	PDoI Approval	On the PDoI Business Plan. PIRR application will be submitted once Land Use Planning approval obtained.
	Council Approval	Yes
	Risks / Issues	Land not in Municipal ownership, land invasion
	Readiness Score	3
Project Suitability	**Geotech Conditions**	Suitable, location in an already built-up area
	Strategic alignment	The project falls within the approved urban edge and has been identified in the SDF as future mixed-use, community, and residential infill.
	Planning Opinion	This project has been approved and on the Business Plan of the PDoI. Although the project is located on the southern periphery of Kylemore, it can be considered as well located because of the proximity of two schools adjacent to Erf 64. The project will provide infill development on a site within the urban edge of Kylemore on well-located land and as such should be further investigated.

Stellenbosch Municipality has identified a portion of Erf 64, Kylemore (approximately 8 hectares) as a potential site for a residential housing development. Pre-feasibility studies conducted in previous years have indicated that the site is suitable for the envisaged development, a finding further supported by outcomes from community engagement processes.

The remainder of Erf 64 is located on the south-eastern edge of Kylemore village. The site is bordered by Kylemore High School to the north, agricultural land to the south and west, and undeveloped land and a stream to the east, providing a defined spatial context for future development.

The Municipality has appointed the Housing Development Agency (HDA) through an Implementation Protocol Agreement (IPA) to support and finalise the transfer of the land from the National Department of Public Works and Infrastructure (NDoPW&I) to the Municipality. The National Treasury approved the release of the property on 25 October 2021, and the Department of Public Works and Infrastructure subsequently released Erf 64 to the HDA under a Special Power of Attorney on 15 November 2021.

The HDA has reviewed existing planning work and legacy layout proposals and has appointed a service provider to undertake detailed planning and design of the preferred development option. A beneficiary committee was established through a public meeting held on 13 March 2024, followed by a formal engagement on 6 May 2024 to initiate the social compact process and address the street naming and numbering framework. A memorandum regarding street naming and numbering was submitted to the Land Use Management Section.

A Land Use Application was submitted by the HDA on 20 February 2025, with amendments in accordance with municipal planning recommendations. Internal departmental comments have been received and addressed, and the application is scheduled to be presented at the Municipal Planning Tribunal (MPT) during May 2026.

Overall, the project is progressing through key planning, legal, and administrative stages toward implementation readiness.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Implementation
2027/28	Implementation
2028/29	Implementation

6.2 Adam Tas Precinct 10, Kayamandi (also known as Northern Extension) (Ward 12)

Project Name	Adam Tas Corridor Precinct 10, Kayamandi (also known as Northern Extension)
Property Description	Various
Town	Stellenbosch
Suburb	Kayamandi
Geo-reference	33°54'55"S 18°50'08"E
Catalytic / PHDA Project	Catalytic project

Urgency (Proposed year of implementation)		2027/28
% of Total need addressed by Project		24,5 – 36,8
Housing Programme/s		IRDP / FLISP
Housing Opportunities	**Sites**	±3355 Housing Opportunities Mixed-use housing opportunities
	Serviced Sites	±580
	Top Structures (Units)	±3355 residential opportunities
	Other	±2500 less formal residential (upgrading)
Project Readiness	**Land Obtained**	Yes
	EIA ROD	No. The Basic Assessment Report (BAR) has been finalised and submitted to Department of Environmental Affairs and Development Planning (DEA&DP) for decision.
	Bulk capacity	Upgrading of bulk have commenced.
	Land Use Approval	The Land Use application will serve before the Municipal Tribunal (MPT) during April 2026.
	PDoI Approval	Yes. On the Business plan of PDoI. PIRR application will be submitted once Land Use Planning approval obtained.
	Council Approval	Yes
	Risks / Issues	Large scale land invasions. Water pressure standard reduced the proposed housing opportunities.
	Readiness Score	3
Project Suitability	**Geotech Conditions**	Mostly suitable although some steep slopes are on certain properties
	Strategic alignment	This project falls within the approved urban edge and has been identified in the SDF as future mixed-use, community, and residential infill. Portion of the property partially forms part of the ATC LSDF project. From an MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially.
	Planning Opinion	This project has already been supported through the release of planning funding as well as the funding of land acquisition of the Watergang site that was subsequently invaded. This project is seen as a viable solution to the continued formalisation of Kayamandi and will be critical to the decanting of the Kayamandi housing projects.

The Adam Tas Precinct 10 (Northern Extension) housing project is located north of Kayamandi, adjacent to Cloetesville and Welgevonden Estate, on the western side of the R304 main arterial route into Stellenbosch. The proposed development area comprises multiple land parcels, including Remainder Farm 182 Stellenbosch, Portion 1 of Farm 182, portions of the Remainder of Farm 183 (Farm 183 A, B, and C), Portion 1, Portion 5, and Portion 23 of Farm 183, as well as Portions 36 and 60 as recorded in the Surveyor-General database. Collectively, the precinct represents approximately 130 hectares of land identified for potential urban expansion.

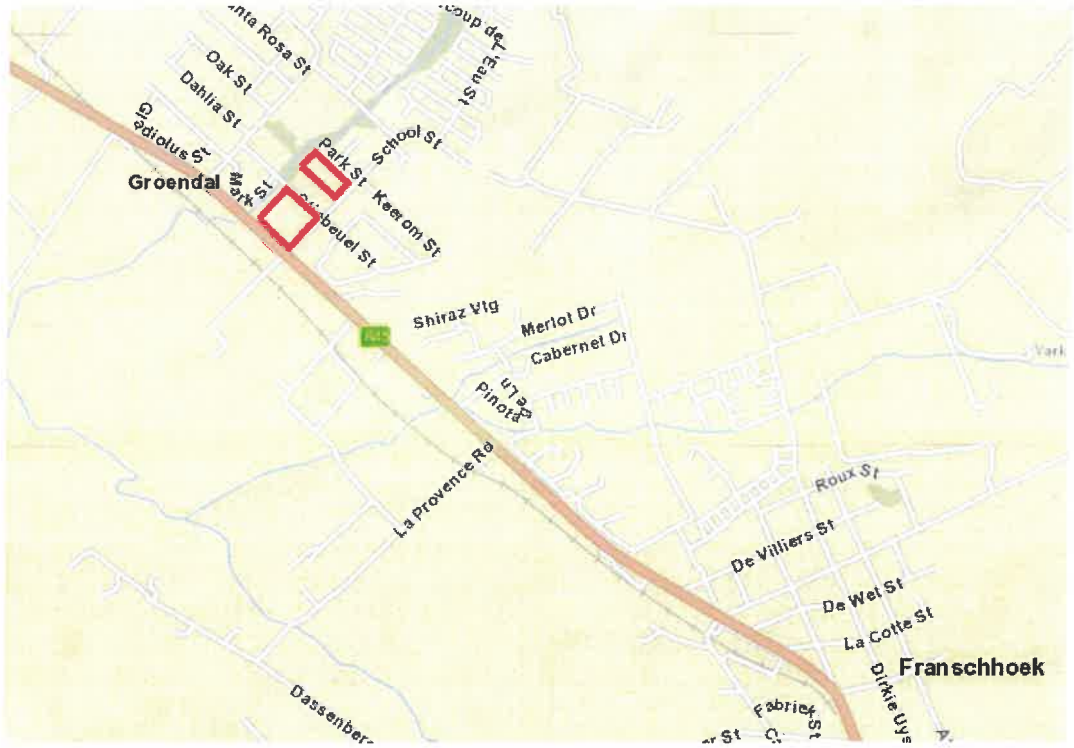
The site forms part of the strategic northern extension of the town and is closely aligned with the proposed Western Bypass, which will define the western boundary of the development area and establish the future north-western urban edge of Stellenbosch. A feasibility study has confirmed the potential to deliver approximately 3,500 to 5,000 residential opportunities, supported by associated

social amenities and public facilities. The project is intended to deliver a mixed-income housing environment, offering a range of accommodation options across different affordability segments.

The feasibility study assessed the development potential from engineering, planning, and environmental perspectives and identified suitable developable portions within the broader study area. Subsequent planning processes will require the rezoning of agricultural land to appropriate urban and mixed-use zonings in terms of the Stellenbosch Municipality Zoning Scheme By-Law, to enable the proposed densities and land use mix.

Stellenbosch Municipality appointed a multidisciplinary team through a service provider to undertake due diligence assessments and to develop a Broad Conceptual Urban Design Framework for the precinct, including the progression of town planning and development rights. The project is targeted to obtain development rights within the 2025/26 financial year.

A Market Analysis Study conducted by the Western Cape Department of Environmental Affairs and Development Planning (DEA&DP) in May 2022 informed the conceptual design process. Design options were further refined through workshops with internal municipal departments, including Spatial Planning and Infrastructure Services, as well as senior management inputs. Comments received from Heritage Western Cape in September 2022 necessitated additional specialist studies, including an Archaeological Impact Assessment and a Visual Impact Assessment, which were subsequently incorporated into revised layouts.



The formal land use application was submitted on 1 December 2023, followed by a public participation process concluding on 25 February 2024. The application underwent multiple iterations in response to internal and external departmental comments, including infrastructure requirements such as reservoir planning. The updated Development Plan and Proposed Subdivisional Layout were submitted on 11 December 2024. Negotiations are ongoing to secure access servitudes over privately owned land.

The Land Use Application was approved by the Municipal Planning Tribunal (MPT) on 24 April 2026, marking a key milestone toward implementation of this strategically significant mixed-use and mixed-income urban expansion project. An appeal process of 21 days will be followed once the approval letter has been issued by the MPT decision.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Implementation
2027/28	Implementation
2028/29	Implementation

6.3 Erven 412, 217 and 284 Groendal, Franschhoek (Ward 2)

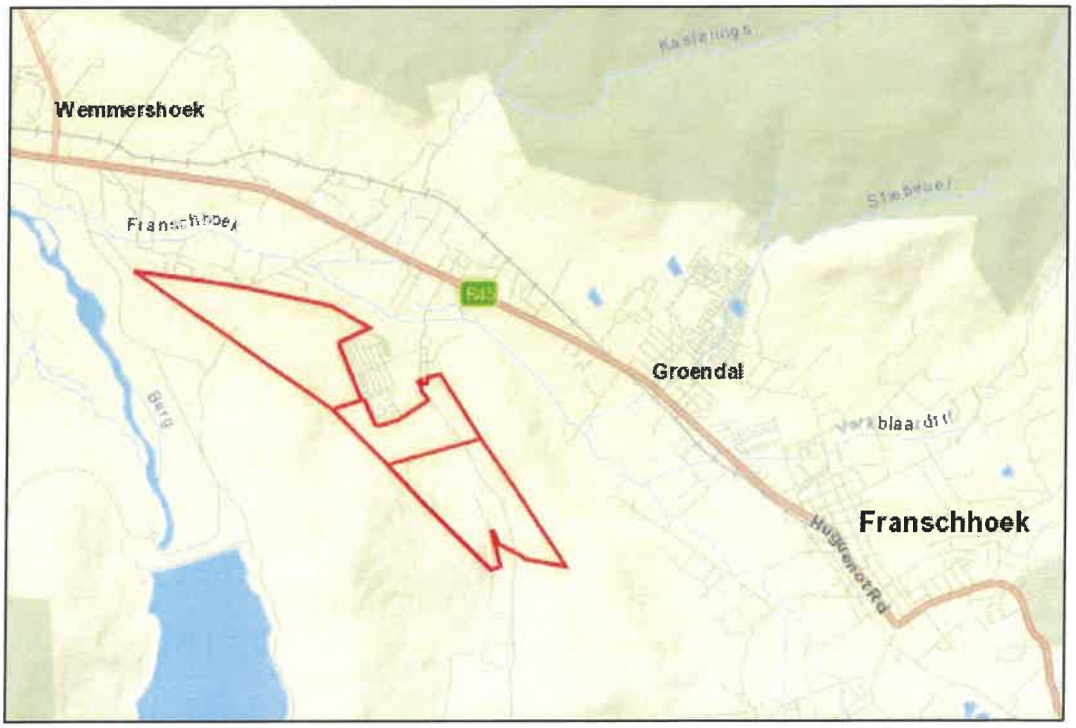
Project Name		Erven 412, 217 and 284, Groendal
Property Description		Erven 412, 217 and 284, Groendal
Town		Franschhoek
Suburb		Groendal
Geo-reference		33°53'47"S 19°06'06"E and 33°53'43"S 19°06'11"E
Catalytic / PHDA Project		N/A
Urgency (Proposed year of implementation)		TBD
% of Total need addressed by Project		0,9 – 1,2
Housing Programme/s		IRDP / FHF (formally known as FLISP)
Housing Opportunities	**Sites**	Earmark for business and residential opportunities
	Serviced Sites	TBD
	Top Structures (Units)	TBD
	Other	0
Project Readiness	**Land Obtained**	Yes
	EIA ROD	No
	Bulk capacity	TBD
	Land Use Approval	No
	PDoI Approval	No
	Council Approval	Yes
	Risks / Issues	TBD
	Readiness Score	2
Project Suitability	**Geotech Conditions**	Suitable, located in an already built-up area
	Strategic alignment	This project falls within the approved urban edge and has been identified in the SDF as strategic sites, projects, and/or infill opportunities of the MSDF. From an MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially.
	Planning Opinion	Various studies have been undertaken over the years regarding the development of Erf 412. Most of the studies included extensive public participation processes. The result of these studies is that the property should be developed for business opportunities.

Erven 412, 217 and 284, Groendal are located along Santa Rosa Street in Groendal, Franschhoek, adjacent to the R45. The site is situated within a predominantly medium- to high-density urban environment, characterised by a mix of residential, non-residential, and light industrial land uses.

Over time, several studies have been undertaken in relation to the development potential of Erf 412, incorporating extensive public participation processes. The outcomes of these studies supported the development of high-density residential units, complemented by opportunities for business and light industrial uses. Erf 412 was subsequently rezoned in 2016 to a subdivisional area, permitting general residential, local authority, and general business land uses.

Initial proposals for Erf 284 considered the development of an old age home or retirement village; however, this did not materialise due to financial constraints. The Section: Property Management and Section: Housing Development subsequently initiated a process to develop a Call for Proposals in alignment with the approved municipal mandate. A service provider was appointed to develop alternative site development concepts.

An agenda item was prepared and circulated for departmental input, with additional layout inputs received from the Directorate: Infrastructure Services. The matter was subsequently considered by the Section 80 Human Settlements Committee in May 2022. Further engagements with senior officials concluded in November 2022, during which an enquiry relating to Erf 284 was raised and referred to the Provincial Department of Infrastructure (PDoI) for input.



A professional service provider was appointed to prepare three conceptual site development options for Erven 214 and 217, with an emphasis on business-oriented development. The proposed land use framework allows for low-intensity commercial activities compatible with surrounding residential uses, including offices, retail outlets, markets, food franchises, medical consulting rooms, and clinics, in accordance with the Stellenbosch Municipal Zoning By-law.

The development concept prioritises compatibility with surrounding land uses and considers site-specific constraints such as visual impact, building height, traffic implications, and bulk service capacity. The proposal was approved by Council on 30 October 2024.

Subsequently, the Section: Property Management was instructed to appoint a professional valuer to determine the market value of Erven 412, 217, and 284 based on size and development potential. Upon completion of the valuation process, the Section: Housing Development will be in a position to go out on a Call for Proposals to appoint an implementing agent for the development of the sites.

Timeframes	Project Deliverables
2026/27	Procurement process to appoint an Implementing Agent and to obtain development rights
2027/28	Implementation
2028/29	Implementation

6.4 La Motte: Farm 1339, Farm 1158 and Farm 1158/1 Paarl (Ward 2)

Project Name		La Motte Old Forest Station IRDP
Property Description		Farm 1339, Farm 1158 and Farm 1158/1 Paarl
Town		Franschhoek
Suburb		La Motte
Geo-reference		33°53'54"S 19°04'19"E (Farm 1339) 33°53'56"S 19°04'36"E (Farm 1158) 33°54'05"S 19°04'45"E (Farm 1158/1)
Catalytic / PHDA Project		No
Urgency (Proposed year of implementation)		TBD
% of Total need addressed by Project		6,8
Housing Programme/s		IRDP / FLISP
Housing Opportunities	**Sites**	±1000 residential opportunities
	Serviced Sites	TBD
	Top Structures (Units)	TBD
	Other	0
Project Readiness	**Land Obtained**	No (Awaiting State Land Release for the subject property from NDoPW&I)
	EIA ROD	No
	Bulk capacity	TBD
	Land Use Approval	No
	PDoI Approval	Yes. Approved on the Business Plan
	Council Approval	Yes. To conduct pre-feasibility studies
	Risks / Issues	Land not in municipal ownership
	Readiness Score	2

Project Suitability	**Geotech Conditions**	Suitable, located in an already built-up area
	Strategic alignment	Amended MSDF 2023 - The proposed housing development layout options falls within the urban edge of La Motte (Page 87), and the project is listed on Page 200. IDP 2022-2027- Project is listed as a current municipal project on Page 245. The Project is not included in the Stellenbosch PHSHDA.
	Planning Opinion	This project has received support from the Provincial Department of Infrastructure (PDoI), including the release of Tranche 1.1 funding, and forms part of Stellenbosch Municipality's broader strategy to address housing pressures associated with the Langrug informal settlement. The development is intended to facilitate the phased relocation (decanting) of qualifying beneficiaries from Langrug to the Groendal site, thereby contributing to improved living conditions and the formalisation of housing opportunities. The project is aligned with municipal objectives to provide structured human settlements and improve access to adequate housing. However, careful attention is required regarding the social and community dynamics associated with introducing a relocated population into an established rural settlement. Effective stakeholder engagement, social facilitation, and integration planning will be critical to ensure community cohesion and the long-term sustainability of the development.

La Motte is a former Bosbou hamlet located approximately 3.5 km north-west of Franschhoek along Robertsvallei Road, near its intersection with the R45. The settlement was originally established to accommodate forestry workers and consists of existing residential units and supporting community facilities. During the construction of the Berg River Water Scheme, additional housing was developed adjacent to the original settlement to accommodate construction personnel, with these units subsequently transferred to identified beneficiaries.

The proposed expansion area includes Portions of Farm 1653, Remainder Farm 1339, Remainder Farm 1158, and Portion 1 of Farm 1158, situated within the Paarl district. These properties have been identified for mixed-use housing development to support the spatial expansion and integration of La Motte.

Feasibility studies and various development scenarios have been completed, indicating that the identified land parcels have sufficient capacity to support an integrated housing development. The findings confirm the suitability of the area for structured residential expansion, subject to further planning and implementation processes.

The properties are owned by the National Department of Public Works and Infrastructure (NDoPW&I). Engagements with the national authority have been initiated to facilitate the transfer of the land to Stellenbosch Municipality for housing development purposes. In 2021, the Municipality entered into an Implementation Protocol Agreement (IPA) with the Housing Development Agency (HDA) to support and facilitate the land transfer process.

