in line with the current prime lending rate of 10.25 per cent. At this rate, total finance charges over the term of the loan are estimated at R176.74 million, contributing to the overall cost of the external borrowing.

7. The repayments will be made on a semi-annual basis, with the first instalment scheduled for 31 December 2026 and the final instalment due on 30 June 2041.

8. In considering the affordability of the proposed loan, a selected number of financial ratios (based on the Audited AFS of 2023/24 and 2024/25) were considered, as depicted in Table 2.

Table 2: Ratio analysis

Ratio	National Treasury Norm or acceptable range	Comment	2023/24 (Audited)	2024/25 (Audited)	M09 March 2026 (In-year monitoring)
Current Ratio	1.5-2:1	Within NT norm	2.0:1	1.9:1	2.6:1
Debtors' collection period	30 days	Outside NT norm	50 days	43 days	43 days
Capital Cost (Interest paid and redemption to total operating expenditure)	6% - 8%	Within NT norm	4.7%	5.1%	2.8%
Total Liabilities to Total Assets	<50%	Within NT norm	18.7%	18.1%	16.8%
Cash and cash equivalents to Current liabilities	1:1	Below NT norm	0.3:1	0.1:1	1.3:1
Debt (Total Borrowings) to Total Operating Revenue[1]	45%	Within NT norm	27.3%	21.5%	28.9%

[1] For M09 in-year monitoring calculation of this ratio, adjusted budgeted operating revenue is used.

9. The current ratio shows a slight decrease between the 2023/24 and 2024/25 financial years yet remains within the National Treasury norm of 1.5–2:1. While this indicates that current assets comfortably exceed current liabilities, the Municipality should monitor this trend to ensure that excess liquidity is not sitting idle and is instead utilised effectively.

10. The net debtor's collection period slightly improved from 50 days in 2023/24 to 43 days in 2024/25 financial year; however, it remains outside the acceptable NT norm of 30 days. This highlights the need for the Municipality to strengthen its present credit management and debtor collection policies and processes to increase cash flow from outstanding debt and align the debtor collection duration within the NT's norms.

11. The interest paid and redemption to total operating expenditure ratio shows a slight increase from 4.7 per cent in 2023/24 to 5.1 per cent in 2024/25 and remains favourably below the NT norm of 6-8 per cent. This is an indication that the Municipality has capacity to increase its borrowing. However,

other future cash flow projections will have to be considered as part of the Municipality's long - term financial planning.

12. The total liabilities to total assets ratio results indicate a decrease from 18.7 per cent in 2023/24 to 18.1 per cent in 2024/25 and remains within the NT norm. The ratio indicates that the Municipality has sufficient assets to cover its liabilities when they are due.

13. The cash and cash equivalents to current liabilities ratio declined from 0.3:1 in the 2023/24 financial year to 0.1:1 in the 2024/25 financial year, remaining well below the National Treasury norm of 1:1. This suggests that the Municipality may not have sufficient immediate cash and cash equivalents to meet its short-term obligations as they fall due, indicating a weakened liquidity position. However, once short-term investments are factored in, the results indicate that the Municipality possesses adequate funds to cover and settle these liabilities.

14. The debt-to-total operating revenue ratio decreased from 27.3 per cent in the 2023/24 financial year to 21.5 per cent in the 2024/25 financial year, reflecting strengthened debt management. Based on the 2025/26 adjusted budget figures, the projected gearing ratio amounts to approximately 28.96 per cent. Should the proposed additional long-term borrowing of R198.02 million be concluded, the ratio is expected to increase to approximately 35.8 per cent, which remains within the National Treasury benchmark of below 45 per cent. The Municipality should nevertheless continue to carefully consider the impact of any additional funding on long-term affordability and debt sustainability.

15. In addition to the financial ratios derived from the 2023/24 and 2024/25 audited AFS, further analyses were conducted using the 2025/26 section 71 data as at 31 March 2026.

    a) The repayment of the loan will be funded from trading service revenue to be collected in the future. As at 31 March 2026, the Municipality reported a collection rate of 98 per cent, reflecting a strong and effective revenue management environment. The Municipality is commended for maintaining a consistently high collection rate throughout the financial year exceeding the NT norm of 95 per cent. Sustained and further strengthening credit control and revenue enhancement mechanisms will be critical to ensure continued cash flow availability to meet long-term debt obligations.

    b) In addition, the Municipality's capital cost (interest paid and redemption) as a percentage of total operating expenditure, averages 2.2 per cent over the 2026/27 MTREF and is similarly budgeted at 2.2 per cent for the 2025/26 financial year. The actual year-to-date ratio amounted to 1.3 per cent as at 31 March 2026. These ratios remain well below the norm of 6 to 8 per cent, indicating that debt servicing costs are manageable and support the Municipality's capacity to sustainably service the proposed long-term borrowing.

    c) During the 2025/26 financial year, the Municipality adjusted its operating revenue upwards, including an increase of R42.50 million in service charges. As at 31 March 2026, there is an overperformance of R129.70 million against the year-to-date budgeted operating revenue of R1.95 billion. This revenue performance resulted in an operating surplus of R456.91 million, which is significantly higher than the year-to-date budgeted surplus of R210.07 million for the same period. This positive operating outcome demonstrates the Municipality's capacity to generate sufficient revenue to support operational requirements, service long-term debt obligations and maintain overall financial sustainability.

    d) Capital expenditure as at 31 March 2026 amounted to R253.11 million against a year-to-date budget of R377.28 million, resulting in an underperformance of 32.9 per cent. Although capital commitments of R181.07 million were recorded as at 31 March 2026, the current expenditure levels indicate a slow drawdown of borrowed funds relative to project implementation timelines. This follows similar trends in the prior financial year, where capital expenditure amounted to

R390.73 million or 74.5 per cent of the adjusted budget as at 30 June 2025. Nine months into the 2025/26 financial year, only 42.5 per cent of the adjusted capital budget had been spent.

e) Borrowing-funded capital expenditure amounted to R64.78 million, representing 32.7 per cent of the adjusted borrowings budget of R198.02 million. While the Municipality's use of bridging finance is acknowledged, the continued slow pace of capital budget implementation and drawdown of borrowed funds remains a concern and may negatively impact service delivery outcomes and the effective utilisation of approved loan funding. The Municipality should strengthen project planning, procurement readiness, and in-year monitoring to ensure that borrowing funded capital projects are implemented within planned timeframes and that approved funding is fully utilised.

f) Total debtors as at 31 March 2026 amounted to R510.52 million, reflecting a marginal year-on-year increase of 1.5 per cent from the R502.97 million reported in the prior financial year. Debtors outstanding for more than 90 days increased by R5.87 million year-on-year; however, this represents an improvement when compared to trends observed in previous financial years. Reductions in long-outstanding water and electricity debtors were noted, indicating improved collection efforts in these revenue streams. However, a year-on-year increase of 32.3 per cent in debtors over 90 days owed by organs of state was observed. The Municipality is encouraged to intensify engagements with organs of state and engage the Provincial Treasury, which has a government debt template aimed at assisting in intergovernmental relations.

g) In March 2026, the liquidity ratio increased to 1.3 times from 1.2 times compared to February 2026. The ratio is above the National Treasury recommended norm of 1.1, indicating that the Municipality can settle its short-term obligations immediately.

h) In March 2026, the cost coverage ratio increased to 4.2 times from 3.5 times compared to February 2026, indicating that the Municipality can meet its monthly fixed operating commitments from cash and short-term investments without collecting any additional revenue.

i) The proposed borrowing aligns with the Municipality's budget, IDP and strategic objectives, addressing the Municipality's socio-economic reality, infrastructure demands and service delivery needs.

Conclusion

16. After assessing the proposed long-term borrowing and the current financial position of the municipality, PT draws attention to the following:

a) The proposed borrowings are integral to the funding mix to finance the approved 2025/26 capital programme of the Municipality.

b) The Municipality should ensure that it sets an appropriate tariff structure which is affordable to ensure sufficient revenue is generated to sustain the long-term debt obligation.

c) The Municipality has the fiscal capacity to borrow; however, this is subject to sustained revenue performance, improved capital spending efficiency, and strengthened management of outstanding debtors.

d) The Municipality is advised to continue implementing stringent credit control and debt collection measures to enable timeous collection.

e) The intended loan will contribute towards the creation of new and the expansion of existing economic and social infrastructure that will improve the lives of citizens within the municipal area.

f) All factors considered, PT concludes that the Municipality has the fiscal capacity to borrow money and service the loan. However, the Municipality should continue to carefully manage any potential risks due to current economic uncertainties, capital project implementation, affordability criteria, and the Municipality's solvency.

g) PT supports the loan application and advises the Municipality to consider the above comments/recommendations.

h) This letter should be presented to Council for review.

Kind regards,

_____

Mr O Willcox
CHIEF DIRECTOR: PUBLIC POLICY SERVICES
WESTERN CAPE PROVINCIAL TREASURY

Attention: Mr O. Wilcox

Chief Director: Public Policy Services
Western Cape Provincial Treasury
7 Wale Street
Cape Town
8000

Dear Mr Wilcox

RESPONSE PERTAINING TO COMMENTS MADE BY THE WESTERN CAPE PROVINCIAL TREASURY ON THE RAISING OF THE EXTERNAL LOAN

This letter serves to provide a response on the areas highlighted in the letter dated 20 May 2026, reference PTR 16/1/11/1. Stellenbosch Municipality expresses its appreciation, to the office of the Provincial Treasury, for the positive commentary encapsulated in the letter received and endeavour to respond to all aspects raised.

In terms of compliance the municipality has followed all due processes in terms of all the applicable legislation as alluded by the comments.

The municipality would like to raise the following points in the terms of its financial ratios as highlighted by the provincial treasury:

The municipality note that the ratio's highlighted are predominantly favourably within the treasury norms apart from the debtor's collection period and the cash and cash equivalents to current liabilities.

The municipality will continue to strive and improve on its debt collection mechanisms to ensure that older debt is collected and propose to council to consider writing off debt which is substantially older than 365 days.

The municipality does not agree with the calculation in relation to the cash and cash equivalents to current liabilities. Short-term investments are an integral part of the ratio and a substantial backing to the municipality's cash flow forecasting. The municipality has calculated this ratio as 1.32:1 (R724 826 687/R550 950 651) as at 31 March 2026; which is within the national treasury norms.

The municipality takes cognisance of the concerns on the capital expenditure within the current financial year and is actively monitoring the internal implementation processes to improve expenditure.

In conclusion, the municipality will carefully manage any potential risks due to current economic uncertainties, capital project implementation, affordability criteria.

Yours faithfully,

Kevin Carolus
Chief Financial Officer

Subject: [EX] Public Comment and Objection in Terms of Section 46(3) of the Municipal Finance Management Act regarding Proposed External Loan from Nedbank

CAUTION: This email originated from outside the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

I hereby submit the following objection and comment regarding the municipality's intention to enter into a long-term external loan agreement with Nedbank for an amount of R198 019 488 over a 15-year repayment period.

This submission is made in terms of:

- Section 46 of the Local Government: Municipal Finance Management Act 56 of 2003 ("MFMA")
- Section 21A of the Local Government: Municipal Systems Act 32 of 2000
- Principles contained in Sections 152 and 195 of the Constitution of the Republic of South Africa, 1996

1. Based on analysis of the municipality's capital budget patterns over the past five years, many of the projects listed in the notice appear to be:

- recurring infrastructure maintenance programs,
- phased projects already appearing in previous budgets, or
- projects likely delayed and repeatedly rolled over.

These include, among others:

- waterpipe replacement,
- sewerpipe replacement,
- SCADA implementation,
- bulk water infrastructure,
- wastewater treatment upgrades,
- electricity network upgrades,
- landfill expansion projects.

Section 46(1)(b) of the MFMA permits long-term debt only for capital expenditure on property, plant or equipment to be used for the purpose of achieving the objects of local government.

However, where projects have already been budgeted in previous financial years and not implemented effectively, the proposed loan may effectively serve to:

- finance historic implementation failures,
- replace unspent or lost grant funding,
- or cover cost escalations caused by delays.

This raises concerns regarding prudent financial management and value for money as contemplated in:

- Section 62(1)(a) of the MFMA,
- Section 195(1)(b) of the Constitution (efficient, economic and effective use of resources).

2. Analysis of historical grant utilisation trends indicates a pattern of:

- declining grant spending efficiency,
- increasing unspent conditional grants,
- and potential return or rollover of infrastructure grants.

In terms of Section 18(1) of the MFMA:

> "An annual budget may only be funded from realistically anticipated revenues to be collected, cash-backed accumulated funds from previous years' surpluses not committed for other purposes and borrowed funds, but only for the capital budget referred to in section 17(2)."

The municipality should therefore first demonstrate:

- why existing grant funding mechanisms were insufficient,

- whether grants were lost, returned, or rolled over,
- and whether procurement or implementation failures contributed to the current funding gap.

Borrowing should not become a substitute for unresolved project execution deficiencies.

3. The notice states that:

- total long-term debt will increase to approximately R677 million,
- representing approximately 23% of operating revenue.

Although this may technically fall within permissible borrowing norms, affordability must be considered in light of:

- rising consumer debt pressure,
- increasing municipal tariffs,
- growing bad debt provisions,
- and declining collection quality trends.

Section 46(3)(c) of the MFMA specifically requires the municipality to consider:

- the municipality's capacity to repay the debt,
- future operational costs,
- and the likely impact on rates and service charges.

The estimated total repayment of approximately R374 million for a R198 million loan means that residents may ultimately pay nearly double the original capital amount over the life of the loan through tariffs and service charges.

This is particularly concerning where:

- several projects appear to be delayed legacy projects,
- some are maintenance-related recurring programs,
- and certain projects may not generate direct revenue streams sufficient to support debt repayment.

4. Several listed projects, including:

- SCADA implementation,
- telemetry systems,
- streetlights,
- landfill expansion,
- and certain replacement infrastructure, do not directly generate revenue.

Prudent municipal borrowing practice generally requires long-term debt to support:

- revenue-generating infrastructure,
- growth-enabling assets,
- or projects with measurable financial return.

Using long-term debt for non-revenue-generating or delayed maintenance infrastructure risks

placing additional long-term tariff pressure on residents without corresponding increases in municipal income.

5. Before any borrowing resolution is approved, it is respectfully requested that the municipality publicly disclose:

1. The original budget years in which each listed project first appeared;
2. The amounts already spent on each project to date;
3. Any grants previously allocated to the projects;
4. Any grants rolled over or returned to Treasury;
5. Reasons for implementation delays;
6. Updated project completion timelines;
7. Full lifecycle cost implications;
8. Tariff impact assessments over the 15-year repayment period.

Without such disclosure, meaningful public participation as envisaged in:

- Sections 21 and 21A of the Municipal Systems Act,
- and Section 46(3) of the MFMA, cannot properly occur.

6. While infrastructure investment is necessary and important, the proposed borrowing raises serious concerns regarding:

- historical project implementation performance,
- grant utilisation efficiency,
- debt substitution for delayed projects,
- long-term tariff affordability,
- and intergenerational financial burden.

It is therefore respectfully submitted that the municipality should:

- reconsider the scale of the proposed borrowing,
- prioritise recovery of grant efficiency,
- improve procurement and project execution capacity,
- and provide fuller disclosure before proceeding with the proposed debt agreement.

Yours faithfully,

Charles Booysen

21 May 2026
Attention: Mr. Charles Booysen
By email: charlesjdbooysen@gmail.com

Dear Mr. Booysen

REGARDING: PUBLIC COMMENT AND OBJECTION IN TERMS OF SECTION 46(3) OF THE MUNICIPAL FINANCE MANAGEMENT ACT REGARDING PROPOSED EXTERNAL LOAN FROM NEDBANK.

With reference to the above subject, the response follows the sequence of matters outlined in your email received on 14 May 2026.

1. Infrastructure Projects and Historical Capital Budget Patterns

The municipality acknowledges that several infrastructure projects have appeared over multiple financial years. However, this reflects the long-term and phased nature of municipal infrastructure programmes rather than implementation failure.
The municipality recorded R359.4 million in infrastructure capital expenditure during 2024/25 and achieved a capital budget spending performance of 90.19%, which demonstrates strong implementation capacity relative to municipal norms.
These figures demonstrate that the municipality is actively implementing infrastructure programmes and not merely carrying projects forward without expenditure.

2. Grant Utilisation

The municipality noted the concern raised regarding grant utilisation efficiency and the importance of ensuring that external funding allocations are implemented effectively and responsibly.

The annual report demonstrates that the municipality continues to achieve strong levels of capital grant expenditure and infrastructure implementation across multiple service delivery programmes.

Importantly, several major capital grants achieved strong spending performance levels during the 2024/25 financial year, including:

- Municipal Disaster Response Grant: R25.375 million spent against an adjusted budget of R25.413 million, representing approximately 99.9% expenditure.
- Integrated National Electrification Programme (INEP) Grant: R9.556 million spent against an adjusted budget of R9.556 million, representing 100% expenditure.
- Informal Settlements Upgrading Partnership Grant (ISUPG): R22.335 million spent against an adjusted budget of R27.056 million, representing approximately 82.5% expenditure.
- Maintenance and Construction of Transport Infrastructure Grant: R380 000 spent against an adjusted budget of R380 000, representing 100% expenditure.
- Integrated Transport Planning Grant: R628 000 spent against an adjusted budget of R628 000, representing 100% expenditure.
- The municipality also achieved an overall capital budget expenditure performance of 90.19%, which reflects a strong implementation rate relative to many municipalities nationally.

These expenditure levels demonstrate that the municipality is actively implementing funded infrastructure programmes rather than allowing projects to stagnate or remain persistently unspent.

The municipality further notes that large infrastructure projects are often implemented across multiple financial years which can be due to many reasons for example: phased construction sequencing, procurement timing, statutory approvals, engineering complexity or environmental compliance requirements.

Where projects extend beyond a single financial year, rollover applications are submitted in accordance with National Treasury processes and do not necessarily indicate failed implementation or loss of grant funding.

The municipality additionally reported a decrease in unspent conditional grants as per the audited annual financial statements of the 2024/2025.

The municipality remains committed to continuously improving project implementation efficiency, procurement planning, and infrastructure delivery capacity. The capital grant expenditure performance reflected in the Annual Report provides assurance that grant funding continues to be effectively utilised to support infrastructure investment and long-term service delivery objectives across the municipality.

3. Affordability, Debt Levels, and Financial Sustainability

The municipality fully recognises the importance of affordability and repayment sustainability.

The municipality has a long-term financial plan and affordability envelope which forms part of the Capital Expenditure Framework that informs its borrowing capacity.

The debt indicators reflect that the municipality's borrowing levels remained affordable throughout the review period. This is evidenced by the gearing ratio trending below the NT maximum norm of 45% at an average of 21% p.a. over the review period.

The municipality's actual long-term borrowing reduced from R584 million in 2023/24, to R514.7 million in 2024/25. In addition, capital charges represented only 5.08% of operating expenditure, which remains below the normal benchmark range of 6%–8%.

The municipality therefore remains within prudent borrowing norms and continues to maintain strong liquidity and debt management indicators.

4. Revenue-Generating Versus Non-Revenue-Generating Infrastructure

The capital projects identified forms part of the infrastructure networks for revenue generating assets and is essential for protecting the municipality's long-term financial sustainability and service delivery capacity.

These projects support the municipality's broader infrastructure network and economic base, which in turn protects municipal revenue streams linked to electricity and water sales.

5.Concluding remarks

The municipality continues to demonstrate strong governance and financial oversight. The Annual Report confirms that the municipality has achieved its sixth consecutive clean audit outcome by the Auditor-General.

The municipality also maintains an operational Audit and Performance Audit Committee, risk management structures, borrowing management controls, and long-term financial planning tools. Importantly, the municipality has already developed a formal Long-Term Financial Plan, which is continuously updated to support strategic planning and affordability modelling.

The municipality appreciates the concerns raised regarding infrastructure implementation, borrowing levels, affordability, and grant utilisation. However, the Annual Report demonstrates that:

- substantial infrastructure expenditure is already taking place,
- grant funding continues to be utilised extensively,
- the municipality maintains strong collection and liquidity levels,
- debt levels remain within prudent norms,
- and governance and audit outcomes remain strong.

The proposed borrowing is therefore intended not to finance operational shortfalls, but to responsibly fund long-life infrastructure assets required to support a growing municipality, maintain service reliability, and ensure long-term sustainability for residents and businesses across Stellenbosch.

Yours faithfully,

Kevin Carolus
Chief Financial Officer

ANNEXURE C

Annexure A

INFORMATION STATEMENT: RAISING OF EXTERNAL LOAN		
	In terms of Section 46(3) of the Local Government: Municipal Finance Management Act (Act 56 of 2003) read together with Section 21A of the Local Government Municipal Systems Act (Act 32 of 2000), the following information statement is made public.	
AMOUNT	R198 019 488	
PURPOSE	Stellenbosch Municipality has approved a final budget on 30 May 2025 and made provision for incurring long-term debt to the amount of R198 019 488 for the funding of capital projects.	
	PROJECT NAME	**IDP OBJECTIVE**
	Expansion of the landfill site (New cells)	Green and Sustainable Valley
	Bien don 66/11kV substation new	Valley of Possibility
	Electricity Network: Pniel	Valley of Possibility
	Jan Marais Upgrade: Remove Existing Tx and replace with 20MVA	Valley of Possibility
	Kayamandi new substation 11 kV switching station	Valley of Possibility
	Network Cable Replace 11 Kv	Valley of Possibility
	SCADA Implementation	Green and Sustainable Valley
	Streetlights R304	Dignified Living
	Switchgear Substation Groendal	Valley of Possibility
	Switchgear Substation Merriman Z	Valley of Possibility

12.7	**FINAL SUSTAINABLE DEVELOPMENT GOALS (SDGs) VOLUNTARY LOCAL REVIEW (VLR) REPORT OF STELLENBOSCH MUNICIPALITY**

Collaborator No:
Files
IDP KPA Ref No: Good Governance and Compliance
Meeting Date: 27 May 2026

1. SUBJECT: FINAL SUSTAINABLE DEVELOPMENT GOALS (SDGs) VOLUNTARY LOCAL REVIEW (VLR) REPORT OF STELLENBOSCH MUNICIPALITY

2. PURPOSE

To submit to the Council the Final Sustainable Development Goals (SDGs) Voluntary Local Review (VLR) Report, for consideration for approval.

3. DELEGATED AUTHORITY

Council.

4. EXECUTIVE SUMMARY

Stellenbosch Municipality was selected for Phase 2 of the SDG Localisation Programme, focusing on Voluntary Local Reviews (VLRs), asset management, and intergovernmental collaboration. The programme is a partnership between SALGA, the National Planning Commission (NPC), Stats SA, UN agencies, and other stakeholders.

The municipality recognises the strategic importance of this initiative for advancing sustainable development at the local level and reiterates its commitment to aligning municipal planning, implementation, and reporting processes with the broader national and global SDG agenda. In South Africa, the municipal-level VLR process is still emerging, with a few metros and local municipalities having undertaken their first reviews in 2023.

As part of the SDG Localisation Programme, the Stellenbosch Municipality is required to draft a VLR report to highlight the municipality's contribution to achieving the targets set for the SDGs 2030. However, there are 17 SDGs, and the municipality cannot report on them all comprehensively. Consequently, only six (6) SDGs were selected on which the municipality realistically reported on, given the timeframe set by the SDG Localisation Programme in which the municipality is participating.

The draft VLR report was released for public input during the IDP and Budget public participation period in April 2026. Inputs received were considered and included in the final report where possible.

5. RECOMMENDATIONS

The following is recommended to the Council:-

(a) that the Council takes note of the input received on the draft VLR report; and

(b) that the Council Approves the final VLR report.

6. DISCUSSION

6.8 Background

In 2015, the Heads of State and Government Representatives, as the United Nations, in September 2015, adopted the Sustainable Development Goals (SDGs), which are also termed "Agenda 2030."

The 17 Sustainable Development Goals and 169 targets, which were adopted, aimed to demonstrate the scale and ambition of the new universal agenda and to build on and complete what was not achieved in the Millennium Development Goals. The agenda serves as an action plan for people, the planet, and prosperity, emphasising the strengthening of peace and partnerships. The SDGs are integrated and indivisible and balance the three dimensions of sustainable development: economic, social, and environmental.

The 17 SDGs are as follows:

Sustainable Development Goals-

- **Goal 1. End poverty in all its forms everywhere;**
- Goal 2. End hunger, achieve food security and improved nutrition and promote sustainable agriculture;
- Goal 3. Ensure healthy lives and promote well-being for all at all ages;
- Goal 4. Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all;
- **Goal 5. Achieve gender equality and empower all women and girls;**
- Goal 6. Ensure availability and sustainable management of water and sanitation for all;
- Goal 7. Ensure access to affordable, reliable, sustainable and modern energy for all;
- Goal 8. Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all;
- Goal 9. Build resilient infrastructure, promote inclusive and sustainable industrialisation and foster innovation;
- Goal 10. Reduce inequality within and among countries;
- **Goal 11. Make cities and human settlements inclusive, safe, resilient and sustainable;**
- Goal 12. Ensure sustainable consumption and production patterns;
- **Goal 13. Take urgent action to combat climate change and its impacts;**
- Goal 14. Conserve and sustainably use the oceans, seas and marine resources for sustainable development;

- Goal 15. Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, halt and reverse land degradation and halt biodiversity loss;

- **Goal 16. Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels; and**

- **Goal 17. Strengthen the means of implementation and revitalise the global partnership for sustainable development.**

The SDGs are integrated and indivisible, and they balance the three dimensions of sustainable development, namely, economic, social, and environmental.

The municipality is unable to comprehensively report on all the SDGs and their associated targets due to the strict timeframes within which the VLR report must be presented to the SALGA. To mitigate this challenge, a task team was established to review the 17 SDGs and to determine a selection that is based on the availability of data, projects, programmes, and key initiatives that the municipality can realistically report on.

The following six SDGs were selected out of the 17 SDGs listed above:

1. Goal 1. End poverty in all its forms everywhere;

2. Goal 5. Achieve gender equality and empower all women and girls;

3. Goal 11. Make cities and human settlements inclusive, safe, resilient and sustainable;

4. Goal 13. Take urgent action to combat climate change and its impacts;

5. Goal 16. Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels; and

6. Goal 17. Strengthen the means of implementation and revitalise the global partnership for sustainable development.

A key component of the VLR report was stakeholder engagement and awareness raising. The municipality responded to this by hosting both an external and internal workshop on 25 and 26 February 2026, respectively. The SALGA facilitated both workshops. In addition to this, the draft VLR report was presented to communities and stakeholders during the IDP and Budget open days, as well as during the IDP and Budget Stakeholder Engagement in April 2026.

The comments received from the South African Local Government Association (SALGA) are included in Annexure B. The comments have been noted and, to the extent that is possible, incorporated into the final VLR report.

Regarding the timeframes of the VLR report, the municipality has completed the activities listed in the table below:

Action	Timeframe	Outcome	Progress	Rating
• Prepare Departments Internally for the SDG Localisation and Voluntary Review Process • Identify Political and Administrative Champions • Establish a small SDG Technical Committee	November / December 2025	Consensus building internally	Political and administrative champions have been selected and are actively working on the VLR report.	Complete
Formation Project Teams / working groups or using current structures	November 2025	Working groups established	An internal task team was formed. The six selected SDGs were divided into two groups, with each group having a nominated team leader.	Complete
Inception Workshop	January 2026	Orientation of All Stakeholders and obtain buy-in	The external workshop with stakeholders was held on 25 February 2026.	Complete
Consultations and sensitisation / awareness-raising	January 2026	Working group meetings and Stakeholder engagements	The external workshop with stakeholders was held on 25 February 2026.	Complete
Integrate asset management and SDG data	February 2026	Stakeholder List for Stellenbosch Municipality	As far as possible, available asset management information was incorporated into the draft VLR report.	Complete
Data collection	January 2026	All data on those specific SDGs gathered	The two teams collected the data, and all necessary write-ups were completed using Harvard referencing to cite the sources included in the draft VLR report.	Complete
Data Analysis	February 2026	Reading the data to present findings	The draft VLR report is to be submitted to the March 2026 Council meeting.	Complete
Presentation of main findings	March 2026	Findings will identify gaps and what is done well.	The draft VLR report is to be submitted to the March 2026 Council meeting.	Complete
Preparation of Draft Report	01 April till 31 May 2026	Draft consolidated municipal SDG & AM plans	The draft VLR report underwent a public participation process in April 2026. The input received was incorporated into the final report where possible.	Complete
Consolidation of Feedback Validation workshops	01 May 2026 till 01 June 2026	Validated municipal SDG and AM plans	The VLR report was presented to communities and stakeholders during the IDP and Budget open days, as well as during the IDP and Budget Stakeholder Engagement in April 2026.	Complete

Key Messages from the VLR report:

1. Embedding SDGs into Municipal Planning and Service Delivery:

- Stellenbosch Municipality integrates the Sustainable Development Goals (SDGs) into its core planning, budgeting and reporting frameworks, including the Integrated Development Plan, Spatial Development Framework and Capital Expenditure Framework; and

- This integration ensures that sustainable development goals are translated into practical, locally relevant interventions that improve service delivery, infrastructure investment, and socio-economic outcomes for communities.

2. Advancing a Sustainable, Inclusive and Resilient Urban System:

   - The municipality is driving a long-term vision of a "Green and Sustainable Valley" through climate action, environmental management and sustainable urban planning; and

   - Investments in spatial integration, infrastructure-led development, waste management innovation and access to basic services contribute to resilience, economic opportunity, and improved quality of life for all residents.

3. Strengthening Governance, Partnerships and Innovation for the SDGs Delivery:
   - The VLR demonstrates that Stellenbosch Municipality has established robust governance systems anchored in inclusive stakeholder engagement, international partnerships and participation in global networks such as the Strong Cities Network;
   - These mechanisms effectively operationalise SDG 17 by embedding collaboration, knowledge exchange and multi-level alignment into municipal planning and implementation; and
   - The municipality further distinguishes itself through innovative approaches, including reverse learning and the application of the Normstorm methodology, which enhance institutional capacity, promote inclusive governance, and position Stellenbosch as both a learner and contributor in global development practice.