The HDA has been mandated to coordinate the State Land Release process and has submitted a renewed request for release of the identified properties. The NDoPW&I is in the process of issuing the necessary Power of Attorney (PoA) to enable the commencement of specialist studies required for development readiness.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	State Land Release process
2027/28	Planning
2028/29	Planning approval

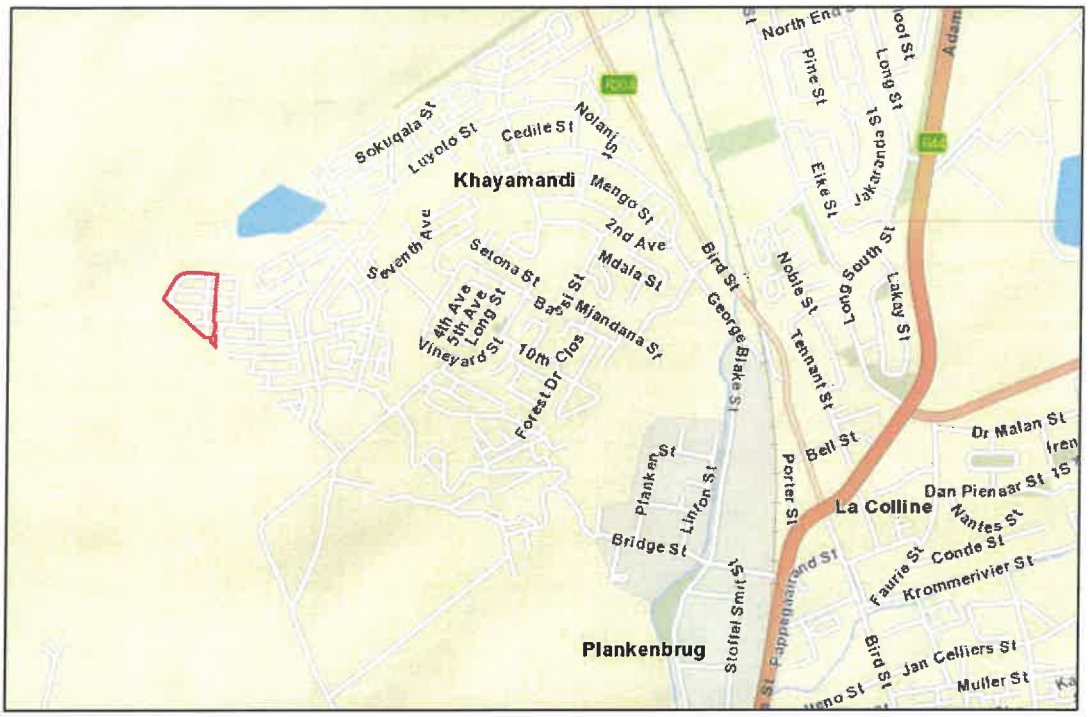
6.5 Droë Dyke: Portion 35 of Farm 183 and Portion 8 of Farm 283 Vreedenburg (Ward 20)

Project Name		Droë Dyke (1000)
Property Description		Portion 35 of Farm No. 183, Stellenbosch RD (2.4124 ha) Portion 8 of the Farm Vreedenburg No. 283, Stellenbosch RD (13.2302 ha)
Town		Stellenbosch
Suburb		Stellenbosch
Geo-reference		33°56'42"S 18°49'53"E (Farm 185/35) 33°56'51"S 18°49'44"E (Farm 283/8)
Catalytic / PHDA Project		PHDA
Urgency (Proposed year of implementation)		TBD
% of Total need addressed by Project		6,1
Housing Programme/s		IRDP, FLISP, Social Housing
Housing Opportunities	**Sites**	TBD
	Serviced Sites	TBD
	Top Structure (serviced)	TBD
	Other	0
Project Readiness	**Land Obtained**	No (Awaits State Land Release for the subject property to the NDoPW&I)
	EIA ROD	No
	Bulk capacity	No (Upgrades planned and being implemented)
	Land Use Approval	No
	PDoI Approval	Due to the unresolved status of the land transfer process, the Municipality has proposed that the project be deferred to the outer years of the Provincial Department's Business Plan to better align implementation timelines with land availability and administrative approvals. The Department has indicated its continued support and, communicated its willingness to assist the Municipality in facilitating the land transfer process. This includes supporting engagements with the relevant national authority to help resolve outstanding requirements and advance the application toward an outcome. It is proposed that the Tranche 1.1 funding be moved to the 2026/27 FY.
	Council Approval	Yes (Part of the Adam Tas Corridor Precinct)
	Risks / Issues	Scale, dependence on Adam Tas TOD Project
	Readiness Score	1

Project Suitability	**Geotech Conditions**	TBD
	Strategic alignment	Amended MSDF 2023 - Project falls within Urban Edge. From an MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially.
	Planning Opinion	This project was previously presented to the Dept. of Infrastructure in 2013 and was in principle supported. The project did not proceed from the pre-planning stage because the land could not be transferred from the National Department of Transport and Public Works & Infrastructure (NDoPW&I). A letter was received from NDoPW&I on 6 February 2024 whereby the Deputy Director-General: Real Estate Management Services indicated that the application to transfer Portion of Remainder Farm 279; Portion 1 of Farm 284; Remainder Farm 284; Portion 17 of the Farm 183; Remainder Portion 35 of the Farm 183; Portion 8 of Farm 283; Remainder Farm 283; Farm 281 are not approved by the said department. The initial request from the Municipality amounted to different farm portions which estimated an area of 89,75 ha in extent. The entire area site is not required by the Municipality, as the mix used development only requires approximately 15ha of the land as identified. Therefore, a further application was submitted to NDoPW&I during March 2024 explicitly requesting land parcels as identified in property description above.

In terms of the Stellenbosch Municipal Spatial Development Framework, Droë Dyke is identified as a key component of the Adam Tas Corridor Catalytic Initiative, which aims to support the spatial restructuring of Stellenbosch Town. The precinct comprises Portion 35 of Farm 183, Stellenbosch RD (2.4124 ha), and Portion 8 of Farm Vreedenburg No. 283, Stellenbosch RD (13.2302 ha), collectively forming an area of approximately 15.6426 hectares.

Droë Dyke forms part of the broader residential component within the Adam Tas Corridor redevelopment framework and is earmarked for medium- to high-density residential development, complemented by commercial uses and public facilities. The precinct plan provides the spatial framework for urban form, land use distribution, movement routes, and development structuring, with an overall developable area of approximately 15 hectares.



The site is strategically positioned within a designated restructuring zone, making it suitable for social housing delivery. It presents a significant opportunity to contribute towards addressing the housing demand within Stellenbosch Municipality, while supporting integrated urban development objectives. The precinct is also considered appropriate for a mixed-income housing model, accommodating social housing, affordable housing, and open market residential opportunities.

Overall, Droë Dyke represents a high-priority catalytic site with strong alignment to municipal spatial restructuring objectives and housing delivery targets.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Obtain PoA from NDoPW&I.
2027/28	-
2028/29	-

6.6 Watergang Phase 2C – Erf 3603, Kayamandi (Ward 14)

Project Name		Watergang Phase 2C
Property Description		Erf 3603, Kayamandi
Town		Stellenbosch
Suburb		Kayamandi
Geo-reference		33°55'10"S 18°50'13"E
Catalytic / PHDA Project		PHDA
Urgency (Proposed year of implementation)		2025/2026
% of Total need addressed by Project		0,5
Housing Programme/s		UISP

	Serviced Sites	TBD
	Top Structures (Units)	TBD
	Other	0
Project Readiness	**Land Obtained**	Yes
	EIA ROD	Yes
	Bulk capacity	Yes
	Land Use Approval	Yes
	PDoI Approval	Yes
	Council Approval	Yes
	Risks / Issues	Land invasion and vandalism to infrastructure services.
	Readiness Score	Current
Project Suitability	**Geotech Conditions**	Suitable
	Strategic alignment	N/A
	Planning Opinion	Service provider appointed for extension of subdivision approval process and registration of the General Plan at the Deeds office.

Erf 3603, Kayamandi, has been subdivided and the General Plan approved by the Surveyor-General. In February 2024, the Section: Informal Settlements appointed a service provider to assess site conditions and evaluate the extent of damages across the property.

The final assessment report indicated that the cost of rehabilitating the site to make it fully habitable is extremely high, primarily due to the extent of civil engineering interventions required, including significant retaining wall construction. Notwithstanding these constraints, the site has the potential to yield approximately 86 residential opportunities and was serviced by the Section: Project Management Unit (PMU) in February 2026.

The development of Erf 3603 is directly linked to the upgrading of the Zone O informal settlement. The project is intended to facilitate the relocation of approximately 60 residents who do not qualify for government subsidy programmes. It has been resolved that these residents will be temporarily relocated to Erf 3603 to enable the phased implementation of the Zone O upgrading project.

The Zone O upgrading project is planned to commence with the construction of top structures during the 2026/2027 financial year. However, implementation has been delayed due to challenges including resistance from some residents to relocation, as well as the cancellation of the initial tender due to high bid prices exceeding available funding allocations.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Construction of ABT/ wendies
2027/28	
2028/29	

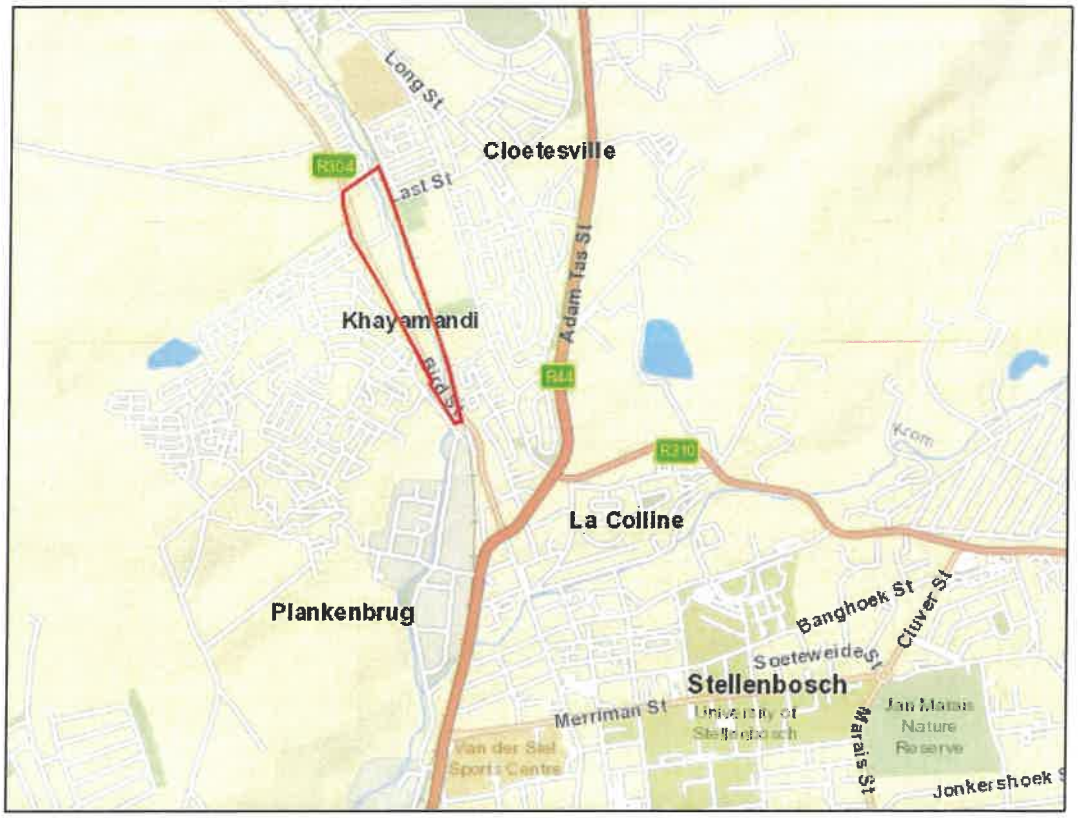
7. SOCIAL HOUSING

It is the intention of the Stellenbosch Municipality to give effect to the Social Housing Programme by making available land portions in the Restructuring Zones to Social Housing Institutions (SHI) and/or Other Development Agencies (ODA) who then will undertake all the necessary processes for the development of Social Housing Estates and the effective management of new rental stock. It is imperative that such SHI's and ODA's are duly accredited by the SHRA.

Social Housing is not a method for mass delivery, but a way to pursue integrated and sustainable urban development. Restructuring Zones were identified based on their proximity to social and economic amenities and their potential to promote integration, access to economic opportunities and spatial restructuring.

Social Housing currently caters for people earning between R1 850 – R22 000 per month. It is desirable that environments created through this process should conform to health and safety principles, be liveable, vibrant, with the requisite amenities and facilities that provide a better quality of life for tenants. The proposed Social Housing Estate should optimise the utilisation of the land portions through innovative approaches in the development of a medium to high density residential estate.

Stellenbosch Municipality's Social Housing Programme aims to affect the provision of affordable, well-located housing opportunities to low and moderate-income households. It is implemented within the framework of the National Social Housing policy, legislation, and regulations. The Municipality is on a drive to accelerate the pace and scale of housing delivery, maximising social housing opportunities, and promoting socio, spatial and economic integration of people into its urban fabric.



This transformative aim will be fulfilled by the Municipality's continued effort to identify well located municipal owned parcels of land for infill development of Social Housing with a precinct development approach. The key purpose is the creation of socially integrated neighbourhoods providing housing for low-middle income households into areas that they would normally be excluded from due to past legacies and the prevailing property markets.

It is crucial that the Social Housing projects complement the social functionality of the neighbourhood with inclusion of other minimum ancillary and complementary uses in the development driven by the integrated development principles. Social integration should be achieved by having an urban design approach that integrates the development with the existing surroundings. The creation of an enhanced public realm with quality environments should be promoted by designing active and passive green open space systems that link the proposed site with public facilities and amenities through safe pedestrian orientated public open space systems. Proposed layouts should consider barrier free access for physically disabled people and cater to people with special needs.

The urban design concept for such sites should be based on a socially integrated development with a holistic and reasonable neighbourhood level planning approach that unfolds though the site plan. It should show some level of conformity with the character of the existing urban environment and some innovation that fosters a sense of place. The site plan must demonstrate an appropriate medium-high density approach by building height and compact site plan with minimum parking. In addition, the site plan design for the public realm, common spaces and landscaping must facilitate social integration with existing neighbourhoods.

Sites situated in approved and gazetted Restructuring Zones are eligible for social housing grants. Application for the social housing grants will be the responsibility of the SHI/ ODA.

7.1 Cloetesdal Social Housing (Farms 81/2 and 81/9, Stellenbosch) (Ward 16)

Project Name		Farms 81/2 and 81/9
Property Description		Farms 81/2 and 81/9
Town		Stellenbosch
Suburb		Cloetesville
Geo-reference		33°54'52"S 18°51'01"E (Farm 81/2) 33°55'00"S 18°51'04"E (Farm 81/9)
Catalytic / PHDA Project		PHDA
Urgency (Proposed year of implementation)		2025/2026
% of Total need addressed by Project		1,5 – 2,1
Housing Programme/s		Social Housing
Housing Opportunities	**Sites**	0
	Serviced Sites	0
	Top Structures (Units)	0
	Other	± 813 rental units
Project Readiness	**Land Obtained**	Yes
	EIA ROD	No
	Bulk capacity	Bulk upgrades required
	Land Use Approval	The Land Use application will serve before the Municipal Tribunal (MPT) during April 2026.
	PDoI Approval	No. Await ROD
	Council Approval	Yes (SHI appointed to develop and manage the site. The Land Availability Agreement (LAA) was signed on 23 June 2025.)
	Risks / Issues	Various site constraints; significance as gateway. Often used for dumping building material on site.
	Readiness Score	2
Project Suitability	**Geotech Conditions**	The property is regarded as suitability for residential development. The factors that reduce the suitability of the land for development are the extent of uncontrolled fill, the existing topography and soil corrosivity.
	Strategic alignment	This project falls within the approved urban edge. From an MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially.
	Planning Opinion	TBD

In support of the Social Housing Programme, Stellenbosch Municipality has identified Portions 2 and 9 of Farm 81, Stellenbosch, as a strategic site for the delivery of social housing. The property is located between the Cloetesville and Kayamandi settlements, bounded by the R304 to the west and the railway line to the east. The Plankenburg River traverses the eastern portion of the site. The southern boundary incorporates sections of the Kayamandi Tourism Centre and a railway bridge, while the northern boundary adjoins the Mount Simon residential development.

A feasibility study completed in January 2020 confirmed the development potential of the site, and Council approved the findings on 12 February 2020 for the development of social housing rental stock. Subsequent planning investigations undertaken in March 2021 included geotechnical studies, Floodline Assessments, and a Traffic Impact Assessment, all of which have since been updated to reflect current site conditions.

The geotechnical assessment confirmed that the site is generally suitable for residential development, although constraints such as areas of uncontrolled fill, challenging topography, and soil corrosivity will require appropriate mitigation during detailed design and construction phases.
Following procurement processes, a service provider, Crowie Property Solutions, was appointed in February 2024 to advance the project. A Draft Land Availability Agreement (LAA) was submitted to Council on 14 November 2024 to formalise arrangements with the developer, and the LAA was subsequently signed on 23 June 2025.

A further service provider has been appointed to secure the necessary development rights for the site. The Land Use Application was approved by the Municipal Planning Tribunal (MPT) on 24 April 2026. An appeal process of 21 days will be followed once the approval letter has been issued by the MPT decision. Thereafter, a Draft Project Agreement is expected to be finalised by the end of July 2026, marking a key milestone toward implementation of the social housing development.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2025/26	Obtain development rights
2026/27	Implementation
2027/28	Implementation

7.2 Lapland Precinct (Ward 10)

Project Name		Lapland Precinct
Property Description		Erven 2149, 6590, 2608, 2609, 6659, 9106 Stellenbosch

	Land Use Approval	No
	PDOI Approval	No
	Council Approval	Yes
	Risks / Issues	Relocation of prison; construction above existing units
	Readiness Score	0

Project Suitability	**Geotech Conditions**	TBC
	Strategic alignment	This project is located within the approved urban edge and has been identified for infill development. From an MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially.
	Planning Opinion	TBD

The Lapland Precinct comprises Erven 2149, 6590, 2608, 2609, 6659 and 9106, Stellenbosch. The precinct is strategically located on the northern outskirts of the Stellenbosch CBD and is well connected via the R44 and Helshoogte Roads, providing strong access to surrounding commercial, residential, and economic nodes. The area is bordered by Kromrivier and Teen-die-Bult to the north, the Plankenberg River to the west, the Stellenbosch CBD to the south, and Die Rand to the east.

The precinct includes a mix of municipal and state-owned properties and currently accommodates key public and institutional uses, including the Stellenbosch Traffic Department, the Department of Home Affairs, Correctional Services facilities, and three existing high-rise municipal rental blocks (Lavanda, Aurora, and Phyllaria), collectively providing approximately 220 rental units. Preliminary structural assessments indicate that the existing buildings are generally sound, with certain upgrades having been undertaken.

In line with densification principles and findings of the Status Quo Study, the precinct has been identified for significant urban intensification and mixed-use redevelopment. Proposed development concepts include the conversion of two existing high-rise buildings into mixed-use eight-storey towers incorporating ground-floor government services, retail, and office space. The upper floors are proposed for a combination of social housing (one- and two-bedroom units across five floors) and market-oriented rental housing on the top floors. The proposal includes widened pedestrian infrastructure, structured public realm improvements, and provision for informal trading. A residential density of approximately 320 dwelling units per hectare is envisaged.

A further component of the proposal includes the potential relocation of the existing correctional services facility to an alternative site to be identified by Stellenbosch Municipality in consultation with the Department of Correctional Services. This would enable additional redevelopment opportunities, including market-oriented rental housing and ground-floor commercial uses, with a projected density of approximately 616 dwelling units per hectare.

The precinct also provides opportunities for infill development on vacant land between existing structures, enabling further densification and spatial optimisation in line with Social Housing Regulatory Authority (SHRA) design standards. The long-term development vision is to consolidate the precinct as a dedicated social housing and mixed-income residential environment, including supporting social infrastructure such as a crèche.

To enable implementation, the Municipality intends to follow a procurement process to appoint accredited Social Housing Institutions (SHIs) and/or Other Development Agencies (ODAs) to undertake development of the precinct.

In support of project preparation, three professional service providers were appointed in April 2023 to undertake key technical studies, including:

- A structural integrity and maintenance assessment of the existing rental stock (Erf 2149);
- A geotechnical investigation assessing the feasibility of high-density residential development (8-storey walk-ups) on the site; and
- A traffic impact assessment evaluating the proposed development's impact on the surrounding road network, including access, public transport integration, and non-motorised transport considerations.

These studies collectively inform the precinct's redevelopment potential as a high-density, mixed-use, and strategically significant urban housing node.
It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Follow a procurement process to appoint a Service Provider
2026/27	-
2027/28	

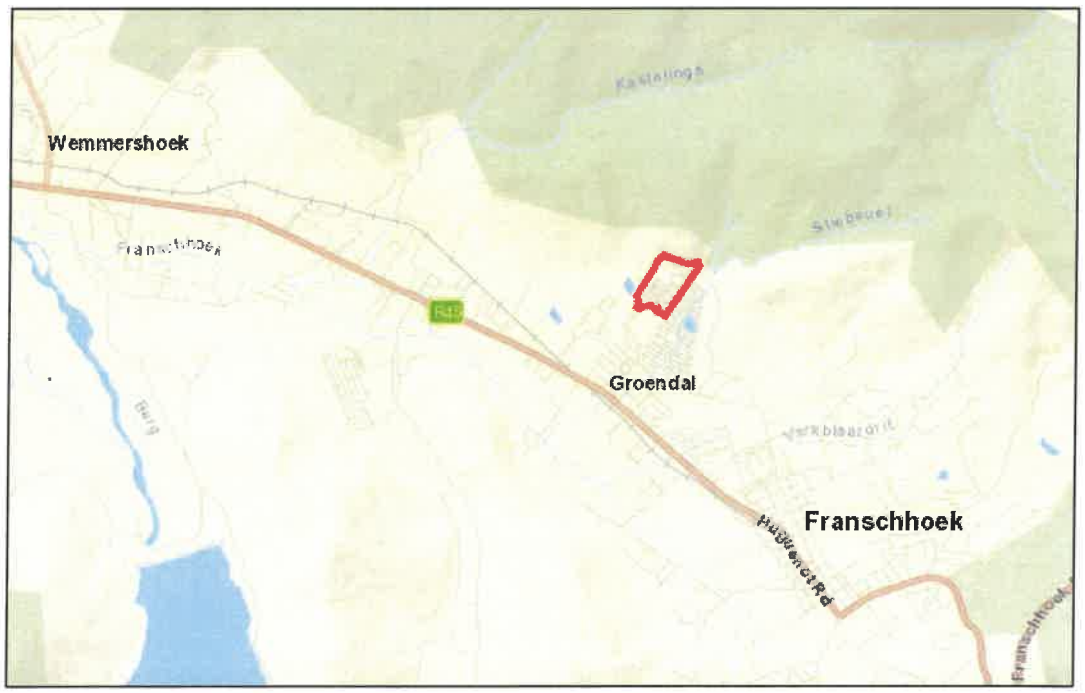
7.3 La Colline (Ward 10)

Project Name		La Colline Precinct
Property Description		Erven 2644, 2645, 2660, 2661, 2666, 2667, 2683, 2684, 2727 and 2729 Stellenbosch
Town		Stellenbosch
Suburb		La Colline
Geo-reference		33°55'23"S 18°51'35"E (Erven 2644 and 2645) 33°55'23"S 18°51'38"E (Erven 2666 and 2667) 33°55'26"S 18°51'36"E (Erven 2660 and 2661) 33°55'26"S 18°51'38"E (Erven 2683 and 2684) 33°55'24"S 18°51'45"E (Erf 2729)
Catalytic / PHDA Project		PHDA
Urgency (Proposed year of implementation)		TBD
% of Total need addressed by Project		TBD
Housing Programme/s		Social Housing
Housing Opportunities	**Sites**	TBD
	Serviced Sites	TBD
	Top Structures (Units)	TBD
	Other	TBD
Project Readiness	**Land Obtained**	properties owned by the Municipality and the Department of Local Government and Housing
	EIA ROD	No
	Bulk capacity	TBD
	Land Use Approval	No
	PDoI Approval	No
	Council Approval	No
	Risks / Issues	TBD
	Readiness Score	0
Project Suitability	**Geotech Conditions**	TBD
	Strategic alignment	This project falls within the approved urban edge. The two public open spaces are important to be retained and upgraded. There are densification opportunities available. From an MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially. Once the project reaches the planning phase, it needs to be considered within the capital planning process/CEF.
	Planning Opinion	TBD

The La Colline Precinct comprises Erven 2644, 2645, 2660, 2661, 2666, 2667, 2683, 2684, 2727 (General Residential), and 2729 (Public Open Space), Stellenbosch. The precinct is strategically located just north of the Teen-die-Bult and Lapland precincts and is well connected via Helshoogte Road to the east, Ryneveld Street to the south, and the R44 to the north.

The precinct consists of existing residential properties arranged around two public open spaces, namely Tobruk Park (forming part of the precinct erven) and La Colline Park. The residential stock comprises low-rise duplex flats, which are generally structurally sound, with only minor cosmetic repairs required. The properties are owned jointly by the Department of Local Government and Housing and Stellenbosch Municipality.

From a spatial planning perspective, it is proposed that the existing residential component be retained in its current form, serving as a stabilising residential asset within the broader precinct restructuring strategy. In this regard, the La Colline Precinct is envisaged as a compensatory or "trade-off" area, supporting density maximisation initiatives within the adjacent Teen-die-Bult redevelopment area.



The public open spaces within the precinct are proposed to be enhanced and formalised as active recreational spaces to promote community use, safety, and social cohesion. This approach supports broader urban regeneration objectives by integrating residential stability with improved public realm investment and reinforcing the precinct's role within the wider densification framework of the area.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2025/26	-
2026/27	-
2027/28	-

8. FORMALISING AND UPGRADING OF INFORMAL SETTLEMENTS AND EXISTING SETTLEMENTS

8.1 Langrug Dam, Franschhoek (Planning P1) (Ward 1 and 2)

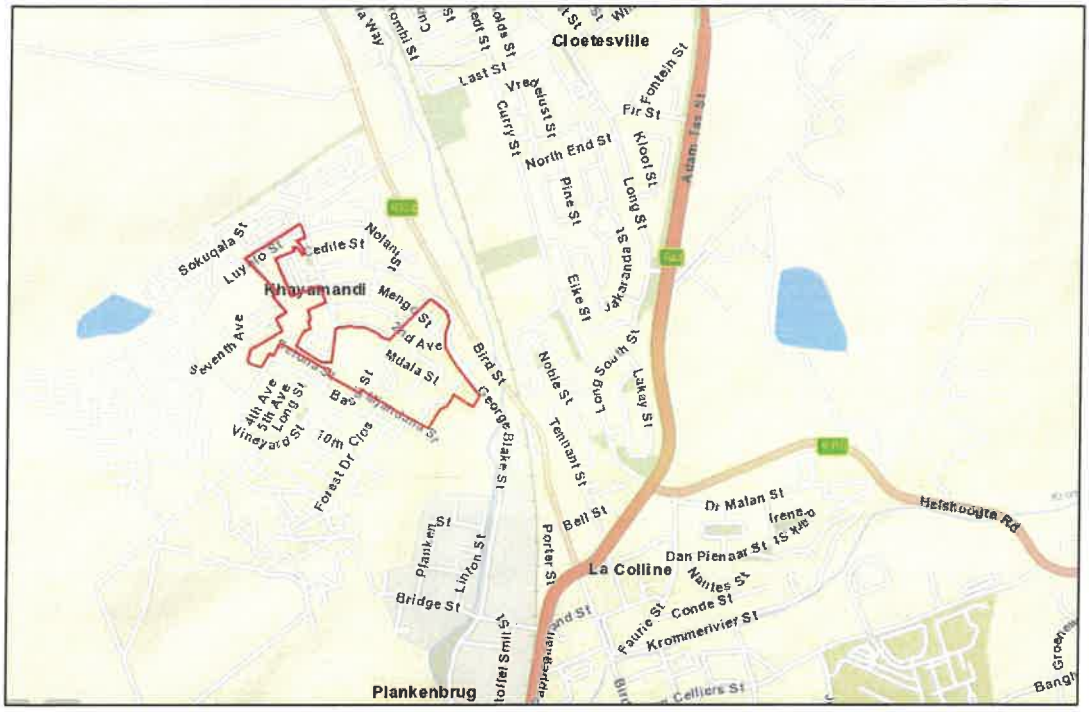
Project Name		3256 Franschhoek Langrug (1900) UISP
Property Description		Erven 959 – 1120 and Erf 2901
Town		Franschhoek
Suburb		Langrug
Geo-reference		33°53'09"S 19°06'23"E
Catalytic / PHDA Project		No
Urgency (Proposed year of implementation)		2025/26 – Rehabilitation of freshwater dam and fencing
% of Total need addressed by Project		TBD
Housing Programme/s		UISP
Housing Opportunities	**Sites**	0
	Serviced Sites	250-300
	Top Structures (Units)	0
	Other	0
Project Readiness	**Land Obtained**	Yes
	EIA ROD	No
	Bulk capacity	TBD
	Land Use Approval	No
	PDoI Approval	Yes (PID)
	Council Approval	Yes
	Risks / Issues	Land invasion
	Readiness Score	3

Project Suitability	**Geotech Conditions**	Suitable, location in an already built-up area, although structures are being constructed on steep mountain slopes.
	Strategic alignment	Amended MSDF 2023 - Project does fall within the approved Urban Edge of Franschhoek (page 77), and the project is listed on page 200. MHSP 2020 - Project is included in the proposed Housing Pipeline noted on page 131. IDP 2022-2027 - Project is listed as a current municipal project on page 245. PHSHDA - The Project is not included in the Stellenbosch PHSHDA.
	Planning Opinion	This project has been supported by the PDoI with the release of Tranche 1.1 and is a critical priority for the PDoI. Addressing the Langrug informal settlement must be a major priority for both local and provincial government.

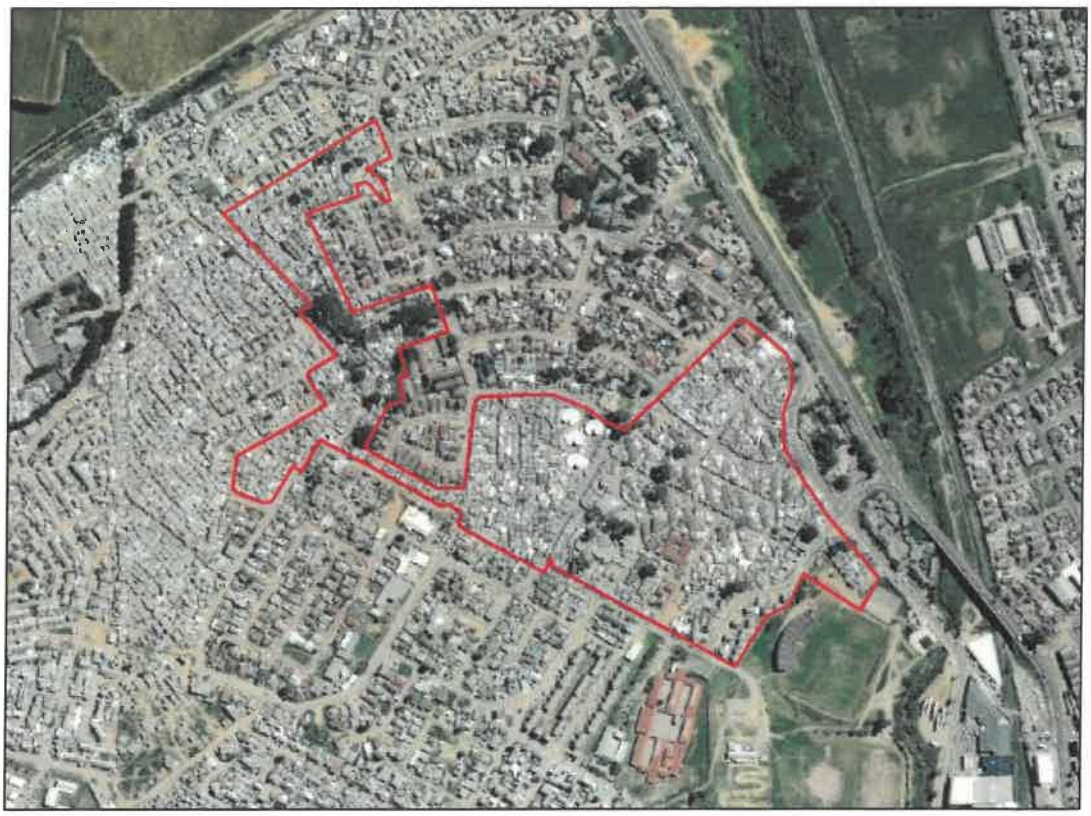
Langrug informal settlement, located in the north-eastern area of Franschhoek, falls within the jurisdiction of Stellenbosch Municipality and is bordered by Groendal formal housing to the south, Mooiwater to the east, and a nature reserve along the mountainous slopes to the north. The settlement continues to face significant socio-economic and infrastructure challenges, including limited access to basic services, environmental health risks, and increasing pressure from population growth and informal expansion.

In response, the Municipality has adopted an incremental upgrading approach aimed at improving living conditions while maintaining existing settlement patterns where feasible. key interventions have been implemented or are currently underway as part of the medium- to long-term upgrading strategy.
Progress to date includes:

- Completion of Phase 2 of the emergency access road;
- Completion of relocation of households from the Langrug Dam area to the Temporary Relocation Area (TRA) at Mooiwater (Erf 3229);
- Completion of perimeter fencing and rehabilitation of the dam area;
- Appointment of a service provider to finalise detailed conceptual layout plans for the freshwater dam rehabilitation and in-situ upgrading project;
- Submission of funding applications to the Provincial Department of Infrastructure (PDoI) for planning and implementation;
- Approval of funding for Interim Basic Services (IBS) by the PDoI; and
- Appointment of a qualified contractor, in collaboration with the Section: Project Management Unit (PMU), to implement the rehabilitation of the Langrug Dam.



In addition, the Municipality is actively exploring measures to prevent further land invasion and to safeguard the rehabilitated dam area, ensuring the long-term sustainability of the intervention.



These coordinated efforts form part of a broader strategy to enhance service delivery, mitigate environmental risks, and progressively formalise the Langrug Informal Settlement through structured, phased development interventions.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/2027	Planning
2027/2008	Implementation
2028/2029	Implementation

8.2 Kayamandi Town Centre (Wards 12, 13 and 14)

Project Name	3258 ISSP Kayamandi Town Centre (1000) UISP
Property Description	Various
Town	Stellenbosch
Suburb	Kayamandi
Geo-reference	33°55'06"S 18°50'50"E
Catalytic / PHDA Project	PHDA

Urgency (Proposed year of implementation)		2025/2026
% of Total need addressed by Project		11,3
Housing Programme/s		UISP / Institutional
Housing Opportunities	**Sites**	0
	Serviced Sites	0
	Top Structures (Units)	1 854
	Other	0
Project Readiness	**Land Obtained**	Yes
	EIA ROD	No
	Bulk capacity	Yes
	Land Use Approval	No
	PDoI Approval	Yes (PID)
	Council Approval	Yes
	Risks / Issues	Large scale of project and need for decanting onto a non-existent TRA
	Readiness Score	4
Project Suitability	**Geotech Conditions**	Suitable, location in an already built-up area
	Strategic alignment	Amended MSDF 2023 - Project does fall within the approved Urban Edge of Stellenbosch (page 70), and the project is listed on page 200. MHSP 2020 - Project is included in the proposed Housing Pipeline noted on page 130. IDP 2020-2025 - Project is listed as a current municipal project on page 179. PHSHDA - The Project is included in the Stellenbosch PHSHDA.
	Planning Opinion	This project has already been supported by the release of Tranche 1.1 and PFR application has been submitted on 20 June 2020. The project will entail the redevelopment of the older town centre of Kayamandi that is in desperate need of attention. The project will require a decanting site. This project can be further supported for feasibility studies.

Stellenbosch Municipality appointed a service provider to undertake a feasibility study for the redevelopment of the Kayamandi Town Centre. The feasibility phase included an assessment of the existing status quo, contextual and policy analysis, and the preparation of a site development plan outlining proposed land uses, development patterns, residential densities, and housing opportunities. The feasibility study was completed in December 2017, and Council approved the proposed development on 28 March 2018. The project aims to deliver a comprehensive mixed-use redevelopment, including residential components, supported by appropriate infrastructure and services.

Subsequent project milestones include:

- Completion of environmental and heritage studies;
- Preparation of draft layouts and housing typologies;
- Completion of a geotechnical investigation confirming development considerations;
- Submission of a funding application to the Provincial Department of Infrastructure in June 2020 for the detailed planning of approximately 1,854 residential units; and
- Approval of the planning layout by Council on 24 August 2020.

The Land Use Application was submitted in November 2022 and advertised for public participation on 25 January 2024. During the review process, additional technical assessments were requested by the Directorate: Infrastructure Services to confirm the capacity of bulk and link infrastructure, particularly water and sewer systems, to support the proposed development.

Furthermore, the Section: Land Use Planning and Infrastructure Services required revisions to the Site Development Plan (SDP) to ensure adequate provision for parking in line with planning requirements. The user department is currently in the process of appointing a service provider to update the Traffic Impact Assessment.
Once the necessary amendments to the SDP and supporting studies are completed, the application will be finalised and submitted to the Municipal Planning Tribunal (MPT) for consideration and decision.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Planning Approval
2027/28	Implementation into phases
2028/29	Implementation into phases

8.3 Maasdorp Village, Franschhoek (Ward 2)

Project Name	Maasdorp Village, Franschhoek
Property Description	Farm La Motte 1041/27 and 1041/28 Paarl
Town	Maasdorp
Suburb	Rural
Geo-reference	33°53'12"S 19°04'51"E (Farm 1041/3) 33°53'07"S 19°04'55"E (Farm 1041/7)

Housing Opportunities	**Sites**	0
	Serviced Sites	0
	Top Structures (Units)	0
	Other	16 existing units
Project Readiness	**Land Obtained**	No
	EIA ROD	Yes - Checklist completed; EIA not applicable
	Bulk capacity	No
	Land Use Approval	Yes
	PDoI Approval	No
	Council Approval	Yes – with respect to a Memorandum of Understanding with the Dept. of Public Works
	Risks / Issues	Costly sites
	Readiness Score	1
Project Suitability	**Geotech Conditions**	Suitable, already built-up area
	Strategic alignment	This project falls within the approved urban edge and has been identified in the SDF as future mixed-use, community, and residential infill. From a MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially.
	Planning Opinion	TBD

The Maasdorp Forest Village, located approximately 4 km north-east of Franschhoek, comprises Portions 27 and 28 of Farm La Motte No. 1041 and currently accommodates around 32 formal residential units and associated outbuildings.

The Land Use Application for the development has been approved by the Municipal Planning Tribunal (MPT), enabling the project to proceed to the next phase. A key priority is the development of an appropriate funding model tailored to the specific needs of the existing community. Structured timeframes are recommended to guide the project's progression from planning approval through to implementation.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Transfer of title deeds
2027/28	-
2028/29	-

8.4 Enkanini ABS (Planning) (Ward 12)

Project Name	3259 ISSP Kayamandi Enkanini (1300) UISP
Property Description	Various
Town	Stellenbosch
Suburb	Kayamandi
Geo-reference	33°55'29"S 18°50'46"E
Catalytic / PHDA Project	PHDA

Urgency (Proposed year of implementation)		Current (planning and installation of basic service)
% of Total need addressed by Project		8
Housing Programme/s		UISP
Housing Opportunities	**Sites**	1 300
	Serviced Sites	0
	Top Structures (Units)	0
	Other	0
Project Readiness	**Land Obtained**	Yes
	EIA ROD	No (to undertake a 24G application)
	Bulk capacity	Yes
	Land Use Approval	Yes
	PDoI Approval	Yes
	Council Approval	Yes
	Risks / Issues	Large scale of project and need for decanting onto a non-existent TRA
	Readiness Score	4
Project Suitability	**Geotech Conditions**	Steep slopes, increased cost of development
	Strategic alignment	This project is located within the approved urban edge and has been identified in the SDF as future mixed-use, community, and residential infill. From an MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially.
	Planning Opinion	This project has already been supported by the release of Tranche 1.1 and the PDoI is waiting for the PFR application currently. The project will entail the formalisation of the Enkanini Informal Settlement in Kayamandi. The project will require a decanting site. This project can be further supported for feasibility studies.

Enkanini informal settlement, located to the north-west of Stellenbosch, spans approximately 17.9 hectares across multiple land parcels and accommodates an estimated 3,300 structures and a population of around 10,000 residents. The settlement is situated adjacent to light industrial areas and other informal settlements, including Zone O, and is in proximity to the town centre.

All required statutory planning, environmental, and related approvals have been secured to enable the formalisation of the settlement. The project is progressing toward implementation, with a service provider in the process of being appointed to roll out Interim Basic Services (IBS), scheduled to commence in the third quarter of the 2025/26 financial year.

In parallel, the Directorate: Infrastructure Services is implementing electrification works, with approximately 700 electrical connections currently being installed under the Integrated National Electrification Programme (INEP). This programme will be rolled out over the next three to four years to expand access to electricity across the settlement.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2025/26	Provision of electricity; In situ upgrading
2026/27	Implementation
2027/28	Implementation

8.5 Five housing projects in Kayamandi, Stellenbosch

The Kayamandi Township was originally proclaimed in terms of the Black Communities Development Act, 1984 (Act 4 of 1984) and established as a development area with the creation of Erf 288, Kayamandi (34.4957ha in extent). The aforementioned erf was then subdivided in accordance with General Plan L149/1987 after which the township register was opened in terms of the Upgrading of Land Tenure Rights Act, 1991 (Act 112 of 1991).