6.2 Financial Implications

There are no financial implications beyond those that have been provided for in the 2025/26 MTREF Budget.

6.3 Legal Implications

(a) The Constitution of the Republic of South Africa of 1996.
(b) South African Foreign Policy.
(c) The National Development Plan.
(d) The United Nations, Sustainable Development Goals, 2015.
(e) The Intergovernmental Relations Framework Act, 2005 (Act No. 13 of 2005).
(f) The Stellenbosch Municipality Intergovernmental Relations and International Relations Policy 2025.

6.4 Staff Implications

This report has no additional staff implications for the municipality.

6.5 Risk Implication

None

6.6 Previous / Relevant Council Resolutions

Item 10.4.1 of the 36th Meeting of the Council of Stellenbosch Municipality (26 November 2025).

Item 12.4 of the 39th Meeting of the Council of Stellenbosch Municipality (31 March 2026).

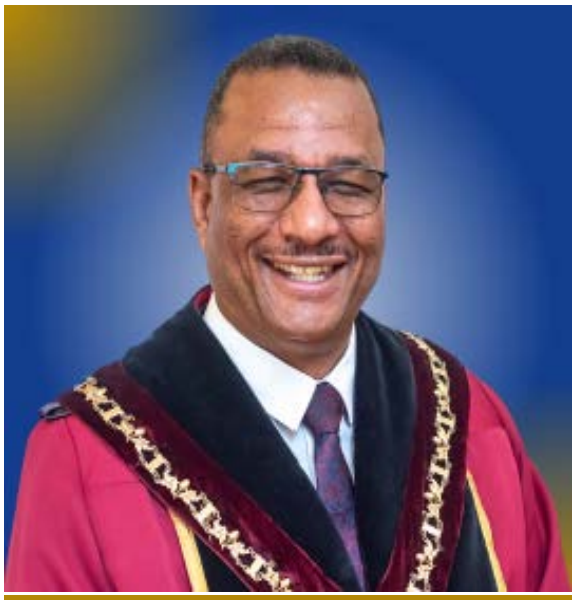
EXECUTIVE SUMMARY



Stellenbosch Municipality finds itself in a much peculiar situation—for the very first time, this vibrant municipality—solidly established on the map and bolstered by a diverse range of provincial and national institutions—has become actively engaged in the ambitious global Sustainable Development Goal (SDG) project that seeks to address pressing issues worldwide in a multitude of contexts. This significant participation is marked by enthusiastic involvement from various stakeholders across different sectors, combined with a collective voice that is more than ready to share its unique and compelling story with the world at large, showcasing its rich heritage and innovative spirit.

This Voluntary Local Review (VLR) report is undertaken to gather, formulate, and present compelling evidence of progress and challenges in the municipality's firm commitment to sustainability and holistic development efforts. This multifaceted and innovative approach, as reported in this VLR, highlights the critical importance of community input, collaboration, and meaningful engagement, as well as the shared desire among its residents and local leaders to contribute meaningfully to crucial global dialogues that seek to promote sustainable practices and foster a better future for all members of society.

With every initiative and project, such as this VLR report, Stellenbosch Municipality not only reinforces its place on the global stage but also sets a precedent for sustainable development that will hopefully inspire others to emulate.

This is not yet a chronicle of success, but rather a retelling of the municipality's efforts—updates on the past, not yet on what has been fulfilled or achieved. Although the focus here might be primarily on stocktaking, in another sense, the report can also be viewed as a sounding board, collecting not objective data and information but rather part of the stories of the people of the municipality. The basis of much of the discussion is an interactive process of analysis and reflection supported by the Integrated Development Plan (IDP) and related documents, focusing specifically on the SDGs selected by the municipality to report on.

FOREWORD BY THE EXECUTIVE MAYOR

Cllr J Fasser

Executive Mavor

It is my privilege to present this Voluntary Local Review (VLR) of our municipality's progress toward achieving the Sustainable Development Goals (SDGs). This report reflects not only our commitment to global development priorities, but more importantly, how these goals are embedded in the everyday work of delivering services to our residents.

As a municipality, we must remain constantly cognisant of the SDGs. They are not abstract international ideals; they are practical, guiding principles that inform how we plan, budget and serve our communities. From ensuring access to basic services, to protecting our natural environment, the SDGs are deeply aligned with our strategic objectives and the lived realities of our citizens.

One of our five Strategic Focus Areas (SFAs) is our vision to be a Green and Sustainable Valley. This vision is not aspirational alone - it is actively being realised through a range of impactful initiatives. We continue to explore alternative and renewable sources of energy, while making significant strides in modernising and rehabilitating our waste landfill site. Our commitment to reducing waste to landfill is further strengthened by expanding recycling services across all areas of the municipality.

A particularly noteworthy initiative is the capture and utilisation of methane gas at our landfill site. By converting harmful methane into less harmful carbon dioxide through controlled burning, we are reducing our environmental footprint while harnessing energy in the process. Complementing this is our Material Recovery Facility, established in recent years, where waste is sorted, processed, and packaged into bales for resale into the private sector – turning waste into economic opportunity.

Our commitment to sustainability also extends to the greening of informal settlements and public spaces. We are proud to plant an average of two trees per week across parks, cemeteries, sidewalks, open spaces and nature areas. These efforts contribute not only to environmental resilience but also to the well-being and dignity of our communities.

Furthermore, our municipality stands out as the only category B-Municipality with four nature reserves - an achievement that underscores our dedication to biodiversity conservation and environmental stewardship.

This VLR is both a reflection of progress made and a roadmap for the journey ahead. While we celebrate our achievements, we recognise that the work of building a sustainable, inclusive, and resilient municipality is ongoing. Through continued alignment with the SDGs, collaboration with our communities, and a steadfast commitment to innovation, we will ensure that no one is left behind.

Together, we are shaping a greener, more sustainable future for all.

_____

Cllr Jeremy Fasser
Executive Mayor

OVERVIEW BY THE MUNICIPAL MANAGER

Geraldine Mettler
Municipal Manager

It is with great pride that I present this Voluntary Local Review (VLR), which reflects our administration's ongoing commitment to embedding sustainability, environmental stewardship and resilience into every aspect of municipal governance.

For us as an administration, the Sustainable Development Goals (SDGs) are not distant global targets – they are rooted in how we plan, implement and deliver services daily. Whether it is the rollout of basic municipal services, infrastructure development or long-term spatial planning, we are continuously working to ensure that our actions today safeguard the needs of future generations.

The vision of a Green and Sustainable Valley is not only a strategic priority but also a guiding principle that shapes our operational approach. We are intentional in integrating environmentally responsible practices into our delivery service models—ensuring that sustainability is not an afterthought, but a foundation.

On a personal level, the SDGs resonate strongly with me as a passionate conservationist and environmentalist. This commitment is reflected in the work of our teams, who strive to expand recycling services to more communities each year, reducing the volume of waste sent to the landfill and encouraging a culture of responsible consumption.

Our ongoing tree-planting initiatives are another important contribution, steadily lowering our carbon footprint while enhancing the natural beauty and ecological health of our municipality. At the same time, we recognise that sustainability is also about protecting our most precious resources. Water, in particular, demands our urgent attention, and we are committed to ensuring that pipe leaks and infrastructure faults are addressed as quickly as possible to minimise unnecessary loss.

We are already witnessing the tangible impacts of climate change in our daily operations—from shifting weather patterns to increased pressure on infrastructure and resources. These realities compel us to adapt, innovate and strengthen our resilience as an institution.

This VLR demonstrates that sustainability is not a single project or initiative, but a continuous, collective effort embedded in the way we govern and serve. As an administration, we remain committed to aligning our work with the SDGs, ensuring that our municipality continues to grow in a way that is responsible, inclusive and environmentally conscious.

Geraldine Mettler
Municipal Manager

Chapter 1: Introduction and Overview

1.1 Introduction

The United Nations Agenda 2030 for Sustainable Development is a pivotal global initiative that encourages all member states to align their various national strategies with the 17 Sustainable Development Goals and 169 targets explicitly defined in the UN Resolution 70/1. These goals are crucial for guiding countries toward a more sustainable future. This alignment process includes a strong emphasis on the integration and localisation of these ambitious goals by sub-national and local governments to achieve meaningful long-term sustainable economic, social, and environmental development. The global Agenda 2030 is fundamentally about creating a comprehensive to-do list for humanity aimed at ending poverty, reducing inequality and sustaining the planet, with an additional focus on ensuring that all nations and people are placed at the centre of development initiatives. By doing so, it significantly sets the stage for fostering a similar local development agenda that can effectively meet the unique challenges faced by diverse communities. In alignment with the fundamental objectives outlined in Agenda 2030, Stellenbosch Municipality has proactively participated in the voluntary review project (Musekiwa and Mandiyanike, 2017:138).

Stellenbosch Municipality is acclaimed as a scenic wine-producing town located in the Western Cape Province of South Africa. The town, Stellenbosch, serves as the administrative hub of the municipality that showcases a distinctive combination of urban and rural characteristics, coupled with a picturesque setting enveloped by lush vineyards and majestic mountain ranges (Kaye-Essien and Bidandi, 2025:34).

The local economy of Stellenbosch is notable for being characterised by relatively high-income levels, which contribute to the overall prosperity of the area. In fact, the Stellenbosch region has become an increasingly popular destination owing to four key activities that significantly contribute to its economic landscape: the development of attractive residential estates, the thriving sectors of tourism and agritourism, extensive university-related services, and the production of artisanal food products, which prominently include the brewing of local beers (de Lange and Bricker, 2024:15).

In this context, it is crucial to recognise that to preserve a lasting and expanding legacy, concepts of sustainability must be integrated into the municipality's operations and the development, maintenance, and growth of the municipality. Consequently, sustainability

influences every facet of how the municipality conducts its business (de Lange and Bricker, 2024:16).

Therefore, the size and responsiveness of local government in relation to the needs of citizens significantly position municipalities at the leading edge of Sustainable Development Goals (SDG) implementation. The approach known as the voluntary review seeks to harness and enhance the monitoring of local SDG implementation processes to effectively bolster citizen dialogue, promote internal policy coherence, and foster intergovernmental alignment concerning the entire SDG agenda across diverse sectors, various policies, and the multiple planning cycles in place. As such, the Stellenbosch Voluntary Review Initiative emerges as an important exploratory case study that illustrates the localisation of the 2030 Agenda. Consequently, it highlights the specific, pivotal role that a municipal government can fulfil when responding to the challenges presented by these global goals. Through this initiative, municipalities not only address local concerns but also contribute to the global discourse around sustainable development, thereby underscoring their essential function in achieving broader objectives related to sustainability and social equity (Kaye-Essien and Bidandi, 2025:34).

1.2 Socio-economic Context of Stellenbosch Municipality

Stellenbosch Municipality is located at the edge of the City of Cape Town, but still manages to retain its distinct small-town character. This undoubtedly gives Stellenbosch a strong competitive advantage – sharply contrasting with similarly sized towns located 400 km or more from the nearest metropolis. Aside from being a mere 50 km from Cape Town's central business district (CBD) and being flanked by the N1 and N2 main routes, Stellenbosch is also just 30 km away from the sea (at Somerset West / Strand) and only a few kilometres away from one of the most attractive mountain ranges of the Boland. In addition, Stellenbosch is a mere 28 km from Cape Town International Airport, one of South Africa's top (air) links to the global economy, and not much further away from Cape Town Harbour, the shipping portal to both the Atlantic and Indian Oceans (Stellenbosch Municipality, 2026:24).

This convergence of environmental resources, scenic quality and business opportunities has two other mutually reinforcing spin-offs: The largest number of JSE-listed companies based in any small South African town have their headquarters in Stellenbosch, and the town is home to a disproportionately high number of corporate CEOs and executives, which in turn means that it can sustain a comparatively high level of economic activity and

consumer services for a town of its size. This results in other benefits throughout the value-added chain and for employment. The municipal area covers approximately 900 km². The municipality's area of jurisdiction includes the towns of Stellenbosch and Franschhoek, as well as several rural hamlets such as Wemmershoek, La Motte, De Novo, Kylemore, Pniël, Johannesdal, Lanquedoc, Groot Drakenstein, Muldersvlei, Klapmuts, Elsenburg, Raithby, Jamestown, Koelenhof and Vlottenburg (most with a population of less than 5 000). Apart from formal settlement areas, the municipal area also includes several informal settlements. Franschhoek, known as the "French Corner", is celebrated for its exceptional culinary scene, offering a delectable fusion of French and South African flavours. It is a favourite among local and international tourists. Due to recent developments, Klapmuts is considered a regional growth node thanks to its regional connectivity (Stellenbosch Municipality, 2026:24).

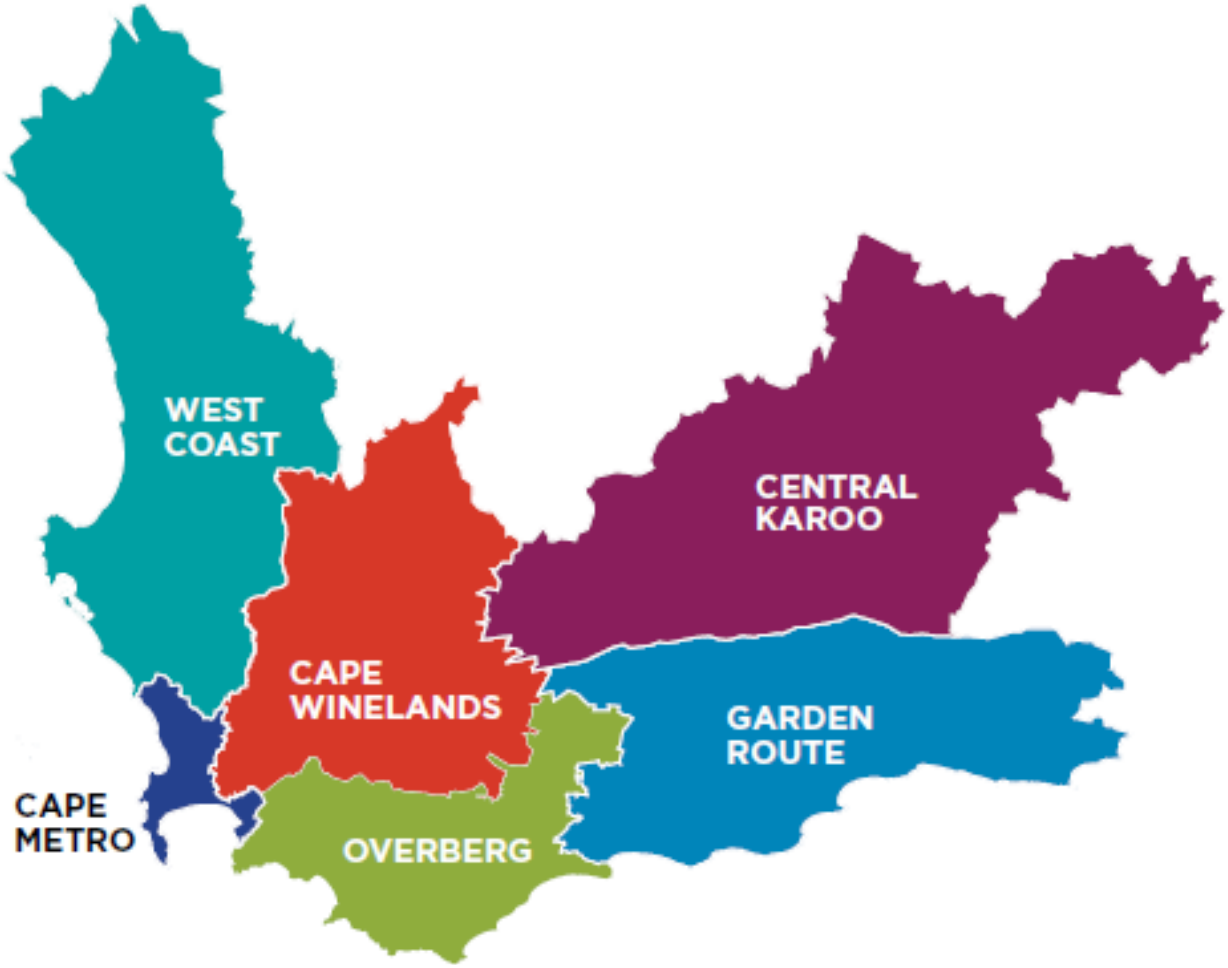
Stellenbosch is the second oldest town in South Africa, dating back to 1679 when an island in the Eerste River was named Stellenbosch by the then Governor of the Cape, Simon van der Stel. The first farming activities in the area were started in 1679. Today, the area has become primarily known for its extraordinary wines and fruits. The towns of Stellenbosch and Franschhoek are renowned for various architectural styles such as Dutch, Georgian, and Victorian, which reflect their heritage and traditions, but also divisions of the past (Stellenbosch Municipality, 2026:24).

The area houses excellent educational institutions, including the University of Stellenbosch and several prestigious schools. It has a strong business sector, ranging from major South African businesses and corporations to smaller enterprises and home industries. The tourism industry alone is responsible for the creation of about 18 000 jobs in the area. Wine farms and cellars abound, and the area is the home of the very first wine route in South Africa. A variety of sports facilities are available. Coetzenburg, with its athletics and rugby stadiums, has delivered star performances over many generations. The municipal area has a variety of theatres, which include Stellenbosch University's HB Thom Theatre, Oude Libertas Amphitheatre (renowned for its summer season of music, theatre, and dance), and Spier Amphitheatre, as well as Klein Libertas Theatre, Dorp Street Theatre, and Aan de Braak Theatre (Stellenbosch Municipality, 2026:24).

1.3 Ward Demarcation

The Stellenbosch Municipality is currently structured into the following **23** wards:

Table 1: Municipal ward demarcation



Ward	Areas
1	Mooiwater, Franschhoek Town and Surrounding Farms
2	Langrug, La Motte, Dennegeur, Groendal
3	Lanquedoc, Wemmershoek to La Motte Wine Farm and Leopards Leap Wine Farm
4	Kylemore, Johannesdal, Pniël and Surrounding Farms
5	Ida's Valley (Hillside Village, La Gratitude Park (Kreefgat), The Ridge, La Roche, Lindida, Bloekomlaan(Moses / Martin) Lindley)
6	On the corner of Moffat Street to the end of Lelie Street, the Corner of Moffat Street to Rustenburg Road, Desch Street to Rustenburg Road, Moffat Street, Hahn Street, Weber Street, Tindell Street, Juffernbruch Street, Kahler Street, Luckhoff Street, Erasmussmith Street, Baker Street, Desch Street, Lelie Street, Protea Street to Erasmusmith Street, Botmanskop Way, Dahlia Street, Speler Street, Rustenburg road of the corner of Helshoogte Road to Lelie Street; Glenelly Estate in Lelie Street; Helderfontein in Helshoogte Road; Nietvoorbij on R44; Blue Jay / Timberlea Trust Farm on R44; Kloofbosch on R44; Babin Farm on R44; Morgenhoff Wine Estate on R44; Remhoogte on R44; Groenhof on R44; Muratie Wine Estate on R44; Delheim Wine Estate on R44; Kanonkop on R44; Uitkyk on R44; Warrick on R44; Lievland on R44

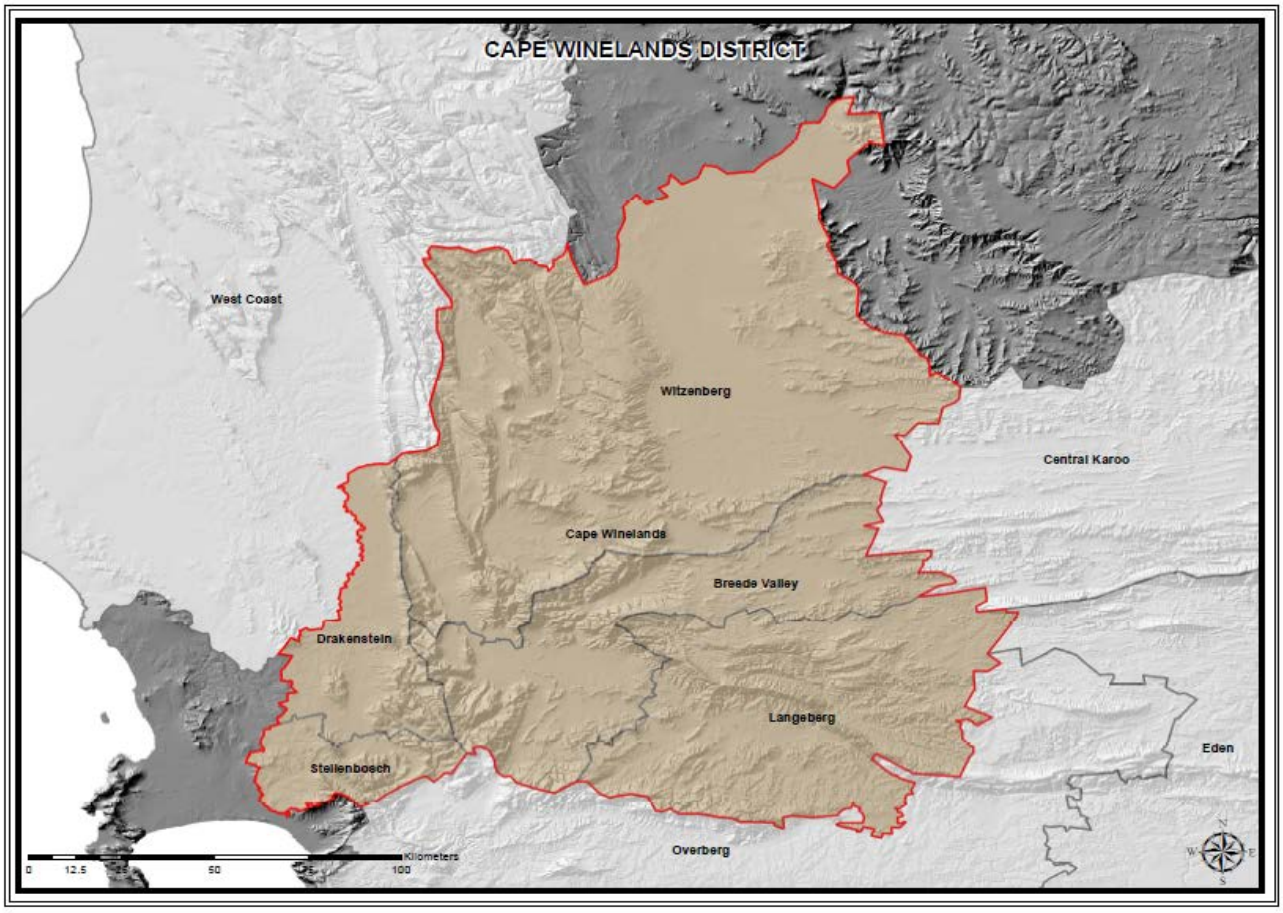
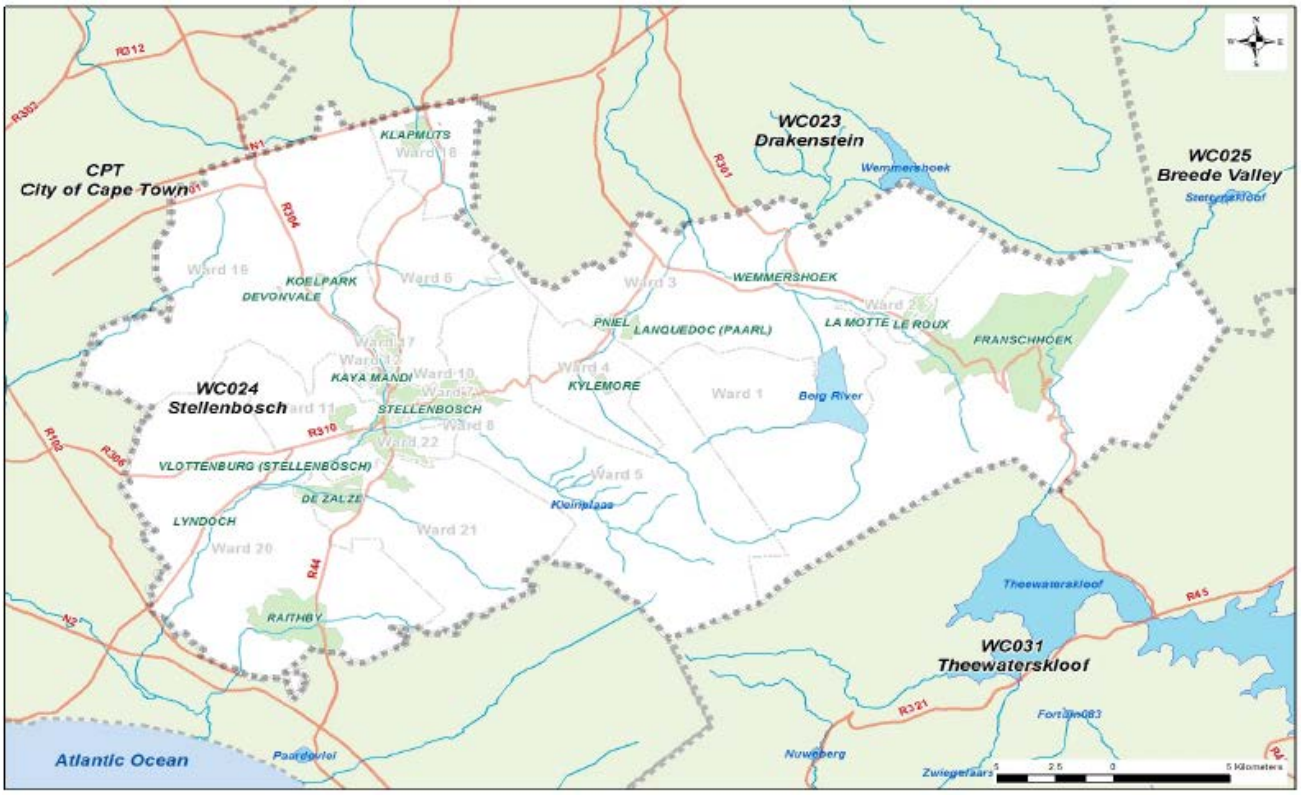
Below is a map of the Cape Winelands District concerning the provincial district boundaries:



Map 1: Locality of Cape Winelands concerning Provincial Boundaries

The Western Cape Province makes up 10.6% of the country's land surface and encompasses an area of 129 462 km2. The province's spatial area includes 1 metropolitan area (City of Cape Town), 5 district municipal areas (Central Karoo, Eden renamed Garden Route, Overberg, Cape Winelands, and West Coast), and 24 local municipalities (Stellenbosch Municipality, 2026:27).

Below is a map of the municipalities in the Cape Winelands District:



Map 2: Locality map of Stellenbosch Municipality concerning Cape Winelands District Boundaries

The Cape Winelands District Municipality is located within proximity of the City of Cape Town, which offers excellent access to trade opportunities, routes, and infrastructure such as expanding broadband networks, an international airport (with direct flights to international cities), the second-largest container port in the country, and a comprehensive road and rail network. This makes the Cape Winelands district ideally located as an investment destination. The Cape Winelands District municipal area incorporates Drakenstein, Stellenbosch, Breede Valley, Langeberg, and Witzenberg (Stellenbosch Municipality, 2026:27).

Below is a map of the Stellenbosch Municipality's area of jurisdiction:

Map 3: Locality map of municipal boundaries

Stellenbosch Local Municipality is located in the heart of the Cape Winelands and adjacent to the City of Cape Town and Drakenstein Municipality. Stellenbosch Municipality, as a local authority, governs the towns of Stellenbosch, Pniël, Klapmuts, Kylemore, Jamestown, Raithby, Ida's Valley, Cloetesville, Kayamandi, and Vlottenburg, as well as the surrounding rural areas. The area covers 831 square kilometres and adjoins the City of Cape Town (CoCT) to the west and south and the Breede Valley, Drakenstein, and Theewaterskloof municipalities to the east and north. Functionally, Stellenbosch Municipality (SM) forms part of the Greater Cape Town metropolitan area (Stellenbosch Municipality, 2026:28).

The main settlements in SM are the historic towns of Stellenbosch, Franschhoek, and Klapmuts. There are also several smaller villages, including Jamestown (contiguous with Stellenbosch town), Pniël, Johannesdal, Lanquedoc, Lynedoch, and Raithby. New nodes are emerging around agricultural service centres, for example, Koelenhof and Vlottenburg. Stellenbosch is a sought-after space, offering opportunity and quality of living while being near city life. This has placed the municipal area under constant development pressure (Stellenbosch Municipality, 2026:28).