Kayamandi was then extended in terms of Proclamation Notice G.K. 598/1991 with the acquisition of Portion 56 of Farm 183 (Erf 707), Portion 3 of Farm 181 (Erf 1070) and Portion 59 of Farm 183 (Erf 634). The new development area (18.5ha in extent) was then surveyed and established in terms of the Black Communities Development Act, 1984 (Act 4 of 1984) with the registration of General Plans 7988/1991, 3443/1991 and 7989/1991.

The former Stellenbosch Transitional Council commissioned the preparation of a Spatial Development Framework for Kayamandi in 1995 to guide and direct the severe development pressure that existed in the Kayamandi Township at the time. During this process a number of high priority housing projects were identified. This culminated in the approval of the Kayamandi SDF in September 1996 and the Housing Projects Plan in January 1997. The eight high priority housing projects that were identified included the following:

- Project 1: Costa Land Development (greenfield development)
- Project 2: Snake Valley (greenfield development)
- Project 3: Watergang (greenfield development)
- Project 4A: Rental Apartments (town centre upgrade)
- Project 4B: Red Brick Hostels (town centre upgrade)
- Project 5A: High Density Units (town centre upgrade)
- Project 5B: High Density Units (town centre upgrade)
- Project 8: Mpelazwe (town centre upgrade)

Although the abovementioned projects (excluding Project 3: Watergang) were implemented during this period, the majority of erven have never been formally registered in order to enable the individual transfer of these properties to their respectively beneficiaries. The main reason for the aforesaid challenge was that Stellenbosch Municipality did not have the necessary authority to consider and approve the formal amendments of the General Plans due to the statutory provisions that applied in terms of the Black Communities Development Act, 1984 (Act 4 of 1984).

Stellenbosch Municipality subsequently appointed a Service Provider to assist the municipality in obtaining the necessary land use rights for five projects in Kayamandi, known as Projects 4A, 4B, 5A, 5B and 8 (Mpelazwe).

Progress has since been made, with four projects approved by the Municipal Planning Tribunal (MPT) on 27 January 2023 and subsequently registered with the Surveyor-General. A further project submitted to Land Use Planning remains on hold due to an outstanding Power of Attorney for Erf 66, which is not currently under municipal ownership.

This matter is being addressed by the Department: Corporate Services within Stellenbosch Municipality. This is necessary to enable the Municipality to finalise the formal registration of these properties with the Surveyor-General and the Deeds Office so that the title deeds of the properties can be transferred to their respective new owners.

8.5.1 Project 4A: Erven 1080 – 1112 Kayamandi (33 erven) (Ward 12)

Project Name		Erven 1080 – 1112 Kayamandi (33 erven)
Property Description		Erven 1080 – 1112 Kayamandi
Town		Stellenbosch
Suburb		Kayamandi

	Strategic alignment	These projects fall within the approved urban edge and have been identified in the SDF as future mixed-use, community, and residential infill. From an MSDF/CEF perspective, these projects fall within the functional area and priority development areas and from a strategic perspective align spatially.
	Planning Opinion	TBD

The project was approved by Council in 1996 and comprised the development of 146 family units by Stocks Housing Cape (Pty) Ltd. The 146 units were developed as rental stock units on Erven 1080 to Erven 1112 and were completed in 1998. The project was approved by the Municipal Planning Tribunal (MPT) on 27 January 2023 and subsequently registered with the Surveyor-General.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2025/26	Investigation possible of sectional title deeds.
2026/27	Transfer of title deeds.
2027/28	

8.5.2 Project 5B: Erven 513-522, 66, 67, 69 and Portion of Erf 523, Kayamandi (Wards 12 and 15)

Project Name		Erven 513-522, 66, 67, 69, a portion of Erf 523, Kayamandi
Property Description		Erven 513-522, 66, 67, 69, a portion of Erf 523, Kayamandi

	PDoI Approval	Yes (previous)
	Council Approval	Yes
	Risks / Issues	Community challenges and possible encroachments
	Readiness Score	4
Project Suitability	**Geotech Conditions**	Suitable, location in an already built-up area
	Strategic alignment	TBD
	Planning Opinion	TBD

This project formed part of the Kayamandi Town Centre urban renewal project, as funded in terms of the overall hostel project upgrading programme. The development made provision for 137 higher density units, a new road and several open spaces.

The underlying erven forms part of General Plan 149/1987 and General Plan 290/1989. The development entails the consolidation of Erven 67, 69, a portion of Erf 523 and Erven 513-522 and the re-subdivision thereof into individual higher density units.

The project was implemented and constructed during 2004. The project was partially completed due to the construction of informal structures on the remainder of the property. A total of 42 units has been built. It is recommended that the amendments of the General Plans (149/1987 and 290/1989) be done. Project 4B that was submitted to Land Use Planning remains on hold due to an outstanding Power of Attorney for Erf 66, which is not currently under municipal ownership. This matter is being addressed by the Department: Corporate Services within Stellenbosch Municipality.

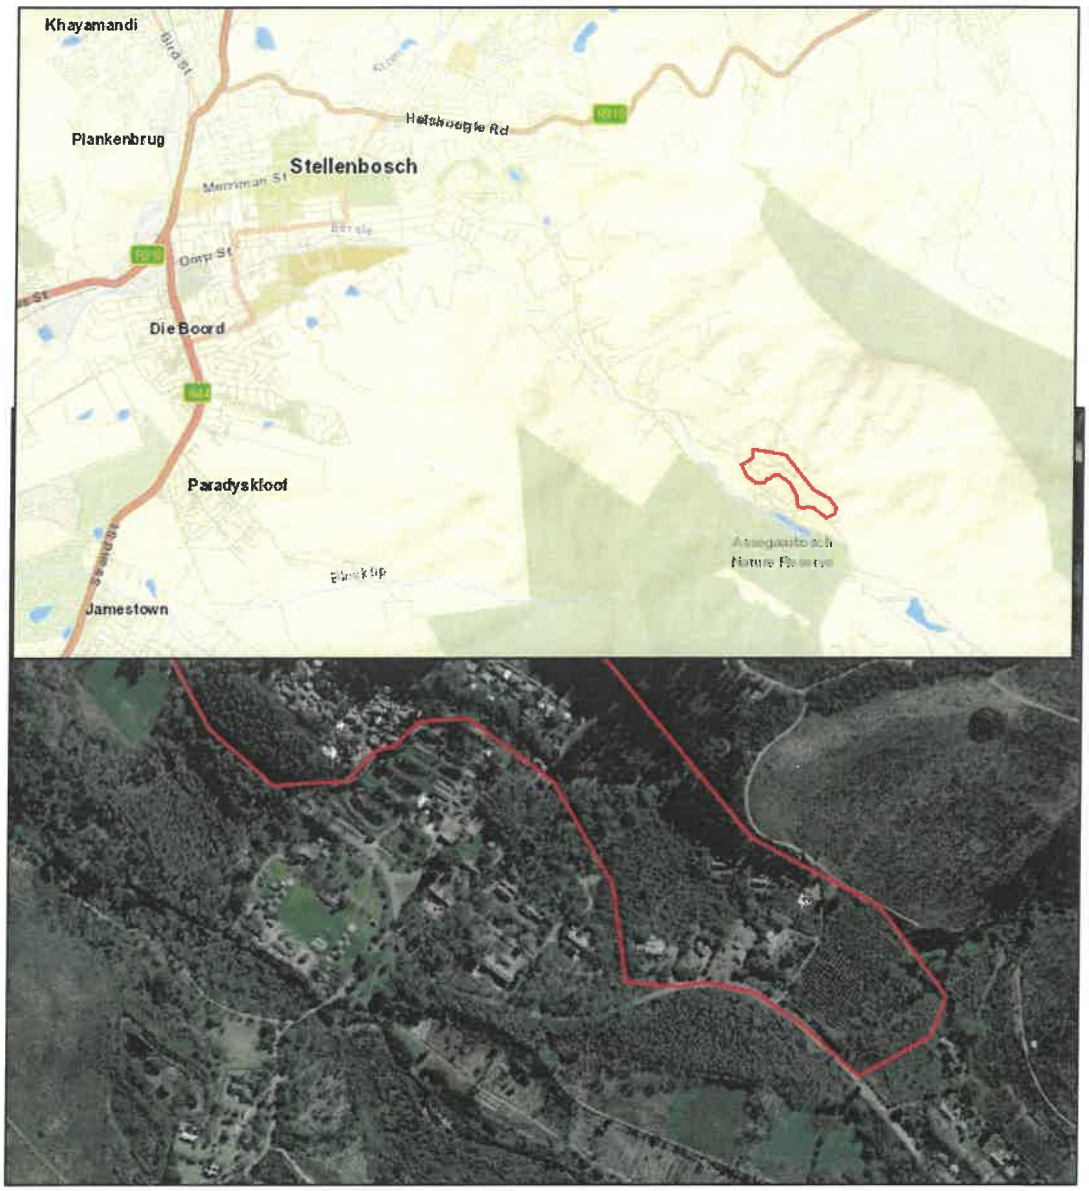
It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Planning approval outstanding due to PoA for Erf 66
2027/28	Registration of erven at the SG office/ Transfer of title deeds
2028/29	Transfer of title deeds

8.6 Portion 1 of the Farm Meerlust No 1006 Paarl, Franschhoek (Ward 3)

Project Name		3460 Meerlust, Franschhoek (200)
Property Description		Portion 1 of the Farm Meerlust 1006
Town		Franschhoek
Suburb		Meerlust
Geo-reference		33°51'35"S 18°58'41"E
Catalytic / PHDA Project		No
Urgency (Proposed year of implementation)		TBD
% of Total need addressed by Project		1,2
Housing Programme/s		IRDP
Housing Opportunities	**Sites**	200
	Serviced Sites	TBD
	Top Structures (serviced)	TBD
	Other	0
Project Readiness	**Land Obtained**	Yes
	EIA ROD	No
	Bulk capacity	TBD
	Land Use Approval	No
	PDoI Approval	Yes (PID)
	Council Approval	Yes
	Risks / Issues	Location, site is not located close to any urban settlements and the extremely small scale of the project
	Readiness Score	3
Project Suitability	**Geotech Conditions**	TBD
	Strategic alignment	This property is partially located within the approved urban edge. The portion within the urban edge has been identified in the SDF as future mixed-use, community, and residential infill as well as green areas to be retained. The Spatial Planning Section will undertake a Local Spatial Development Framework (LSDF) to determine the potential and future development of this property.
	Planning Opinion	TBD

In accordance with the housing need, Stellenbosch Municipality has identified a portion of land, Portion 1 of the Farm Meerlust No 1006 Paarl, in the Franschhoek Valley known as Meerlust for residential development. Ownership of the property currently vests with the National Department of Public Works and Infrastructure.



The site is located on the southern edge of the R45 close to the intersection of the R45 and the R310 and lies between Werda in the north-west and Allee Bleue, Lekkerwyn and the Pickstones to the east. The site is located on a sub-regional corridor linking the towns of Franschhoek and Paarl.

The Municipality has appointed the Housing Development Agency (HDA) via an Implementation Protocol Agreement (IPA) to assist and finalise the transfer of land from the National Department of Public Works and Infrastructure (NDoPW&I) to the Municipality. The HDA has reviewed previous planning studies and proposed layout options that were conducted on the property. On 5 November 2024, a request was given to the HDA to complete an audit and report of the management of basic water services in the Meerlust Village following irregularities in consumption and billing in the village. The HDA is facilitating the release of land from NDoPW&I to Stellenbosch Municipality through Power of Attorney.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Transfer of land from NDoPW&I
2027/28	Detailed Planning studies
2028/29	Planning

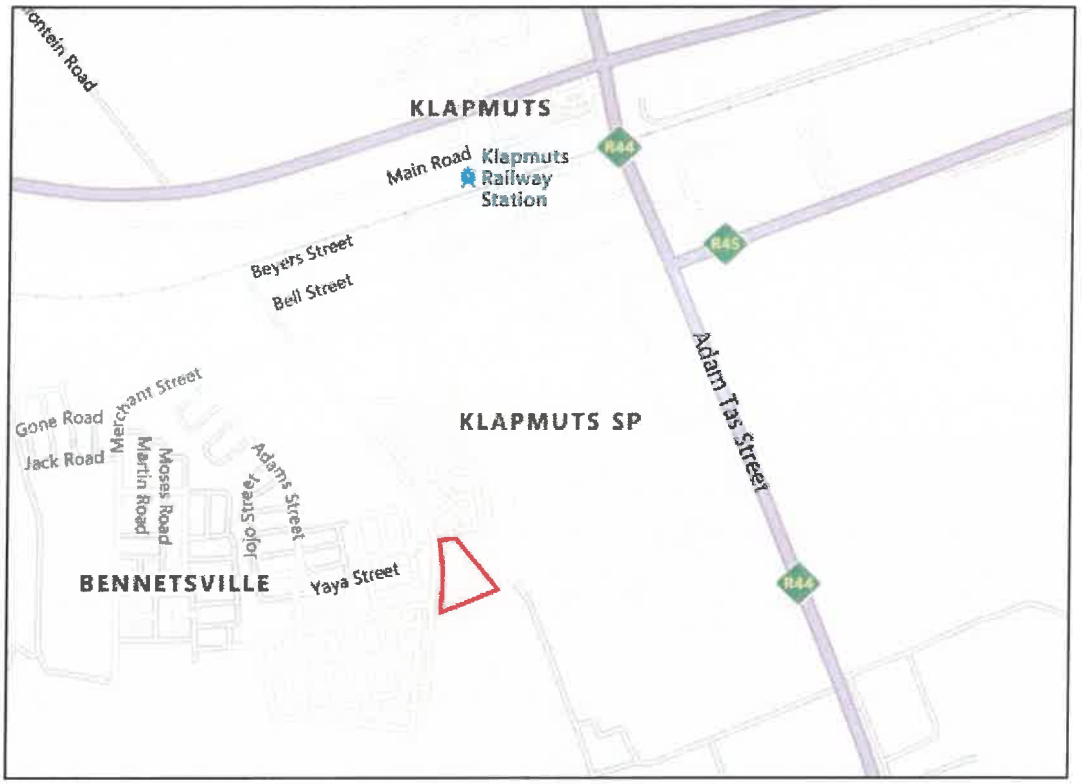
8.7 Jonkershoek (Ward 5)

Project Name	Jonkershoek
Property Description	Various
Town	Stellenbosch
Suburb	Jonkershoek
Geo-reference	33°57'47"S 18°55'42"E
Catalytic / PHDA Project	N/A
Urgency (Proposed year of implementation)	TBD
% of Total need addressed by Project	0,7
Housing Programme/s	Township Establishment / IRDP / FHF (formally known as FLISP)

Housing Opportunities	**Sites**	TBD
	Serviced Sites	TBD
	Top Structures (Units)	TBD
	Other	40 existing units
Project Readiness	**Land Obtained**	No
	EIA ROD	No
	Bulk capacity	No
	Land Use Approval	No
	PDoI Approval	No
	Council Approval	Yes- with respect to a Memorandum of Understanding
	Risks / Issues	Conservation status and bulk service provision restraints
	Readiness Score	0
Project Suitability	**Geotech Conditions**	TBD
	Strategic alignment	The Spatial Planning Section planned to undertake a Local Spatial Development Framework (LSDF) to determine potential and future development of this property.
	Planning Opinion	TBD

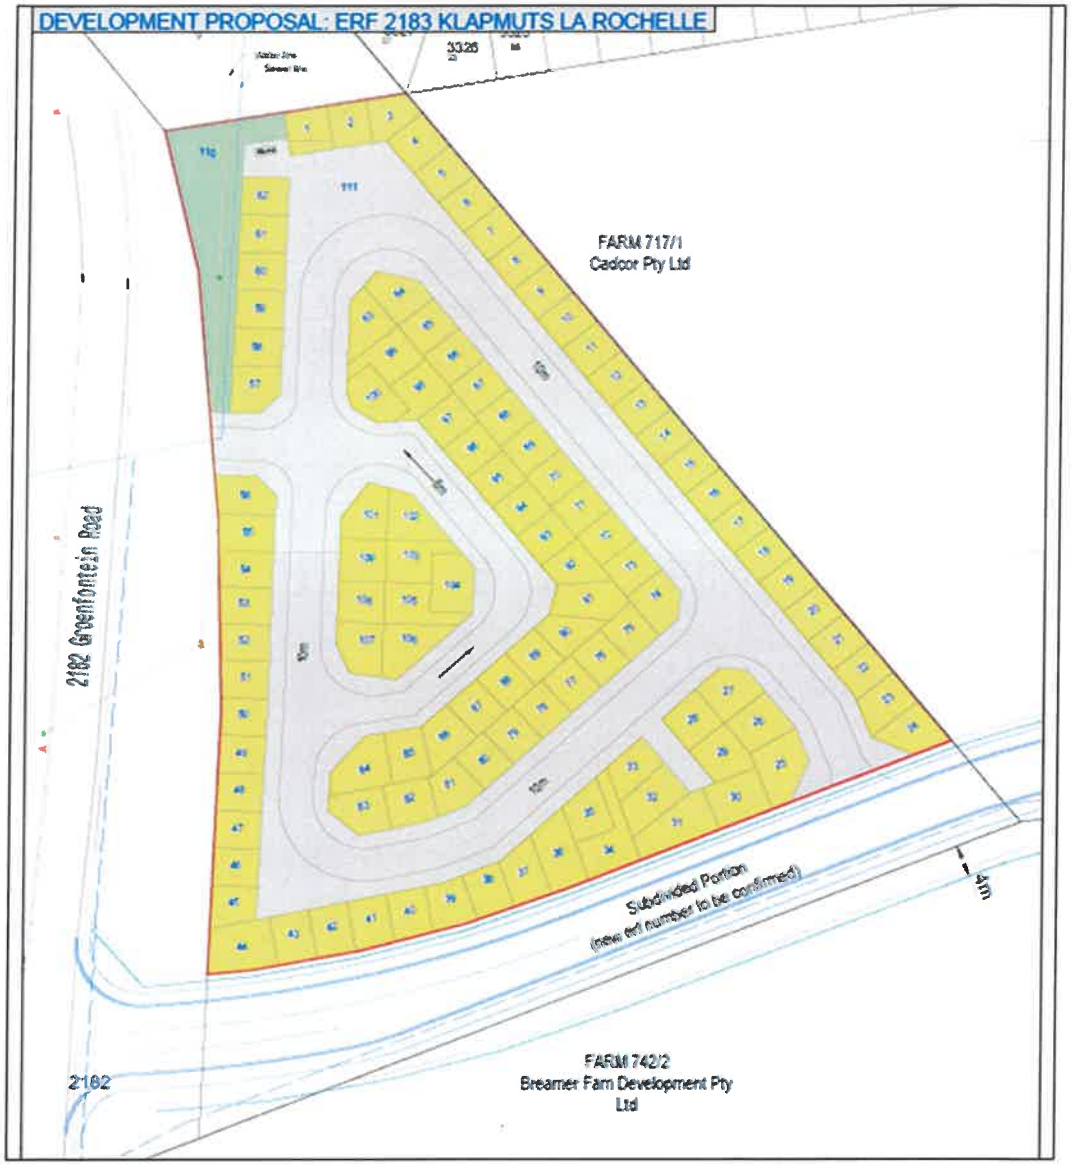
The Jonkershoek Valley is located about 10km east of Stellenbosch, below the imposing Hottentots-Holland Mount ains. The valley is relatively narrow (3-5 km) and approximately 13 kilometres in length. The upper Jonkershoek Valley has been conserved as part of the Jonkershoek Nature Reserve to preserve the mountain fynbos ecosystems; however, large areas have been converted to plantation forestry. Besides the original Jonkershoek farmyard, Jonkershoek has a Bosdorp, which historically accommodated the labour force of forestry and catchment management.

The Municipality has appointed the Housing Development Agency (HDA) via an Implementation Protocol Agreement (IPA) to assist and finalise the transfer of land from the National Department of Public Works and Infrastructure (NDoPW&I) to the Municipality.



The HDA has reviewed previous planning studies and proposed layout options that were conducted on the property. On receipt of the Power of Attorney (PoA), the Land Use Application to obtain land use rights to develop the subject properties for human settlement purposes will be lodged with the Municipality.