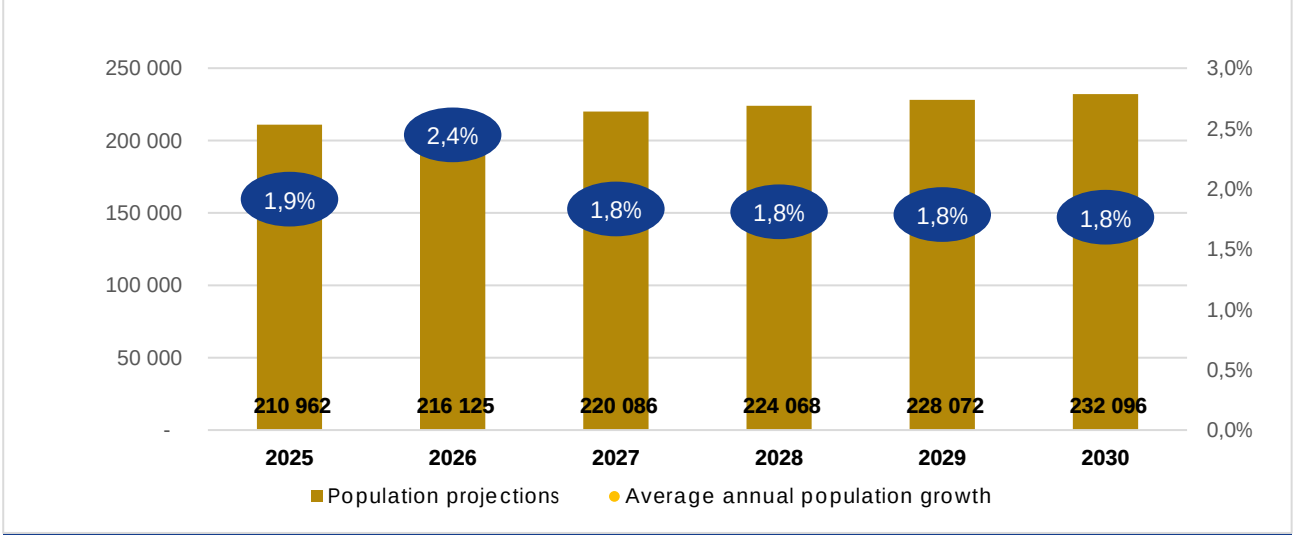
1.5 Socio – Economic Context

All socio-economic information is sourced from the Local Government 2025 – 2026 Municipal Economic Review and Outlook (MERO). The report provides a snapshot of the safety and well-being of our communities, and economic growth. The statistical data are primarily sourced from Statistics South Africa, administrative data from sector departments, the Municipal Review and Outlook (MERO), Global Insight Regional Explorer, and Quantec (Western Cape Government, 2025:283).

Population growth and socioeconomic data are essential for effective municipal planning and the equitable distribution of public services. Population size, household growth, age structure and migration patterns all have a direct impact on the demand for infrastructure, housing, education, healthcare and social services. In rapidly expanding economic hubs such as the Stellenbosch municipal area, monitoring these trends enables policymakers to better anticipate future service demands, allocate resources efficiently, and design targeted interventions that enhance social well-being while also strengthening economic resilience (Western Cape Government, 2025:283).

The GDPR performance, risk, and vulnerability factors can be read in detail within the Local Government MERO 2025 for the Stellenbosch municipal area (Western Cape Government, 2025:283).



1.5.1 Population Growth

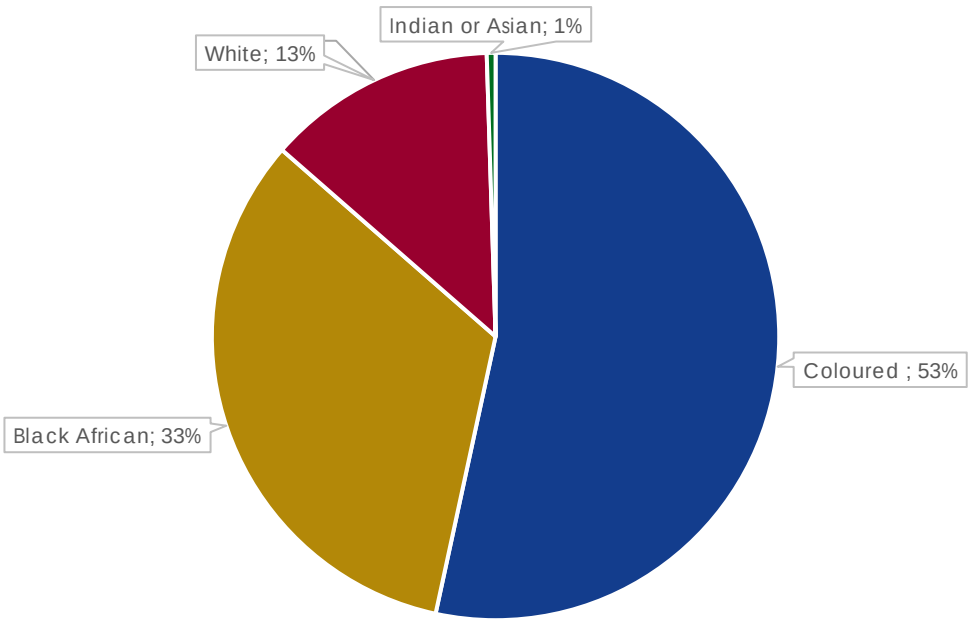
In 2025, the Stellenbosch municipal area was home to 210 962 individuals, reflecting an annual growth rate of **1.9 per cent** during 2025. This significant increase illustrates Stellenbosch's appeal, particularly due to migration to the educational institutions and vibrant community atmosphere. This growth necessitates strategic planning for infrastructure and local services to support the needs of a larger population (Western Cape Government, 2025:281).

The household growth reflects the demographic expansion within Stellenbosch. In terms of households, Stellenbosch exhibits an annual growth from **57 520 in 2024 to 58 912 in 2025,** with an annual growth rate of approximately **3.6 per cent.** This increase highlights a growing demand for municipal services and housing that aligns with the growing population. Addressing this growth in households will require proactive planning and resource allocation for maintaining service quality and community engagement (Western Cape Government, 2025:281).

The figure below depicts the estimated population growth from 2025 to 2030:

Figure 1: Population Growth, Stellenbosch, 2025 – 2030

Source: Western Cape Government, MERO, 2025:281)



1.5.2 Racial Split

The race dynamics in the Stellenbosch municipal area present a diverse demographic landscape. Much of the population comprises Black African individuals, accounting for 33.1 per cent of the total, followed closely by the Coloured community, constituting 53.5 per cent. White residents make up 13.1 per cent of the population, while individuals categorised as Indian / Asian represent a smaller proportion at 0.5 per cent (Western Cape Government, 2025:283).

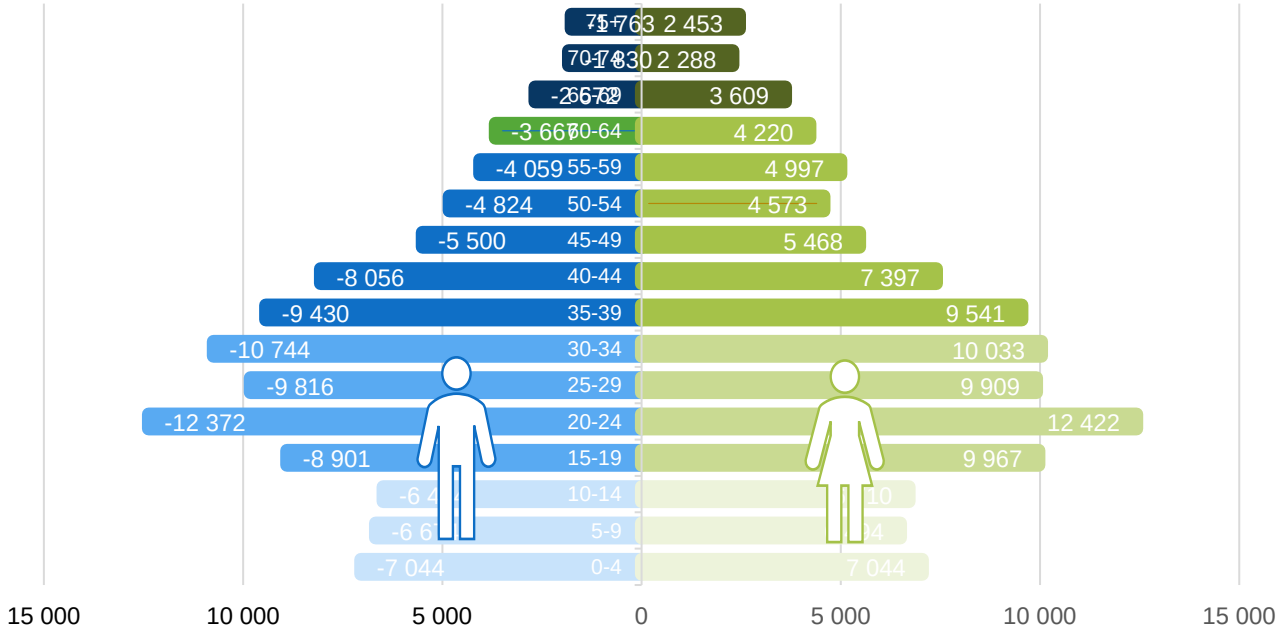
This cross-analysis highlights the intricate racial composition within the Stellenbosch community, underscoring the significance of cultural diversity and its potential impact on economic and social interactions (Western Cape Government, 2025:283).

The figure below indicates the ratio split within the Stellenbosch Municipality:

Figure 2: Racial Split for the Stellenbosch Municipal area

Source: Western Cape Government, MERO 2025 (Quantec, 2025)

1.5.3 Gender Ratio



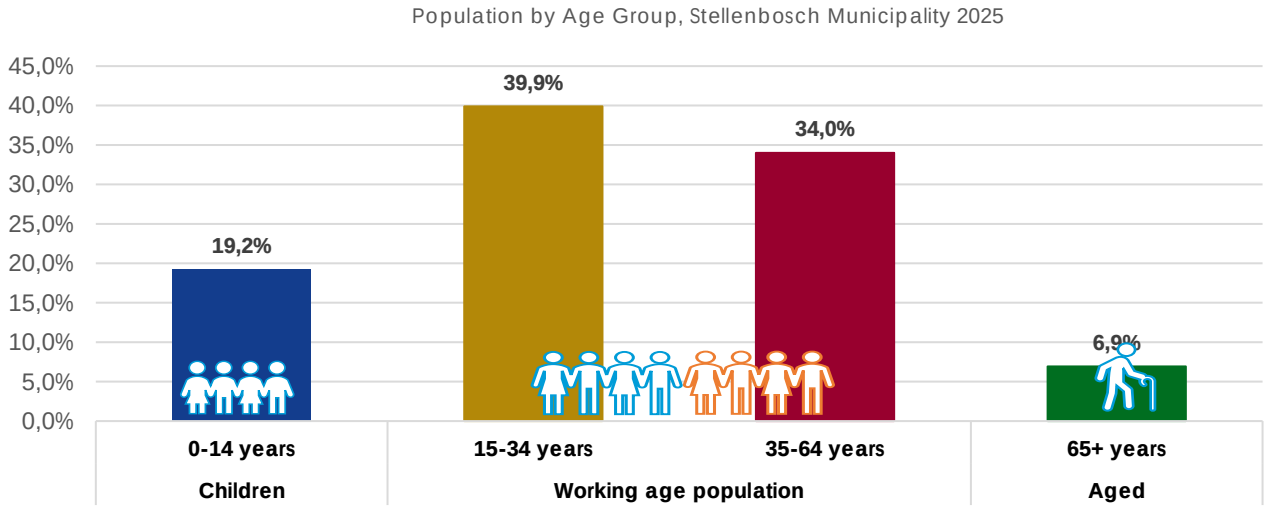
The 2025 population pyramid of the Stellenbosch municipal area indicates a noticeable gender imbalance within the 20-24 and 25-29 age cohorts, with 12 372 males compared to 12 422 females in the 20-24 age group. This pattern reflects the underlying demographic and socio–economic dynamics of the area. The gender imbalances could be a nexus of labour migration patterns, the substantial student population (which often influences age–specific demographic distribution) and potential out–migration of males seeking employment opportunities elsewhere. These factors contribute toward shaping the structure of the local labour force and demographic profile of the Stellenbosch municipal area (Western Cape Government, 2025:282).

This demographic imbalance may contribute to a growing dependency burden. The relatively large base of children (0 to 14 years) and the rapidly expanding elderly population (especially females aged 60 and above) will place increasing pressure on a potentially constrained work – age population to sustain public expenditure on social services, healthcare and pensions. In addition, it will in the future strain public resources and shift housing demands and settlement patterns. To sustain economic growth and social stability, policy responses will need to focus on strategies that retain young male professionals or

facilitate adaptation to a workforce with a higher female participation rate (Western Cape Government, 2025:282).

The table below depicts the gender ratio within the Stellenbosch municipal area.

Figure 3: Ratio of % females and males



Source: Western Cape Government, MERO, 2025:282)

1.5.4 Age Cohorts

The age distribution of the Stellenbosch population has significant socioeconomic implications, particularly for future housing and service delivery. With a substantial **39.9 per cent** of the population **aged 15 to 34**, the municipality is under pressure to facilitate job creation and supply affordable housing for young working-age persons. This demographic projection, combined with a sizeable child population (19.2 per cent), indicates continued high demand for basic services and infrastructure, placing a strain on municipal resources. The relatively small population of elderly residents (6.9 per cent) suggests a lower immediate burden on care systems for the aged. In addition, the overall youth-heavy structure points to sustained, long-term demand for indigent support as these young adults form households in a challenging economic environment (Western Cape Government, 2025:283).

Figure 4: Population by age group, Stellenbosch Municipality

Source: Western Cape Government, MERO 2025 and Department of Social Development, Western Cape Provincial Population Unit (PPU), 2025:282)

1.5.5 Safety and Security

All the data below are sourced from the Local Government MERO 2025 for the Stellenbosch Municipal area.

The 2024 crime statistics indicate that the Stellenbosch municipal area is facing a deeply dualistic socio-economic crisis, in which the crime profile is both a cause and a consequence of deep-seated structural inequalities (Western Cape Government, 2025:303).

The statistics in the table below reflect that Stellenbosch's rate of crime per 100 000 people far surpasses CWD averages in almost every category of crime. The incidence of driving under the influence (DUI) and the prevalence of commercial crime show significant disparities. The 61.0 per cent rate of DUI recorded in Stellenbosch in 2024 signals a public safety risk and deeper substance abuse issues. The persistence of these trends in 2024 indicates that current approaches to curbing DUI are merely containing, not resolving, the underlying matters (Western Cape Government, 2025:303).

Table 3: Number of cases per crime category, crime per 100 000 people, 2022 - 2024

Crime Category	Actual Numbers			Trend	Crime per 100 000 Population	
	2022	2023	2024		Stellenbosch	Cape Winelands District
Murder	90	80	79	↔	38	43
Sexual Offences (also see SDS)	248	209	254	↑	123	103
Common assault	1 041	1 119	1 116	↔	539	634
Malicious damage to property	818	839	806	↓	389	416
Burglary at residential premises	941	877	996	↑	481	471
Commercial crime	876	1 064	1 229	↑	594	268
Drug-related crime	1 233	1 474	1 464	↓	707	735
Driving under the influence of alcohol or drugs	264	254	251	↔	121	75

Source: Western Cape Government, MERO 2025:303)

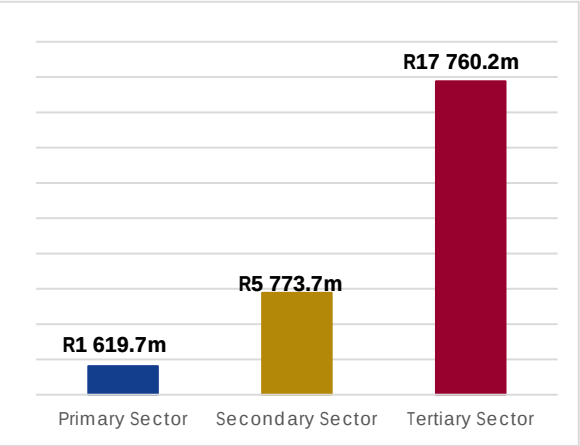
1.5.6 Economy and Labour Market Performance

1.5.6.1 Sectoral Overview

In 2024, the economic landscape of the Stellenbosch municipal area boasted a Gross Domestic Product at the regional level (GDPR) of R25.2 billion, equivalent to 24.0 per cent of the CWDM and 2.7 per cent of the Western Cape economy. Economic activity in 2024 was broadly stagnant, with GDPR growth of only 0.1 per cent and total employment declining by 1.3 per cent to 77 504 jobs. Labour market indicators weakened correspondingly: the unemployment rate rose to 13.8 per cent in 2024, while the labour-force participation rate fell to 66.2 per cent and the labour-absorption rate to 57.0 per cent (Western Cape Government, 2025:109).

Employment is predominantly focused on Stellenbosch town, which accounts for the majority of formal jobs dominated by higher education, financial and business services, retail activities associated with Stellenbosch University, commercial offices, and tourism. The Franschhoek town is a secondary employment node, with its main sectors in hospitality, accommodation, and restaurants, while Lanquedoc is defined by agri-processing and support activities for crop production. Elsenburg, by contrast, drives public sector and agricultural research employment through provincial and academic institutions. This geographic distribution shows a dual economy, one being an urban, service-driven core

centred in Stellenbosch town, and a productive agricultural periphery extending through the valley settlements and wine estates (Western Cape Government, 2025:109).



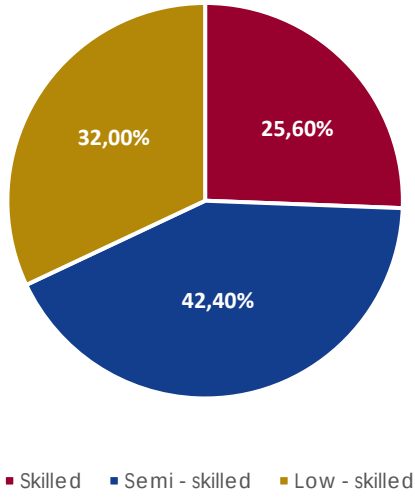
The municipality's economy thrives on a dominant tertiary sector, led by finance, trade and personal services. The finance and business sector provided the only positive growth momentum in 2024, contributing 0.8 per cent points to the overall GDPR (Western Cape Government, 2025:109).

Table 4: Sectoral contribution to GDPR 2024

Primary Sector	
Sector	**2024**
Agriculture	R1 584.5m
Mining	R35.2m
Total	**R1 619.7m**

Secondary Sector	
Sector	**2024**
Manufacturing	R4 496.0m
Electricity	R407.8m
Construction	R869.9m
Total	**R5 773.7m**

Tertiary Sector	
Sector	**2024**
Trade	R2 541.3m
Transport	R4 425.3m
Finance	R6 541.9m
General Government	R1 385.1m
Personal Services	R2 866.6m
Total	**R17 760.2m**



Source: Western Cape Government, MERO 2025 (Quantec, 2025)

1.5.6.2 Formal and Informal Employment

The presence of Stellenbosch University and the diverse industries in the area have led to a significant workforce composition, with 25.6 per cent classified as skilled workers and 42.4 per cent as semi-skilled workers. Informal sector activities, particularly in trade, agriculture, and personal services, contribute significantly to employment, accounting for 23.1 per cent of the workforce in 2024. However, a notable challenge exists for low-skilled workers, constituting 32.0 per cent of the workforce, as recent job creation trends have favoured semi-skilled and skilled workers, limiting opportunities for this demographic (Western Cape Government, 2025:113).

Figure 5: Skills Level Contribution, 2024

	2024	Change from 2023
Skilled	25,60%	-0,20%
Semi - skilled	42,40%	-0,60%
Low - skilled	32,00%	-0,40%

Source: Western Cape Government, MERO 2025:113

1.5.6.3 Job Gains and Unemployment

It is crucial to facilitate access to education and skills development initiatives in communities where high unemployment rates occur. Social transformation needs to be promoted and provide enough relevant opportunities and resources for the affected demographic areas (Western Cape Government, 2025:117).

Not only does this initiative enhance the socio-economic landscape, but it also has implications for municipal revenue. A skilled and educated workforce can contribute to a more vibrant local economy, generating higher tax revenues to support municipal projects and services (Western Cape Government, 2025:117).

An analysis of the formal sector indicates that, although there was a net gain of 3 293 formal jobs, this was overshadowed by losses elsewhere. The most notable increases in informal employment occurred in management consultancy (1 693 jobs) and short-term accommodation (358 jobs). However, these gains were countered by significant job losses in sectors such as other telecommunications activities (617 jobs), private security activities (322 jobs), and notably the manufacture of wines (221 jobs), the latter reflecting the broader downturn experienced in the agriculture sector (Western Cape Government, 2025:117).

Chapter 2: SDG Governance in Stellenbosch Municipality

2.1 Introduction

The attainment of Sustainable Development Goals (SDGs) necessitates effective governance frameworks that incorporate the SDGs into municipal governmental operations. Consequently, the subsequent key themes have been identified as a conceptual framework for the implementation of the Sustainable Development Goals in Stellenbosch Municipality: governance, integration, coherence, accountability, and multi-level alignment. The SDGs do not encompass all institutional obligations of municipalities; rather, they align with the principal performance domains of municipal governance.

Governance encompasses the institutional frameworks and procedures by which individuals and groups express their interests, resolve their conflicts, and fulfil their legal rights and responsibilities. Integration denotes the coordination of activities across sectors and the formulation of comprehensive policies that acknowledge the interrelation of economic, social, environmental, and governance matters. The phrase ‘coherence’ denotes the necessity for both vertical and horizontal alignment. Vertical alignment guarantees that policies and strategies are congruent with national and global obligations, whereas horizontal alignment pertains to the consistency among diverse strategies formulated to fulfil specific commitments, including those associated with climate change, national development, and sustainable development.

Accountability is the execution of duties and obligations mandated by law, regulations, or programmes, together with the enforcement of commitments undertaken. Given that different organisations function at distinct levels and possess differing mandates, it is imperative to establish systems to guarantee their accountability for respective responsibilities and actions. This element is closely associated with transparency, defined as the accessibility of information regarding plans, procedures, decisions, and outcomes. Multi-level alignment recognises that national governments cannot attain the SDGs independently, especially in federal or decentralised systems. Sub-national governments, community-based organisations, and the commercial sector are essential actors in promoting sustainability at the local level. Various tiers of government participate in planning, service provision, and funding. In multi-tiered systems, coordination and cooperation among government levels and other stakeholders are essential for formulating cohesive responses to the SDGs and addressing interconnected challenges.

2.2 SDG Governance

2.2.1 Interdepartmental Coordination Mechanisms

Stellenbosch Municipality has achieved notable progress in establishing effective interdepartmental coordination mechanisms, which are essential for improving the integration of the Sustainable Development Goals (SDGs) into its carefully designed municipal governance frameworks. This meticulously organised governance and institutional system is intentionally crafted to include elected political leaders, the Municipal Manager, and two SDG champions, who are supported by SDG team leaders responsible for data management and report writing. This team collaborates effectively with the five directorates to finalise the VLR report for the six selected SDGs.

The alignment of each official's portfolio is carefully determined to correspond well with the selected SDGs, which act as a crucial framework for advancement and cohesion. This alignment fosters a unified operational plan that highlights the municipality's forward-looking vision for sustainable development, ensuring that all activities are coordinated towards reaching common goals. This strategic alignment not only directs fundamental municipal operations but also shapes vital budgetary priorities and creative service delivery methods that effectuate substantial change. This thorough method guarantees that resources are distributed with maximum efficiency and accountability, surpassing mere compliance and promoting true community improvement. Furthermore, the municipality's Strategic Focus Areas (SFAs) act as essential focal points, consistently targeted by the planning processes employed by each Directorate, thereby fostering a cohesive and synergistic approach in their joint efforts to achieve the municipality's overarching goals. Stellenbosch Municipality reaffirms its steadfast commitment to advancing essential developmental agendas while ensuring the efficient delivery of essential services to its community members, thereby enhancing their quality of life and contributing to a sustainable future for all.

2.2.2 Stakeholder Engagement and Partnerships

According to Agusdinata (2022:1604), the implementation of the 2030 Agenda for Sustainable Development commences with informed and explicitly defined priorities crucial for attaining its goals. These priorities necessitate localised implementation strategies aimed at fostering effective local, provincial, and national development. This pressing requirement is distinctly evident in the diverse local, district, provincial, and national plans established to achieve these ambitious global objectives, including initiatives for poverty alleviation, environmental sustainability, and social fairness.

Local government plays a crucial and essential part in this process, as it represents the closest level of governance to the communities and individuals it serves every day. Local government, positioned at the forefront of this project, serves as the primary vocal point for Agenda 2030, promising that the programmes are accessible and attuned to community needs. The Stellenbosch Municipality, committed to realising the Sustainable Development Goals (SDGs) specified in the 2030 Agenda, is undertaking significant measures to establish the first Stakeholder Engagement Platform dedicated as an interactive initiative to co-plan and co-implement matters relating to the SDGs selected by the municipality.

Therefore, a stakeholder engagement was arranged on 25 February 2026, where all spheres of government, businesses, NGOs, and any interested and affected parties were invited to share data, projects, initiatives, and programmes with the municipality. This engagement highlighted stakeholders' desire to work with the municipality to ensure a sustainable future for all. Various matters of concern were raised. These matters will be championed by the municipal SDG team members to ensure that the matters of concern raised get a foothold in municipal planning and implementation initiatives.

This innovative initiative aims to assist all stakeholders, including local government representatives, business leaders, academics, non-profit organisations, and civil society, in understanding the municipality's firm commitment to achieving the SDGs and recognising their potential contributions to these significant and transformative initiatives. Stellenbosch Municipality selected 6 out of 17 SDGs as an initial step to report on the SDGs in its VLR report. This will provide clear direction and targets to enable significant stakeholder engagement. The objective of establishing these links is to attain substantial outcomes that encourage more community engagement and enhance collaboration for sustainable development (Sever, Tok and Sellami, 2025:06).

2.2.3 Global Policy Direction

The Stellenbosch Municipality’s strategic planning does not occur in a vacuum. Various key policy directives are being employed, ranging from a global reach to more specific directives applicable to the municipality and its neighbouring municipalities. All these directives are considered when framing future strategic planning and resource allocation. The sections below outline key policy directives considered when framing Stellenbosch Municipality’s 4th review of the 5th Generation IDP 2022 – 2027 (Stellenbosch Municipality, 2026:52).

2.2.4 Sustainable Development Goals

The Sustainable Development Goals (SDGs), officially known as Transforming Our World: The 2030 Agenda for Sustainable Development, are a set of seventeen aspirational "Global Goals" with 169 targets between them. The Agenda is an action plan for people, the planet, and prosperity, with a focus on strengthening peace and partnerships. The SDGs are integrated and indivisible and balance the three dimensions of sustainable development: economic, social, and environmental (Stellenbosch Municipality, 2026:53).

Figure 6: ***Sustainable Development Goals***

Sustainable Development Goals (SDGs) 2030

- **Goal 1: End poverty in all its forms everywhere.**
- Goal 2: End hunger, achieve food security and improved nutrition, and promote sustainable agriculture.
- Goal 3: Ensure healthy lives and promote well-being for all ages.
- Goal 4: Ensure inclusive and equitable quality education and promote life-long learning opportunities for all.
- **Goal 5: Achieve gender equality and empower all women and girls.**
- Goal 6: Ensure availability and sustainable management of water and sanitation for all.
- Goal 7: Ensure access to affordable, reliable, sustainable, and modern energy for all.
- Goal 8: Promote sustained, inclusive, and sustainable economic growth, full and productive employment, and decent work for all.
- Goal 9: Build resilient infrastructure, promote inclusive and sustainable industrialisation, and foster innovation.
- Goal 10: Reduce inequality within and among countries.
- **Goal 11: Make cities and human settlements inclusive, safe, resilient, and sustainable.**
- Goal 12: Ensure sustainable consumption and production patterns.
- **Goal 13: Take urgent action to combat climate change and its impacts.**

- Goal 14: Conserve and sustainably use the oceans, seas, and marine resources for sustainable development.
- Goal 15: Protect, restore, and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat deforestation, halt and reverse land degradation, and halt biodiversity loss.
- **Goal 16: Promote peaceful and inclusive societies for sustainable development, provide access to justice for all, and build effective, accountable, and inclusive institutions at all levels.**
- **Goal 17: Strengthen the means of implementation and revitalise the global partnership for sustainable development.**

(Stellenbosch Municipality, 2026:53).

The table below indicates how the municipality's Strategic Focus Areas (SFAs) are aligned with national, provincial, and district plans.

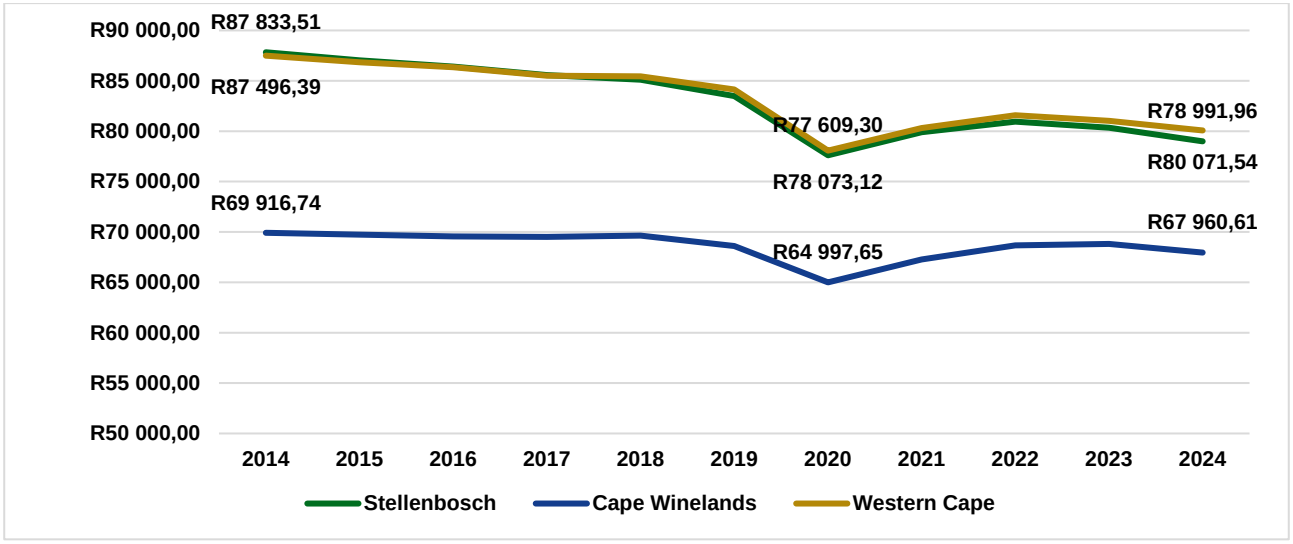
Table 5: Horizontal Alignment Matrix

Strategic Focus Areas (SFAs)	Sustainable Development Goals (SDGs)	Medium-Term Development Plan	Western Cape Provincial Government	CWDM Strategic Objectives
SFA 1 Valley of Possibility	Promote sustained, inclusive, and sustainable economic growth, full and productive employment, and	Drive inclusive growth and job creation (1)	Growth for Jobs (1)	Promoting sustainable infrastructure services and transport systems which foster social
SFA 2 Green and Sustainable Valley	Take urgent action to combat climate change (13) Protect, restore, and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss (15)	Build a capable, ethical and developmental state (3)	Educated, Healthy and Caring Society (3) Innovation, Culture and Governance (4)	Creating an environment and forging partnerships that ensure the health, safety, social and economic development of all communities, including the empowerment of the poor in the Cape Winelands District through economic, environmental, and social infrastructure investment.
	Make cities and human settlements inclusive, safe, resilient, and sustainable (11)	Build a capable, ethical and developmental state (3)	Educated, Healthy and Caring Society (3)	Promoting sustainable infrastructure services and transport systems which foster social and economic opportunities.

Strategic Focus Areas (SFAs)	Sustainable Development Goals (SDGs)	Medium-Term Development Plan	Western Cape Provincial Government	CWDM Strategic Objectives
SFA 3 Safe Valley	Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable, and inclusive institutions at all levels (16)	Build a capable, ethical and developmental state (3)	Safety (2)	Creating an environment and forging partnerships that ensure the health, safety, social and economic development of all communities, including the empowerment of the poor in the Cape Winelands District.
SFA 4 Dignified Living	Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all (4) Ensure healthy lives and promote well-being for all at all ages (3)	Reduce poverty and tackle the high cost of living (2)	Educated, Healthy and Caring Society (3)	Creating an environment and forging partnerships that ensure the health, safety, social and economic development of all communities, including the empowerment of the poor in the Cape Winelands District.
	Build resilient infrastructure, promote inclusive and sustainable industrialisation and foster innovation (9)	Drive inclusive growth and job creation (1)	Innovation, Culture and Governance (4)	Promoting sustainable infrastructure services and transport systems which foster social and economic opportunities.
SFA 5 Good Governance and Compliance	Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable, and inclusive institutions at all levels (16)	Build a capable, ethical and developmental state (3)	Growth for Jobs (1) Innovation, Culture and Governance (4)	Promoting sustainable infrastructure services and transport systems which foster social and economic opportunities.
			Innovation, Culture and Governance (4)	To provide an effective and efficient financial and strategic support service to the Cape Winelands District Municipality.

(Stellenbosch Municipality, 2026:59).

CHAPTER 3: SDG SELECTION AT STELLENBOSCH MUNICIPALITY



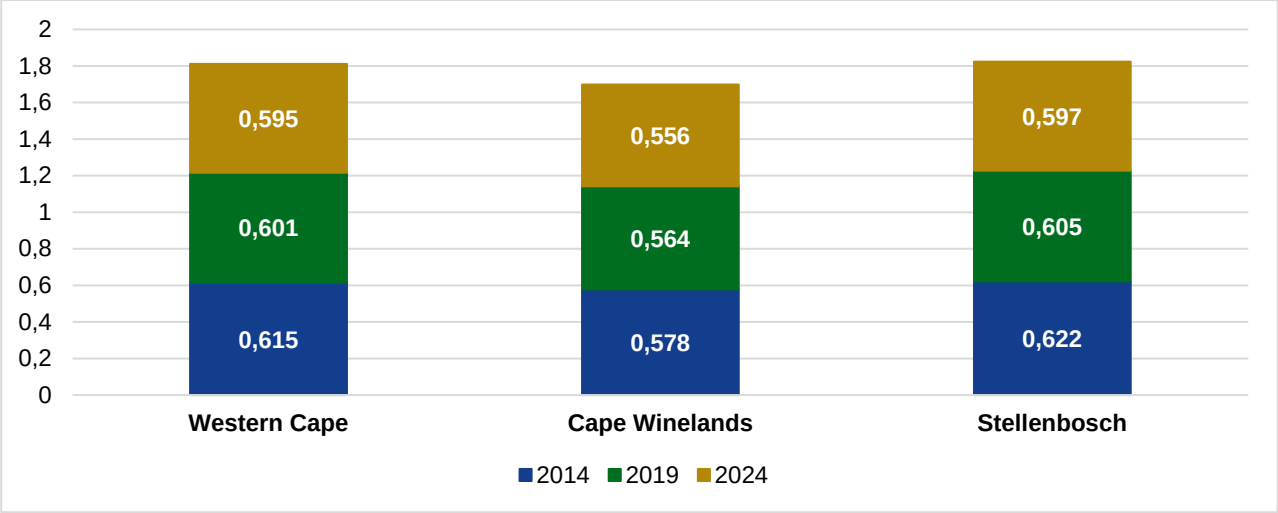
3.1 SDG 1 No Poverty

One of the main objectives of the Sustainable Development Goals is to end severe poverty for all people worldwide by 2030 (United Nations, 2026).

3.1.1 GDPR Per Capita

In terms of Gross Domestic Product per capita (GDP), an increase is only witnessed when economic growth surpasses population growth. According to the MERO 2025, Stellenbosch's GDP per capita consistently exceeds the Cape Winelands region's and provincial averages, indicating its economic growth. In 2020, per capita GDPR in Stellenbosch contracted sharply (declining to R77 609), then peaked in 2022 (R80 943). It declined for two consecutive years to R78 992 in 2024. This indicates that Stellenbosch's high-value economy, underpinned by viticulture, tourism and academia, is confronting structural headwinds, including inflationary pressures or slower export growth, which are limiting gains in per capita economic well-being (Western Cape Government, 2025:294).

Figure 7: GDP Per Capita



Source: Western Cape Government, MERO 2025

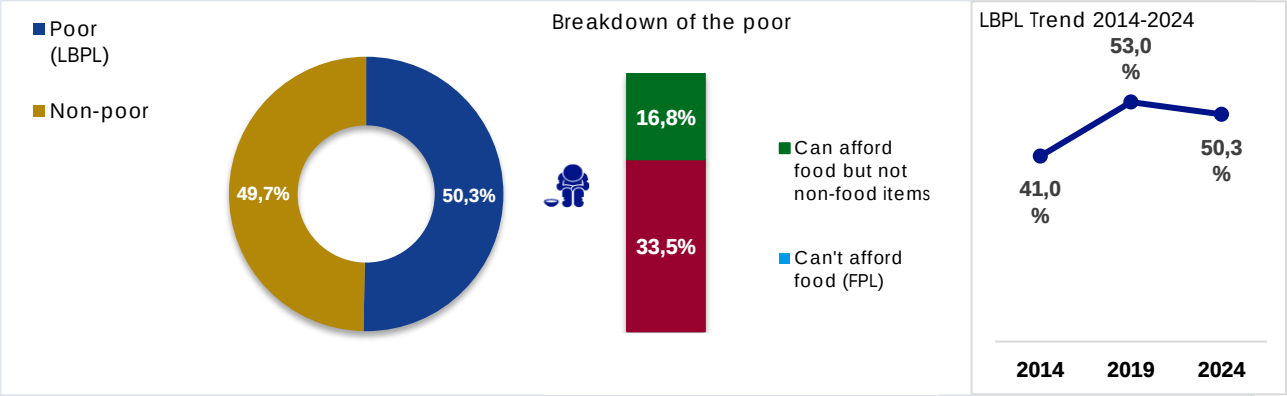
3.1.2 Income Inequality

According to the widely used Gini index, South Africa has one of the highest levels of inequality globally. Inequality is seen through a distorted distribution of income, unequal opportunities, and regional discrepancies.

The National Development Plan (NDP) has set a target of reducing income inequality in South Africa from a Gini coefficient of 0.7 in 2010 to 0.6 by 2030 (South African Government, 2025:34). The Gini coefficient of the Stellenbosch municipal area decreased from 0.605 in 2019 to 0.597 in 2024. However, the improvement was negligible, and the figure remains close to 0.600 – a ratio indicative of severe social strain. The Stellenbosch coefficient exceeds the average for the Western Cape and far surpasses that of the CWD (Western Cape Government, 2025:296).

Figure 8: Income Inequality

Source: Western Cape Government, MERO, 2025:295



3.1.3 Poverty Line

The Upper Bound Poverty Line (UBPL) headcount ratio is the proportion of the population living below the UBPL, i.e., that cannot afford to purchase adequate levels of food and non-food items (Western Cape Government, 2025:299).

Poverty affects the social development of communities through lower life expectancy, malnutrition and food insecurity, higher exposure to crime and substance abuse, lower educational attainment, and poor living conditions (Western Cape Government, 2025:299).

In 2024, 50.3 per cent of Stellenbosch's population fell below the lower – bound poverty line (LBPL). Of this population, 33.5 per cent fell below the Food Poverty Line (FPL), indicating an inability to afford basic nutritional requirements, while 16.8 per cent were able to meet food needs but remained unable to cover essential non – food needs. Although an improvement has been shown from 2019 of 53.0 per cent, poverty levels remain substantially higher than those recorded in 2014 (41.0 per cent) (Western Cape Government, 2025:299).

Figure 9: Poverty Headcount Rate, 2014 – 2024

Source: Western Cape Government, MERO 2025:299

3.1.4 Basic Service Delivery

The Constitution stipulates that every citizen has the right to adequate housing access and that the state must take reasonable legislative and other measures within its available resources to achieve the progressive realisation of this right. Access to housing also includes access to basic services such as potable water, basic sanitation, safe energy sources, and refuse removal services, to ensure that households enjoy a decent standard of living.

This section reflects on the latest available information from the MERO 2025 and Quantec Research for 2025. The latest official statistics were collected by Statistics South Africa in the 2022 Census, but for the purpose of these statistics, Quantec's modelled estimates were utilised by the Western Cape Provincial Government to compile the MERO 2025, which offers more recent and regularly updated figures. The information on indigent households was obtained from the Western Cape Department of Local Government.

3.1.5 Housing and Household Services

In 2024, in the Stellenbosch municipal area, which comprises 57 520 households, 72.4 per cent had access to formal housing, lower than the Cape Winelands District average of 73.7 per cent. The remaining households were spread across other housing types: 10.0 per cent lived in informal dwellings (i.e., informal dwellings or shacks not located in a backyard), 0.8 per cent occupied traditional dwellings, and 0.2 per cent resided in other or unspecified housing types (Western Cape Government, 2025:300).

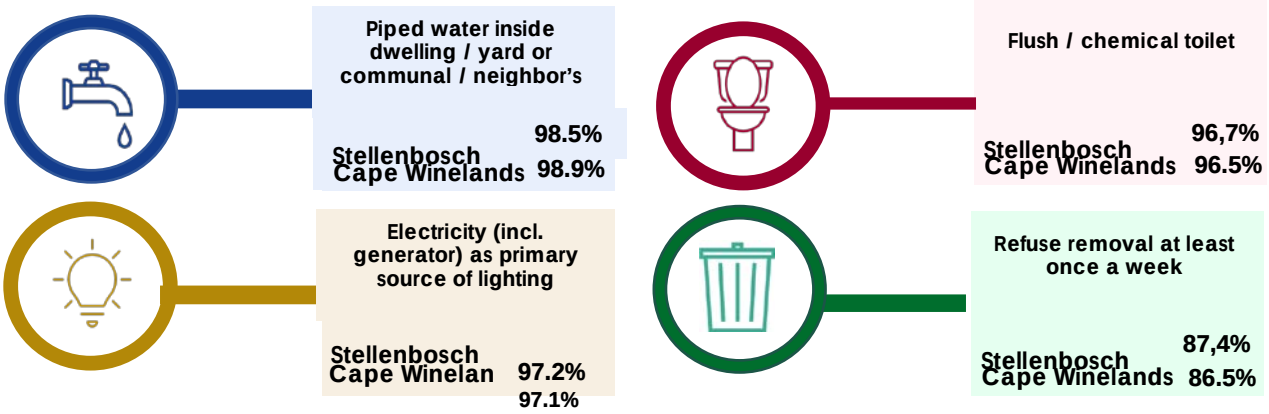


Table 6: SDG Target 1.4

Target 1.4 By 2030, ensure that all men and women, in particular the poor and the vulnerable, have equal rights to economic resources, as well as access to basic services, ownership and control over land and other forms of property, inheritance, natural resources, appropriate new technology and financial services, including microfinance	
Indicator	**Baseline** (up to 30 June 2025)
1.4.1 Proportion of population living in households with access to basic services	-
1.4.2 Proportion of total adult population with secure tenure rights to land, with legally recognised documentation and who perceive their rights to land as secure, by sex and by type of tenure	-

It should be noted that the proportion of households in Stellenbosch residing in informal dwellings was substantially higher than the district average (6.8 per cent). This category, which includes structures in densely populated informal settlements, reflects persistent housing shortages, ongoing urban in-migration pressure, and income inequality (Western Cape Government, 2025:301).

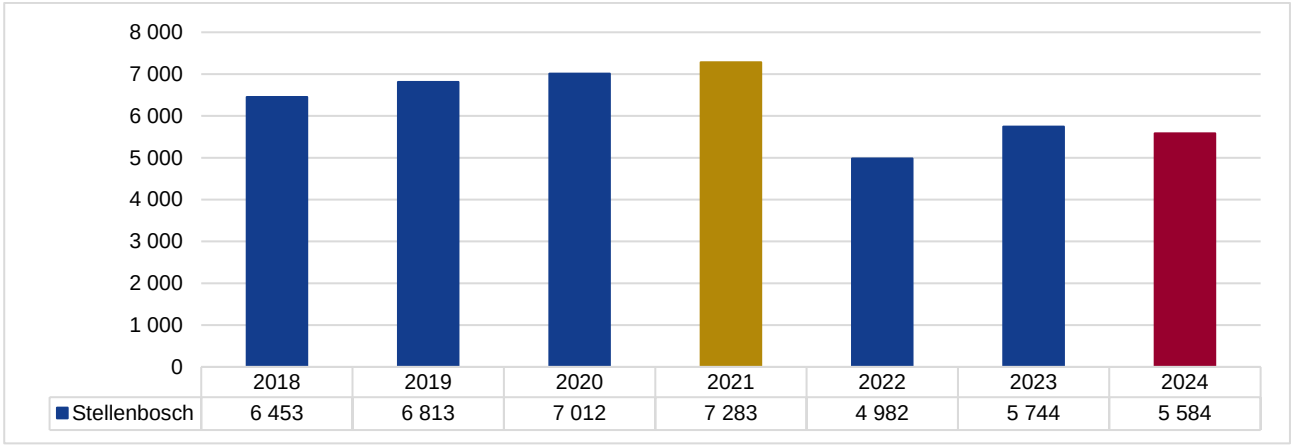
Service delivery access levels within the municipal area were considerably higher than access to formal housing, with access to piped water (98.5 per cent), flush or chemical toilet access (96.7 per cent), electricity access (including generators) for lighting (97.1 per cent), and the removal of refuse at least weekly by the local authority at 87.4 per cent of households. These access levels were above the district figures for electricity and refuse removal services (Western Cape Government, 2025:302).

Figure 10: Service delivery access levels (HH)

Source: Western Cape Government, MERO 2025:302

3.1.6 Free Basic Services

The following table indicates the percentage of average registered indigent households that have access to free basic municipal services. The total number of indigent households



excludes all informal households and includes formal households that have been registered as indigent households. The total i.t.o. of free basic electricity includes only indigent households claiming 100 kWh from the Stellenbosch Municipality. Additionally, it excludes the totals for areas where ESKOM manages the electricity distribution (Western Cape Government, 2025:302).

Per the approved Indigent Policy of the municipality, all households earning less than R7 500 per month will receive free basic services as prescribed by national policy and in terms of Stellenbosch Municipality's Indigent Policy, 2025 (Stellenbosch Municipality, 2025:07).

Stellenbosch had a decline in the number of households that were registered for indigent support from 2021 to 2022. In 2021, 7 283 households were recorded, followed by a 32.0 per cent drop to 4 982 in 2022. The lowest recorded number of indigent households was in 2024/25 at 5 584, which is well below pre – pandemic (COVID-19) counts (Western Cape Government, 2025:302).

The table below indicates the number of households receiving free basic services.

Figure 11: Indigent Households, 2018 - 2024

Source: Western Cape Government, MERO 2025:302

Municipalities offer free basic services to financially vulnerable households, and the number of households receiving these services in the Stellenbosch municipal area sharply declined in 2024. Target local initiatives have successfully lifted a major portion of households out of poverty, as evidenced by the divergence from 2022 to 2024. Such interventions include municipal indigent support programmes and expanded access to basic services (Western Cape Government, 2025:302).

Per the approved Indigent Policy of the municipality, all households earning less than R7 500 per month will receive free basic services as prescribed by national policy.

Indigent households in the Stellenbosch Municipal Area receive:

- free sanitation services;
- free refuse removal services;
- 6 kilolitres of free water per month; and
- 100 units of free electricity per month.

The Rates Policy allows for an additional R100 000 reduction for indigent consumers over and above the total of R250 000 reduction / exclusion already granted to owners of residential properties.

Table 7: Access to Free Basic Services

Year	Number of Households							
	Free Basic Water		Free Basic Sanitation		Free Basic Electricity		Free Basic Refuse Removal	
	Access	%	Access	%	Access	%	Access	%
2018/19	6 813	13.01	6 813	13.01	4 833	9.23	6 813	13.01
2019/20	6 666	100%	6 666	100%	4 932	100%	6 666	100%
2020/21	7 283	100%	7 283	100%	5 189	100%	7 283	100%
2021/22	4 681	100%	4 681	100%	4 982	84.25%	4 681	100%
2022/23	5 744	100%	5 744	100%	5 744	100%	5 744	100%
2023/24	5 584	100%	5 584	100%	5 584	100%	5 584	100%
2024/25	6 732	100%	6 732	100%	6 732	100%	6 732	100%

Table 8: SDG Target 1.1

Target 1.1 By 2030, eradicate extreme poverty for all people everywhere, currently measured as people living on less than $3.00 a day		
Indicator	**Baseline** (up to 30 June 2025)	**Post-Baseline Developments** (after 30 June 2025)
1.1.1: Proportion of the population living below the international poverty line by sex, age, employment status and geographic location (urban / rural)	*Not applicable at the local government level*	*Not applicable at the local government level*
RSA Domesticated Indicator		
Indicator	**Baseline** (up to 30 June 2025)	**Post-Baseline Developments** (after 30 June 2025)
Proportion of households living in poverty	*50.3 per cent*	*Information not available*

In 2024, 50.3 per cent of the municipal population lived below the lower-bound poverty line (LBPL). Of these, 33.5 per cent were unable to afford food, as represented by the food poverty line (FPL), while 16.8 per cent were able to meet food needs but not non-food needs.

Although this reflects an improvement from the 2019 peak of 53.0 per cent, poverty levels remain considerably higher than in 2014 (41.0 per cent) (MERO, 2025).

3.1.7 Grant in aid

Grant-in-Aid is an annual donation programme implemented by the municipality. It originates from S67 of the MFMA and has been operational in the municipality through the approved Grant-in-Aid Policy for many years. The information relating to Grant-in-Aid for the purpose of the VLR will focus on the last 5 years.

3.1.7.1 Overview of Programme

The purpose, aims, and objectives of the programme, as contained in the Grant in Aid Policy, include the following:

This policy aims to provide a framework for Grant-in-Aid to non-governmental organisations (NGOs), community-based organisations (CBOs), non-profit organisations (NPOs), non-profit companies (NPCs) or Public Benefit Organisations (PBOs) and bodies that are used by government as an agency to serve the poor, marginalised or otherwise vulnerable as envisaged by Sections 12, 17 and 67 of the Local Government: Municipal Finance Management Act, 2003 (Act No. 56 of 2003).

The purpose of the Grant-in-Aid Policy is to complement the goals, objectives, programmes and actions of the Stellenbosch Municipality's Integrated Development Plan (IDP), to create a sustainable, credible and caring municipality by empowering and building communities and enhancing growth and sharing through partnerships. Priority ward needs, as identified through the Council's IDP, must be the guiding factor in developing these partnerships.

Grant-in-Aid should not duplicate services already provided for by the Council, which falls within the geographical jurisdiction of the Council.

Grant-in-Aid should improve the opportunity for the Council to elicit the support of external organisations to deliver those services to communities which fall within the Council's geographical area of responsibility in a way that allows the Stellenbosch community and town to create an enabling environment for community development.

3.1.7.2 Outcome

The table below depicts the outcome of the programme and indicates the number of Grant in Aid organisations supported and the budget spent over the last four years:

Table 9: Number of Grant in Aid applications recommended and approved

Financial Year	Organisations supported	Funding Allocated
2021/22	90	R4 898 457
2022/23	61	R4 527 340
2023/24	41	R4 450 800
2024/25	31	R5 292 510

3.1.7.3 Statistical data- Beneficiaries

All beneficiaries of the successful grant applicants are local citizens living within the municipal area. They range from young to old. Some organisations render generic social services, whilst others are more specialised / focused on the services they render.

Table 10: Grant in aid categories

Financial Year	General	ECD	Disability	Elderly	Youth	Substance Abuse	Gender	Food Security	Homeless	Environment	Skills Dev	Health	Sport	Arts and Culture
2021/22	4	48	4	6	13	2	2	2	1	1	3	1	16	15
2022/23	1	30	2	2	7	0	0	1	1	1	5	2	7	2
2023/24	4	18	2	2	5	1	1	2	1	0	2	3	0	1
2024/25	4	12	3	0	2	1	0	1	2	0	1	2	1	2

Grant-in-Aid Outreach

3.1.8 Give Responsibly Campaign

The campaign was launched in March 2019 by Heartflow NPC and is currently implemented by Stellenbosch Night Shelter. This includes the distribution and record-keeping of coupons sold to the public vs coupons redeemed for services by homeless persons. The statistics show clearly that many people want to go to the shelter, make use of the coupons and have accepted this system as something that works for them. The campaign aims to stop the cash economy on the streets of Stellenbosch by encouraging citizens to give coupons to homeless persons begging on the streets, which they can use to access services.

The campaign is implemented in collaboration between the municipality and local roleplayers.

The role distribution of the campaign is as follows:

- **Stellenbosch Municipality:**

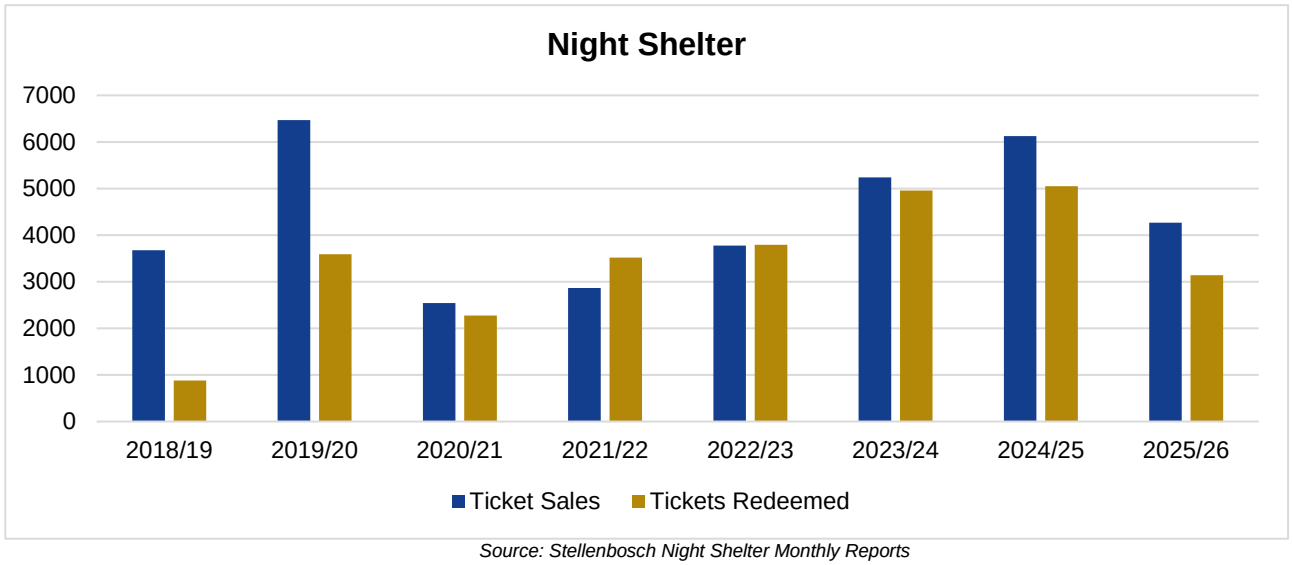
Develop marketing materials. Communicate information on the campaign via municipal social media accounts to citizens. Support Stellenbosch Night Shelter through the Grant-in-aid donation programme.

- **Stellenbosch Night Shelter:**

Recruit local businesses to become vendor distribution points. Distribute coupons to vendors. Deliver services to homeless persons in exchange for a coupon.

- **Visit Stellenbosch:**

Communicate the campaign to tourists and vendors of coupons and host information on the tourism website.



- **Stellenbosch Feeding in Action:** Provide lunch to homeless persons through Grant-in-Aid Donation at the Bergzicht Taxi Rank.
- **Animal Welfare Society Stellenbosch:** Provide access to coupons in exchange for menial jobs**.**
- **Dog Walking at the Devon Valley AWSS**

Through the Stellenbosch Homeless Ministries Network, a project in collaboration with Heartflow started, where homeless persons can walk dogs at the AWSS in exchange for a Give Responsibly Coupon. The homeless walk the dogs for about an hour, but some have found the connection so compelling that they stay there and assist with the cleaning of the feeding and water bowls, as well as the kennels. It is difficult to accommodate the people when the weather is rainy. The project is not suitable for all homeless persons, but it provides an opportunity where a person can, through personal effort, obtain a coupon to sleep in the shelter without having to beg for it.

3.1.8.1 Statistical data Ticket Sales

Figure 12: Give Responsibly Campaign Ticket Statistics

Source: Stellenbosch Night Shelter Monthly Reports

Due to the COVID-19 lockdown period, no payment was required for access to the Stellenbosch Night Shelter or the Municipal Shelter. This is evident in the decrease in tickets redeemed in the 2019/20 financial year.

3.2 SDG 5 Gender Equality

3.2.1 Achieve gender equality and empower all women and girls

Gender mainstreaming is one of the SDGs and the District Development Model (DDM) objectives. The SDG (Goal 5) and DDM advocate that the government should aim for gender equality, empower all women and girls, and ensure inclusivity through gender-responsive budgeting based on the needs and aspirations of our people and communities at a local level. In support of the SDG and DDM objectives, the Stellenbosch Municipality aims to establish an environment that encourages gender mainstreaming interventions at the municipal level. Although priority issues identified by the different segments of the community cannot be addressed at once due to insufficient resources, the municipality is implementing interventions as a start to address gender and gender mainstreaming.

Gender mainstreaming will require the municipality to shift in organisational cultures and ways of thinking, as well as in the goals, structures, and allocation of resources. Through the IDP and in support of the SDG and DDM objectives, the Stellenbosch Municipality will make an effort to incorporate gender into each phase of planning. As a stepping stone to incorporating gender in municipal planning, it will take the form of identifying key gender indicators linked to the projects and programmes encapsulated in the 5th Generation IDP 2022 – 2027. The table below on the gender matrix is in alignment with the principles of gender mainstreaming as stipulated below:

- Gender-sensitive language;
- Gender-specific data collection and analysis;
- Equal access to and utilisation of services;
- Women and men are equally involved in decision–making; and
- Equal treatment is integrated into steering processes.

The benefits of incorporating gender outcomes into the IDP will be:

- Positive impact on individuals, organisations, and at a societal level;
- Acceleration of the implementation of Sustainable Development Goals (SDGs);
- Higher rate of growth and development;
- Improved resource management;
- Improved productivity; and
- By examining the overall situation of women and men across municipalities, a stronger analysis could provide a basis for identifying their specific needs and assessing

whether certain groups of women and men could be adversely affected by development programmes and projects.

The following SDG 'Targets' and 'Indicators' have been selected for this baseline review process:

Table 11: SDG Targets 5.1 and 5.5

Target	Indicator
Target 5.1	End all forms of discrimination against women and girls everywhere.
Target 5.5	Ensure women's full and effective participation and equal opportunities. For leadership at all levels of decision-making in political, economic, and public life.

3.2.2 Gender Interventions

In terms of integrated planning and streamlining governance processes, the Department: Community Development and the Provincial Department: Social Development signed an MOU to collectively focus on various programmes with gender as one of the focal points. This includes the implementation of empowering programmes for women, reaching out to single mothers, hosting the 16 Days of Activism / Gender-Based Violence, and establishing a Gender-Based Violence Forum.

The implementation of gender-specific programmes is depicted in the table below:

Table 12: Gender Based Interventions

Key Activity / Project / Programme / Initiative (measurable action)	Description of Unit of Measurement	Performance Comment
Establishment of the Greater Stellenbosch GBV Forum	Number of Greater Stellenbosch GBV Forums established by 30 June 2024	The GBV Forum has been established by the Department of Social Development (DSD) in the 2023/24 financial year.
Hosting of the 16 Days of Activism event	Number of 16 days of activism events hosted by 30 November	The 16 Days of Activism event will be hosted each financial year for the period 2022 – 2027. This programme is linked to the Mayoral Outcome to create safer environments for communities. Implementation and monitoring of the programme will be on a departmental level.

3.2.3 Addressing GBV through the lens of International Partnerships

The partnership between Stellenbosch Municipality (South Africa) and Jönköpings kommun (Sweden), under the auspices of the Swedish International Centre for Local Democracy (ICLD), represents a shift from traditional, transactional North-South twinning to normative, reciprocal paradiplomacy.