It is suggested that the following timeframes should be considered for project progression:



Timeframes	Project Deliverables
2026/27	Obtain PoA and Detailed planning studies
2027/28	Obtain development rights
2028/29	Obtain development rights

9 IMPLEMENTATION PHASE

9.1 Erf 2183, La Rochelle, Klapmuts (Ward 18)

Project Name		La Rochelle, Klapmuts
Property Description		Erf 2183, Klapmuts
Town		Klapmuts
Suburb		Klapmuts
Geo-reference		33°48'50"S 18°52'08"E
Catalytic / PHDA Project		No
Urgency (Proposed year of implementation)		2025/26
% of Total need addressed by Project		0,6
Housing Programme/s		UISP/IRDP
Housing Opportunities	**Sites**	0
	Serviced Sites	109
	Top Structures (Units)	Possible Temporary Relocation Units
	Other	0

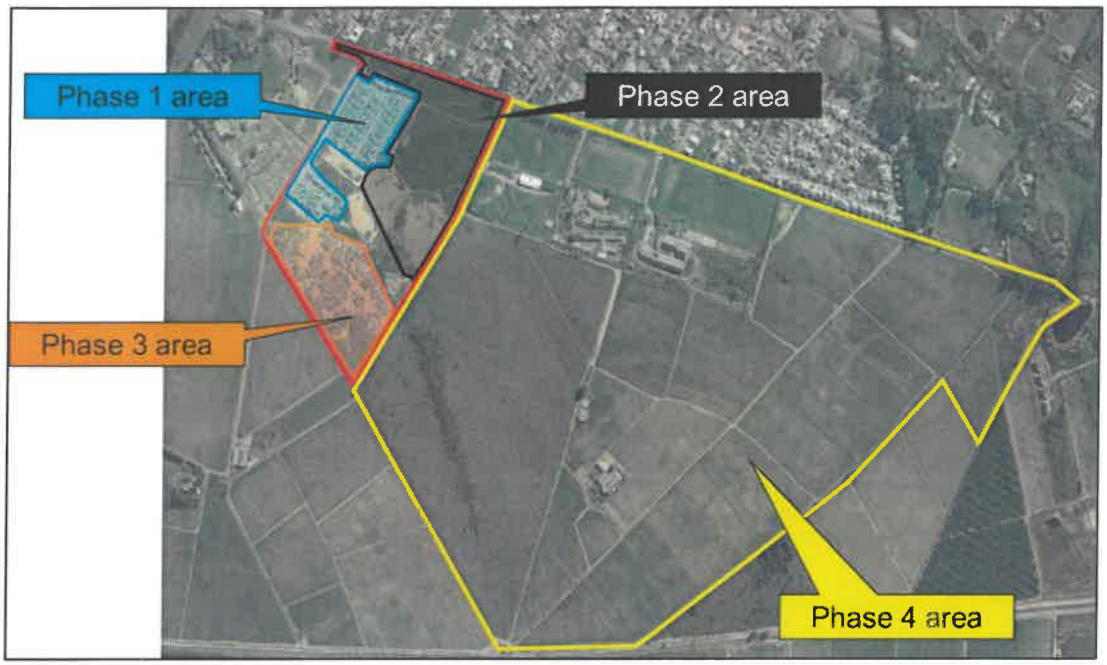
Project Readiness	**Land Obtained**	Yes
	EIA ROD	No (Awaits Environmental Authorisation)
	Bulk capacity	Yes (Sewerage will require upgrades)
	Land Use Approval	Yes
	PDoI Approval	Yes
	Council Approval	Yes
	Risks / Issues	Small size of project, high risk of possible land invasion
	Readiness Score	1
Project Suitability	**Geotech Conditions**	Suitable, location in an already built-up area
	Strategic alignment	Project does fall within the approved Urban Edge of Klapmuts. The Project is included in the draft Development Plan for the Stellenbosch Urban Core PHDA (Revised December 2024).
	Planning Opinion	This project was previously presented to the PPC in 2016 and in principle supported for further studies. The specific type of housing program to be used was not confirmed by the Municipality. The site is located within in walking distance of socio-economic facilities in Klapmuts and development will increase the urban density of Klapmuts.

Erf 2183, Klapmuts is strategically located along Gomas Street in Klapmuts, approximately 1.5 km from the R310, which provides connectivity between Stellenbosch and the N1 transport corridor. The site is situated on the south-eastern edge of Klapmuts and is bordered by vacant land to the south and east, with planned residential expansion towards Mandela City on the western and northern boundaries.

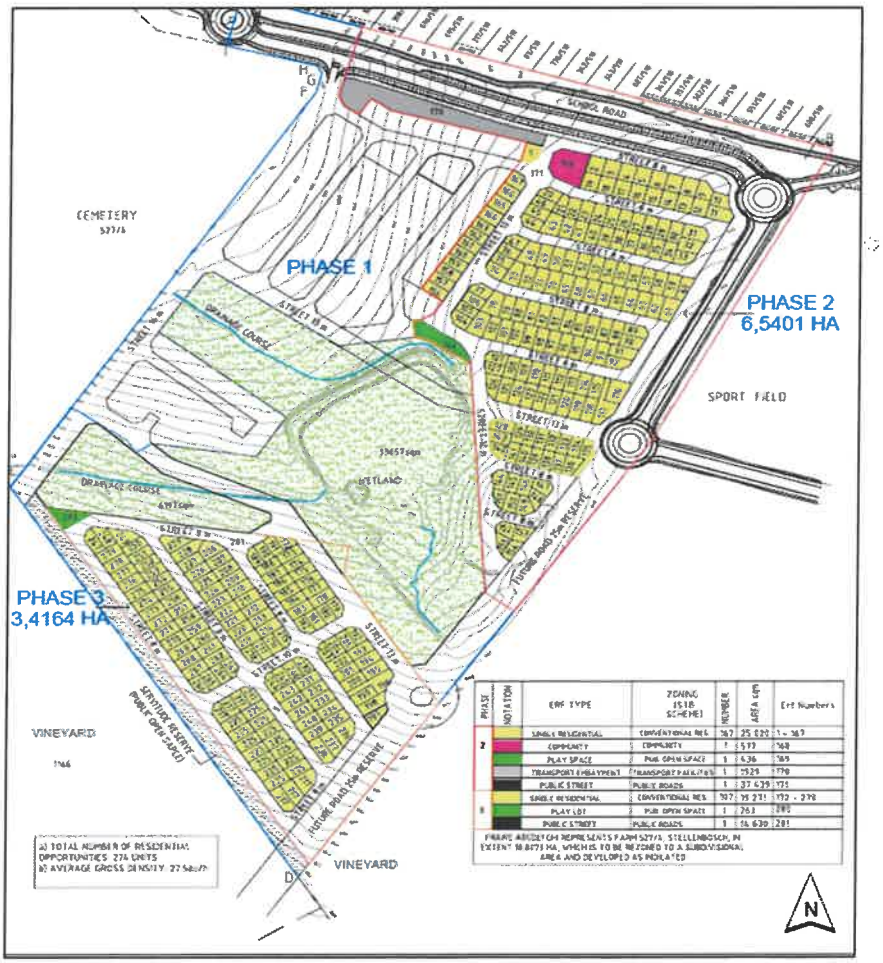
Given the acute housing demand in Klapmuts, particularly among backyard dwellers, the site has been identified for a "site-and-service" incremental housing development. The project aims to provide serviced residential opportunities through the creation of small residential erven, supporting affordable access to land and basic services.

The property is zoned as a Subdivisional Area, permitting Less Formal Residential, Public Open Space, and Public Road and Parking uses. A multidisciplinary team of professional service providers has been appointed to undertake the subdivision of the property into residential erven of approximately 40 m^2 to 50m^2, facilitate Surveyor-General approvals, and prepare documentation for submission to the Provincial Department of Infrastructure to secure funding for implementation.

The Municipal Planning Tribunal (MPT) approved the Land Use Application in February 2024, and the Provincial Department of Infrastructure has approved funding for the installation of bulk and internal services. A service provider has been appointed to undertake detailed infrastructure design and construction management for project implementation and occupation readiness.



In parallel, environmental compliance processes are being addressed. The Department of Environmental Affairs and Development Planning (DEA&DP) issued a compliance notice in terms of Section 31L of the National Environmental Management Act (NEMA) relating to land use changes for low-income housing development. The Municipality has appointed environmental consultants to undertake the required Section 24G rectification process to ensure regulatory compliance.



Overall, the project represents a key incremental housing intervention aimed at addressing urgent housing needs in Klapmuts through structured, serviced site delivery.

It is suggested that the following timeframes should be considered for project progression:

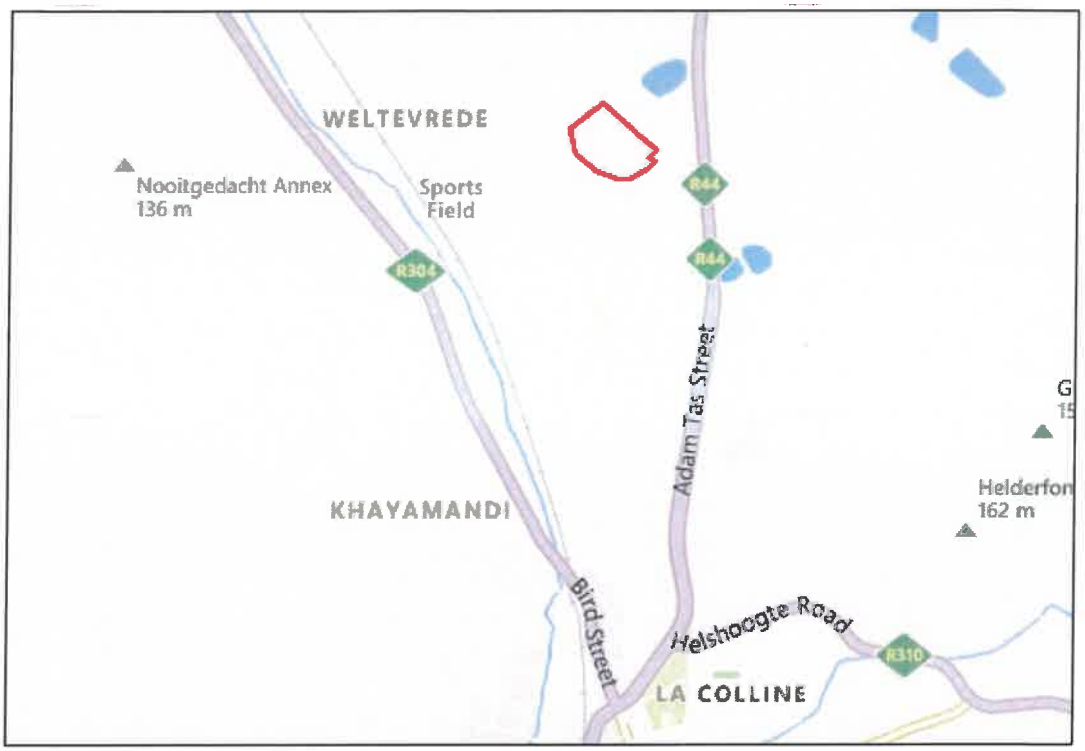
Timeframes	Project Deliverables
2026/27	Implementation
2027/28	Implementation
2028/29	Implementation

9.2 Jamestown Development: Phase 2 – 4 (Ward 21)

Project Name		3269 Jamestown Phases 2 to 4 (1069) IRDP
Property Description		Portion of the Remainder, Portion 3 and a broader portion of Portion 7 of Farm No 527
Town		Stellenbosch
Suburb		Jamestown
Geo-reference		33°59'00"S 18°50'38"E (Phase 2 & 3) 33°59'13"S 18°50'52"E (Phase 4)
Catalytic / PHDA Project		PHDA
Urgency (Proposed year of implementation)		2025/2026 (Phase 2 &3)
% of Total need addressed by Project		12,3
Housing Programme/s		IRDP / FHF (formally known as FLISP)
Housing Opportunities	**Sites**	±274 housing opportunities- Phase 2 and 3
	Serviced Sites	274 Single residential and Serviced sites
	Top Structures (Units)	TBD
	Other	0
Project Readiness	**Land Obtained**	Yes
	EIA ROD	Yes
	Bulk capacity	Yes.
	Land Use Approval	Yes (Phase 2 and 3)
	PDoI Approval	Yes, on Business Plan of PDoI
	Council Approval	Yes
	Risks / Issues	Proposed road reduced the number of opportunities for Phases 2 and 3 by 134 opportunities. Road widening upgrades on the R44 are a condition of the project's approval. Bulk water upgrades completed. The reservoir has an influence on the design layout affecting the number of housing opportunities for Phase 4.
	Readiness Score	4

Project Suitability	**Geotech Conditions**	Suitable, location in an already built-up area
	Strategic alignment	Majority of the proposed development is located within the approved urban edge. From an MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially. The appointed service provider and the specialist studies must be used to provide the detailed supporting evidence to substantiate the inclusion of portion of the property within the urban edge.
	Planning Opinion	PIRR application was submitted for the implementation of Phases 2 and 3. The following points serve as motivation for project support: • The project is consistent with the PSDF and Municipal SDF (2023) that promotes compaction and densification within the urban edge. • The project was in principle supported by PPC in 2016. • The project forms part of the Municipality's Housing Pipeline and is incorporated in the Municipal 5-year IDP (dated 2022 – 2027). • The project is located within the proclaimed Stellenbosch PHDA. • This project will provide new housing opportunities in the GAP-market which is a strategic objective of the Municipality.

The subject property is located on the southern edge of the suburb of Jamestown, east of the R44 between Stellenbosch and Somerset West. It is flanked by an existing cemetery on its western boundary and a sports field located centrally on its northern edge. The site falls within an area characterized by medium to high-density residential as well as non-residential uses that serve the local community of Jamestown.



A professional team was appointed during June 2022 to undertake a broad conceptual urban design framework for a portion of Portion 7 of Farm 527 and remainder Farm 527, Stellenbosch, and to obtain town planning and development rights. A public participation process was concluded. It should be noted that development rights have been approved by the MPT on 1 March 2024 for Phases 2 and 3 on Portion 7 of Farm 527 (single residential erven and service sites. An appeal was lodged against the application. The final notice of appeal was issued on 26 August 2024 wherein the appeal was dismissed and the application was approved.

The project is approved and funded by PDoI. The user department is in the process of appointing an Implementing Agent. The tender was awarded by BAC on 28 April 2026, and a letter of award has been issued with a 21-day appeal period to all bidders. Once the appeal period has lapsed, and there are no objections a Section 33 process will commence, as the project is anticipated to extend more than 3 years.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Implementation of Phase 2 – 3 Obtain development rights: Phase 4
2027/28	Implementation of Phase 2 – 3
2028/29	Implementation of Phase 4

9.3 Erf 7001, Cloetesville ("Soek-mekaar") (Ward 17)

Project Name		3694 Erf 7001 Cloetesville (360) IRDP
Property Description		Erf 7001
Town		Stellenbosch
Suburb		Cloetesville
Geo-reference		33°54'13"S 18°51'16"E
Catalytic / PHDA Project		PHDA
Urgency (Proposed year of implementation)		2025/26 | 2026/27
% of Total need addressed by Project		1,5 – 1,8
Housing Programme/s		FHF (formally known as FLISP)
Housing Opportunities	**Sites**	201 Housing Opportunities GAP/ FHF (formally known as FLISP) housing opportunities
	Serviced Sites	No
	Top Structures (Units)	201
	Other	0
Project Readiness	**Land Obtained**	Yes
	EIA ROD	N/A
	Bulk capacity	Yes
	Land Use Approval	Yes
	PDoI Approval	Yes. On Business plan of PDoI
	Council Approval	Yes
	Risks / Issues	FLISP Beneficiaries
	Readiness Score	5
Project Suitability	**Geotech Conditions**	Suitable, location in an already built-up area
	Strategic alignment	Amended MSDF 2023 - Project falls within the approved Urban Edge of Stellenbosch, and the project is listed on page 199. MHSP 2023 - Project is included in the proposed Housing Pipeline noted on page 130. IDP 2022-2027 - Project is listed as a priority municipal project on page 189. PHSHDA - The Project is included in the Stellenbosch PHSHDA.
	Planning Opinion	The PDoI fully supported the PID and PFR application which allowed the Stellenbosch Municipality to complete the planning process. The following points serve as motivation for project support: • The project is consistent with the PSDF and Municipal SDF (2023) that promotes compaction and densification within the urban edge • The project was in principle supported by PPC in 2017 • The project forms part of the Municipality's Housing Pipeline and is incorporated in the Municipal 5-year IDP (dated 2022 – 2027) • The project is located within the proclaimed Stellenbosch PHDA • This project will provide new housing opportunities in the GAP-market which is a strategic objective of the Municipality. The PDoI have approved funding for this project on their Business Plan for the 2026/2027 and 2027/2028 Financial Years.

A study was done by a service provider to investigate different sites for possible developments in Cloetesville. In accordance with the recommendations which were presented to Council, Erf 7001 was identified for possible GAP/FHF (formally known as FLISP) housing. A Call for Proposal for the mixed-use development of Erf 7001, Cloetesville was advertised on two occasions.

A team of professionals have been appointed in April 2022 to undertake a to undertake a Broad Conceptual Urban Design framework for Erf 7001 and to obtain town planning and development rights.

A public participation process was concluded to obtain public comment. The MPT approved the land use application and consequently, land development rights have been obtained.

A funding application to PDoI has been approved. The user department advertised a tender for the appointment of an Implementing Agent; no bids were received. User department will re-visit the specifications and will be re-advertise in 2026/27 financial year.

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Implementation
2027/28	Implementation
2028/29	Implementation

9.4 Zone O, Kayamandi (Wards 14 and 15)

Project Name		ISSP Kayamandi Zone O (711) UISP
Property Description		Erf 2991
Town		Stellenbosch
Suburb		Kayamandi
Geo-reference		33°55'06"S 18°50'35"E
Catalytic / PHDA Project		PHDA
Urgency (Proposed year of implementation)		Current
% of Total need addressed by Project		4,4
Housing Programme/s		UISP
Housing Opportunities	**Sites**	711 in total
	Serviced Sites	170 sites have been serviced by PMU
	Top Structures (Units)	TBD
	Other	0
Project Readiness	**Land Obtained**	Yes
	EIA ROD	Yes
	Bulk capacity	Yes
	Land Use Approval	Yes
	PDoI Approval	Yes (PIRR)
	Council Approval	Yes
	Risks / Issues	Risk of land invasion and community unrest
	Readiness Score	Current

Project Suitability	**Geotech Conditions**	Suitable
	Strategic alignment	This project is located within the approved urban edge. From an MSDF/CEF perspective, this project falls within the functional area and priority development areas and from a strategic perspective aligns spatially.
	Planning Opinion	Development rights have been obtained (MPT approval)

The property is located on the western side of Kayamandi, on the slope leading up to the school and reservoir. The access to the land is through Kayamandi, with the most direct route being from the R304 (Bird Street extension) via the northern entrance to Kayamandi (Sokuqala Street). Zone O comprises an original portion of Remainder of Erf 2183, Portion of Erf 1714, Unregistered Erven 863 and 873 (Portions of Erf 707) Kayamandi.

The civil designs and drawings for project have been approved by the relevant competent authorities. The project will be implemented in phases as indicated in the map above (i.e. phase 1, phase 2 and phase 3). For technical reasons, the implementation of the project will commence at phase 3 which comprises of 170 sites. The **Section: Project Management Unit (PMU)** advertised a tender for the appointment of a contractor for the construction of 170 top structures. No responsive bid was received. Tender to be readvertised in 2026/27 FY

It is suggested that the following timeframes should be considered for project progression:

Timeframes	Project Deliverables
2026/27	Construction of top structures.
2027/28	Construction of top structures.
2028/29	Relocation of Phases Construction of top structures.

10.6	**INFRASTRUCTURE SERVICES : (PC : R PHEIFFER)**

10.6.1	**STATUS REPORT ON THE ALTERNATIVE ENERGY GENERATION PROGRAMME – MAY 2026**

Collaborator No: 805078
IDP KPA Ref No: Green & Sustainable Valley
Meeting Date: 20 May 2026 and 27 May 2026

1. SUBJECT: STATUS REPORT ON THE ALTERNATIVE ENERGY GENERATION PROGRAMME – MAY 2026

2. PURPOSE

For Council to note the progress of the Alternative Energy Programme projects which are underway at present.

3. DELEGATED AUTHORITY

Municipal Council.

4. EXECUTIVE SUMMARY

4.1 20-Megawatt MW Independent Power Producer Plant: A partial version of the Power Purchase Agreement (PPA) was submitted to the winning bidder on 21 April 2026 after vetting by the Municipality's appointed Legal Firm and Legal Services. The Bidder is perusing the document and will revert with their response for finalisation. Once signed by all parties, the obtainment of development rights will proceed for the project.