While the partnership spans multiple democratic dimensions, its most critical mechanism is its focus on Gender-Based Violence (GBV), walkability, integration and public safety.
Here is an advanced breakdown of the intersection between these two municipalities, centring on Stellenbosch's proactive agency.

3.2.4 Stellenbosch's Strategic Role in the GBV Partnership

While Jönköping provides the pedagogical blueprint for norm-critical interventions, Stellenbosch Municipality does not act as a passive recipient. Instead, it serves as an institutional laboratory for contextualising gender safety within a high-friction, unequal urban environment.

3.2.5 Contextualising the "Normstorm" Methodology

Developed by Jönköping in 2012, "Normstorm" is a pedagogical tool that utilises creative and analytical exercises to deconstruct societal norms driving inequality and violence (ICLD, 2024).

Whilst not the original intention, however, considering the broader gender context, Stellenbosch Municipality also addressed the "dignity deficit" created by years of unequal policy and treatment of especially female inhabitants.

- **The Stellenbosch Intervention:**

  While education falls under provincial jurisdiction (Western Cape Province), Stellenbosch Municipality used its convening power to embed Normstorm into local curricula (Jönköpings kommun, 2025). By 2025, the programme expanded from three pilot schools to twelve, demonstrating how a municipality can drive educational policy despite lacking a direct constitutional mandate.

  Another unintended outcome is the expansion of the partnership programme to include youth participation, primarily through the newly established Junior Town Council (JTC)

- **Spatial Materialisation:**

  Stellenbosch translated classroom discussions into spatial urban planning. An example is the safety upgrade along George Blake Avenue (GBA), where municipal engineering departments used resident feedback on gendered spatial insecurity to overhaul public lighting and pedestrian accessibility (ICLD, 2024).

3.2.6 Disrupting Unidirectional Policy Transfer (Reverse Learning)

A critical, often overlooked aspect of this partnership is that **Stellenbosch trains Jönköping**. Traditional paradiplomacy assumes the Global North teaches the Global South. In this corridor, the learning is bidirectional.

- **The Stellenbosch Model:**

  Political leaders and senior managers from Jönköping have undergone training led by Stellenbosch representatives regarding **citizen dialogues and gender budgeting** (ICLD, 2024).

- **Critical Insight:**

  Stellenbosch's systematic approach to using gender-disaggregated data and monthly citizen budget consultations is seen by Swedish officials as a benchmark for overcoming the "illusion of equality" (the self-image trap in Nordic states where assumed equality blind-sides local governments to latent gaps) (Jönköpings kommun, 2025).

3.2.7 Redefining Public Safety

In partnership workshops, Stellenbosch successfully shifted the problem formulation from generic "urban insecurity" to "Safety in Public Environments through an Equality Lens" (ICLD, 2023).

- **The Structural Friction**:

  Stellenbosch officials pushed the discourse beyond psychological perceptions of safety (the standard Swedish focus) to incorporate tangible infrastructure realities, such as how energy insecurity and rolling blackouts disproportionately expose women to physical violence in transit (ICLD, 2021).

3.2.8 Critical Takeaway: The Institutionalisation of Gender

The strategic value of this partnership for Stellenbosch is the capacity-building of its civil servants and councillors (Stellenbosch Municipality, 2024). By training its internal leadership to look at standard municipal directives (zoning, waste, transport) through a GBV-preventative lens, Stellenbosch Municipality is slowly shifting GBV from a "social development" issue to a core, cross-departmental engineering and compliance mandate.

3.3 SDG 11 Sustainable Cities and Communities

3.3.1 Introduction

SDG 11 is “Sustainable Cities and Communities”, and it has 10 targets with 15 official global indicators (UN 2025). The goal is to create sustainable cities and communities that are inclusive, safe, resilient, and sustainable. Achieving this goal requires a multi-stakeholder approach and involves governments, civil society, the private sector, and individuals working together to address the following challenges, i.e.:

- Adequate, safe, and affordable housing (11.1);
- Sustainable transport systems (11.2);
- Inclusive and sustainable urbanisation (11.3);
- Protect cultural and natural heritage (11.4);
- Reduce disaster impacts (11.5);
- Reduce the disaster environmental impact of cities (11.6); and
- Access to green and public spaces (11.7).

The aforementioned challenges pertain to cities and their ability to address urbanisation, climate change, inequality, and inadequate infrastructure. One of the overarching and enabling indicators for SDG 11 is the development of National Urban Policies (NUP) and Regional Development Plans (RDP), which need to respond to population dynamics, ensuring balanced territorial development, and increase in the fiscal space (11.a.1). Coupled with this strategic urban planning policy is linking development assistance and other flows in support of urban infrastructure or urban infrastructure projects (11.c.1). The goal of these indicators is to support positive economic, social and environmental links between urban, peri-urban and rural areas by strengthening national and regional development planning.

The SDG 11.a.1 indicator further relates to several goals and targets (UN, 2025), particularly SDG 1 (land tenure security and resilience), 2 (land tenure security and urban-rural linkages), 5 (safety and ownership and control over land), 6 (access to drinking water and sanitation), 7 (access to renewable energy and energy efficiency), 8 (job creation, decent work and youth unemployment), 9 (access to and upgrading and financing infrastructure), 10 (discriminatory laws), 12 (waste management), 13 (resilience and adaptive capacity; capacity for effective climate-change-related planning and management), 15 (integrate ecosystem and biodiversity values), 16 (government subsidiarity and institutional capacity building; non-discriminatory laws and policies), and 17 (policy coherence for sustainable

development; effective public, public-private and civil society partnerships) (UN 2018; UN 2025).

NUPs and RDPs (also known as urban development plans, frameworks, or strategies) are defined as a set of decisions or principles of actions derived through a deliberate government-led process of coordinating and rallying various actors for a common vision and goal that will promote a more transformative, productive, inclusive, and resilient urban development for the long term (a 20 – 30-year or even a 100-year horizon). An RDP follows the same definition but is applied at the subnational level (UN, 2014; UN, 2025). In the policy development process of these urban development plans / frameworks / strategies, consideration should be given to key qualifiers based on the SDG metadata for SDG 11. a.1. These include the following:

- Feasibility and diagnosis of policy problems and opportunities;
- Formulating a NUP or RDP responding to population dynamics, including population composition, trends, and projections at a geographic scale over time;
- Formulating a NUP or RDP ensuring and promoting a spatially coherent territory that includes a balanced system of human settlements, including cities and towns, and including urban corridors that address social, economic, environmental, and spatial disparities, considering the urban-rural continuum.
- Formulating a NUP or RDP with an understanding of the sum of financial resources available for improved delivery of basic social and economic services at the local level as a result of the budget and related decisions by governments at all levels, without any prejudice to the sustainability of a government's financial position (UN 2014; UN 2025).

The rationale for the SDG 11.a.1 indicator is based on the notion that the development and implementation of NUPs and RDPs should support participation, partnership, cooperation, and coordination of actors as well as facilitate dialogue (refer to SDG 11.3.2 as well). A coordinated effort from the government through the development of urban development plans / frameworks / strategies provides the best opportunity for achieving sustainable and

inclusive urbanisation and balanced territorial development by linking sectoral policies, connecting national, regional, and local government policies, and strengthening urban, peri-urban, and rural links through balanced territorial development. The urban policy process is led at the national level to ensure the articulation and coordination of different sectors and government levels, but it engages both top-down and bottom-up processes. Subnational governments are key implementing partners due to their proximity to citizens and their role in delivering services and infrastructure. Therefore, a NUP does not replace regional or local development policies and plans but strengthens them and relies on their horizontal alignment and vertical articulation (UN 2025).

The NUP provides the overarching framework articulating and aligning subnational and local plans and policies under a common vision for urbanisation that also makes it particularly suited to consider the urban-peri-urban-rural continuum. These plans are seen as an additional mechanism to ensure intergovernmental agreements, such as the New Urban Agenda (NUA – aligned to SDG 11), are also considered and implemented (UN 2025). Key actions from the NUA that should be included in the formulation of NUPs include the following:

Urbanisation is a catalyst for economic growth and social progress, and even holds the possibility for the protection and more efficient use of natural resources, climate change mitigation, and adaptation. However, the positive impact of this process is not automatic and can bring about negative economic, social, and environmental impacts when it is rapid and/or unplanned. Therefore, a NUP should provide the framework for understanding urbanisation processes and how the dividends can be leveraged, and the negative impacts, such as increasing congestion, sprawl, informality, social exclusion, inadequate infrastructure, etc., can be mitigated. A NUP provides the strategic planning instrument ensuring sectoral government policies are aligned and coordinated towards achieving sustainable urban development by promoting more compact, socially inclusive, better-connected and integrated cities which are resilient to climate change (UN 2014; UN 2025).

Due to the rapid urbanisation trend in low- and middle-income countries, UN-Habitat has prioritised the development and implementation of NUPs in these countries. South Africa is categorised as an upper-middle-income country, with 65% of the population urbanised and, on average, a 1.59% annual urban population growth rate (UN 2018), necessitating an urgent need to formalise and approve a NUP.

3.3.2 South Africa's National Urban Policy (NUP)

The monitoring of SDG 11.a.1 is done by the UN-Habitat every year, and it compiles and presents national urban policies (NUPs) into a National Urban Policy Database (https:nupdb.urbanpolicyplatform.org). The primary source data are the official documents submitted by the member states in the NUP survey. Each NUP submitted to the UN-Habitat is assessed in terms of its alignment with the indicators by independent national-level policy evaluators to avoid subjectivity and bias (UN 2025). To date, 191 countries have submitted NUPs on SDG 11.a.1 (https:nupdb.urbanpolicyplatform.org accessed 24 March 2026).

In addition to the NUP Database, the UN-Habitat, in partnership with OECD and Cities Alliance, produces reports on the state of NUPs. The Global State of National Urban Policy 2018 (UN 2018) reports assessed 150 countries' NUPs. South Africa's NUP formed part of this first analysis report, and the policy is called the Integrated Urban Development Framework (IUDF). The IUDF was created in 2009, and the NUP was further formulated and released for public participation in 2014 by the Ministry of Cooperative Governance and Traditional Affairs (CoGTA). The draft IUDF was assessed as part of the Global State of National Urban Policy report, and the analysis included a thematic scope in five policy sectors: economic development, spatial structure, human development, environmental sustainability, and climate resilience. In the assessment, four categories were used: extensive, moderate, low, and insufficient information.

The draft IUDF was assessed using the framework, and the following outcomes were indicated in the table below (UN 2018), namely:

Table 13: Global State of NUP – South Africa result

Country	Nature of NUP	Level of attention by theme (*** = extensive ** = moderate * = low - = insufficient information)				
		Economic development	Spatial structure	Human development	Environmental sustainability	Climate resilience
South Africa	**IUDF Explicit**	***	***	***	***	*

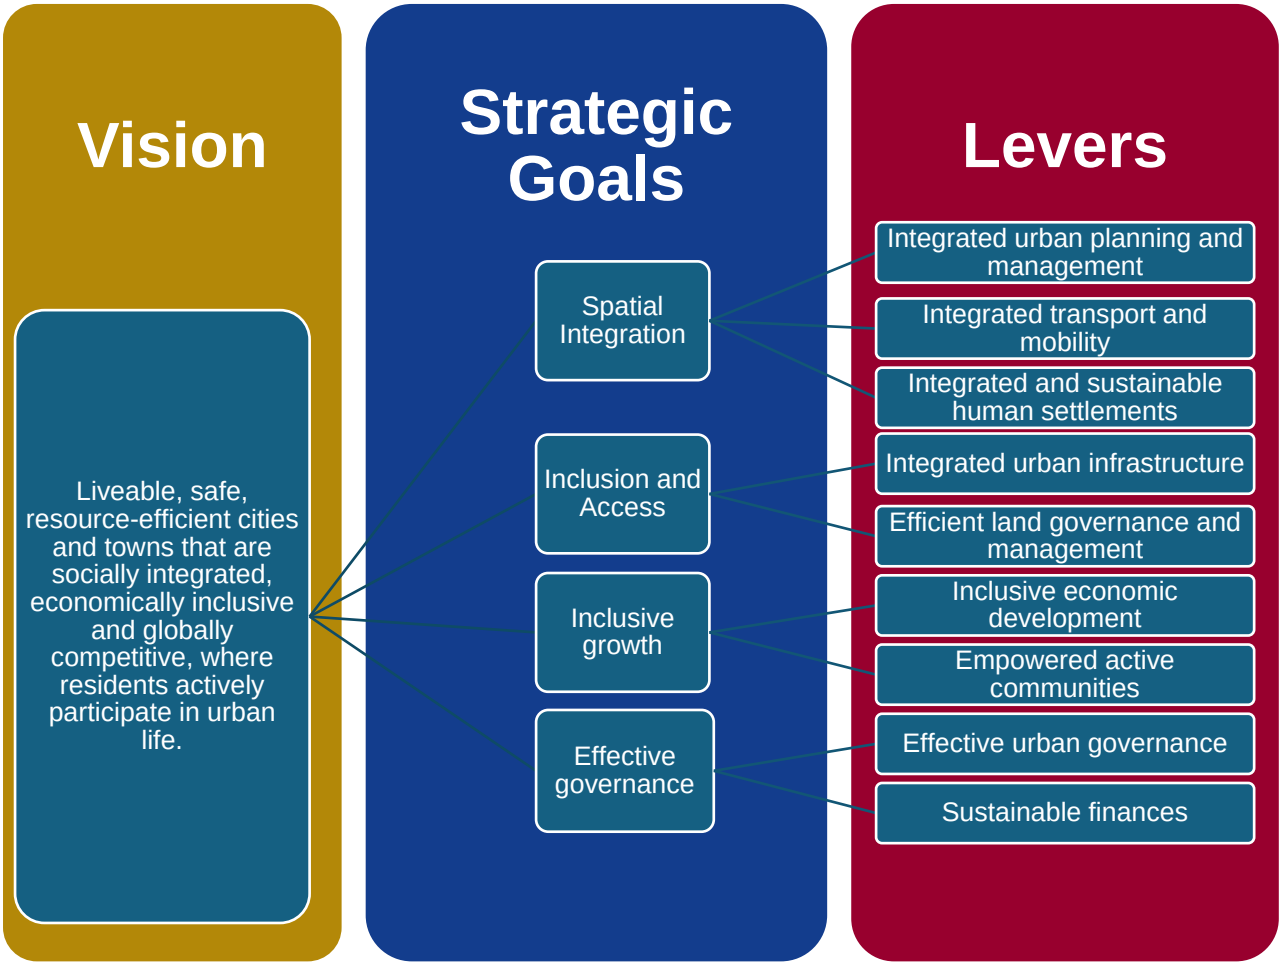
Source: UN 2018

- The draft IUDF explicitly states that it is an NUP, which represents a strong policy commitment on the part of the national government (UN 2018).
- The economic development theme is extensively covered, meaning that the IUDF highlights sustainable and inclusive urban economies as a key principle, promoting the agglomeration benefits of well-planned urbanisation, which includes high productivity, competitiveness, and innovation, with full, productive, and decent employment for all.

In this thematic area, the draft IUDF is a key tool to link urbanisation with the National Development Plan 2030 (NDP). The NDP identifies economic development as a policy priority, and the IUDF provides the linkage with the broader economic development policies and how to capitalise on the economic opportunities of urbanisation. Cities are the engines of national economic growth, and maximising the potential economic benefits of urbanisation through the national urban policy can be transformative and a future-oriented strategy to achieve the overall NDP goals (UN 2018).

- The spatial structure theme is extensively covered, meaning that the draft IUDF highlights the need for balanced spatial development to address economic, social, and environmental goals; for instance, limiting urban expansion to protect high-potential agricultural land. Focusing on balanced spatial development can address the persistence of poverty, inequalities, socio-economic exclusion, spatial segregation, and environmental degradation. The draft IUDF adopts a framework to reduce urban and territorial disparities through productive and inclusive systems of cities and urban-rural linkages, as well as an equitable provision of and access to infrastructure, public goods and services, national and regional economic development, resilience, environmental protection, and adequate housing (UN 2018).
- The human development theme is extensively covered, meaning the draft IUDF highlights the vision of “cities for all”, which is a principle of “leave no one behind”, and a transformative commitment to sustainable urban development for social inclusion and ending poverty. Human development entails a wide range of actions, such as ensuring urban residents have equal rights, opportunities, and access to democratic participation, infrastructure, basic services, and adequate, affordable, and decent housing as a component of the right to an adequate standard of living. It also means that vulnerable populations are considered and engaged (UN 2018).
- The environmental sustainability theme is extensively covered, meaning the draft IUDF promotes sustainable patterns of compact, dense, and mixed urban development and, more generally, ensures sustainable consumption and production patterns, the efficient and responsible use of resources, protecting biodiversity and green spaces, curbing pollution, and harnessing the opportunities of new technologies and clean energies (UN 2018).
- The climate resilience theme (SDG 13) has low coverage, which indicates that the draft IUDF either does not address this aspect in the policy or the sectoral policies are unconnected to the overarching NUP. Areas that need to be further explored associated with this theme include how to translate the transformative commitment to

an environmentally sustainable and resilient urban development, including addressing the need to build urban resilience, reduce disaster risks, and mitigate and adapt to climate change (UN 2018).



The five thematic themes provide an international benchmark in terms of policy areas that need to be considered and addressed in the policy formulation of an NUP and, by extension, an RDP. Based on the analysis of the draft IUDF, the policy responds to the main concerns of global urban agendas (i.e., SDG 11.a.1 and the NUA) and is a transformative and future-oriented strategy to achieve the overall national development goals contained in the National Development Plan – Vision 2030 (NDP). The final IUDF (South African NUP) was presented and approved by Cabinet in 2016.

The IUDF builds on various national development goals contained in the NDP and further extends Chapter 8: Transforming human settlements and the national space economy and its vision for urban South Africa (IUDF 2016; NPC 2012). Considering that South Africa will be three-quarters (71%) urbanised by 2030 and reaching almost 80% by 2050 (IUDF 2016, p. 12), the NDP goal of “meaningful and measurable progress in reviving rural areas and in creating more functionally integrated, balanced and vibrant urban settlements” is critical to unlock the positive impacts and dividends from urbanisation in cities and towns. The strategic framework from both the NDP and IUDF guides the growth, management, and transformation of cities and towns in response to rapid urbanisation, setting out the "New Deal" for cities and towns into inclusive, efficient, and sustainable places through integrated planning, investment, and governance (IUDF 2016). The vision of the IUDF is -

“Liveable, safe, resource-efficient cities and towns that are socially integrated, economically inclusive and globally competitive, where residents actively participate in urban life.” (IUDF 2016)

The NUP / IUDF integrates with the NDP and steers the spatial transformation agenda whilst acknowledging that cities and towns have different roles, requirements, and need to address unique conditions and challenges within a system of cities. The vision should therefore be interpreted and pursued in differentiated and locally relevant ways (IUDF 2016). To achieve this spatial transformation vision, four (4) strategic goals are introduced with nine (9) policy levers.

Figure 13: IUDF Vision, Strategic Goals, and Levers

Source: IUDF 2016

These strategic goals inform the priority objectives of the nine (9) policy levers, which are:

- Integrated spatial planning and land use management, which relates to cities and towns that are spatially organised to guide investments that promote integrated social and economic development, resulting in a sustainable quality of life for all citizens;
- Integrated transport and mobility, which relates to cities and towns where people can walk, cycle, and use different transport modes to easily access economic opportunities, educational institutions, health facilities, and places of recreation;
- Integrated sustainable human settlements, which relate to cities and towns, are spatially equal, integrated, and multi-functional, in which settlements are well-connected to essential and social services, as well as to areas of work opportunities;
- Integrated urban infrastructure, which relates to cities and towns that have transitioned from traditional approaches to resource-efficient infrastructure systems, provides for both universal access and more inclusive economic growth;
- Efficient land governance and management, which relates to cities and towns that grow through investments in land and property, providing income for municipalities that allow

further investments in infrastructure and services, resulting in inclusive, multi-functional urban spaces;

- Inclusive economic development, which relates to cities and towns that are dynamic and efficient, fosters entrepreneurialism and innovation, sustains livelihoods, enables economic growth, and generates the tax base needed to sustain and expand public services and amenities;
- Empowered active communities, which relate to cities and towns that are home to socially and culturally diverse citizens, who are actively involved in city life and committed to making South Africa work;
- Effective urban governance, which relates to cities and towns that have the necessary institutional, fiscal, and planning capabilities to build inclusive, resilient, and liveable urban spaces; and
- Sustainable finance, which relates to cities and towns, is supported by a fiscal framework that acknowledges the development potential and pressures of urban spaces, manages their finances efficiently and effectively, and can access the necessary resources and partnerships for inclusive urban growth (IUDF 2016).

3.3.3 Integrated Planning Framework

The IUDF represents South Africa's overarching National Urban Policy (NUP), providing the strategic framework to guide the management of urbanisation and the transformation of spatial patterns in cities and towns. The section of this report presents how the implementation of the IUDF occurs through municipal planning and budgeting instruments guided by the Spatial Planning and Land Use Management Act (Act No. 16 of 2013) (SPLUMA), and the Local Government: Municipal Systems Act (Act No. 32 of 2000) (MSA).

3.3.3.1 Alignment between the IUDF and SPLUMA

The IUDF operationalises the spatial transformation principles introduced by SPLUMA. The key alignment areas between the legislative framework (SPLUMA) and the policy (IUDF) are:

- Spatial transformation – SPLUMA establishes the legal requirement for spatial restructuring through the development principles of spatial sustainability and efficiency. Whilst the IUDF provides the policy approach and implementation framework (compact cities, integration, accessibility, etc.);
- Integrated planning – SPLUMA requires alignment between SDFs, land use management, and infrastructure planning, which enforces the development principle

of spatial resilience and spatial integration. Whilst the IUDF strengthens this through integrated urban infrastructure, transport, and land governance policy levers; and

- Spatial justice – SPLUMA introduces the development principle of spatial justice as a legal principle, whilst the IUDF translates this into practical implementation through housing location, densification, and improved accessibility.

In practice, SPLUMA provides the legislative framework, while the IUDF provides the policy direction and the implementation strategy.

3.3.3.2 Alignment between the IUDF and the Municipal Spatial Development Framework (MSDF)

The MSDF provides the spatial vision and the spatial restructuring logic for the municipality. The MSDF gives spatial expression to the IUDF strategic goals and objectives. In addition, the IUDF directly informs how the MSDF should be prepared and implemented over the 20-year planning horizon. The key planning implications for MSDFs are:

- Promote compact and connected urban form;
- Prioritise public transport corridors and nodes;
- Encourage infill, densification, and mixed-use development;
- Protection of environmental and agricultural land;
- Improve access to economic opportunities and social services; and
- Align spatial planning with infrastructure investment.

This means that MSDFs should function not only as a statutory spatial plan but also as strategic urban restructuring strategies and investment prioritisation to achieve the vision of spatial transformation over the long term.

3.3.3.3 Alignment between the IUDF, the Capital Expenditure Framework (CEF), and the Integrated Development Plan (IDP)

The role of the IDP is the municipality's primary strategic planning document and coordinates development priorities, sector plans, and budgets over a 5-year planning horizon. The IUDF strengthens the short-term (5-year) spatial and economic components of the IDP by:

- Setting the development vision for the municipality;
- Linking spatial planning with economic development priorities;
- Setting the spatial transformation priorities;
- Infrastructure investment programmes;
- Economic development strategies; and

- Social inclusion and service delivery targets.

The role of the CEF is to guide and coordinate the medium- to long-term capital investment in the built environment over a 3- (MTREF budget) to 10-year planning horizon. The CEF ensures financial alignment with the MSDF and IUDF spatial priorities. The IUDF is promoted in the CEF through:

- Targeted spatial investment in targeted and priority investment areas or catalytic projects (also known as spatial targeting);
- Aligning infrastructure investment with spatial restructuring.
- Supporting transit-oriented development;
- Coordinated investment in infrastructure (housing, transport, and municipal infrastructure services); and
- Alignment between spatial plans and municipal capital budgets.

3.3.3.4 IUDF policy levers and municipal implementation

The IUDF's nine (9) policy levers translate directly into municipal planning and budgeting responsibilities, which are required in terms of the applicable legislated framework, namely:

Table 14: IUDF and Municipal Implementation

IUDF policy lever	Municipal Implementation Instrument	Time Horizon
Integrated spatial planning	MSDF / CEF / LSDF / Precinct plans	20 - 30 years
Integrated transport and mobility	MSDF / Comprehensive Integrated Transport Plans / Roads master plans / CEF	5 - 10 years
Integrated human settlement	MSDF / Integrated Human Settlement Plans / CEF / Housing Pipelines / Inclusionary Housing	10 years
Integrated urban infrastructure	CEF / Capital Investment Plans / IDP	10 years
Land governance and management	Zoning schemes / Overlay Zones/development management	10 years
Inclusive economic development	CEF / IDP / Local economic development strategies / Rural development strategies / urban regeneration	5 years
Empowered communities	IDP Public participation processes / Customer satisfaction surveys	Yearly (or more frequently)
Effective urban governance	MSDF / IDP / performance management	Yearly reviews
Sustainable finances	CEF / Capital investment prioritisation / Long-term financial strategies and planning	MTREF and 10 years (reviewed yearly)

Source: IUDF, SPLUMA and MSA

3.3.3.5 Overall planning significance of the IUDF in municipal planning

The IUDF provides a comprehensive national policy framework that strengthens the implementation of SPLUMA and guides municipal spatial planning and investment decision-making. The IUDF shifts municipal planning away from fragmented sectoral planning towards:

- Integrated spatial planning;
- Infrastructure-led spatial transformation;
- Compact and efficient urban form;
- Inclusive economic growth; and
- Long-term spatial restructuring.

Together, the IUDF, MSDF, IDP, and CEF form the policy-to-implementation chain for urban development within the local government context, ensuring that spatial planning is directly linked to implementation and resource allocation. In this context, the IUDF is a critical instrument for enabling municipalities to transition toward compact, efficient, and inclusive urban systems.

3.3.4 Stellenbosch Municipality's alignment with the IUDF

The Stellenbosch Municipal Spatial Development Framework (MSDF, 2023) demonstrates strong alignment with the IUDF as South Africa's National Urban Policy. The MSDF explicitly recognises the IUDF as a key policy informant and adopts its core objective of achieving compact, connected and coordinated urban development (MSDF, 2023). The section of this report presents a compliance matrix aligning the nine (9) policy levers of the IUDF with the MSDF adopted by the Council on 27 June 2023.

Table 15: MSDF alignment to the IUDF

IUDF policy lever	IUDF requirement	MSDF response	MSDF reference	Compliance assessment
Integrated spatial planning	Promote compact, connected cities; integrated land use	MSDF promotes compact urban form, urban edge containment, nodal hierarchy, and corridor development.	Spatial Vision and Structuring Elements	**Strong alignment**
Spatial integration (SPLUMA principle)	Reduce spatial fragmentation and apartheid spatial form	Corridor-based development (Adam Tas, R304), integration of Stellenbosch–	Spatial Structuring and Development Corridors	**Strong alignment**

IUDF policy lever	IUDF requirement	MSDF response	MSDF reference	Compliance assessment
		Klapmuts settlements.		
Integrated transport and mobility	Public transport, TOD, NMT prioritisation	MSDF promotes TOD along corridors, NMT networks, and reduced car dependency.	Transport and Mobility Framework	**Moderate–Strong alignment**
Integrated human settlement	Inclusive, well-located housing	Focus on densification, infill, upgrading informal settlements, and inclusionary housing.	Human Settlements Strategy and Inclusionary Zoning Policy	**Strong alignment**
Integrated urban infrastructure	Infrastructure-led development and coordinated investment	Capital Expenditure Framework (CEF) aligns infrastructure with spatial priorities; catalytic infrastructure projects.	Infrastructure and CEF Chapter	**Strong alignment**
Land governance and management	Manage land use efficiently; protect strategic land	Urban edge enforcement; protection of agricultural land; densification policies.	Land Use Management and Rural Protection	**Strong alignment**
Inclusive economic development	Support inclusive, spatially targeted economic growth	Strengthening of the Adam Tas Corridor, Klapmuts node; agri-processing and tourism economy.	Economic Development Strategy	**Strong alignment**
Empowered active communities	Participatory planning and inclusive governance	Public participation processes embedded in MSDF preparation and LSDFs.	Public Participation and Governance Sections	**Compliant**
Effective urban governance	Integrated, coordinated planning and budgeting	Alignment between MSDF, IDP, CEF; intergovernmental coordination (e.g., Capital Planning Forum).	Institutional and Implementation Framework	**Strong alignment**
Sustainable finances	Financial sustainability and investment prioritisation	CEF aligns capital budgeting with spatial priorities, leveraging IUDG funding.	Finance and Implementation	**Strong alignment**
Spatial sustainability (SPLUMA principle)	Protect the environment and promote resilience	Protection of biodiversity, agricultural land, and environmental systems.	Strategic Environmental Framework	**Strong alignment**
Infrastructure-led growth (cross-cutting IUDF principle)	Use infrastructure to unlock development	Identification of Priority Development Areas (PDAs) and catalytic projects (Adam Tas).	Implementation Strategy	**Strong alignment**

Source: Own using MSDF/CEF 2023

3.3.4.1 Summary of compliance of the MSDF with the IUDF

The MSDF (2023) demonstrates full alignment with the IUDF spatial transformation objectives. It translates the NUP into a localised spatial strategy by:

- Promoting compact, connected, and integrated settlements;
- Strong integration of infrastructure-led development and spatial planning;
- Effective use of corridor development and nodal structuring; and
- Clear linkage between planning, budgeting (CEF), and implementation.

3.3.4.2 Key Strengths

The MSDF (2023) demonstrates the following key strengths:

- Strong urban edge management and compact city approach;
- Clear corridor-based spatial structuring, i.e., Adam Tas Corridor;
- Integration of CEF as a spatial investment tool; and
- Alignment with IUDF implementation mechanisms (e.g., Integrated Urban Development Grant (IUDG), Priority Development Areas (PDAs)).