4.2 50-Megawatt MW Independent Power Producer Tender: The tender has closed. The first Bid Evaluation Committee (BEC) meeting was held on 20 February 2026, in which permission was given to obtain clarification from certain bidders. The second BEC meeting was held on 24 April 2026 and the Item will then serve at the Bid Adjudication Committee (BAC) once the Bid Evaluation Committee is satisfied with all procedural requirements.

4.3 Supervisory Control and Data Acquisition (SCADA) Telemetry Project – Phase 3: The Scope of works entails remote monitoring and remote switching functionality at 11kV secondary substations. The project is in construction at present and planned to be completed by June 2026. The following substations will be completed in Phase 3:

- Main substation
- University substation
- La Terra substation
- Techo Park
- Huguenot
- Tennant

4.4 Fire Station Progress: The system is currently operating in accordance with the design specifications. The actual energy production for some months exceeded the projected production.

4.5 NPK Building Progress: To accommodate the heritage approval process, a departmental memorandum was drafted to seek a budget increase and an extension of the project completion date to December 2026. The memorandum

was subsequently approved, and a heritage sub-consultant has been appointed.

4.6 Main Building (Neethling Huis) Progress: Following the meeting held on 29 January 2026 with the Fire Safety Department, it was discovered that the installation of fire doors and fire-rated walls is classified as minor works, thereby necessitating the appointment of a heritage sub-consultant. This requirement will impact both the project timeline and budget.

4.7 Municipal Community Buildings Progress: Tender B/SM 34/25 Turnkey – Engineering, Procurement and Construction (EPC) of Hybrid Inverter with Battery Storage Systems at fourteen Stellenbosch Municipality Community Buildings. Installation at Jamestown Library has been completed.

4.8 Eskom Hot Water Load Control (HWLC) and RT 29-2024 Contracts for smart meters: The A Request for Proposals (RFP) for the Condition Assessment Report was sent to the panel on 21 April 2026, the clarification meeting was on 23 April 2026, and the RFP is closing on 5 May 2026.

4.9 The Municipality's load curtailment application: A Departmental meeting was held on 12 March 2026, during which it was agreed that the Municipality will no longer be pursuing a load curtailment application but will instead focus on the other AEG initiatives. A memorandum outlining such was submitted to the AEG Committee and was approved by the Municipal Manager on 26 March 2026. The item will be removed from the AEG agenda.

The above projects, 4.1 to 4.8, are still being pursued by the Municipality's Alternative Energy Program with the focus on securing cheaper and renewable energy, as well as the focus on business continuity during outages and ensuring that critical plants and systems are still operational.

5. RECOMMENDATION

that Council notes the latest progress with the Alternative Energy Generation projects in implementation at present.

6. DISCUSSION / CONTENTS

6.1 Background

The Constitution did not allow Local Government to enter into the generation of electricity, and the Electricity Regulation Act did not allow municipalities to purchase electricity from any company other than Eskom. Through the promulgation of Electricity Regulation Act Regulations, on 16 October 2020, this changed, and municipalities are now allowed to generate electricity and purchase electricity from other electricity providers other than Eskom.

6.2 Discussion

6.2.1 20 MW Independent Power Producer Contract: Tender conditionally awarded to successful bidder. A Legal Firm has been appointed by the Municipality and has interrogated the draft Power Purchase Agreement. Once the draft Power Purchase Agreement is finalised and signed off by both parties, the Section 33 process and development rights will commence.

Following the meeting on the 13 February 2026, the Legal Firm has been revising the PPA, and their latest submission was on 2 April 2026. Upon reviewing the PPA, the Legal Department raised three items that remain under consideration and will require further internal deliberations, including consultation with the Municipal Manager.

To avoid further delays, the Department proposed issuing the PPA be issued to the bidder as a partial submission, clearly highlighting items still in discussion. Accordingly, the PPA was issued to the bidder on 21 April 2026.

6.2.2 50 MW Independent Power Producer Tender: The Request for Proposals closed on 30 September 2025. The first technical evaluation report was submitted to SCM on 29 October 2025 and an informal BEC meeting was held on 6 November 2025.

The second technical evaluation report was submitted to SCM on 03 December 2025. The BEC meeting was scheduled for 28 January 2026, however it was subsequently cancelled following the Department's submission of a memorandum to the Municipal Manager requesting intervention regarding the Transaction Advisor's role and the tender evaluation approach being recommended by the Transaction Advisors.

The BEC meeting was held on 20 February 2026, in which permission was given to obtain clarification from certain bidders.

After obtaining clarification from the bidders, the Transaction Advisors submitted their revised report on 20 March 2026, and the Department submitted its report to SCM on 01 April 2026. The BEC meeting was then scheduled for 14 April 2026 but was subsequently cancelled due to the BEC chairperson requesting more information on the technical evaluation report.

The Department updated the report accordingly and submitted it to SCM on 17 April 2026. The BEC meeting was held on 24 April 2026. The Department is currently awaiting the BAC meeting date.

6.2.3 SCADA Phase 3: commenced in July 2025. The kick-off meeting was held on 25 July 2025.
Phase 3 scope of works entails remote monitoring and remote switching functionality at 11kV secondary substations. The project is planned to be completed by June 2026.
The following substations will be completed in Phase 3:

- Main substation
- University substation
- La Terra substation
- Techo Park
- Huguenot
- Tennant

Installation at Main, La Terra and Tennant substations have been completed. Monthly progress meetings are proceeding, and the project remains on schedule for completion by June 2026.

6.2.4 Fire Station Progress: The Stellenbosch Fire Station Battery Energy Storage System (BESS) was completed in April 2024. The project is currently under the defects and liability period.

The system is currently operating in accordance with the design specifications, with actual energy generation exceeding projected outputs in certain months. The contractor started including the monthly savings in Rands in the performance monthly reports. For the months on February and March, the savings were R 9 822.00 and R 9 918.38 respectively.

6.2.5 NPK Building Progress: The consultant is currently preparing the tender specifications based on the option chosen for implementation.

To accommodate the heritage approval process, a departmental memorandum was drafted to request budget adjustment and an extension of the project completion date to December 2026. The memorandum was approved, and a heritage sub-consultant was appointed in February 2026.

The sub- consultant prepared the Visual Impact Assessment report which was submitted to the Heritage Department. The report has been conditionally approved, subject to changing the Battery Energy Storage System (BESS) container color, as per the Heritage Department's recommendation. The sub-consultant has accepted the proposed modification and will update the report accordingly.

The consultant is preparing the tender specifications and submission to Supply Chain Management (SCM) is planned for end of June 2026.

6.2.6 Main Building (Neethling Huis) Progress: The Municipal Manager commented that only the Speaker has power as per the Rules of Order to change/request a virtual Council meeting, on the memo requesting to convene the November 2026 Council and Mayoral Committee meetings virtually or at an alternative venue.

Following the meeting held on 29 January 2026 with the Fire Safety Department, it was discovered that the installation of fire doors and fire-rated walls is classified as minor works, thereby necessitating the appointment of a heritage sub-consultant. This requirement will impact both the project timeline and budget.

The consultant is experiencing challenges in obtaining quotations from a heritage sub-consultant. Upon receipt of a quotation and associated program, the Department will prepare a memorandum for the AEG Committee detailing the required scope adjustments to accommodate heritage approval requirements, together with the associated cost implications and impact on the overall project schedule.

6.2.7 Municipal Community Buildings Progress: Tender B/SM 34/25 Turnkey – Engineering, Procurement and Construction (EPC) of Hybrid Inverter with Battery Storage Systems at fourteen (14) Stellenbosch Municipality Community Buildings. In the previous report, it was incorrectly stated that thirteen (13) out of fourteen (14) buildings had been completed, whereas the correct status was twelve (12) out of fourteen (14). Construction at Jamestown Library has been completed. Law Enforcement installation was removed from the current tender scope due to construction underway. The installation will be completed under a separate tender once construction has been completed. The project has reached completion and therefore the item will be removed from the AEG agenda.

6.2.8 Eskom Hot Water Load Control (HWLC) and RT 29-2024 Contracts for smart meters: The RFP to appoint a Condition Assessment Report consultant was sent to the panel on 21 April 2026. The clarification meeting was held on 23 April 2026, and the RFP is closing on 5 May 2026.

6.2.9 The Municipality's load curtailment application: A Departmental meeting was held on 12 March 2026, during which it was agreed that the Municipality will no longer be pursuing a load curtailment application but will instead focus on other AEG initiatives. A memorandum was drafted to the AEG committee detailing such and was approved by the Municipal Manager on 26 March 2026. The item will be removed from the AEG agenda.

6.3 Financial Implications

This report has no further financial implications for the municipality, and the projects have been appropriately budgeted for.

6.4 Legal Implications

The recommendations in this report comply with Council's policies and all applicable legislation.

6.5 Staff Implications

Specialized technical staff would be required to facilitate and implement the switching and optimization of different sources of energy into the Municipal grid. The department has identified vacancies as well as new posts which will be submitted in a new draft organogram for review.

6.6. Previous / Relevant Council Resolutions

URGENT COUNCIL MEETING: 2025-03-04: ITEM 5.1

NOTED

(a) the clarification of the Feasibility Study Report (**Stellenbosch Municipal Independent Power Producer Procurement Pioneering Project – T008/23)** approved in August 2024;

(b) the project is in the Bid Specification phase of the procurement process of the 50MW Solar PV and 15 MWh BESS Project;

(c) that Council be reminded that the chosen option and size of battery energy storage, as per the approved Feasibility Study by Council in August 2024, will unfortunately not contribute to the Municipality reducing Eskom loadshedding levels, but is projected to significantly contribute towards electricity costs savings to the Municipality and ratepayers; and

(d) that should no responsive bidders be found, it will result in the tender cancellation, whereafter Council will be informed.

23RD COUNCIL MEETING: 2024-06-14: ITEM 10.6.1

NOTED

The Alternative Energy Generation project updates identified by the AEG Committee and the latest progress with the Alternative Energy Generation projects in implementation at present.

"40TH COUNCIL MEETING: 2021-01-27: ITEM 11.5.1

RESOLVED (nem con)

(a) that Council approves the investigation into alternate methods of electricity generation and purchases.

(b) that Council approves the joint investigation to be done by University of Stellenbosch, Council for Scientific and Industrial Research (CSIR), and the Western Cape Government.

(c) that Council accepts the initiating of the following processes as may be required:

i. Municipal Systems Act, Section 78(1) processes

ii. Municipal Finance Management Act, Section 33 investigation processes

iii. Electricity Regulation Act, Section 13; and

(d) that Council considers the funding of such investigations and implementation of completed investigations within the determination of the 2021/22 budget process.

16TH COUNCIL MEETING: 2023-08-23: ITEM 11.6.3

NOTED

The progress of the Alternate Energy Generation initiatives and studies.

20TH COUNCIL MEETING: 2024-02-21: ITEM 11.6.1

NOTED

The Alternative Energy Generation strategies identified by the AEG Committee and the progress with the Alternative Energy Generation projects initiated.

6.7 Risks / Challenges: Implications and Mitigation:

The existing ICT network infrastructure is being upgraded in tandem with the SCADA project.

6.8 Comments from Senior Management:

6.8.1 Director: Corporate Services

The ICT department is part of the planning regarding the SCADA monitoring project. Additional staff must be appointed once the project of SCADA installation is completed to monitor the equipment. The organogram will have to be amended for this process.

6.8.2 Municipal Manager

Requested item on agenda.

RECOMMENDATION FROM THE EXECUTIVE MAYOR, IN CONSULTATION WITH THE EXECUTIVE MAYORAL COMMITTEE, TO COUNCIL: 2026-05-20: ITEM 7.6.1

that Council notes the latest progress with the Alternative Energy Generation projects in implementation at present.

10.8	PLANNING AND LOCAL ECONOMIC DEVELOPMENT AND TOURISM: (PC: CLLR T KUMM)

10.8.1	TO OBTAIN COUNCIL'S APPROVAL OF NEW DESIGNATED MOBILE FOOD AND COFFEE TRAILERS AND EXISTING INFORMAL TRADING SITES

Collaborator No: 805133
IDP KPA Ref No: Valley of Opportunity
Meeting Date: 20 May 2026 and 27 May 2026

1. SUBJECT: TO OBTAIN COUNCIL'S APPROVAL OF NEW DESIGNATED MOBILE FOOD AND COFFEE TRAILERS AND EXISTING INFORMAL TRADING SITES

2. PURPOSE

To provide feedback and obtain approval of new designated mobile and existing informal trading sites within the Stellenbosch municipal area.

3. DELEGATED AUTHORITY

Council.

4. EXECUTIVE SUMMARY

Mobile food and coffee trailers and informal traders, often referred to as street vendors or mobile food operators, play an important role in supporting local economic activity within towns. These enterprises contribute to the accessibility of goods and services, promote entrepreneurship and small business development, and add vibrancy to public spaces.

Informal trading is widely recognised as a catalyst for local economic development, providing livelihood opportunities and enabling emerging entrepreneurs to participate in the local economy.

In line with Council's commitment to support inclusive economic growth, additional potential sites for mobile and informal trading within the WC024 municipal area have been identified. These sites were advertised for public comment in accordance with Council's previous resolutions.

This report provides feedback on the process undertaken and seeks Council's approval for the designation of additional mobile and informal trading sites within the municipal area.

5. RECOMMENDATION

that Council approve the additional mobile food and coffee-trailer sites and the existing historical informal trading sites (see Table 2).

6. DISCUSSION / CONTENTS

6.1 Background

On 26 November 2025, Council approved the following:

Advertisement of the designated mobile and informal trading sites for public comment; and

A request to invite public proposals for additional potential mobile (e.g., food trucks) and informal trading (e.g., stalls, street vendors) sites for consideration.

The public participation period closed on 5 December 2025. Several new sites were proposed by the public, as detailed in Table 1 (shaded in grey). Some of these sites are historical in nature, where trading has occurred for years. It is therefore fitting to approve them alongside the new sites to legalise these longstanding operations.

The sites listed in Table 1 were extensively discussed with internal departments, including the Infrastructure and Community Services Directorates, as well as Cape Winelands District Municipality's health services.

The final recommended sites are listed in Table 2 for Council's consideration and approval.

The value that Informal Trading brings to the Municipality

Mobile food and coffee trailers and informal traders provide several benefits within municipal areas and have become an increasingly visible component of urban economies. These types of businesses contribute to the vibrancy of towns and enhance access to goods and services for residents and visitors.

Some of the key benefits include:

Accessibility

Mobile food and coffee trailers and informal traders bring goods and services closer to communities, making it more convenient for residents to access products without needing to travel long distances.

Entrepreneurship and Economic Participation

Informal trading provides opportunities for entrepreneurs to establish small businesses with relatively low start-up costs compared to conventional brick-and-mortar establishments. This contributes to job creation and supports inclusive economic growth.

Revitalisation of Public Spaces

Informal and mobile traders can activate underutilised public spaces by attracting pedestrian activity and contributing to vibrant and safe urban environments.

Tourism Enhancement

In many municipalities, informal and mobile trading adds to the character of local destinations and enhances the overall tourism experience.

Stellenbosch Municipality recognises the significant contribution of the informal sector to employment creation within the municipal area. As such, the Municipality seeks to support the development of emerging entrepreneurs while also providing opportunities for the growth and formalisation of existing traders.

The emergence of mobile businesses operating from vehicles or trailers represents an innovative form of economic participation, enabling traders to respond flexibly to areas of demand.

At the same time, informal trading requires appropriate municipal oversight to ensure alignment with urban planning, public health and safety standards, traffic management, and equitable access to trading opportunities.

PROPOSED NEW AND EXISTING SITES					
No	**Land/ Property**	**TOWN**	**Erf Number/Farm Number**	**Business Type Mobile (M) /Street Vendors (Sv)**	**Comments and objections by internal departments**
1	118 Merriman Ave, Stellenbosch	Stellenbosch	2156	M	The site will require a dedicated refuse removal arrangement. Illegal parking incidents have previously occurred in this area, which resulted in the installation of bollards. The identified space is not a designated parking bay. The exact trading area must be clearly demarcated and located away from the roadway to ensure public safety. A portion of the area falls within Jan Marais Park. Supported subject to compliance with the above conditions.
2	3 Park Road, Welgelegen Street	Stellenbosch	910	M	The area is not designated for parking, except during approved events. Refuse removal will remain the responsibility of the trader.

					The street is narrow and may create traffic and pedestrian movement constraints. Application not supported.
3	225 Banhoek Street	Stellenbosch	175/0	M	Application supported and approved
4	Corner of Bosman and Murray Street	Stellenbosch	1810	M	Application supported with conditions.
5	Corner of Crozier Street and Ryneveld street	Stellenbosch	6167	M	Written approval from Stellenbosch University should be obtained due to the site's close proximity to university property. Trading within the road reserve will not be permitted. Application not supported.
6	Corner of Victoria street and Ryneveld street	Stellenbosch	10849	M	Written approval from Stellenbosch University should be obtained due to the site's close proximity to university property. Trading on sidewalks and within the road reserve will not be permitted. Application not supported.
7	Corner of Soeteweide and Groeneweide Street	Stellenbosch	2243	M	Written approval from Stellenbosch University should be obtained due to

					the site's close proximity to university property. A red traffic line prohibits parking within this area. Placement of a trailer may obstruct motorists' line of sight and create road safety concerns. Application not supported.
8	Entrance to Academia	Stellenbosch	3385	M	The site is located on university-owned property. No trailer trading will be permitted within the road reserve. Application not supported.
9	Corner Banghoek Street / Cluver Road	Stellenbosch	2145	M &SV	Application supported and approved.
10	Hammanshand Road opposite Goldfields Hostel	Stellenbosch	3385	M	The exact location and extent of the proposed trading area must be clearly identified. The absence of dropped curbing may create traffic and accessibility concerns when traders move equipment on and off the curb. Application not supported.
11	Outside of Home Affairs	Stellenbosch	6590	M & SV	Application supported and approved.

12	Infront of the Engineering Building	Stellenbosch	3385	M	The proposed site raises both traffic and pedestrian safety concerns. There is insufficient parking or stopping space available for customers. Application not supported.
13	Kerk Street, Kylemore	Kylemore	696	SV	Confirmation is required as to whether adjacent residents have been consulted regarding trading activities in front of residential properties. The area lacks sufficient parking facilities. The site raises traffic and pedestrian safety concerns. The trading area must be clearly defined, and trading may not extend beyond the approved demarcated area. Adequate toilet and waste removal facilities must be arranged and maintained. Informal trading activities must cease should the area be required for Roads, Transport, or other Municipal purposes. Approved but with conditions.

14	Skool Street, Kylemore	Kylemore	620	SV	Application not supported
15	Maties Gym Parking	Stellenbosch	306/0	M	Application not supported
16	Old Paarl Road, Klapmuts	Klapmuts	81	SV	The site is situated on private property. The area is currently utilised as a truck stop. Notwithstanding the above, the location has historically been used as a trading site, with permits previously issued subject to approval from the church and surrounding businesses. Approved with conditions
17	Opposite Eden Forest	Stellenbosch	369/0	M	Approved, but with conditions.
18	Pniel Church Parking Helshoogte	Pniel	155	M & SV	The site is located on church property. Application not supported.
19	R301, Pniel	Pniel	1674/14	M & SV	Informal traders are currently operating at this location. The site capacity should be restricted to a defined number of traders. The site is located along a Provincial Road and may require additional approval from the relevant road authority.

					Application supported subject to conditions.
20	R44 Enroute to Strand	Stellenbosch	6084	SV	The site is located along a Provincial Road. The area has historically functioned as a trading site. Parking constraints have been identified at this location. Additional congestion occurs during school-related events when parents utilise the area for parking. Application supported subject to conditions, including a cap on the number of traders permitted.
21	Sidewalk, Entrance to the Traffic Department	Stellenbosch	6659	M & SV	A red traffic line is present outside the Traffic Department. Trading on the sidewalk will not be permitted. Application not supported.
22	Stellenbosch Traffic Department Grounds	Stellenbosch	6659	M	Application not supported.

23	Techno Park, Elektron Road	Stellenbosch	9190	M	The proposal should first be discussed with the Technopark Body Corporate. Trailer trading within the road reserve will not be permitted. Application not supported.
24	Corner of Suidwal Road and Piet Retief Road	Stellenbosch	309/4	SV	The site forms part of a public open space area. The location is directly opposite Spar. No formal demarcated trading site currently exists on the erf. Placement of trading infrastructure on the corner may obstruct visibility and create traffic safety concerns. Application not supported.

25	Paul Roos Prima Nova Residence (Opposite the Bridge)	Stellenbosch	16499	M	The site forms part of a public open space area. The site will require a dedicated refuse removal arrangement. The exact trading area must be clearly demarcated and located away from the roadway to ensure public safety. Application supported with conditions.
26	Old FNB, Franschhoek (Opposite Woolworths)	Franschhoek	232	SV	Application supported and approved.
27	Die Braak	Stellenbosch	670	M & SV	The application will not be considered.
28	Dorp Street	Stellenbosch	State land	M & SV	The application will not be considered.
29	Trumali House Area / R44 Schuilplaats Road	Stellenbosch	396/0	This is an existing municipal structure.	This site was referred to Property Management for consideration as it falls outside Informal Trading.
30	Hangbrug	Stellenbosch	3593	M	The site forms part of a public open space area. The site will require a dedicated refuse removal arrangement. The exact trading area must be clearly demarcated and located away

					from the roadway to ensure public safety. Application supported with conditions.

Table 2: Recommended Sites for Council Approval

RECOMMENDED SITES FOR COUNCIL'S CONSIDERATION				
No	**Land/ Property**	**TOWN**	**Erf Number/Farm Number**	**Business Type Mobile (M) /Street Vendors (SV)**
1	118 Merriman Ave, Stellenbosch	Stellenbosch	2156	M
2	225 Banhoek Street	Stellenbosch	175/0	M
3	Corner Banghoek Street / Cluver Road	Stellenbosch	2145	M &SV
4	Outside of Home Affairs	Stellenbosch	6590	M & SV
5	Kerk Street, Kylemore	Kylemore	696	SV
6	Old Paarl Road, Klapmuts	Klapmuts	81	SV

10	Old FNB, Franschhoek (Opposite Woolworths)	Franschhoek	232	SV
11	Corner of Bosman and Murray Street	Stellenbosch	1810	M
12	Paul Roos Prima Nova Residence (Opposite the Bridge)	Stellenbosch	16499	M
13	Hangbrug	Stellenbosch	3593	M

6.2 Financial Implications

There are no additional financial implications, other than the cost for the placement of the advertisement.

6.3 Legal Implications

The recommendations in this report comply with Council's policies and all applicable legislation.

6.4 Staff Implications

The Department will implement the necessary administrative and operational mechanisms to facilitate the allocation and monitoring of trading permits associated with the designated sites.

This includes coordination between the relevant municipal departments to ensure compliance with permit conditions, effective site management, and ongoing oversight of trading activities.

6.5 Previous / Relevant Council Resolutions:

35TH COUNCIL MEETING: 2025-10-23: ITEM 10.8.1 RESOLVED (nem con)

(a) that Council approves the advertisement of the designated mobile and informal trading sites for public comment; and

(b) that Council approves the request to invite the public to propose any further additional potential mobile (e.g. food trucks) and informal trading (referred to as stalls, street vendor) sites for consideration.

The 17th Council meeting: 2014-01-16: Item 7.7 resolved

a) that Council support the initiative to amend the by-laws for the Supervision and Control of the Carrying on of Business of Street Vendor, Pedlar or Hawker;

b) that the decision to amend the above-mentioned By-law be advertised for public comment (internally and externally) before the final decision is made by Council.

On the 9th Council Meeting dated 2022-11-23: ITEM 11.9.1 Council resolved as follows:

a) that Council approves the request of the Directorate: Planning & Economic Development for the pilot period of one (1) year in order to issue permits to informal traders using mobile units to trade within pre-determined areas in accordance with the terms and conditions;
b) that Council approve that such mobile informal trading also be allowed on the premises of the Stellenbosch Municipality`s Traffic Department (Stellenbosch), Jan Marais Park, or any other identified municipal property, with approval from the user Department of such property; and

c) that the Section: Economic Development & Tourism in consultation with the Director: Community & Safety Services and Directorate: Infrastructure Services allocate such trading bays and areas within the premises of the Traffic Department (Stellenbosch) or any other pre-determined areas.

18TH COUNCIL MEETING: 2023-11-29: ITEM 11.8.6

RESOLVED (nem con)

That Council approves the extension of the Mobile Trading Pilot as approved in Council on 23 November 2022 for another year.

6.6 Risk Implications

The Municipality is currently strengthening its monitoring and administrative capacity through the **implementation of an Informal Trading Administration Management System (ITAMS)**, an electronic platform designed to improve the management of informal trading permits and trading sites.

The ITAMS system will enable traders to:

- Submit permit applications electronically;
- Log service requests or operational concerns relating to trading sites;
- Facilitate improved communication between traders and the Municipality.

From a municipal management perspective, the system will enhance:

- Monitoring of trading permits and compliance with permit conditions;
- Efficient administration of trading site allocations;
- Improved response times to operational issues raised by traders.

The introduction of ITAMS will therefore present an opportunity to strengthen oversight, improve service delivery, and support a more transparent and efficient informal trading management system within the Municipality.

6.7 Comments from Senior Management:

6.7.1 *Director: Planning and Economic Development*

Agree with the recommendations.

RECOMMENDATION FROM THE EXECUTIVE MAYOR, IN CONSULTATION WITH THE EXECUTIVE MAYORAL COMMITTEE, TO COUNCIL: 2026-05-20: ITEM 7.8.1

that Council approve the additional mobile food and coffee-trailer sites and the existing historical informal trading sites (see Table 2).

MUNICIPAL NOTICE: 189/2025
PUBLIC PARTICIPATION: PRE-DETERMINED AND ADDITIONAL SITES FOR MOBILE AND INFORMAL TRADING IN THE STELLENBOSCH MUNICIPAL AREA

Notice is hereby given that Stellenbosch Municipality invites the public to submit comments on the identified pre-determined sites, as well as proposals for additional sites, for mobile and informal trading within the Stellenbosch Municipal area.

Members of the public who wish to propose additional sites must clearly indicate their proposals on a locality plan, obtainable from the Municipality.

Written comments and/or proposals must be submitted on or before 5 December 2025 to the following officials:

Carmen.Saville@stellenbosch.gov.za

Sharon.Pedro@stellenbosch.gov.za

Copies of the locality plans showing the pre-determined sites are available for inspection during office hours at the Local Economic Development Office, NPK Building, corner of Ryneveld and Plein Street, Stellenbosch. The plans are also accessible on the Stellenbosch Municipality website at www.stellenbosch.gov.za and will remain available for a period of thirty (30) days from the date of publication of this notice.

Please note that late submissions will not be considered, and all comments must be submitted in writing.

For any enquiries, please contact the officials via the email addresses provided above.

ANNEXURE 2

Proposal Submission: Public Participation - Mobile and Informal Trading Sites in the Stellenbosch Municipal Area
In Response to Municipal Notice 189/2025

Submitted by:
Juandré Kruger
Resident of Stellenbosch
Former South African International Rugby Player
+27 82 662 3534
ceo@eyelaserclinic.co.za

1. Introduction

My name is **Juandré Kruger**, a proud **resident of Stellenbosch** for many years and a former international rugby player who has dedicated much of my career to building communities through sport and teamwork.
After 17 years representing South Africa professionally, I have settled in Stellenbosch with my family and am committed to supporting the town's responsible growth. My focus is on creating strategic job opportunities, connecting communities, and revitalising unused public areas so that families, students, and residents can enjoy safe, vibrant spaces rather than leaving municipal properties underutilised.
This proposal is submitted in response to Municipal Notice 189/2025, which invites public participation and proposals for mobile and informal trading sites within the Stellenbosch Municipal Area.

2. Purpose of Submission

The purpose of this submission is to:

1. Request permission for the temporary or pilot use of two currently unused municipal sites for community activation and small-scale informal trading.
2. Request guidance and documentation on the relevant approval processes, zoning conditions, and trading permissions applicable to mobile or semi-permanent public-use sites.
3. Enquire whether the Eerste Rivier structure project has been formally approved and may serve as a precedent for this initiative. Furthermore, I would like to know whether this approval is publicly accessible, and if an example or framework could be shared for reference to assist in strategic planning and compliance alignment for this proposal.
4. Identified Municipal Sites

Site A – Paul Roos Prima Nova Residence (Opposite the Bridge)

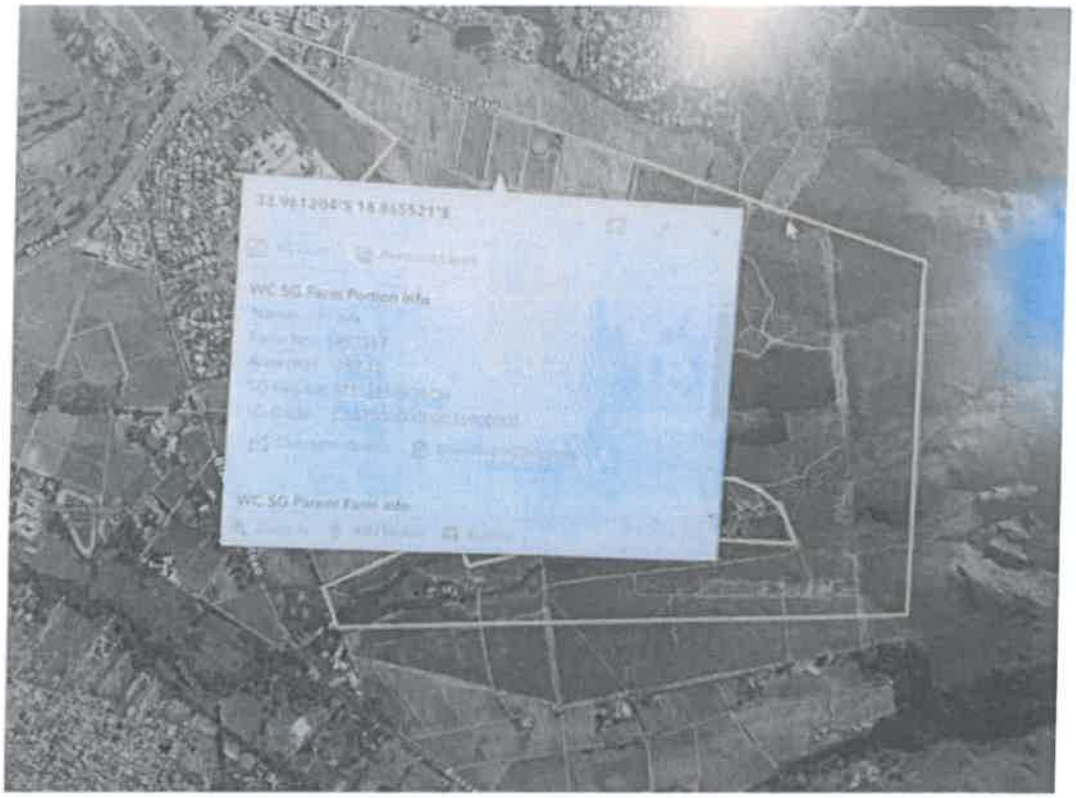
- Location: –33.940926, 18.862785
- Current Condition: Vacant municipal verge, partly fenced, with irregular parking and no active use.
- Proposal:

– Install a mobile coffee/snack kiosk with simple shaded seating. – Employ 2–4 local residents.
– Maintain cleanliness, landscaping, and security.

Objective: Transform an idle corner into a welcoming social node serving parents, students, active outdoor people, and visitors in the Paul Roos area.

Site B – Trumali House Area / R44 Schuilplaats Road

- Location: –33.958046, 18.857222
- Property Reference: Farm Portion RE/369, Stellenbosch (±289.15 ha)
- Current Condition: A deteriorating unused structure and surrounding open land, fenced with limited informal use.



Proposal:

– Revive and repurpose the existing structure through restoration and beautification.
– Develop a small community café or mobile trading hub with outdoor seating and local art displays.
– Employ and train local residents.

Objective: To revitalise this neglected municipal structure into a safe, vibrant, and economically active community space - one that promotes local entrepreneurship, encourages foot traffic, and enhances the surrounding area's aesthetic and social value. The goal is to create a sustainable model of urban renewal that fosters pride, safety, and opportunity for the people of Stellenbosch.

WC SG Farm Portion info
WC SG Parent Farm info

4. Motivation and Community Value

– Job Creation: Generate direct and indirect employment for local residents.
– Community Activation: Convert underused land into safe, inclusive spaces.
– Urban Renewal: Enhance visual appeal and reduce dereliction.
– Tourism and Lifestyle Value: Provide clean, welcoming spaces for locals and visitors.
– Environmental Care: Maintain regular cleaning and waste management.

These projects align directly with the Municipality's vision of sustainable, inclusive, and economically beneficial urban development.

5. Financial and Long-Term Considerations

I fully acknowledge that all development and activation initiatives involve costs and long-term considerations. It is in the best interests of both the Municipality and all involved parties to approach these opportunities with a clear framework that ensures:
– Risk mitigation through structured approvals and regulatory compliance.
– Financial sustainability so setup, maintenance, and safety costs are responsibly managed.
– Long-term planning that delivers ongoing community benefits rather than short-term solutions.
By collaborating transparently and obtaining the appropriate permissions early, we can reduce risk, avoid duplication, and create a sustainable model for future site activations across Stellenbosch.

6. Requests to the Municipality

1. Grant approval in principle for the proposed use of the two identified municipal sites for mobile and informal trading.
2. Provide the official application templates and documentation required for these approvals.
3. Identify the relevant departments responsible for zoning, safety, and trading compliance.
4. Consider granting a long-term approval for the use of the identified sites, together with a first right to renew or extend such approval upon review of compliance and continued community benefit. This approach would ensure sustainability, investor confidence, and continuity, while protecting the initiative from potential political or administrative changes that could disrupt community progress.
5. Confirm whether the Eerste Rivier activation was approved under this same framework, and whether the documentation or process can be shared for strategic alignment and planning purposes.
I commit to full compliance with all municipal regulations, including health, safety, environmental, and operational standards.

7. Conclusion

As a long-standing Stellenbosch resident, I believe in partnership between citizens and the Municipality to enhance our shared spaces.
By transforming unused or deteriorating municipal areas into clean, safe, and economically active micro-hubs, we can create jobs, instil civic pride, and connect communities through positive and sustainable initiatives.
I respectfully request the opportunity to engage further with the Municipality to finalise the approval pathway for this initiative - ensuring it aligns with both policy compliance and long-term community benefit.

Sincerely,
Juandré Kruger
Resident – Stellenbosch

I would like to express my objection to the return of the Dorp Street market.

I'm not against any market, but the location is inconvenient and disruptive.

As a cyclist, my safety is my concern, as a user of Dorp Street and surrounding areas, especially on Sundays. Dorp Street is already dangerous as is on weekdays and during peak traffic.

Good afternoon,

Please re-add predetermined stalls along Dorp street previously hosting the Dorp Street Sunday market as this was a favourite for so many Stellenbosch residents and was a must-do whenever I had friends or family visiting from other provinces and overseas. Nothing beats walking through the Sunday Market and then supporting the local businesses in the area.

Regards,
S Elson

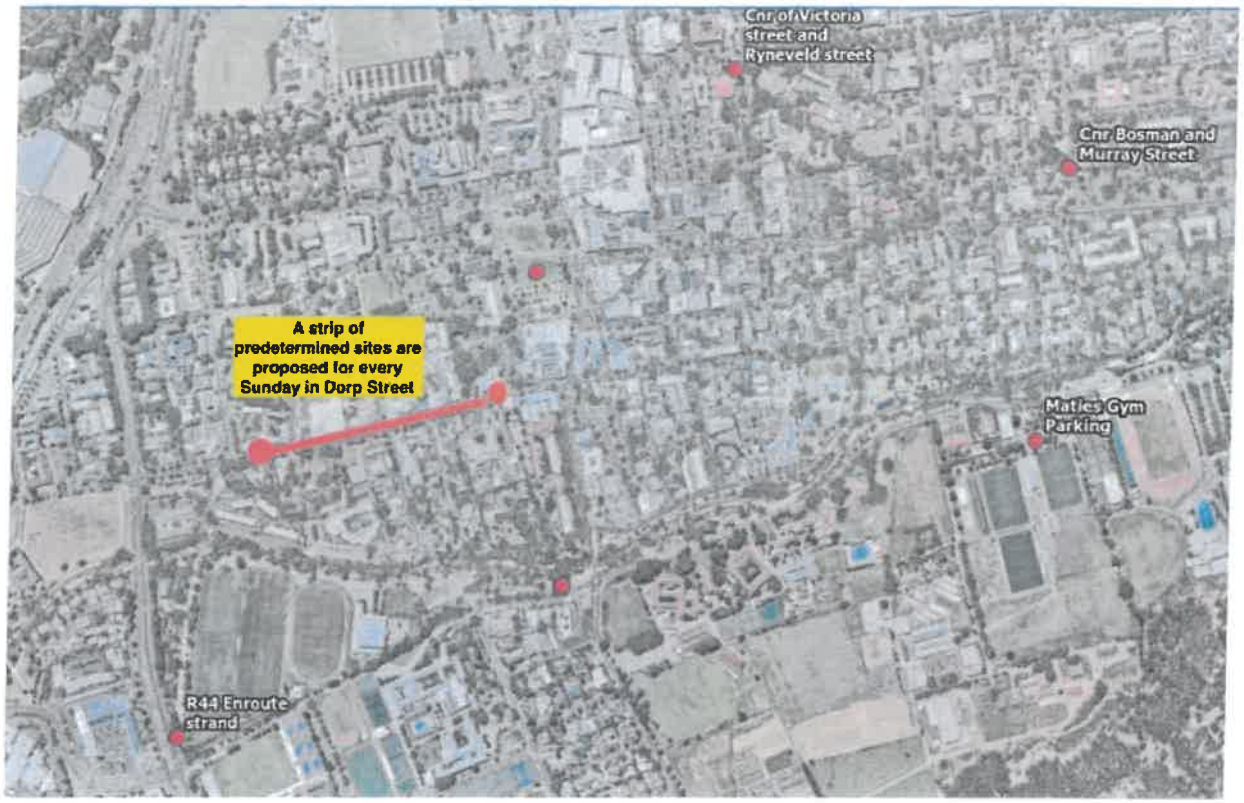
RE: NOTICE 189/2025



An invitation for the public to comment on the identified pre-determined sites for mobile and informal trading in the Stellenbosch municipal area was advertised. The notice also calls for proposals for additional sites.

• The Stellenbosch Interest Group (SIG) is generally in agreement with the proposed distribution of trading sites, but we remain concerned about the lack of detail regarding what will be permitted at the Braak (one of the identified locations). Simply stating that sites are allocated for trading is insufficient. What type of goods or activities will be allowed? How will traders be selected and permits issued? What will the trading hours and trading days be?

• SIG strongly urge the municipality to heed the overwhelming public support for allowing trading sites in Dorp Street on Sundays only, as illustrated in the photograph below. Before the Dorp Street Sunday Market was unceremoniously discontinued by the municipality, it attracted thousands of visitors every Sunday, providing a significant financial boost to surrounding businesses. It created a vibrant, unique atmosphere and added real value to the town on Sundays. In contrast, Dorp Street is now extremely quiet on Sundays.

Regards

Claire Erasmus

10.8.2	APPROVAL OF THE REVISED AND UPDATED INTEGRATED CAPITAL EXPENDITURE FRAMEWORK, 2025/2026

Collaborator No: 805134
IDP KPA Ref No: Valley of Opportunity
Meeting Date: 20 May 2026 and 27 May 2026

1. SUBJECT: APPROVAL OF THE REVISED AND UPDATED INTEGRATED CAPITAL EXPENDITURE FRAMEWORK, 2025/2026

2. PURPOSE

To request Council approval to approve the revised and updated Integrated Capital Expenditure Framework, 2025/2026 ("CEF").

3. DELEGATED AUTHORITY

Council

4. EXECUTIVE SUMMARY

The purpose of the report is to provide Council with the pertinent facts to approve the Revised and Updated Integrated Capital Expenditure Framework ("CEF"), 2025/2026 as part of the SDF / IDP / Budget, as prescribed in terms of:

- Sections 29 of the Municipal Systems Act (Act 32 of 2000) ("MSA");
- Section 21(1) of the Municipal Finance Management Act (Act 56 of 2003) ("MFMA") and;
- Section 21 of the Spatial Planning and Land Use Management Act (Act 16 of 2013 ("SPLUMA").

5. RECOMMENDATION

that Council **approves** the Revised and Updated Integrated Capital Expenditure Framework ("CEF"), 2025/2026, attached as **APPENDIX 1** to this report.