3.3.4.3 Areas for strengthening / Identified gaps.

The following areas of improvement have been identified in the MSDF (2023):

- Further details are required on public transport implementation and TOD phasing.
- Strengthening monitoring indicators aligned to the IUDF outcomes; and
- Enhanced articulation of community empowerment beyond participation processes.

3.3.5 Conclusion

The Stellenbosch MSDF / CEF (Final Amended 2023) is substantially compliant with the Integrated Urban Development Framework (IUDF) and successfully translates national urban policy into a locally responsive spatial strategy. The MSDF and the CEF demonstrate strong alignment across all IUDF policy levers, particularly in relation to spatial integration, infrastructure-led development, and inclusive economic growth, thereby supporting the municipality's long-term spatial transformation objectives.

3.4 SDG 13 Climate Action

3.4.1 Goal 13. Take urgent action to combat climate change and its impacts

Goal description: Sustainable Development Goal (SDG) 13 calls for urgent climate action on two fronts: cutting greenhouse gas emissions (mitigation) and strengthening resilience to climate-related hazards (adaptation). Climate change has emerged as one of the greatest intergenerational challenges threatening sustainable development, environmental health, and human well-being. Its effects have been observable for decades and are projected to worsen throughout the 21st century, underscoring the need for bold action now. In 2024, climate change reached alarming new levels globally, with some impacts already irreversible for centuries. For the first time on record, the world's average temperature exceeded 1.5°C above pre-industrial levels, making 2024 the hottest year in 175 years of observations. Extreme weather events, including tropical cyclones, floods and droughts, led to the highest number of new displacements in 16 years, worsening food crises and causing massive economic losses and social instability.

Yet, with swift and courageous action, we can still avert the worst outcomes of the climate crisis. Limiting long-term global warming to 1.5°C remains scientifically possible if greenhouse gas emissions are halved by 2030. Achieving this requires transformational change across every sector of the economy: a rapid transition to net-zero emissions powered by clean energy and innovation. Every fraction of a degree of avoided warming reduces risks, lowering future costs, and preventing irreversible damage to people and the planet. At the same time, investment in climate resilience needs to be scaled up.

If left unchecked, climate change places the world on a perilous path toward more than 3°C of warming by century's end. Scientists warn that this would trigger catastrophic tipping points and overwhelm the limits of adaptation. In response, countries, cities, and communities — including youth movements — are increasingly united in calls for urgent, collective action. The cost of inaction now far exceeds the investment needed for climate solutions. Proactive action offers the opportunity not only to safeguard public well-being and protect development gains, but also to realise co-benefits such as job creation, improved public health, and inclusive green growth.

3.4.2 Stellenbosch Municipality's Progress Towards Meeting SDG 13

Stellenbosch Municipality faces a growing climate risk profile, shaped by projections of a hotter and drier climate by 2050 (CSIR, 2023a). These changes are expected to increase heat stress, wildfire risk, water scarcity, and flood exposure in vulnerable areas. Such shifts have direct implications for municipal service delivery, particularly in the areas of stormwater management, water security, roads, electricity infrastructure, and fire services. As assets face rising stress and maintenance demands, climate change will place increasing pressure on both operational budgets and long-term planning systems. It also threatens sectors such as agriculture and tourism, while intensifying risks for communities exposed to heat, resource scarcity, and environmental hazards. As such, integrating climate risk into spatial planning, infrastructure investment, and governance systems is essential to ensure that development in the Stellenbosch Municipal area remains resilient and inclusive.

Although this is Stellenbosch Municipality's first Voluntary Local Review (VLR), several important steps have already been taken toward aligning local action with the objectives of SDG 13: Climate Action. This baseline report primarily indicates progress in outputs and initial outcomes, with long-term impact expected to be quantifiable in subsequent reporting periods as systems, strategies, and projects develop. The following should be noted:

Under Target 13.1 — strengthening resilience and adaptive capacity — the municipality has partially reported on disaster impacts (Indicator 13.1.1) using available fire incident data as a proxy. The municipality also meets Indicator 13.1.3, having adopted a Council-approved Disaster Management Plan (DMP). Looking forward, significant investment has gone into flood resilience — most notably through the Franschhoek Flood Resilience Programme. In addition, the development of a Sustainable Urban Drainage System (SUDS) Strategy marks a shift toward water-sensitive design and infrastructure that can better handle both drought and flood risks.

Table 16: Outputs, Outcomes, and Impacts under Target 13.1

Outputs	Outcomes	Impacts
• Fire incident and casualty data compiled. • DMP adopted. • DMP upgrade from Level 1 to 3 initiated. • Climate-resilience projects (Franschhoek Flood Resilience Programme, Dwars River Project and Sustainable Urban Drainage	• Fire-risk hotspots identified. • Improved understanding of local disaster risk. • Shift from reactive disaster response toward more proactive flood-risk management, infrastructure adaptation and climate-informed disaster planning.	• Reduced vulnerability to climate-related hazards. • Improved protection of lives and infrastructure. • Stronger adaptive capacity across the municipal area.

Outputs	Outcomes	Impacts
Systems (SUDS) Strategy) initiated or planned.		

Under Target 13.2 — integrating climate change into policies and planning — the municipality does not yet have a greenhouse gas inventory (Indicator 13.2.2), but plans are underway to assess the feasibility of developing one in alignment with the Air Quality Management Plan. Although Indicator 13.2.1 applies formally at the national level, Stellenbosch Municipality has begun local-level climate planning with the appointment of its first Climate Change Expert on 1 June 2025, funded through the Experts Fund for Municipal Partnerships Worldwide (SKEW). This marks the first time climate change is being addressed as a dedicated function within the Municipality. Since then, a Climate Change Strategy (CCS) has been under development, which includes both mitigation and adaptation actions.

Table 17: Outputs, Outcomes, and Impacts under Target 13.2

Outputs	Outcomes	Impacts
• Climate Change Expert appointed • Municipal climate risk assessment updated. • CCS under development. • Opportunities for climate change mainstreaming in municipal policies, plans and strategies identified.	• Improved evidence base for climate change-related decision-making.	• A more climate-resilient municipal planning system. • Long-term institutionalisation of climate action across adaptation, mitigation and service delivery.

Under Target 13.3 — improving education, awareness, and institutional capacity — a wide range of activities have taken place since June 2025. These include the launch of the municipality's first climate change awareness campaign via social media, focused on public education around climate change and fire risk, and a set of participatory stakeholder sessions in Franschhoek that combine climate literacy with disaster recovery. Further engagement was integrated into IDP public participation events, and a capacity-building programme for municipal staff was initiated in November 2025, starting with a technical workshop for the Infrastructure Directorate. These efforts represent a growing emphasis on institutional learning and public involvement in climate resilience.

This VLR serves as a foundation, and it is anticipated that future reviews will reflect more comprehensive progress as climate action becomes embedded across municipal systems.

Table 18: Outputs, Outcomes, and Impacts under Target 13.3

Outputs	Outcomes	Impacts
• Public awareness campaigns • Flood-resilience stakeholder engagements. • IDP-linked climate engagement sessions. • Municipal climate capacity needs assessment conducted. • Internal climate change capacity-building workshops planned and initiated.	• Improved public understanding of climate risk. • Opportunities for residents to shape local adaptation responses. • Strengthened the ability of municipal officials to interpret climate projections and apply them to their own areas of work.	• A more informed public. • Stronger institutional climate literacy. • Improved collaboration between the municipality and communities in responding to climate-related hazards.

3.4.3 Methodology

As Stellenbosch Municipality's first VLR, this chapter places strong emphasis on establishing a credible baseline and identifying early climate actions undertaken or planned. The methodology reflects the current state of municipal data availability, institutional capacity, and overall reporting readiness.

Scope and timeframe: The reporting period for this chapter is defined as the baseline period covering activities up to 30 June 2025. Where relevant, post-baseline developments (after 30 June 2025) are also included to reflect the municipality's recent climate-related initiatives and to highlight the momentum following the appointment of a dedicated Climate Change Expert on 1 June 2025.

Indicator selection and interpretation: This chapter follows the official SDG 13 targets and indicators as outlined by the United Nations. However, several indicators — particularly 13.1.2, 13.2.1, 13.3.1, 13.a.1, and 13.b.1 — are not formally applicable at the local government level. Despite this, Stellenbosch Municipality has elected to report qualitatively on selected aspects of these indicators where local relevance exists.

In cases where full reporting against global indicators was not possible, locally appropriate proxies and narrative reporting were used. For example, Indicator 13.1.1, which calls for reporting disaster-related impacts per 100 000 population, was partially addressed using fire incident and casualty data collected by the municipality's fire services from 2021 to 2025 (Stellenbosch Municipality, 2026). These data were disaggregated by area, structure type,

and casualty type. Where further demographic disaggregation (e.g., by age, gender, or disability) was not available, limitations are clearly noted.

Data sources and validation: The methodology used to collect the data for the Comprehensive Fire and Fatality Analysis Report (Stellenbosch Municipality, 2026) employed a multi-stage quantitative approach, sourcing data from municipal fire and rescue logs and validating these data through cross-referencing emergency service records. The following methods were used to ensure data accuracy and trend reliability:

- Data sourcing: primary data were extracted from the Stellenbosch Fire and Rescue Service (SFRS) incident logs. Each entry corresponds to an official dispatch record identified by a unique Incident Number (e.g., SFSBF21013004);
- Classification criteria: incidents were categorised into two primary structural types;
- informal structures — non-permanent dwellings typically found in high-density settlements (e.g., Kayamandi, Langrug); and ii) formal structures — permanent brick-and-mortar buildings, including residential flats and private homes (e.g., Cloetesville, Stellenbosch town);
- Casualty definitions: fatalities — deaths confirmed on-site or as a direct result of fire-related injuries. Injuries — any physical harm recorded by emergency responders requiring medical intervention or hospitalisation;
- Geographic mapping: incidents were mapped by street address or settlement zone to identify geographic hotspots — areas where the frequency of fire or the severity of loss exceeds regional averages; and
- Analysis framework: data were aggregated by calendar year to calculate annual totals and identify shifts in risk. The 2025 data include all recorded incidents up to the current reporting date.

Post-baseline developments were recorded through direct collaboration with internal stakeholders and directorates leading on infrastructure, environmental resilience, and disaster risk reduction projects. Key initiatives — such as the Franschhoek Flood Resilience Programme, the development of the SUDS Strategy, and progress toward a municipal CCS — are described based on internal documentation, interviews, and progress updates received from project leads.

Limitations: As a baseline review, several limitations are acknowledged:

- Incomplete data for several global indicators, particularly those requiring long-term emissions tracking or demographic disaggregation;

- Limited institutional capacity, with only one full-time staff member currently dedicated to climate change; and
- The short timeframe between the appointment of dedicated climate staff and the VLR baseline cut-off date, which meant that many initiatives were still in planning or early implementation phases.

The following section outlines the available data during the baseline reporting period (up to 30 June 2025) and highlights additional activities undertaken or planned post-baseline.

Table 19: SDG Target 13.1

Target 13.1: Strengthen resilience and adaptive capacity to climate-related hazards and natural disasters in all countries		
Indicator	**Baseline** (up to 30 June 2025)	**Post-Baseline Developments** (after 30 June 2025)
13.1.1: Number of deaths, missing persons and directly affected persons attributed to disasters per 100 000 population	35 incidents affecting 52 people (36 injuries, 16 fatalities) and 166 structures (148 informal, 18 formal)	2 major incidents occurred, damaging 50 informal structures and causing 2 fatalities
13.1.2: Number of countries that adopt and implement national disaster risk reduction strategies in line with the Sendai Framework for Disaster Risk Reduction 2015–2030	*Not applicable at the local government level*	*Not applicable at the local government level*
13.1.3: Proportion of local governments that adopt and implement local disaster risk reduction strategies in line with national disaster risk reduction strategies	Disaster Management Plan (DMP) adopted by Council on 26 April 2023	Programme initiated to upgrade the DMP from Level 1 to Level 3

Indicator 13.1.1: Number of deaths, missing persons and directly affected persons attributed to disasters per 100 000 population

Stellenbosch Municipality does not yet have a comprehensive system in place for tracking disaster-related deaths, missing persons, or directly affected individuals, particularly in a way that is disaggregated by age, gender, disability status, or population group. This limits full reporting against Indicator 13.1.1. However, fire-related incidents are consistently recorded by the municipality's fire services, and provide a valuable proxy for local disaster-related impacts (Stellenbosch Municipality, 2026). These records are disaggregated by year, location, structure type, and casualty type (table below).

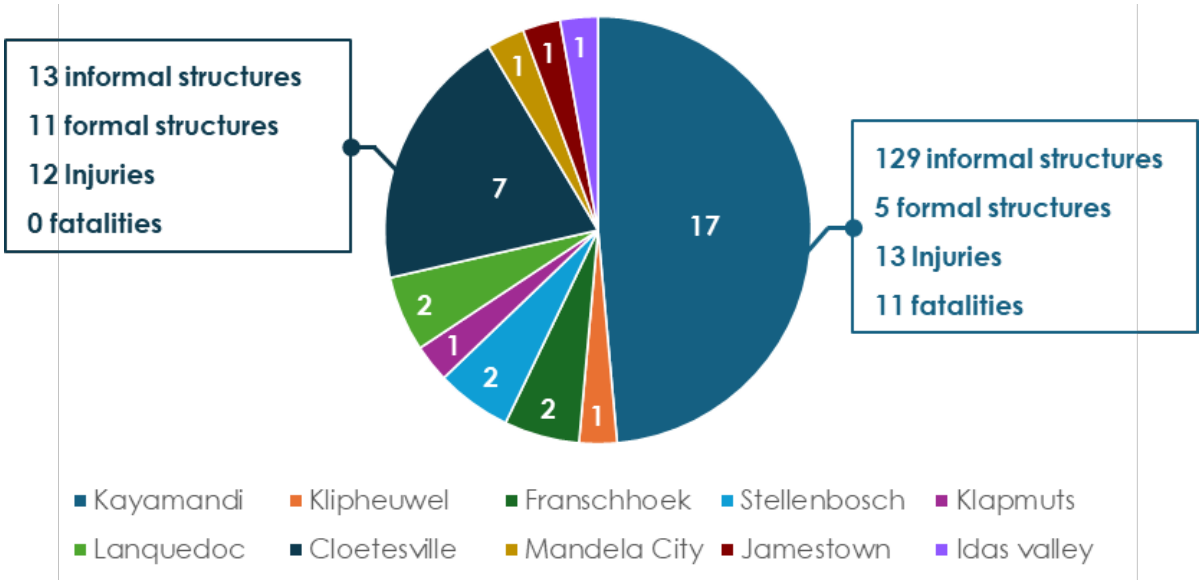


Table 20: Fire-Related Incidents in Stellenbosch Municipality by year, location, structure type, and casualty type (2021–2025).

Year	Location	No of incidents	Structure type		Casualty type	
			Informal	Formal	Injuries	Fatalities
2021	Kayamandi	2	37	2	3	2
	Klipheuwel	1	0	1	0	1
	Franschhoek	1	0	0	2	0
2022	Stellenbosch	1	0	0	1	0
	Kayamandi	5	19	1	4	4
	Klapmuts	1	1	0	1	0
	Lanquedoc	2	1	0	2	0
	Cloetesville	1	2	2	2	0
2023	Kayamandi	8	71	2	5	4
	Mandela City	1	2	0	0	1
	Cloetesville	1	1	0	1	0
	Stellenbosch	1	0	0	1	0
	Jamestown	1	1	0	1	2
2024	Kayamandi	1	1	0	0	1
	Cloetesville	3	10	7	6	0
	Franschhoek	1	1	0	1	1
	Idas valley	1	0	1	2	0
2025	Kayamandi	1	1	0	1	0
	Cloetesville	2	0	2	3	0
Baseline total (up to 30 June 2025)		**35**	**148**	**18**	**36**	**16**
2025	Franschhoek	1	30	0	0	1
2025	Kayamandi	1	20	0	0	1
Cumulative total (Jan 2024–Dec 2025)		**37**	**198**	**18**	**36**	**18**

Source: Stellenbosch Municipality (2026) Comprehensive Fire and Fatality Analysis Report (2021–2025).

During the baseline period (1 January 2021 to 30 June 2025), a total of 35 fire-related incidents were recorded, affecting 52 individuals (36 injuries and 16 fatalities) and 166 structures (148 informal and 18 formal dwellings). The majority of incidents occurred in high-density informal settlements, most notably Kayamandi, which emerged as the area most at risk for both structural loss and fatalities. Cloetesville appears to be the area where formal structures are most affected, with a high ratio of injuries relative to the number of incidents. 2023 was the most severely affected year overall, with a total of 12 fire-related incidents resulting in damage to 75 informal structures and 7 fatalities, mostly in Kayamandi. 2022 recorded the highest number of injuries (10), again concentrated in the Kayamandi area. In 2024, fire-related impacts in formal structure areas rose considerably (8 in total), primarily in Cloetesville.

Figure 14: Number of fire-related incidents recorded in the Stellenbosch Municipal area by location (01 January 2021 – 30 June 2025)

While this VLR establishes a baseline up to 30 June 2025, post-baseline observations are included to inform forward planning. In the second half of 2025, two high-impact fires occurred in the informal settlements of Kayamandi and Langrug (Franschhoek), damaging a combined 50 informal structures. These events make 2025 the second most affected year after 2023 in terms of structural loss. Notably, Langrug has newly emerged as a high-risk informal settlement area experiencing severe fire-related impacts, alongside the well-established hotspot of Kayamandi.

These data reveal that, while formal structures are not immune to fire-related incidents, the burden of structural loss and fatalities is disproportionately concentrated in informal settlements. These findings underscore an urgent need for targeted fire-safety interventions, risk education, and infrastructure improvements in high-density informal areas, particularly in Kayamandi and Langrug.

Indicator 13.1.3: Proportion of local governments that adopt and implement local disaster risk reduction strategies in line with national disaster risk reduction strategies

Stellenbosch Municipality has adopted and is implementing a local disaster risk reduction (DRR) strategy through its council-approved DMP (Stellenbosch Municipality, 2025), which provides the institutional framework for disaster risk governance, preparedness, response, recovery, and long-term risk reduction within the municipal area. The DMP guides the municipality's approach to identifying hazards, reducing vulnerability, strengthening

institutional coordination, and building resilience across communities, infrastructure systems, and key economic sectors.

The DMP is aligned with the legislative framework established under the Disaster Management Act, 2002 (Act No. 57 of 2002), and the National Disaster Management Framework 2005. It also contributes to global commitments under the Sendai Framework for Disaster Risk Reduction. The current DMP was developed as a Level 1 plan and formally adopted by Council on 26 April 2023 to guide the municipality's disaster risk management functions. The plan is subject to periodic review to ensure continued alignment with legislative requirements, evolving risk patterns, and institutional capacity.

During the baseline reporting period (before 30 June 2025), the municipality implemented a range of disaster risk reduction activities, including ongoing risk monitoring, coordination with provincial and district disaster management structures, preparedness planning, and strengthening institutional response arrangements.

Following 30 June 2025, Stellenbosch Municipality initiated a structured programme to upgrade the existing DMP to a fully compliant Level 3 DMP. This programme includes a comprehensive ward-based multi-hazard risk assessment, integration of climate change projections to 2050, development of operational Target Hazard Plans for priority risks, and the strengthening of governance mechanisms such as a Municipal Disaster Management Forum and sectoral hazard custodian framework. These actions aim to further institutionalise DRR, strengthen climate resilience, and enhance early warning and coordination mechanisms across municipal sectors.

Table 21: SDG Target 13.2

Target 13.2: Integrate climate change measures into national policies, strategies and planning		
Indicator	**Baseline** (up to 30 June 2025)	**Post-Baseline Developments** (after 30 June 2025)
13.2.1: Number of countries with nationally determined contributions, long-term strategies, national adaptation plans and adaptation communications, as reported to the secretariat of the United Nations Framework Convention on Climate Change	*Not applicable at the local government level*	*Not applicable at the local government level*
13.2.2: Total greenhouse gas emissions per year	*Not data currently available*	*Not data currently available*

Indicator 13.2.1: Number of countries with nationally determined contributions, long-term strategies, national adaptation plans and adaptation communications, as reported to the secretariat of the United Nations Framework Convention on Climate Change

While Indicator 13.2.1 is designed to track national-level commitments under the United Nations Framework Convention on Climate Change (UNFCCC), local governments are increasingly recognising the importance of integrating climate change mitigation and adaptation into their own strategies, plans, and operations. Although municipalities are not required to report against this indicator, Stellenbosch Municipality has opted to include it in the VLR as a reflection of its growing institutional commitment to addressing climate change.

During the baseline period, Stellenbosch Municipality had no dedicated climate change strategy or implementation framework in place. Climate change considerations were limited to risk identification in the municipal Integrated Development Plan (IDP), where climate change was recognised as one of the top five strategic risks, and within the DMP. Broader climate-related guidance was largely drawn from the Cape Winelands District Municipality (CWDM) Climate Change Adaptation Plan (CSIR, 2023a).

A significant shift began on 1 June 2025, with the appointment of Stellenbosch Municipality's first dedicated Climate Change Expert, funded through SKEW, implemented by Engagement Global gGmbH in collaboration with the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ). This marked the first full-time role within the municipality dedicated exclusively to climate change, with the position funded through the SKEW programme until September 2027. Although this falls just one month before the baseline cut-off date, it represents a key institutional milestone and sets the foundation for structured climate action moving forward.

Following the appointment of the Climate Change Expert, Stellenbosch Municipality initiated a formal process to develop its first Climate Change Strategy (CCS), which will include both adaptation and mitigation components. A climate risk assessment was completed using the Council for Scientific and Industrial Research (CSIR) Green Book data (CSIR, 2023b) and methodology, providing an up-to-date evidence base for municipal decision-making. Based on these risks, the CCS will set out a locally tailored programme of climate responses and establish a framework for integrating climate considerations across municipal functions. In addition to the development of the CCS, a comprehensive review of all key municipal

policies, plans, and strategies is underway, with the aim of mainstreaming climate change across governance, infrastructure, land use, and service delivery.

Indicator 13.2.2: Total greenhouse gas emissions per year

Stellenbosch Municipality does not yet have a municipal-level greenhouse gas inventory in place and is therefore unable to report quantitative data under Indicator 13.2.2 at this stage. However, the importance of local-level mitigation has been recognised, and the development of a greenhouse gas inventory is being explored as a key intervention under the municipality's forthcoming CCS, with the aim of aligning it with emissions data already collected under the municipality's Air Quality Management Plan. This approach is intended to reduce duplication, improve data accessibility, and support integrated planning across environmental management functions.

Other planned mitigation interventions under the CCS include:

- Improving energy efficiency in municipal operations and infrastructure;
- Increasing the share of energy from renewable sources across the municipal area; and
- Expanding recycling efforts and exploring waste-to-energy opportunities.

While formal emissions tracking is not yet in place, these initiatives signal a growing institutional commitment to local climate mitigation, in line with South Africa's national climate targets and the goals of Indicator 13.2.2.

Table 22: SDG Target 13.3

Target 13.3: Improve education, awareness-raising and human and institutional capacity on climate change mitigation, adaptation, impact reduction and early warning		
Indicator	**Baseline** (up to 30 June 2025)	**Post-Baseline Developments** (after 30 June 2025)
13.3.1: Extent to which (i) global citizenship education and (ii) education for sustainable development are mainstreamed in (a) national education policies; (b) curricula; (c) teacher education; and (d) student assessment	*Not applicable at the local government level*	*Not applicable at the local government level*

Indicator 13.3.1: Extent to which (i) global citizenship education and (ii) education for sustainable development are mainstreamed in (a) national education policies; (b) curricula; (c) teacher education; and (d) student assessment

While this indicator is formally designed to track national education systems, Stellenbosch Municipality has opted to report on it from a local government perspective in alignment with

SDG Target 13.3, which calls for improved education, awareness-raising, and institutional capacity for climate change mitigation, adaptation, impact reduction, and early warning.

During the baseline period (up to 30 June 2025), Stellenbosch Municipality had no dedicated staff capacity or structured programmes in place for climate change education or awareness-raising. Human and institutional capacity for climate-related risk reduction, adaptation, and mitigation was consequently limited. No education or outreach events on climate change were hosted by the municipality during this period. However, since July 2025, the municipality has launched multiple public-facing education and awareness initiatives. These include:

- Community Engagement Sessions: As part of the municipality's flood resilience efforts in Franschhoek, a series of participatory community engagement sessions took place in July 2025, August 2025, and February 2026, with further engagements planned. These sessions engage communities that were severely affected by the 2023 floods and focus on co-learning, where residents and municipal staff jointly explore the causes, consequences and solutions to the flood impacts experienced in 2023. In addition to workshop-style engagements, river walks through flood-prone areas are used to identify vulnerabilities, share local knowledge, and discuss ways climate change is likely to impact flood risk in the area. Discussions also centre on practical actions that households and the municipality can take to strengthen local resilience, with community input feeding directly into the design of the Franschhoek Flood Resilience Programme (see below);
- Public participation: During the September 2025 IDP public participation process, five engagement sessions included a presentation on the municipality's climate change plans and provided space for residents to share how climate change is affecting them, express their priorities, and ask questions directly to the Climate Change Expert. Follow-up engagements are scheduled for April 2026; and
- Social Media Campaigns: In December 2025, the municipality launched its first dedicated climate change awareness campaign via Facebook and X (formerly Twitter), aiming to improve public understanding of climate change. Topics included the distinction between weather and climate, key causes of global warming, and practical actions residents can take. A series of posts focused specifically on the relationship between climate change and fire risk, timed to coincide with the fire season in Stellenbosch. Future campaigns are planned for June and December 2026.

In terms of institutional capacity building, during August and September 2025, the municipality conducted a capacity needs assessment across departments to evaluate their current understanding of climate change, its relevance to their operations, and any ongoing climate-related work. This assessment helped identify key knowledge gaps and opportunities for targeted support. Based on the findings, the first internal capacity-building workshop was held on 27 November 2025 for senior managers and managers within the Infrastructure Directorate. The session focused on presenting localised climate projections for the municipal area and linking these to operational risks, serving as a foundation for integrating climate considerations into strategic and operational planning. To further embed climate literacy and action across the municipality, a series of additional capacity-building workshops is scheduled for September and December 2026, as well as March and June 2027, targeting other key directorates within the municipality.

A key step in strengthening the municipality's DRR and early warning capacity has been the appointment of a Senior Disaster Management Coordinator. This strategic position enhances the municipality's institutional capacity to plan, coordinate, and implement climate-informed early warning systems and risk reduction initiatives, directly supporting long-term resilience planning.

The role ensures that disaster risk management efforts are aligned with both provincial and national early warning frameworks, enabling timely interpretation, dissemination, and response to hazard alerts. Through proactive coordination across municipal departments, the Senior Disaster Management Coordinator facilitates the integration of hazard and climate risk information into local planning processes, standard operating procedures, and emergency preparedness strategies.

Moreover, the position actively strengthens community-level awareness and response mechanisms, fostering a culture of preparedness and enhancing the municipality's ability to mitigate the impacts of climate-related hazards. By institutionalising early warning and risk-informed decision-making, this initiative represents a measurable step toward fulfilling Indicator 13.1.3 and demonstrates the Stellenbosch Municipality's commitment to embedding climate resilience into local disaster risk management practices.

Table 23: SDG Target 13.a

Target 13.a: Implement the commitment undertaken by developed-country parties to the United Nations Framework Convention on Climate Change to a goal of mobilising jointly $100 billion annually by 2020 from all sources to address the needs of developing countries in the context of meaningful mitigation actions and transparency on implementation, and fully operationalise the Green Climate Fund through its capitalisation as soon as possible		
Indicator	**Baseline** (up to 30 June 2025)	**Post-Baseline Developments** (after 30 June 2025)
13.a.1: Amounts provided and mobilised in United States dollars per year in relation to the continued existing collective mobilisation goal of the $100 billion commitment through to 2025	*Not applicable to South Africa or at the local government level*	
Target 13.b: Promote mechanisms for raising capacity for effective climate change-related planning and management in least developed countries and small island developing States, including focusing on women, youth and local and marginalised communities and NBSP		
13.b.1: Number of least developed countries and small island developing States with nationally determined contributions, long-term strategies, national adaptation plans and adaptation communications, as reported to the secretariat of the United Nations Framework Convention on Climate Change	*Not applicable to South Africa or at the local government level*	

3.4.4 Municipal Projects and Programmes Supporting Climate Action

In addition to the indicators formally reported on in this VLR, Stellenbosch Municipality is implementing several projects and programmes that contribute directly to climate action and resilience. While not all of these initiatives align fully with a specific SDG 13 indicator, they reflect the municipality's growing commitment to mainstreaming climate considerations into service delivery, infrastructure, urban planning, and community engagement. This section highlights select examples of ongoing municipal interventions that support climate change action, awareness-raising, and institutional strengthening.

3.4.4.1 Franschhoek Flood Resilience Programme

In response to the growing risk of unpredictable and extreme rainfall events under climate change, Stellenbosch Municipality is implementing a multi-year flood resilience programme in the town of Franschhoek. The programme was initiated following the extreme flood event of September 2023, when the La Cotte River overtopped its banks during a 1-in-200-year rainfall event. The resulting flood caused widespread damage to roads, bridges, homes, and municipal infrastructure, exposing the town's high vulnerability to flood hazards.

A key factor contributing to this vulnerability is historic urban development within the river's natural floodplain, which has reduced the river's effective flow capacity to approximately a 1-in-5-year flood in some areas. Emergency repairs were completed in 2024, but the

municipality recognised that long-term resilience would require more than infrastructure restoration. The Franschhoek Flood Resilience Programme was therefore launched as a phased, long-term climate adaptation intervention running through to 2030.

The programme's primary objective is to increase the flood-carrying capacity of the La Cotte River system to handle at least a 1-in-50-year flood event. However, achieving this requires creative design solutions due to the dense development and private land ownership along the river corridor. A combination of interventions has been proposed, including:

- Upgrading and enlarging culverts;
- Strategic river widening in constrained sections;
- Engineered embankments, berms, and gabions; and
- Naturalised riverbank treatments where space allows.

The programme is being implemented in phases, beginning downstream and progressing upstream. The initial focus is on culvert upgrades, with later phases addressing floodplain widening, erosion control, and ecological enhancements. Although the early design relied heavily on hard-engineered solutions, future phases will integrate nature-based interventions, such as:

- Riparian buffer zones with indigenous flood-resilient vegetation;
- Vegetated banks for erosion control; and
- Ecological corridors for education and co-benefits like urban cooling and biodiversity enhancement.

A major component of the programme is community engagement. Many river-adjacent properties are privately owned, and securing community cooperation has required ongoing dialogue to address concerns around land use, construction disruption, and property impacts. This participatory approach, including river walks and community sessions, ensures that local knowledge informs the programme's design and builds long-term support.

3.4.4.2 Sustainable Urban Drainage Systems (SUDS) Strategy

As part of the ongoing review of Stellenbosch Municipality's Stormwater Master Plan, the municipality has recognised the need to adapt its stormwater infrastructure in response to intensifying climate risks. In particular, projected increases in both water scarcity during prolonged drought periods and flooding caused by high-intensity rainfall events have prompted a shift in how the stormwater system is planned and managed.

To address these dual risks, the municipality has initiated the development of an SUDS Strategy, which will form a dedicated component of the revised Stormwater Master Plan. The strategy aims to modernise the municipality's approach to stormwater by treating it not only as a drainage challenge, but also as a valuable resource that can contribute to local water security.

Key objectives of the SUDS Strategy include:

- Designing infrastructure that retains and reuses stormwater runoff during dry periods;
- Improving the capacity of urban drainage systems to absorb and safely convey excess runoff during extreme rainfall events; and
- Reducing urban flood risks while supporting groundwater recharge, water quality, and climate co-benefits.

While the strategy is still in development, it represents an important step toward climate-responsive infrastructure planning. By embedding SUDS principles into municipal policy and design standards, Stellenbosch aims to future-proof its stormwater systems against the growing variability and intensity of climate-related water risks.

3.4.4.3 Dwars River Project

The Dwars River Project was initiated in response to the devastating impacts of the September 2023 floods, which were classified as a 1-in-100-year event in the Dwars River system. The floods caused extensive damage to the river system, leading to severe bank erosion and the loss of critical municipal infrastructure, including sewer pipelines, a bridge, sections of road, and private properties. The event also significantly degraded the ecological health of the river corridor.

While initial municipal recovery efforts in 2024 and 2025 focused on reconstructing the Raising Main Sewer pipeline, which had been washed away during the flood, a broader and more sustainable rehabilitation process commenced in 2026, with the planning and implementation phases envisioned to span at least three years.

The project prioritises the use of nature-based solutions to stabilise eroded riverbanks and restore ecological integrity. A Rehabilitation Plan is currently being developed and will be informed by ecological condition assessments, flow characteristics studies, and expert consultations. Consultants have been appointed, and field inspections and stakeholder engagements have already begun. The project aims to enhance both climate resilience and

ecosystem health in the Dwars River catchment, while reducing future flood vulnerability and supporting long-term infrastructure protection.

3.4.4.4 Tree Planting Project

Stellenbosch's historic town centre is internationally recognised for its majestic English oak trees (*Quercus robur*), many of which are centuries old and officially designated as National Monuments. These trees form a vital part of the town's living heritage and cultural landscape. However, they are now under serious threat from the Polyphagous Shot Hole Borer (PSHB), an invasive beetle that introduces a lethal fungus into large trees, compromising water transport and leading to widespread die-off.

In response, Stellenbosch Municipality has launched the Tree Planting Project to preserve the town's urban tree canopy through a coordinated strategy of protection, removal, and replanting. The project is a collaborative effort between the municipality, concerned residents, Stellenbosch University researchers, and the Stellenbosch Trail Fund NPC, which oversees fundraising and public engagement.

Key elements of the project include:

- Safe removal of PSHB-infected or dead trees in line with protocols from Heritage Western Cape;
- Replanting with more resilient species, such as Turkish oak (*Quercus cerris*) and pin oak (*Quercus palustris*), which show greater resistance to the borer;
- A commitment to plant at least 30 new trees in 2026, with maintenance guaranteed for the first three years (watering, soil care, root barrier systems); and
- Public sponsorship opportunities that allow residents and donors to fund new trees, complete with personalised plaques.

The municipality handles technical aspects such as tree removal approvals, planting pit preparation, and installation of BioBarrier root systems and permeable paving. Community partners lead on procurement, fundraising, and public outreach. Each sponsored tree costs R25 000, covering purchase, planting, maintenance, and replacement if needed.

While the project's immediate goal is to protect Stellenbosch's historic aesthetic and environmental character, it also contributes to broader climate adaptation goals by:

- Cooling urban areas through shade and evapotranspiration;
- Enhancing stormwater absorption and soil stability;
- Increasing carbon sequestration; and

- Building community awareness and engagement in ecosystem protection.

This project demonstrates how cultural heritage and climate resilience can be addressed together, and how community partnerships can drive adaptive urban action at a local level.

3.4.5 Challenges in Meeting Goal 13

Stellenbosch Municipality's growing commitment to addressing climate change is clear, but significant challenges remain that constrain the scale and speed of local climate action. These challenges are not unique to Stellenbosch Municipality and are shared by many local municipalities across South Africa — particularly those operating under tight budgets, complex mandates, and limited technical capacity.

One of the most pressing challenges is institutional capacity. At present, the municipality has only one dedicated staff member focused full-time on climate change. While this appointment in June 2025 marked a significant step forward — and positions Stellenbosch ahead of many peer municipalities where climate functions are typically added onto environmental or planning roles — the scale of the climate crisis far exceeds what a single post can address. Climate change is cross-cutting by nature, impacting every municipal function from infrastructure and energy to water services, housing, and emergency response. Addressing it effectively requires coordination, technical skill, and time — all of which are difficult to sustain within current resourcing levels. The municipality's dedicated climate change post is currently funded only until September 2027, raising concerns about long-term institutional stability and the ability to build and maintain internal momentum.

A second key challenge lies in securing strategic and political buy-in. Climate change is often perceived as an additional issue — a separate environmental concern — rather than a driver that will worsen existing development challenges. In the context of constrained budgets and pressing service delivery needs, climate action can be deprioritised in favour of more visible or immediate development issues such as housing, roads, or basic infrastructure. Yet in reality, climate risks undermine all of these sectors, and failing to address them will compromise long-term development gains. Elevating climate change to a core development priority — not just an environmental one — is essential. This shift in mindset requires sustained advocacy, political leadership, and cross-departmental collaboration.

In short, while meaningful progress has begun, Stellenbosch Municipality — like many local municipalities in South Africa — is still at the early stages of mainstreaming climate change across governance systems. To maintain momentum, climate action must be institutionally embedded, supported by adequate capacity and funding, and prioritised as a development

issue, not just an environmental one. Without these shifts, there is a real risk that climate change will continue to be treated as a peripheral concern — even as it increasingly shapes the municipality's ability to deliver its mandated functions of basic service provision, the protection of vulnerable communities, and building a resilient future.

3.4.6 Key Findings: SDG 13 Climate Action

1. **Climate risk is increasing:** Stellenbosch Municipality faces a projected hotter and drier climate by 2050, with increased heat stress, wildfire risk, water scarcity and continued flood exposure in vulnerable areas. These risks have direct implications for infrastructure, service delivery, disaster management, water security, agriculture and tourism.

2. **Disaster risk governance is being strengthened:** Stellenbosch Municipality has a Council-adopted Disaster Management Plan and has initiated a programme to upgrade the plan from Level 1 to Level 3. This will strengthen local disaster risk reduction, improve multi-hazard planning, and support climate-informed early warnings and preparedness.

3. **Climate change is beginning to be mainstreamed into municipal planning:** The appointment of a dedicated Climate Change Expert and the development of the municipality's first Climate Change Strategy mark a significant institutional shift. Climate risk assessment work using CSIR Green Book data provides an evidence base for integrating climate change into municipal policies, plans and operations.

4. **Public awareness and institutional capacity are improving:** Since the baseline period, the municipality has initiated climate change awareness campaigns, participatory flood resilience engagements in Franschhoek, IDP-linked public engagement and internal capacity-building workshops. These activities are beginning to strengthen both community awareness and municipal climate literacy.

5. **Several municipal projects already support climate action:** Projects such as the Franschhoek Flood Resilience Programme, Sustainable Urban Drainage Systems Strategy, Dwars River Project and Tree Planting Project contribute to climate adaptation, ecosystem resilience, infrastructure protection, urban cooling and community participation.

3.5 SDG 16 Peace, Justice, and Strong Institutions

Goal 16 is about promoting peaceful and inclusive societies, providing access to justice for all and building effective, accountable and inclusive institutions at all levels. People everywhere should be free of fear from all forms of violence and feel safe as they go about their lives, whatever their ethnicity, faith or sexual orientation.

3.5.1 Overview of Strong Cities Network

The municipality joined the Strong Cities Network after attending a workshop for South African cities on the role of local governments in preventing hate, extremism and polarisation, which Strong Cities and the City of Cape Town co-hosted in May 2023. In December 2023, representatives from Stellenbosch participated in a Strong Cities learning trip to Cape Town for mayors from Kenya, Tanzania, and Uganda, as well as other senior city officials. They gave presentations on the many preventative programmes of the Community and Protection Services directorate.

3.5.2 Existing Institutional Responses

Although policing and crime prevention are not municipal functions in South Africa, the municipality has institutionalised several safety-related policies, according to the Strong Cities Network (n.d.), to enable it to take ownership over the safety of its residents. These include:

- The **Auxiliary Enforcement Officers Policy**, which allows the municipality "to invest in public safety, train members of the community and open career paths for residents who want to serve their communities".
- The **Rewards for Criminal Information Policy**, which establishes guidelines for the management of confidential information and for compensation of persons who provide information leading to arrest, confiscation and recovery of stolen goods.
- The **Externally Funded Law Enforcement and Traffic Officer Policy** (or "Rent a Cop"), which facilitates "an increase in visible policing" through partnerships between the private sector and the municipality's Community and Protection Services' directorate, whereby the former invests in local law enforcement capacities by "renting" officers from the latter to work in specific areas.
- The Municipal Council approved the establishment of a Community Safety Forum, as described below (Stellenbosch Municipality, 2022).

3.5.3 Collaboration and Partnerships

Stellenbosch Municipality's Community Safety Forum convenes ward councillors, non-governmental organisations (NGOs), the private sector, city and provincial departments and national actors such as the South African Police Service (SAPS), quarterly to discuss matters of community safety.

The Community Safety Forum (CSF) was approved by the Council on 30 March 2022. The CSF is a multi-stakeholder forum that will address matters of community safety and security in the Stellenbosch Municipal area. The purpose of the CSF is to promote the development of communities in a safe environment and provide access to high-quality services at the local government level through multi-agency collaboration between the different spheres of government and communities. The CSF, as a multi-sectoral structure, would champion the coordination, integration, and implementation of crime and violence prevention and community safety initiatives. The CSF has three clusters, namely: Law Enforcement, Social Cohesion and Crime Prevention through Urban Design (Stellenbosch Municipality, 2022).

Furthermore, the municipality is a member of the Stellenbosch Safety Partnership, a broader security partnership that unites private security firms, non-profits like Winelands Safety Initiative, and security actors like SAPS. To coordinate responses to current security incidents and / or emerging security challenges, these actors are housed in a single municipal control room. A specific hotline, a designated WhatsApp number, and various technological investments like CCTV are used to receive reports of such incidents (Strong Cities Network, n.d.).

According to the Strong Cities Network (n.d.), the municipality also has a partnership with Stellenbosch University, which involves a quarterly mayoral forum where the Mayor, Municipal Manager and Directors meet with senior management from the university to share information, raise awareness (e.g., about emerging challenges each party has observed) and develop joint safety and crime prevention interventions.

3.5.4 Community Engagement

The Stellenbosch Municipality has and continues to invest in and support neighbourhood watches (NHWs) and mobilise communities to support them. This includes direct assistance to NHWs to formalise their registration with the Department of Police Oversight and Community Safety (POCS) so that they can qualify for financial support and participate in sanctioned safety projects. The NHWs form a critical part of the community-based safety

focus of the municipality in that they are located in the communities and understand the particular challenges faced by those communities. In addition to the support received from POCS, the municipality continues to provide training for under-resourced neighbourhood watches and provides them with radios for swift and effective communication with the municipal control room as and when required (Stellenbosch Municipality, 2026). To achieve this, the following role players have been identified as key stakeholders and partners for success:

- South African Police Services (SAPS);
- Department of Police Oversight and Community Safety (POCS);
- Cape Winelands District Municipality (CWDM);
- Neighbourhood watches and farm watches;
- Community Policing Forums (CPFs);
- Private and corporate businesses;
- Private security companies;
- Winelands Safety Initiative (WSI);
- Department of Correctional Services (DCS);
- Department of Justice (DoJ);
- University of Stellenbosch (Campus Security); and
- Stellenbosch Municipality
    - Law Enforcement
    - Traffic Services
    - Fire and Rescue
    - Disaster Management.

Building collaborative relationships with our community stakeholders and highlighting the Council's commitment to maintaining strong partnerships with primary law enforcement agencies remains the foundation of ensuring safety throughout the greater Stellenbosch.

The control room is fully functional and situated at the Stellenbosch Fire Department. The municipality still strives and will continue to, as part of the strategy, to provide a space where all safety and security stakeholders can jointly monitor and communicate with each other on safety and security matters. This includes the monitoring of municipal bylaw transgressions, criminal activity, emergency response in case of disasters, emergencies, and a range of other safety and security-related incidents.

Awareness initiatives have been and will continue to be launched as they contribute to making communities aware of crime prevention tips and other preventative tips, for example,

fire safety and what to do in case of disasters. This will be a joint approach between role-players, supplemented based on crime patterns and situations experienced. Training will also be provided to enhance safety initiatives, for example, road safety (crossing of roads).

3.5.5 Governance components

Stellenbosch Municipality has demonstrated strong institutional performance through its governance systems, including achieving its sixth consecutive clean audit outcome from the Auditor-General of South Africa, the implementation of the Anti-Fraud and Corruption plan, and strong internal controls. The Anti-Fraud and Corruption plan is aligned to the Consequence Management Policy that aims to assist in the prevention, detection, investigation and sanctioning of fraud, corruption, unethical behaviour, and instances of gross negligence that might result in damage or loss to the municipality.

These measures align with SDG 16.5 and SDG 16.6, which emphasise reducing corruption and strengthening transparency and accountability.

3.6 SDG 17 Partnerships

SDG 17 focuses on strengthening global partnerships to support and achieve the 2030 Agenda for Sustainable Development. It recognises that the world's most pressing challenges—poverty, inequality, climate change, and economic instability—cannot be solved by individual countries or sectors acting alone. Instead, effective collaboration across governments, the private sector, civil society, academia, and international organisations is essential (United Nations, 2026).

The Stellenbosch Municipality's Intergovernmental and International Relations (IGR and IR) Policy serves as a strategic framework that guides how the municipality engages with government partners and international stakeholders. Its purpose is to align these engagements with the municipality's broader development goals as outlined in its Integrated Development Plan (IDP). The policy reinforces Stellenbosch's ambition to strengthen its global profile as an appealing destination for tourism, investment, living, and business. It is aligned with the Western Cape Government's International Relations Strategy, which emphasises trade, tourism, investment, skills development, and knowledge sharing (Stellenbosch Municipality, 2025b).

Recognising the growing global role of local governments, the policy underscores the importance of municipalities as drivers of economic growth and development. It also highlights the need for strong intergovernmental collaboration—across local, provincial, national, and non-state partners—to support effective governance, service delivery, economic opportunity, and social upliftment.

International Partnerships Strengthening Community Safety and Climate Resilience in Stellenbosch Municipality

3.6.1 Building Global Municipal Partnerships

Stellenbosch Municipality has actively pursued international partnerships to strengthen its institutional capacity, improve urban governance, and address complex challenges such as community safety, climate change, and sustainable urban development.

Through strategic collaboration with international networks and partner cities, the municipality has participated in knowledge exchange programmes that promote practical solutions to local challenges while contributing to the global United Nations Sustainable Development Goals.

Two notable partnerships illustrate the municipality's commitment to international cooperation and peer learning, namely the following:

- Collaboration with the **Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ)** through the South African–German Peer-to-Peer Learning Network.
- Community safety collaboration with Nansana Municipality (Uganda) through the Strong Cities Network (SCN).

These partnerships have enabled Stellenbosch Municipality to both **learn from international best practices and share its own experience**, strengthening governance and service delivery across multiple sectors.

3.6.2 Partnership 1: South African German Peer-to-Peer Learning Network

3.6.2.1 Project Overview

Stellenbosch Municipality participated in the South African–German Peer-to-Peer Learning Network, implemented by Deutsche Gesellschaft für Internationale Zusammenarbeit on behalf of the German Federal Ministry for Housing, Urban Development and Building in partnership with South Africa's Department of Cooperative Governance.

The initiative forms part of the **Dialogues for Urban Change (D4UC)** programme and aims to strengthen integrated urban development through collaboration between municipalities in South Africa and Germany.

Through a series of workshops, technical exchanges and site visits, participating cities explored solutions to common urban development challenges, including:

- Urban safety and public space management;
- Inner-city regeneration;
- Climate resilience;
- Integrated urban planning; and
- Community engagement.

Stellenbosch Municipality hosted the **third network workshop in February–March 2023**, where international delegates engaged directly with local urban development challenges and community initiatives.

3.6.2.2 Key Outcomes

The partnership generated several institutional and operational outcomes:

Institutional Capacity Building

Municipal officials benefitted from international knowledge exchange and peer learning focused on:

- Integrated urban planning;
- Crime prevention through urban design;
- Public space activation;
- CBD regeneration; and
- Informal economy integration.

Insights gained through the network contributed to improvements in municipal initiatives, including:

- Development of a **Parking Management Model;**
- Informing the municipality's **CCTV infrastructure procurement processes;** and
- Strengthening cross-department coordination on urban development issues.

Community Safety and Training Initiatives

Training programmes supported by the partnership included:

- Community safety training;
- Park activation initiatives;
- Gender-based violence awareness through the **Stepping Stones Programme;** and
- Youth resilience training initiatives.

A **baseline safety study in Kayamandi** was also conducted in partnership with NICRO to inform future safety interventions.

Climate Change Expert Appointment

A major outcome of the partnership was the successful application for funding from **GIZ** to appoint a **Climate Change Expert** within the Office of the Municipal Manager.

The appointment (June 2025 – December 2026, in the process of extension application) focuses on strengthening municipal capacity to address climate-related risks following severe weather events experienced in the region, including the **2023 floods that affected Franschhoek**.

Key responsibilities of the expert include:

- Climate vulnerability assessments;
- Climate Change Adaptation plan;
- Emergency preparedness planning;
- Climate adaptation and mitigation strategies;
- Ecosystem restoration and river corridor development; and
- Community awareness and stakeholder engagement.

This initiative significantly strengthens the municipality's ability to respond to climate change impacts.

3.6.3 Partnership 2: The Stellenbosch–Karlsruhe Municipal Partnership

3.6.3.1 Project overview

The Stellenbosch–Karlsruhe Municipal Partnership is a strategic international collaboration between Stellenbosch Municipality and the City of Karlsruhe in Germany. The partnership is facilitated through the Expert Fund for Municipal Partnerships Worldwide (SKEW), implemented by Engagement Global gGmbH in collaboration with Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ).

The partnership was strengthened during the 4th Network Meeting of the South African–German P2P Learning Network and formally established in response to the September 2023 flood events in Franschhoek, which highlighted the municipality's vulnerability to climate risks. A joint application submitted on 31 January 2024 resulted in the successful appointment of a Climate Change Expert within Stellenbosch Municipality to support integrated climate adaptation planning.

3.6.3.2 Key Outcomes

The partnership was entered into with the agreement that it will be responsible for several key performance indicators, namely:

- To enhance institutional capacity for climate change adaptation within Stellenbosch Municipality;
- To promote knowledge exchange and mutual learning between Stellenbosch and Karlsruhe;
- To integrate climate resilience into municipal spatial planning, infrastructure development, and service delivery;
- To support the development and implementation of Stellenbosch's Climate Change Strategy; and
- To ensure a needs-based and implementation-driven approach to international cooperation.

3.6.3.3 Beneficiaries of the Partnership

In relation to the various webinars and meetings held, it became evident that a wide range of beneficiaries will benefit from the partnership, especially:

- Residents of Stellenbosch Municipality, particularly communities vulnerable to climate-related risks, such as flooding;
- Municipal officials and departments through strengthened technical capacity and access to international expertise;
- Local businesses and stakeholders are benefiting from improved infrastructure resilience and sustainable planning; and
- Broader regional and global networks through shared knowledge and best practices in climate adaptation.

3.6.3.4 Key Outcomes and Alignment with the SDGs

- **Improved Climate Resilience (SDG 13: Climate Action):** Enhanced capacity to respond to climate risks through informed planning, technical support, and the integration of climate adaptation measures into municipal strategies.
- **Sustainable Urban Development (SDG 11: Sustainable Cities and Communities):**

  Strengthened spatial planning and infrastructure resilience, contributing to safer, more inclusive, and sustainable human settlements.

- **Strengthened Global Partnerships (SDG 17: Partnerships for the Goals):**
  Effective international cooperation enables knowledge sharing, technical exchange, and co-development of solutions tailored to local needs.
- **Institutional Capacity Building:**
  Appointment of a Climate Change Expert and ongoing technical engagements have improved internal capacity to implement climate-responsive policies and projects.
- **Tangible Local Impact:**
  A strong focus on implementation ensures that knowledge exchange translates into practical interventions and measurable improvements within the municipality.

3.6.4 Partnership 3: Community Safety Collaboration with Nansana Municipality

3.6.4.1 Project Overview

Through participation in the Strong Cities Network, Stellenbosch Municipality established a city-to-city partnership with Nansana Municipality in Uganda to strengthen community-based safety initiatives.

Nansana faces growing security challenges linked to rapid urbanisation, youth unemployment and social vulnerability. Municipal leaders identified Stellenbosch's **Neighbourhood Watch model** as a potential framework that could be adapted to their local context.

Two technical exchange visits took place:

- **May 2023:** Initial Neighbourhood Watch training and capacity building; and
- **August 2024:** Follow-up engagement focusing on implementation progress and community structures.

The collaboration focused on sharing governance frameworks, operational guidance and community mobilisation strategies to support the development of sustainable neighbourhood safety initiatives.

3.6.4.2 Key Outcomes

Training and Capacity Building

Stellenbosch officials conducted training sessions covering:

- Establishment and governance of Neighbourhood Watch structures;
- Volunteer roles and responsibilities;
- Coordination with police authorities;
- Community mobilisation strategies; and
- Reporting and communication systems.

Participants were guided through practical steps to establish neighbourhood safety initiatives, including the development of constitutions, leadership structures and formal registration processes.

Development of Community Safety Structures

Several communities in Nansana have developed neighbourhood safety initiatives, including:

- **Nansana East I A Zone:** Community safety representatives and a WhatsApp communication network with approximately **145 members**;
- **West II A Zone: 40 Neighbourhood Watch members** and communication platforms with over **200 participants**;
- **Nabweru South Cell III:** Over **500 active Neighbourhood Watch volunteers** coordinating safety activities;
- **Buwambo Area:** Youth-led initiatives; and
- organised neighbourhood safety structures across five zones.

Strengthened Police–Community Collaboration

Engagement with the District Police Commissioner reinforced the importance of collaboration between community safety initiatives and law enforcement authorities.

Police representatives confirmed support for neighbourhood safety initiatives and recommended regular information sharing and structured safety programmes.

3.6.5 Beneficiaries of the Partnerships

The partnerships generated benefits at multiple levels.

Institutional Beneficiaries

Municipal officials from Stellenbosch Municipality benefited from:

- International knowledge exchange;
- Exposure to global urban development practices; and
- Capacity building in climate resilience and community safety.

Municipal leaders and officials in Nansana Municipality also benefited from training and institutional support in establishing community safety structures.

Community Beneficiaries

Community members benefited through:

- Community safety training programmes;
- Youth resilience initiatives;
- Gender-based violence awareness training; and
- Neighbourhood safety initiatives.

Key statistics include:

- **25 youth participants** trained in resilience programmes in Stellenbosch;
- **More than 500 Neighbourhood Watch volunteers** are participating in safety initiatives in Nansana; and
- **Hundreds of residents** are participating in community communication and safety networks.

3.6.6 Contribution to the Sustainable Development Goals

The partnerships contribute to several SDGs, namely the following:

SDG 11 – Sustainable Cities and Communities

- Strengthening urban safety initiatives;
- Improving public space management; and

- Supporting inclusive community participation.

SDG 13 – Climate Action

- Climate vulnerability assessments;
- Climate adaptation planning;
- Municipal climate resilience initiatives.

SDG 16 – Peace, Justice and Strong Institutions

- Strengthening governance and community safety structures; and
- Improving collaboration between communities and law enforcement.

SDG 17 – Partnerships for the Goals

- International municipal cooperation;
- Knowledge exchange between cities; and
- Multi-level governance and institutional collaboration.

3.6.7 Overall Impact of the Partnerships

These partnerships demonstrate the value of international cooperation in strengthening municipal capacity and addressing complex development challenges.

Through collaboration with international partners, Stellenbosch Municipality has enhanced its institutional knowledge, strengthened community safety initiatives and improved its ability to address climate-related risks.

Importantly, these partnerships also position Stellenbosch Municipality as both a learner and contributor in global municipal networks, sharing local expertise while benefiting from international best practices.

The initiatives highlight how global partnerships can deliver practical benefits at the local level, contributing to safer communities, stronger institutions and more resilient cities.

During the partnerships between Stellenbosch Municipality, GIZ, and Nansana Municipality, several key insights for future municipal cooperation and local development initiatives were experienced, namely:

- **Practical Knowledge Exchange**
  Structured peer-to-peer learning and technical exchanges create tangible outcomes when paired with live, locally relevant projects.
- **Local Ownership Ensures Sustainability**
  Initiatives succeed when communities, local leaders, and municipal officials are actively involved in designing, implementing, and managing projects.
- **Multi-Level Partnerships**
  Collaboration across international partners, municipal departments, law enforcement, and community organisations builds long-term institutional resilience.
- **Integrated Approaches**
  Linking climate resilience, urban safety, and social inclusion initiatives ensures broader impact across multiple SDGs, while addressing interdependent local challenges.

3.6.8 Photos of International Partnerships:

Nansana Municipality

1st Network Meeting - Nelson Mandela Bay

2nd Network Meeting - Karlsruhe and Berlin

3rd Network Meeting - Stellenbosch

4th Network Meeting - Nuremberg

5th Network Meeting - KwaDukuza and uMhlathuze

6th Network Meeting - Ludwigsburg, Heidelberg

7th Network Meeting - Bottrop

CHAPTER 4: CONCLUSION AND WAY FORWARD

Stellenbosch Municipality has already begun contributing to the Sustainable Development Goals through a range of programmes, and establishing a clear baseline was important for measuring progress going forward. While significant work still lies ahead to fully achieve the SDGs, the first critical step was to understand our current position, hence the development of the baseline VLR report.

Through the VLR compilation process, it became evident that greater awareness of the SDGs is needed within the municipality, as well as among external stakeholders, including civil society. Although the municipality has undertaken initiatives that are contributing towards the SDGs, these initiatives were not centrally documented.

The baseline VLR now provides the foundation upon which targets and indicators will be integrated into the municipality's predetermined objectives and core policy documents. The municipality also realises that achieving the SDGs cannot be done in isolation, and true progress will require collaboration with our partners across all sectors.

The VLR will be reviewed and updated every two years to ensure progress is tracked, challenges are identified, and momentum toward achieving the SDGs is maintained.

Dear Monique and Colleagues

Apologies for the delayed response on feedback.

Please find below comments:

SALGA WC: Their draft are very comprehensive painting a clear picture on the current state of service delivery in both municipalities, challenges and plans for the future.

STATSSA WC: Most of the statistical information is based on the MERO 2025 (Provincial Treasury). And municipal specific reports show good examples of work done and projects. The population figure seems very high for 2025 (based on MERO 2025). The population growth rate is 1.9%. This is not in line with projects based on the Census 2022 information.

Clarissa:

1. Overall Framing and Strategic Value

The VLR is correctly positioned as a stocktaking and reflective instrument, rather than a performance report. It explicitly acknowledges that it is “not yet a chronicle of success” but a platform for learning and narrative-building

Reflection:

- This is a strength. It aligns with global VLR best practice where learning, localisation, and institutionalisation matter more than perfect performance.
- However, the report could sharpen its results orientation by distinguishing:
  - *Outputs* (activities, projects)
  - *Outcomes* (measurable change)
  - *Impact* (long-term SDG contribution)

2. Strong Alignment with Governance and Planning Systems

The VLR demonstrates clear integration with:

- Integrated Development Plan (IDP)

- Strategic Focus Areas (SFAs)
- National and global frameworks

The emphasis on vertical and horizontal alignment is conceptually sound and well-articulated .

Reflection:

- This is a major institutional strength, many municipalities struggle with this.
- The governance model (SDG champions, directorate alignment) reflects internalisation of SDGs, not just reporting.

Gap:

- Limited evidence of performance management integration:
    - Are SDGs embedded in KPIs?
    - Are they linked to budgeting (MTREF) in measurable terms?

3. Focused SDG Selection – Pragmatic but Narrow

The municipality selects **6 SDGs (1, 5, 11, 13, 16, 17)** as an entry point.

Reflection:

- This is pragmatic and appropriate for a first VLR.
- The selected goals reflect:
    - Social (SDG 1, 5)
    - Spatial/urban (SDG 11)
    - Environmental (SDG 13)
    - Governance (SDG 16, 17)

Concern:

- Economic transformation (SDG 8, 9) is underrepresented despite:
    - High inequality (Gini ~0.597)
    - Rising unemployment and weak growth

Recommendation:

- Future VLR iterations should expand to include **SDG 8 (economic growth)** explicitly.

4. Socio-Economic Reality – A Dual Economy Narrative

The report clearly surfaces a dualistic local economy:

- High-income, globally integrated sectors
- Persistent inequality, unemployment, and poverty

Examples:

- Unemployment: 13.8%
- High inequality close to 0.6 Gini
- Youth-heavy population (39.9% aged 15–34)

Reflection:

- The VLR does well to acknowledge structural inequality.
- It implicitly reflects the broader South African spatial and economic legacy.

Gap:

- Limited interrogation of:
    - Spatial inequality (e.g., informal settlements vs affluent areas)
    - Land use and housing dynamics

5. Service Delivery Performance – Strong but Uneven

Access to basic services is relatively high:

- Water: 98.5%
- Electricity: 97.1%
- Sanitation: 96.7%

Reflection:

- This reflects strong institutional capacity and infrastructure coverage.
- However, service access ≠ service quality or equity.

Concern:

- The VLR does not sufficiently unpack:
    - Reliability of services
    - Informal settlement access disparities
    - Affordability constraints

6. Climate Action – Strong Narrative, Emerging Metrics

The municipality shows commitment to:

- Renewable energy exploration
- Waste management improvements
- Methane-to-energy initiatives

Reflection:

- Climate action is one of the strongest thematic areas in the VLR.
- Clear alignment with SDG 13 and the “Green Valley” vision.

Gap:

- Limited quantified indicators:
    - Emissions reduction
    - Climate resilience metrics
    - Adaptation outcomes

7. Governance, Partnerships and Innovation
The VLR highlights:

- Stakeholder engagement platforms
- International partnerships (e.g., peer learning, city-to-city collaboration)
- Strong Cities Network participation

Reflection:

- This is a standout strength, SDG 17 (Partnerships) is meaningfully operationalised.
- The “reverse learning” and “Normstorm methodology” concepts are innovative.

Opportunity:

- Better articulation of impact of partnerships:
    - What changed because of these collaborations?

8. Data and Evidence – Solid but Descriptive
The report uses:

- MERO data
- Statistics South Africa
- Municipal datasets

Reflection:

- Good baseline data and descriptive statistics.
- Strong use of figures and tables.

Gap:

- Limited:
    - Time-series trend analysis
    - Target vs actual comparisons
    - Forecasting for SDG achievement

9. Narrative Style – Strong Storytelling, Needs Precision
The VLR blends:

- Technical reporting

- Narrative storytelling
- Community voice

Reflection:

- This improves accessibility and aligns with VLR global practice.
- However, some sections are overly verbose and less analytical.

Recommendation:

- Tighten language in technical sections.
- Introduce:
    - Clear indicators per SDG
    - "Key findings" boxes per chapter

10. Key Strategic Takeaways
Strengths:

- Strong governance integration of SDGs
- High service delivery coverage
- Advanced climate and environmental positioning
- Meaningful stakeholder and global partnerships

Critical Challenges:

- Persistent inequality and dual economy
- Youth unemployment and skills mismatch
- Limited economic transformation focus
- Insufficient measurable SDG performance tracking

11. Forward-Looking Reflection
The VLR positions Stellenbosch as:

- A **globally engaged municipality**
- A **learning institution**
- A **pilot case for SDG localisation in South Africa**

But to mature, the next iteration must shift:

> from **"reporting what is happening" → to "measuring what is changing."**

Well done for your 1st draft VLR, you should be proud.

Regards

Clarissa

Subject: Draft Voluntary Local Report - Stellenbosch Municipality

Dear Nico

Herewith attached is the Municipality's draft Voluntary Local Review (VLR) Report, which served before council on 31 March 2026.

The municipality would appreciate the involvement of COGTA in reviewing the draft VLR Report. The report is currently undergoing a public participation process with external stakeholders, and your comments and feedback would be highly appreciated.

Should you not be the appropriate contact person for this matter, kindly direct us to the relevant official to whom this communication should be forwarded.

Kind Regards,

Monique Steyl

OFFICE OF THE SPEAKER

Geliewe Munisipale Bestuurder

KENNISGEWING VAN VRAAG:

Hierdie kennisgewing van vraag word ingevolge Reël 35.1 soos vervat in die Staande Reëls en Ordes vir Vergaderings van die Raad en sy Komitees, goedgekeur deur die Raad op 27 Julie 2022, ingedien.

Inwoners van Meerlust Bosboudorpie, Pniel, Johannesdal, Kylemore en omliggende plaasgemeenskappe word jaar na jaar steeds blootgestel aan herhalende en voortdurende kragonderbrekings, dikwels sonder enige verduideliking of waarskuwing. Wanneer sterk winde die kraglyne beïnvloed, word hele gemeenskappe vir ure lank in duisternis gedompel, en in sommige gevalle selfs vir twee tot drie dae op 'n slag.

Hierdie langdurige kragonderbrekings het 'n verwoestende emosionele en finansiële impak op reeds sukkelende huishoudings. Gesinne word sonder krag, geïsoleerd en sonder enige betekenisvolle kommunikasie vanaf Stellenbosch Munisipaliteit gelaat. Ouers kan nie warm maaltye vir hul kinders voorberei nie, bejaarde inwoners word kwesbaar in die koue en donker gelaat, en baie inwoners leef in vrees en frustrasie elke keer wanneer die weer verander.

Die verlies van kos weens hierdie kragonderbrekings het ondraaglik geword. Inwoners word gedwing om ontdooide vleis, groente, suiwelprodukte en ander kruideniersware waarvoor hulle hard gewerk het, weg te gooi. Vir baie families is dit in die huidige ekonomiese omstandighede eenvoudig onmoontlik om hierdie verliese te vervang. Tog word geen vergoeding of noodverligting aan geaffekteerde huishoudings gebied nie, ten spyte van die herhalende mislukkings in elektrisiteitsvoorsiening.

Daarbenewens word elektriese toestelle en huishoudelike toerusting gereeld beskadig wanneer die krag skielik afgaan of weer aanskakel met kragstuwing. Die herstel en vervanging hiervan plaas verdere finansiële druk op gemeenskappe wat dit die minste kan bekostig.

Mense se bestaansmiddele word ook ernstig ontwrig. Leerders kan nie saans studeer nie, werkers kan nie van die huis af werk nie, besighede ly verliese en strate word gevaarlik donker gelaat, wat die veiligheid van gemeenskappe in gedrang bring.

Ten spyte van talle klagtes vanaf inwoners, word bekommernisse dikwels geïgnoreer of nie betyds aangespreek nie. Gemeenskappe voel alleen en stemloos terwyl wyksraadslede voortdurend versuim om doeltreffend te kommunikeer, terugvoer te gee of daadwerklik vir dringende ingryping namens inwoners op te tree.

Die voortdurende elektrisiteitskrisis het diepe frustrasie, angs en moedeloosheid onder inwoners geskep wat betroubare basiese dienste, waardigheid, aanspreeklikheid en

Die volgende vraag verwys na die aangeleentheid:

1. **Wat is die presiese oorsake van die voortdurende elektrisiteitsonderbrekings wat regdeur die jaar in Meerlust Bosboudorpie, Pniel, Johannesdal, Kylemore en omliggende plaasgemeenskappe ervaar word?**

RAADSLID GRECHARD PETERSEN
GOOD STELLENBOSCH: POLITIEKE KOUKUS VOORSITTER

HIERDIE KENNISGEWING VAN VRAAG SAL BY DIE VOLGENDE RAADSVERGADERING GEDIEN WORD GEDATEER OP 27 MEI 2026.

TO : SPEAKER

FROM : MUNICIPAL MANAGER

DATE : 27 MAY 2026

RE : NOTICE OF QUESTION DATED 14 MAY 2026: COUNCILLOR GRECHARD PETERESEN

Dear Speaker

With reference to the question received from GOOD Councillor G Petersen, submitted in terms of Section 21 of the Rules of Order Regulating the Conduct of Council and Council Committee Meetings, received by my office on 19 May 2026.

QUESTION:

"Wat is die presiese oorsake van die voortdurende elektrisiteitsonderbrekings wat regdeur die jaar in Meerlust Bosboudorpie, Pniel, Johannesdal, Kylemore en omliggende plaasgemeenskappe ervaar word?"

RESPONSE

1. Stellenbosch Municipality Area of Supply:

1.1 The Municipality confirms that the power outages experienced in Pniel, Johannesdal, Meerlust Forestry Village, and the surrounding farms, can largely be attributed to vandalism, theft and/or damage caused by adverse weather conditions.

1.2 Residents are informed and updated on outages, as well as the estimated duration thereof, via our Let's Fix It WhatsApp service as soon as the Municipality becomes aware of any interruption.

1.3 Most of the electrical infrastructure supplying these areas consists of overhead power lines situated on the boundaries of suburbs, making them easily accessible to vandalism. In addition, the nature of the terrain makes the network particularly susceptible to the impact of adverse weather conditions, which can easily disrupt the power supply.

1.4 The Municipality is constantly apportioning more budget, since the take-over from Drakenstein Municipality, to improve the above electrical infrastructure.

1.5 Kylemore: These areas are supplied by Eskom and as soon as the Municipality becomes aware of outages it is escalated and followed up with Eskom Management for intervention or escalation. As we found, we are at the mercy of Eskom resourcing and feedback to residents for Eskom-direct customers.

1.6 Please find below the Municipal-grid projects that have been completed to effect the system improvements / upgrades and/or expansions as well as those that are currently in progress:

NO	PROJECT DESCRIPTION	FINANCIAL YEAR IMPLEMENTED	STATUS
1.	Replace old minisub (MS Riverside) with a 500kVA minisub	2020/2021	COMPLETED
2.	Install a 3-way RMU on the main road to connect with the cable to Mentoor development	2020/2021	COMPLETED
3.	Install 70mm 3C PILC between Ms Mentoor and Ms Johannesdal to close the ring	2020/2021	COMPLETED
4.	Replace Ms Johannesdal 304 with 315kVA or 500kVA Minisub	2020/2021	COMPLETED
5.	Remove Johannesdal pole mount transformer from main line	2020/2021	COMPLETED
6.	Replace LV line at Pastorie Laan with Bundle Conductor - cables were installed / repaired and trees removed that caused trips.	2020/2021	COMPLETED
7.	Install new switchgears to combine the 3 points into one to be able to utilize the total 9MVA.	2020/2021	COMPLETED
8	Build new 11kV overhead lines to combine the three feeder points.	2020/2021	COMPLETED
9.	Install new 11kV overhead line parallel to the existing line along R310 up to MS Pniel to have an alternative feeder for Pniel/Johannesdal.	2020/2021	COMPLETED
10.	Install new metering for each intake point	2020/2021	COMPLETED
11.	New installation of Johannesdal Ring Main Unit taking supply from overhead line to improve the quality and sustainability of supply.	2020/2021	COMPLETED

NO	PROJECT DESCRIPTION	FINANCIAL YEAR IMPLEMENTED	STATUS
12.	Renovated Building, upgraded oil type switchgears, replaced safeplus switchgears installed, fenced, Drakenstein Switching station that was taken over from Drakenstein Municipality (Cnr R45 and R301)– Supply cable from existing station to improve on quality and sustainability of supply.	2022/2023 - 2023/2024	COMPLETED
13.	Replaced Farm Line copper cables with aluminum cables - 4500m at Allee Blue.	2022/2023 -2023/2024	COMPLETED
14.	Replace o/h line with underground cables and install RMU at Rhodes Fruit Farm /R301.	2022//2023 -2023/2024	COMPLETED
15.	**PROJECT 1: NEW 500 kVA MINI SUBSTATION ACROSS R301** **Phase 1** – Medium Voltage works Installation of 500 kVA across R301 to enable the removal of the overhead line and installation of underground cables that will be fed from the new 500 kVA mini-substation. **Phase 2** - Medium Voltage works The installation of the remainder of medium voltage cable from Pastorie Avenue to Main Rd, Pniel **Phase 2** – Low Voltage works Construction work for the installation of the kiosks and service connections at Middel-, Pastorie- and East End Streets to remove the overhead lines and replacement with underground cables.	2024/2025	COMPLETED 2025
16.	**PROJECT 2: R301 – OVERHEAD TO UNDERGROUND NETWORK** This is the replacement of overhead lines with underground cables as well as the installation of kiosks to replace the old pole mounted transformer. All the above projects are implemented as part of the continued effort to improve the quality and sustainability of electricity supply to Pniel.	2024/2025	COMPLETION 2025

NO	PROJECT DESCRIPTION	FINANCIAL YEAR IMPLEMENTED	STATUS
17.	Combination of Riversmeet and Prison intake points.	2025 – 2026	The project is in its initial construction stage with one Ring MAIN Unit and mini – substation having been installed and cables terminated. Allocated Budget: R3 500 000. EXPECTED COMPLETION 30 JUNE 2026
18.	Construction of a new 66 kV intake substation Dwarsrivier area (in planning phase with implementation from 2026).	2024-2026	Development rights phase and contractor appointed.
19.	Prison Intake and Riversmeet intake at Alleu Blue farm to combine and close Hollandsche Mollen line at end.	2025-2026	Total cost: R1 660 937.69 (in progress – expected completion 30 June 2026)
20.	New mini-sub at Erf 1201 Johannesdal to get 11kV line to underground.	2025-2026	Total cost: R1 299 523.69 (In progress – expected completion 30 June 2026)
21.	LV Network at La Motte (Eskom supply to individual pre-paid)	2025-2026	Total Cost: R1 241 727.75: (in progress –

MUNICIPALITY - MUNISIPALITEIT
STELLENBOSCH
14 MAY 2026
@ 16:06
OFFICE OF THE SPEAKER

Geliewe Munisipale Bestuurder

KENNISGEWING VAN VRAAG:

Hierdie kennisgewing van vraag word ingevolge Reël 35.1 soos vervat in die Staande Reëls en Ordes vir Vergaderings van die Raad en sy Komitees, goedgekeur deur die Raad op 27 Julie 2022, ingedien.

Baie huishoudings en belastingbetalers ervaar steeds probleme om die berekening en fakturering van water -en elektrisiteitskoste soos weerspieël op hul maandelikse munisipale rekeninge te verstaan. Inwoners sukkel dikwels om te onderskei tussen normale elektrisiteitsrekeningkoste, voorafbetaalde elektrisiteitsaankope, waterverbruikskoste, diensfooie en ander verwante kostes wat op munisipale state verskyn.

Sien onderstaande water dienstefaktuur 1:

Service Type	Consum.	Tariff/Cost	VAT	Amount
Water: DOM Basic/Basies	1	93.38000	14.01	107.39
Water: DOM Cons - Norm	5.107	41.36000	6.20	47.56
Water: DOM Cons - Restr	7.892	74.05000	11.11	85.16
Rates Monthly RES				410.49
Refuse Removal	1	309.01000	46.35	355.36
Sewerage Levy	1	252.09000	37.81	289.90
** Total monthly:				2758.56

Sien onderstaande elektrisiteits dienstefaktuur 2:

Diens tipe	Verbruik	Tarief/Koste	BTW	Bedrag
Water: DOM Basic/Basies	1	93.38000	14.01	107.39
Water: DOM Cons - Norm	20.620	310.88000	46.63	357.51
Water: DOM Cons - Restr	2.379	19.27000	2.89	22.16
Elekt/Elect Basic/Basies	1	322.62000	48.39	371.01
Elekt/Elect Cons/Verbr	842	2725.52000	408.83	3134.35

Om verwarring, onsekerheid en moontlike waninterpretasie van munisipale nutsdienskoste te voorkom, is dit belangrik dat belastingbetalers en huishoudings 'n duidelike, deursigtige en gedetailleerde uiteensetting ontvang van alle nutsdiensverwante kostes wat op hul munisipale rekeninge weerspieël word. Inwoners het die reg om presies te verstaan waarvoor hulle betaal, hoe tariewe bereken word, en of die fakturering hul werklike verbruik en betalings korrek weerspieël.

Vrae is ook geopper oor die verskil tussen voorafbetaalde elektrisiteit wat deur inwoners aangekoop word en elektrisiteitskoste wat steeds op maandelikse munisipale rekeninge verskyn. Net so is baie inwoners onseker oor hoe waterverbruik gemeet, gefaktureer en bereken word.

Die volgende vraag verwys na die aangeleentheid:

1. **Kan die Munisipaliteit 'n volledige en gespesifiseerde uiteensetting voorsien met verwysing na bovermelde elektrisiteits- en waterverwante kostes wat op water dienstefaktuur 1 en elektrisiteits dienstefaktuur 2 (munisipale rekening) soos aangedui word?**

RAADSLID GRECHARD PETERSEN
GOOD STELLENBOSCH: POLITIEKE KOUKUS VOORSITTER

HIERDIE KENNISGEWING VAN VRAAG SAL BY DIE VOLGENDE RAADSVERGADERING GEDIEN WORD GEDATEER OP 27 MEI 2026.

APPENDIX 2

STELLENBOSCH
STELLENBOSCH • PNIEL • FRANSCHHOEK

TO	**:**	**SPEAKER**
FROM	**:**	**MUNICIPAL MANAGER**
DATE	**:**	**27 MAY 2026**
RE	**:**	**NOTICE OF QUESTION DATED 14 MAY 2026: COUNCILLOR GRECHARD PETERESEN**

Dear Speaker

With reference to the question received from GOOD Councillor G Petersen, submitted in terms of Section 21 of the Rules of Order Regulating the Conduct of Council and Council Committee Meetings, received by my office on 19 May 2026.

QUESTION:

"Kan die Munisipaliteit 'n volledige en gespesifiseerde uiteensetting voorsien met verwysing na bovermelde elektrisiteits- en waterverwante koste wat op water diensfaktuur 1 en elektrisiteits diensfaktuur 2 (munisipale rekening) soos aangedui word?"

RESPONSE

LEVYING OF SERVICES

1. Conventional Water and Electricity meters are read on a monthly basis.
2. Water consumption is measured in kilolitres (1 kilolitre =1000 litres).
3. In cases where it is impossible to read the above meters, an average of the past consumption is used to bill an account for a specific month.
4. When a real reading is taken, the account is accordingly adjusted to account for either an under or over collection.
5. These adjustments are shown on the account as a journal adjustment.

Tariffs are determined and approved by Council annually during the IDP and Budget process. These tariffs are implemented for the next financial which starts at 1 July until 30 June of the next year.

Water tariffs are approved at the normal rates for consumption, but provision is also made for water restriction tariffs in cases of droughts at increases of 10%, 20%, 30% and 40%, depending on the extend of the drought situation.

Council approved a 20% water restriction increase due to the drought situation and the level of the dam.

Water and Electricity tariffs consist out of two components, namely;

1. A Basic Charge;
2. Consumption on a sliding scale.

Although there might be no consumption for a specific month, the basic charge will still be levied on the account.

STELLENBOSCH
STELLENBOSCH • PNIEL • FRANSCHHOEK
MUNISIPALITEIT • UMASIPALA • MUNICIPALITY

INVOICE 1:

1. Property Rates is calculated on the valuation of a property.
2. Refuse removal. The 1 indicates that the property is levied monthly for one removal of refuse per week.
3. Sewerage levy (toilet) The 1 indicates that the property is levied for one toilet per month.
4. Water DOM Basic (DOM = domestic/this is the basic charge for water, and it indicates that there is only one water meter on the property and the tariff is R93.38 plus VAT of R14.01 and the total amount is R107.39 per month.
5. Water DOM Cons – Norm (this is water that is levied at the normal rate).
6. Water Dom Cons – Restr (this is water levied at the restriction tariff). This is the tariff levied with an additional restriction levy of 20% that has been implemented since 1 March 2026.

The main reason why both water levies are stated on the account, is because the reading period is from February to March. The water restriction tariff of 20% was introduced from 1 March 2026 and the consumption was therefore divided between the two periods.

The total consumption for the period in the example was 13kl. Therefore, the consumption was divided between the total number of days to determine the daily average consumption. The daily average consumption in February was calculated at the normal tariff in February. The days in March was multiplied with the daily consumption until the end of March and multiplied with the higher restriction tariff.

In this case, 5.107kl is levied at the normal tariff and 7.892kl at the water restriction tariff to ensure that the client is not disadvantaged.

Water Tariff Table: Per Kilolitre + VAT

Sliding Scale	**Kl Usage**	**Normal Tariff**	**Restriction Tariff (20% Tariff)**
1 tot 6 kl	6	R8,10	R8.10
7 to 12 kl	6	R12,26	R13.45
13 tot 20kl	8	R20.73	R27.92
21 tot 25kl	5	R36.87	R46.20
26 tot 40kl	15	R51.24	R59.27
41 tot 70kl	30	R81.87	R114.62
From 71 kl		R113.83	R235.26

The tariff consists out of two components, namely:

i. Basic Cost Component; and
ii. Sliding scale consumption tariff.

The basic cost component is payable, even though there is no consumption.

STELLENBOSCH
STELLENBOSCH • PNIEL • FRANSCHHOEK
MUNISIPALITEIT • UMASIPALA • MUNICIPALITY

Elekt/Elect Basies/Basic R322.62 + R48.39 BTW = R371.01
Elekt/Elect Cons/Vebr – thid is the real kilowatt hours that were used (Electricity is measured in terms of Kwh.)

The Electricity Sliding Scale Tariffs is as follows:

NB: Tariffs is Vat Exclusive

Sliding Scale	**Kwh**	**Tariff**
1 - 50	50	R1.91
51 – 300	250	R2.45
301 – 600	300	R3.45
From 601		R4.06

When a client changes from a conventional electricity meter to a prepaid meter, then a final reading is taken on the conventional meter, and the client is still debited with this last consumption on his/her municipal account. If there are still further electricity debits on the account after this, then the consumer must report this to our client services section at finance.

During the annual budget process meetings, a summary is given of three categories of municipal consumer accounts, to show what impact the tariff increases will have on these accounts.

Should you require any further information, please feel free to contact the Municipality.

Kind regards,

Geraldine Mettler **Date: 21 May 2026**
Municipal Manager

Geliewe Munisipale Bestuurder

KENNISGEWING VAN VRAAG:

Hierdie kennisgewing van vraag word ingevolge Reël 35.1 soos vervat in die Staande Reëls en Ordes vir Vergaderings van die Raad en sy Komitees, goedgekeur deur die Raad op 27 Julie 2022, ingedien.

Tydens die onlangse swaar reënval het verskeie huiseienaars ernstige oorstromings op hul eiendomme ervaar, wat gepaard gegaan het met die uitspoel van menslike riool. Hierdie situasie het nie net groot skade aan private eiendom veroorsaak nie, maar ook 'n ernstige stank en potensiële gesondheidsgevaar vir families en inwoners nagelaat.

Inwoners van Idasvallei het herhaaldelik klagtes aangemeld rakende die menging van stormwater en rioolstelsels, wat lei tot terugstoot van rioolwater in private wonings tydens swaar reënval. Hierdie toestand skep 'n onaanvaarbare gesondheidsrisiko en wek ernstige kommer oor die integriteit en funksionaliteit van die bestaande infrastruktuur.

Die volgende vraag verwys na die aangeleentheid:

1. **Kan die Munisipale Bestuurder asseblief verduidelik waarom die bestaande stormwater- en rioolinfrastruktuur in Idasvallei en omliggende gebiede faal en aanleiding gee tot die terugstoot van riool en afvalwater na private eiendomme tydens swaar reënval?**

RAADSLID MARIUS VAN STADE

Dear Speaker

With reference to the question received from GOOD Councillor M van Stade, submitted in terms of Section 21 of the Rules of Order Regulating the Conduct of Council and Council Committee Meetings, received by my office on 19 May 2026.

QUESTION:

"Kan die Munisipale Bestuurder asseblief verduidelik waarom die bestaande stormwater- en rioolinfrastruktuur in Idasvallei en omliggende gebiede faal en aanleiding gee tot terugstoot van riool afvalwater na private eiendomme tydens swaar reënval?"

RESPONSE

STORMWATER:

1. The downpours encountered on the 19 April 2026 and 11 May 2026, which led to instances of flooding within the municipal area, are considered extreme events due to its very high rainfall intensity. Historically roads and stormwater networks were designed for a more moderate type of rainfall and a change to a higher intensity rainfall, has led to an increase in the number of extreme weather events encountered.

2. Rainfall data of the April 2026 and May 2026 storm events had been analysed. Parts of Stellenbosch experienced severe weather conditions in April, which equated to a 1 in 20-year storm or worse. During May it was found that as much as 274 mm fell in certain areas over the duration of the storm, which equates to a 1 in 100-year storm. Both the April and May storms are considered extreme events. Furthermore, the Department of Co-operative Governance has classified the severe weather conditions, encountered in the Western Cape, as a National Disaster.

3. We confirm that these extreme rainfall events experienced in the Stellenbosch Municipal area and other parts of the Province, are highly unusual and do place additional pressures on existing (stormwater and sewer) systems and operational procedures.

4. Existing stormwater systems had been developed when rainfall patterns were more moderate in nature. The Municipality is however in process of compiling its updated Storm Water Master Plan (SWMP). The SWMP, to a large extent, takes into account the higher intensity rainfall that is being experienced and proposes improvements to the

system. The SWMP is earmarked for completion at the end of June 2026 and, following an internal review process, will be tabled to Council in the third quarter.

SEWER:

1. Within the Water & Wastewater Services Department, water is purified and clean drinking water is supplied to the public by means of water pipes. Waste/sewage is diverted from the public via sewer pipes to the sewage works where it is purified and dumped into the nearest river. Street stormwater and house rainwater are removed by stormwater pipes from streets and houses and then diverted to the nearest river.

2. In terms of the currently approved Water Services By-law, all consumers are prohibited from dumping any rainwater into the sewer pipe system, rainwater is only allowed in stormwater systems.

3. It was discovered that during the recent storm experience, the amount of sewage received at our sewage plant increased intermittently by 500%. This means that households, on a large scale, are illegally dump their rainwater into the sewer system or as observed, the public lifts a sewer manhole cover to reduce the accumulation of rainwater on their property. Both the above actions are prohibited by the By-law and upon the perception of the violation, there is a fine payable as approved by the Chief Magistrate.

4. Normally there are no problems with moderate rainfall, but during a “cloudburst” or 1 in 20-year storm event, such as those experienced recently, problems are experienced.

5. Therefore, to counter this problem, the households, who are abusing the systems, need to be tracked down. The households in the higher lying areas of Stellenbosch and the surrounding areas, in particular, were found to be causing this problem.

6. The Municipality has already started, to carry out colour smoke tests. These tests involve pumping coloured smoke inside the sewer system and then noting where smoke bubbles out of gutters or inside openings in gardens. These households will therefore be fined and ordered to confine to the system legally. It is expected that many dwellings will experience this problem.

7. Where the public lifts sewer manholes to prevent stormwater ingress, these manholes will be fitted with lockable lids to enable personnel only, with the necessary means to unlock the lid. Note that stormwater manhole covers will not be closed, to ensure that when those covers are lifted, the correct manhole is used to manage the stormwater runoff.

OFFICE OF THE SPEAKER

Geliewe Munisipale Bestuurder

KENNISGEWING VAN VRAAG:

Hierdie kennisgewing van vraag word ingevolge Reël 35.1 soos vervat in die Staande Reëls en Ordes vir Vergaderings van die Raad en sy Komitees, goedgekeur deur die Raad op 27 Julie 2022, ingedien.

Op 19 April 2026, tydens die voorseisoenale reënseisoen, het swaar reënval vanaf die Idasvallei Natuurgebied in Idasvallei daartoe gelei dat private wonings aangrensend tot die natuurgebied ernstig verspoel het, nadat munisipale stormwater-infrastruktuur nie die intensiteit van die reënval kon hanteer nie. Hierdie stormwater het groot skade aangerig aan private wonings en eiendom in Lindidaweg en Merrilhofstraat.

Tydens my oorsigbesoek aan die gebied was ek in gesprek met die Agbare Burgemeester, Raadslid Jeremy Fasser, wat ook die toneel besoek het. Gedurende ons waarneming en gesprekvoering oor die oorsake van die verwoestende vloed en gepaardgaande skade, het die Agbare Burgemeester bevestig dat ingenieurs die stormwater-infrastruktuur moet ondersoek en advies daaroor moet gee.

In voorbereiding vir die voorspelde swaar stormweer vir 10 – 11 Mei 2026, was daar vanaf 8 – 9 Mei 2026 'n graafmasjien (excavator) besig om 'n diep sloot by die Idasvallei Natuurgebied te grawe. Tydens my oorsigbesoek kon ek waarneem dat 'n baie diep sloot reeds gegrawe was en steeds in proses was, terwyl inwoners hul kommer uitgespreek het dat daar geen behoorlike uitlaat vir water bestaan nie en dat 'n moontlike modderstorting kan plaasvind indien die sloot sou breek.

Op Sondag, 10 Mei 2026, tydens die eerste swaar reënval, het die watersloot inderdaad gebars, wat weer eens tot 'n groot watervloed gelei het en beduidende skade aan private eiendom veroorsaak het. Huiseienaars het hul diepe teleurstelling uitgespreek oor die

implementering van die watersloot en het talle vrae oor die besluitneming en uitvoering daarvan geopper.

Die volgende vraag verwys na die aangeleentheid:

1. **Was daar 'n amptelike ingenieursverslag, risiko-assessering of professionele aanbeveling deur die Munisipaliteit of aangestelde ingenieurs wat die grawe van die diep watersloot as 'n waterkeerwal of stormwater-intervensie by die Idasvallei Natuurgebied aanbeveel of goedgekeur het?**

RAADSLID MARIUS VAN STADE