6. DISCUSSION / CONTENTS

6.1 BACKGROUND

As an intermediary city, Stellenbosch Municipality qualifies for the Integrated Urban Development Grant ("IUDG"). The IUDG requires the municipality to compile a Capital Expenditure Framework ("CEF") and to revise it on a regular basis. The CEF is referred to as a key component of the Municipal Spatial Development Framework ("MSDF") in the Spatial Planning and Land Use Management Act (Act 16 of 2013) ("SPLUMA"). Section 21(n) of SPLUMA specifically states that a MSDF must determine a CEF for the municipality's development programmes, depicted spatially. The legislative context is within the realm of municipal planning and relates specifically to Integrated Development Plans ("IDPs"), MSDFs, and the Municipal Budget.

6.2 DISCUSSION

The final Amended MSDF, 2023 adopted by Council on 27 June 2023 included the CEF as required in terms of section 21(n) of SPLUMA. The CEF is a planning tool that aims to ensure the capital infrastructure planning and municipal budgeting is aligned to the spatial strategies and proposal set out in the Council adopted MSDF. Specifically, the outcome of a CEF process is a 10-year capital portfolio of

infrastructure investments that are prioritised according to the municipality's spatial vision, infrastructure planning, and financial objectives; affordable for the municipality (based on the Long-Term Financial Plan and Strategy); and spatially aligned to the MSDF. The implementation of this portfolio of infrastructure investments will assist the municipality in achieving the implementation of the Amended MSDF, 2023 which sets the spatial transformation agenda.

The CEF is used as the primary instrument for grant qualification in the application for IUDG funding by the municipality in addition to the governance criteria set out for ICM's which includes the revision on a regular basis. To continue benefitting from the IUDG funding, the CEF adopted as part of the Amended MSDF, 2023 needs to be reviewed and updated. The municipality accordingly appointed a service provider to review and update the components contained in the CEF report. The updated and reviewed CEF has been completed and was advertised for public participation in line with the SDF / IDP / Budget Time Schedule / Process Plan process. The closing date for the public participation on the draft document closed on 28 April 2026 and **no comments** were received. Accordingly, no amendments are required to the document and the final Revised and Updated Integrated Capital Expenditure Framework (CEF), 2025/2026 is recommended for approval by Council.

6.3 FINANCIAL IMPLICATIONS

There are no financial implications.

6.4 LEGAL IMPLICATIONS

The recommendation in this report complies with the requirements of the legislation on the adoption of the revised and updated Integrated Capital Expenditure Framework as part of the SDF / IDP / Budget.

6.5 STAFF IMPLICATIONS

No additional staff implications.

6.6 PREVIOUS / RELEVANT COUNCIL RESOLUTIONS

39th COUNCIL MEETING: 2026-03-31: ITEM 8.4

RESOLVED (nem con)

(a) that Council approves the Revised and Updated Integrated Capital Expenditure Framework, as set out in **APPENDIX 1** for public release;

(b) that Council specifically takes note of the Long-Term Financial Plan that contains the management principles for sound financial management that was considered for the compilation of the ten-year capital expenditure programme as set out in **APPENDIX 1 – APPENDIX 7**.

SPECIAL COUNCIL MEETING: 2025-08-08: ITEM 8.1

RESOLVED (majority vote with 1 abstention)

(c) That Council adopts the SDF / IDP / Budget Time Schedule / Process Plan for 2026/27 for the compilation of the annual budget in terms of Section 21(1) of the MFMA and Section 29 of the MSA to guide the planning, drafting, and adoption of the 4th review of the 5th Generation IDP 2022 – 2027, attached as Annexure A; and

(d) That advertisement is placed on the official website of the municipality and in the local newspaper, notifying the public of the adopted SDF / IDP / Budget Time Schedule / Process Plan for 2026/27.

SPECIAL COUNCIL MEETING: 2023-06-27: ITEM 10.4

RESOLVED (majority vote with 5 abstentions)

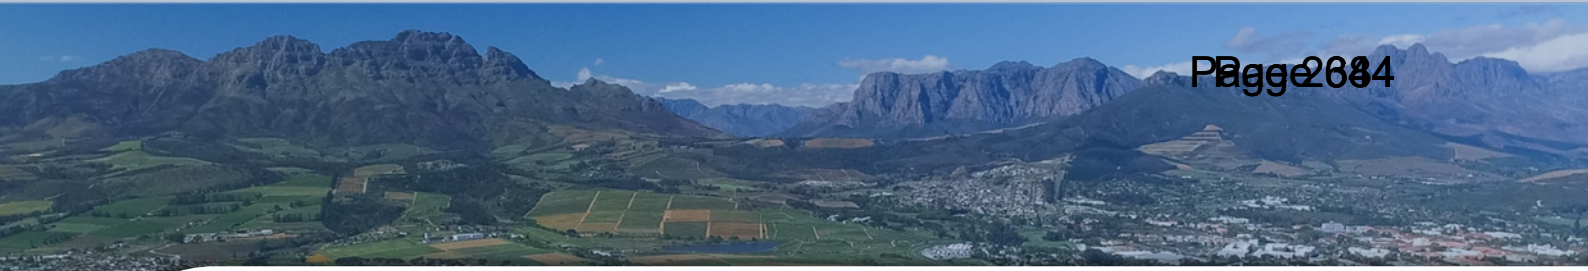
(a) That Council takes note of the feedback from the public participation process, which commenting period closed on 30 May 2023; copies attached as Appendix 2, 3, and 4 of this report;
(b) That Council supports and approves the recommendations contained in the comments and responses tables, copies attached as Appendix 3 and 4 to this report;
(c) That Council approves and adopts the Amended Municipal Spatial Development Framework, 2023 (MSDF), including the Capital Expenditure Framework (CEF), copy attached as Appendix 1 for the subsequent promulgation in terms of the relevant legislation; and
(d) That Council approves that the Amended Municipal Spatial Development Framework, 2023 (MSDF), including the Capital Expenditure Framework (CEF), form part of the updating and amending of the Integrated Development Plan (IDP).

6.7 RISK IMPLICATIONS

The risks are addressed in the item content.

RECOMMENDATION FROM THE EXECUTIVE MAYOR, IN CONSULTATION WITH THE EXECUTIVE MAYORAL COMMITTEE, TO COUNCIL: 2026-05-20: ITEM 7.8.2

that Council **approves** the Revised and Updated Integrated Capital Expenditure Framework ("CEF"), 2025/2026, attached as **APPENDIX 1** to this report.



APPENDICES

Appendix 1: Revised and Updated Capital Expenditure Framework, 2025/2026.

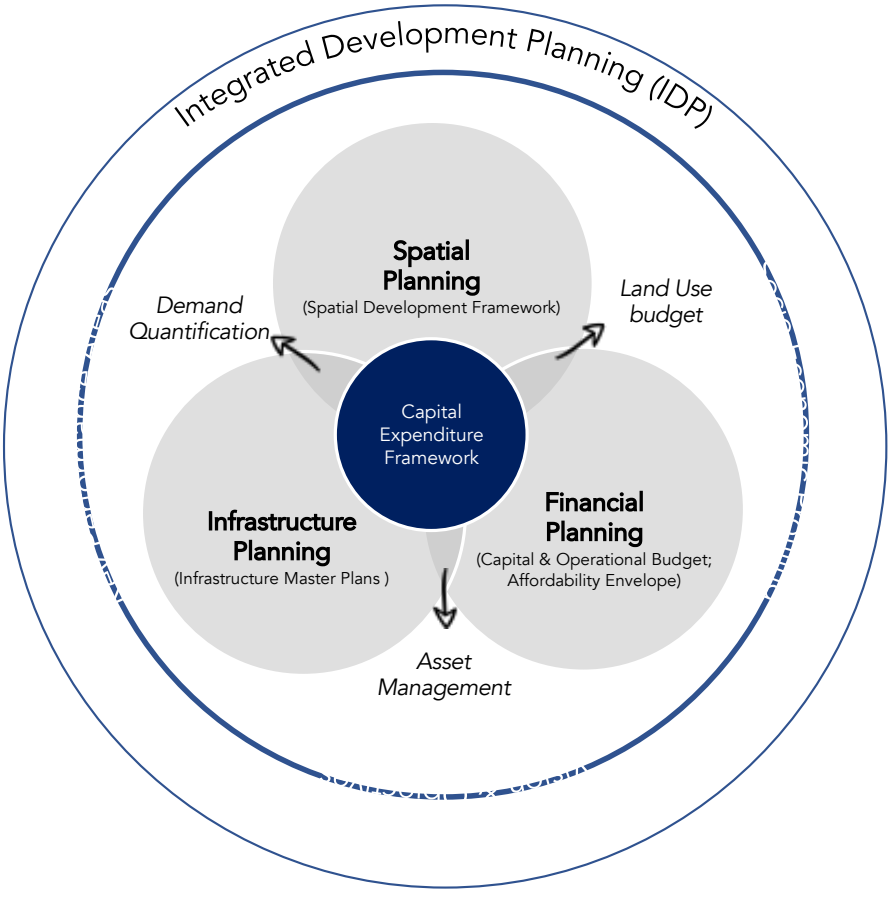
Introduction

1 Introduction



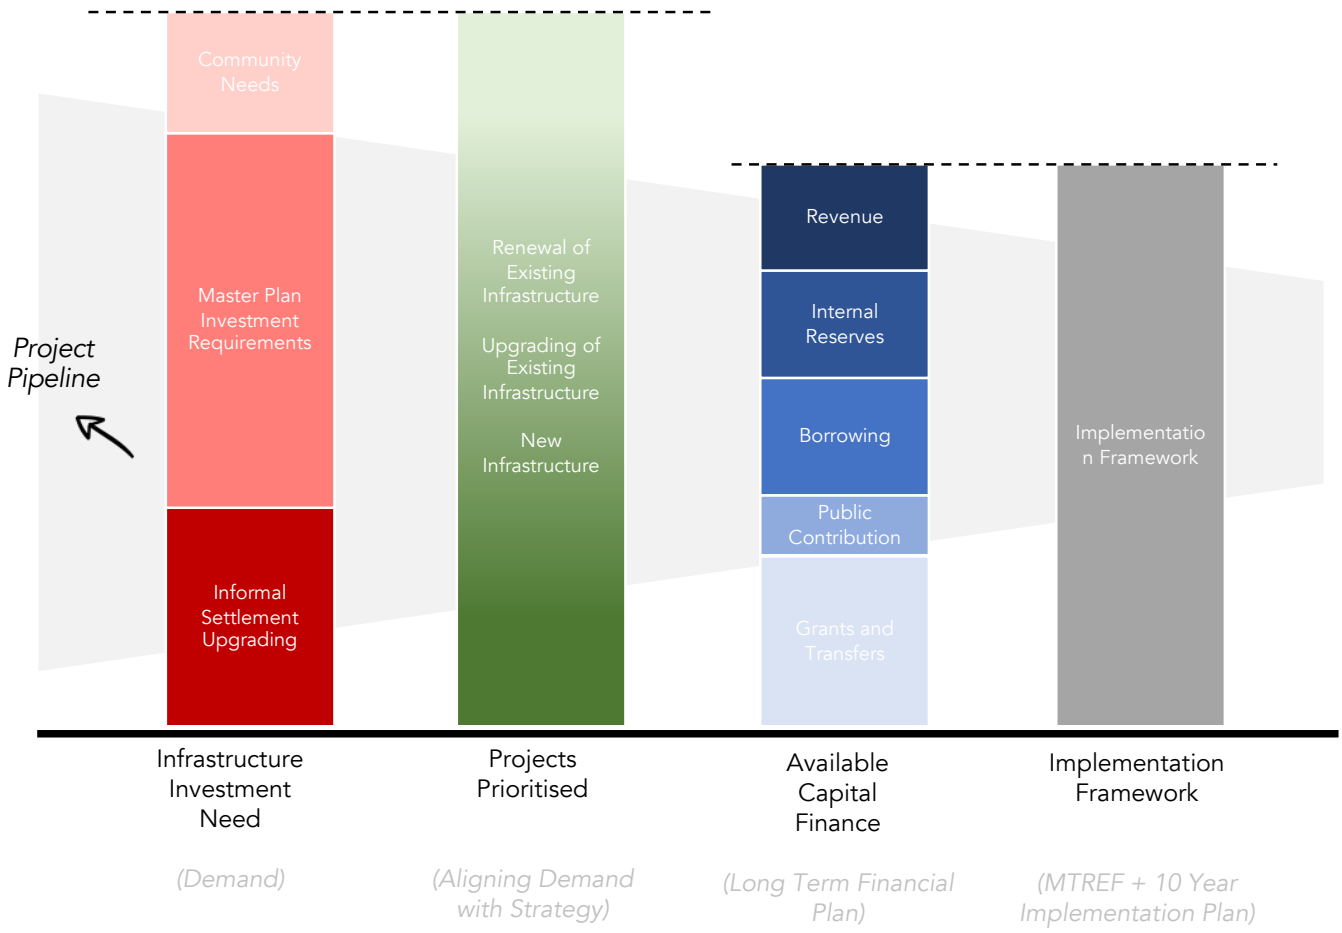
1.1 What is a Capital Expenditure Framework

According to the Department of Cooperative Governance and Traditional Affairs (COGTA) guidelines, a Capital Expenditure Framework (CEF) is a consolidated, high-level view of a municipality's long-term infrastructure investment needs. It ensures that infrastructure priorities are spatially aligned with municipal strategic objectives, budgetary realities, and development plans. The framework is grounded in principles of sustainability, financial feasibility, and strategic alignment, balancing immediate infrastructure needs with long-term development goals, the relationships between these spheres of planning and principles is illustrated in Figure 1–1.

The Spatial Planning and Land Use Management Act, 2013 (SPLUMA) mandates the inclusion of a CEF within a municipality's Spatial Development Framework (SDF). Specifically, Section 21(n) of SPLUMA requires that an SDF "determine a Capital Expenditure Framework for the municipality's development programmes, depicted spatially." This legislative requirement underscores the importance of integrating spatial planning with financial planning, ensuring that the spatial strategies articulated in the SDF are implemented through practical and affordable infrastructure investments.

A Capital Expenditure Framework links spatial development strategies with budgetary constraints and infrastructure demands. It provides a transparent mechanism for prioritising projects, promoting the efficient allocation of resources, and aligning capital expenditure with the municipality's long-term strategic vision.

Figure 1–1: The Capital Expenditure Framework within the built environment context



1.2 Aim of Capital Expenditure Framework

The aim of a Capital Expenditure Framework (CEF) is to create a structured and strategic approach to municipal infrastructure expenditure. The CEF is intended to align the municipality's spatial development strategies with its financial resources and capacity, ensuring that long-term growth and development objectives are achievable, and informs operational activities of a municipality.

A CEF aims to provided a municipality with the means to inform financial planning with infrastructure planning and spatial priorities identified in the Spatial Development Framework (SDF). It aims, furthermore, to establish a clear methodology for municipalities to evaluate, prioritise, and inform implementation processes of infrastructure projects within their affordability envelope, supporting both immediate and long-term development goals.

From Figure 1–2one can see the illustration that infrastructure investment need, expressed as projects, usually exceeds available capital finance, and therefore it is an imperative for municipalities to partake in a prioritisation process to determine which projects are best aligned with the strategy of the municipality, together with a budget scenario process to determine which projects are affordable and should be implemented when.

Figure 1–2: Relationship between infrastructure investment needs, affordability envelope, prioritisation process, and budget scenario process

1.3 Objectives of Capital Expenditure Framework

The key objectives of a CEF is to:

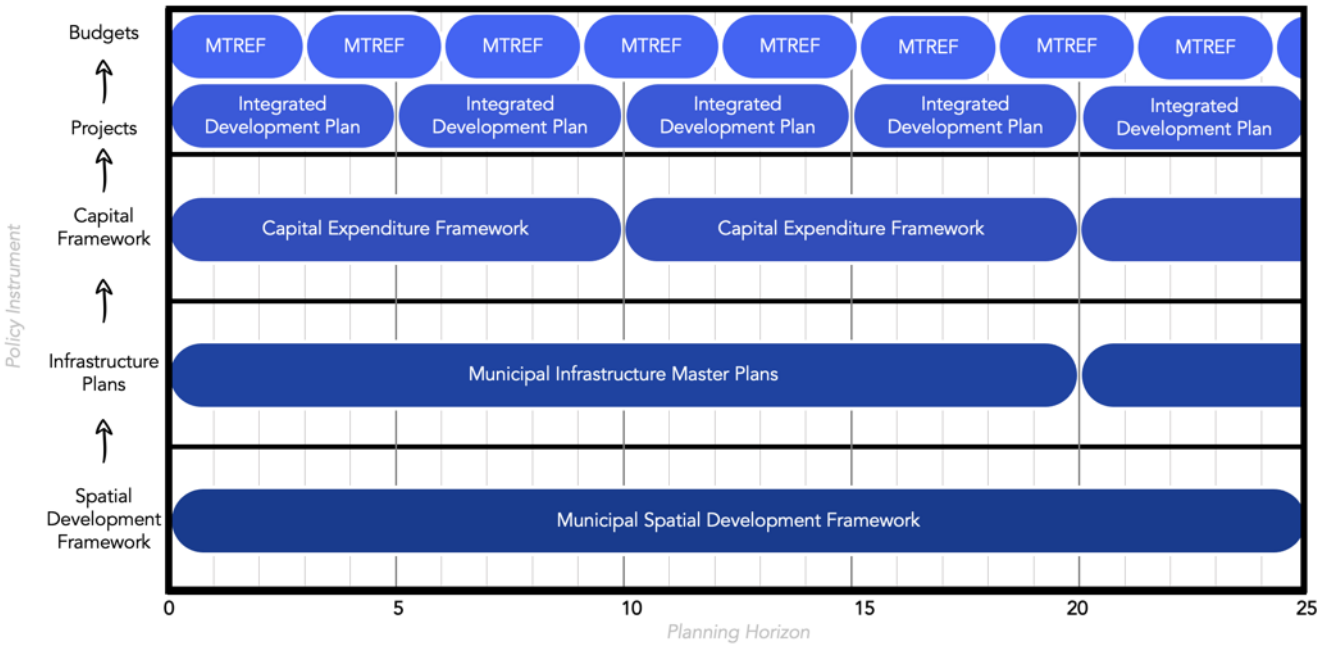
- Socio-economic trends: Understand the socio-economic trends in a municipality over the long term;
- Quantify Infrastructure Needs: Assess and detail the municipality's long-term infrastructure requirements based on an SDF-informed land use budget, infrastructure standards, anticipated socio-economic growth, existing infrastructure, and backlogs;
- Align with the Spatial Development Framework (SDF): Translate the spatial vision and strategic priorities outlined in the SDF into priority development areas which informs prioritisation practices;
- Consolidate Infrastructure Demand: Create a comprehensive list of infrastructure projects across various sectors in line with the municipality's mandate, reflecting the municipality's overall infrastructure demands;
- Contextualise Financial Affordability: Integrate the municipality's affordability envelope, derived from the Long-Term Financial Model (LTFM), to ensure infrastructure expenditure are financially sustainable over the planning horizon;
- Facilitate Prioritisation: Establish a framework to evaluate and rank projects based on strategic alignment, socio-economic impact, and spatial targeting amongst others, ensuring that resources are allocated to the most critical and impactful projects;
- Determine a Budget Scenario: Offer a structured, evidence-based approach to infrastructure planning and budgeting, improving decision-making processes and accountability to stakeholders - amongst others, to indicate project-level responses per asset type per functional area;
- Enable Spatial Transformation: Direct infrastructure investments toward spatial transformation goals, focusing on reducing inequalities, improving access to services, and promoting inclusive economic growth, and;
- Bridge Short-Term and Long-Term Planning: Ensure a coherent link between the short-term MTREF cycles, Medium-term Integrated Development Plan (IDP) cycles and the municipality's long-term development vision, embedding sustainability and foresight into the planning process.

1.4 Role of the Capital Expenditure Framework as a policy instrument

The Capital Expenditure Framework (CEF) is a cornerstone of municipal planning, grounded in South Africa's legislative framework and designed to bridge the gap between long-term spatial development strategies and actionable infrastructure expenditure. The concept of the CEF was formalised under the Spatial Planning and Land Use Management Act (SPLUMA, Act 16 of 2013), specifically in Section 21(n), which mandates municipalities to determine a spatially referenced CEF as part of their Spatial Development Framework (SDF). This legislative requirement reflects the increasing emphasis on aligning planning and budgeting processes to address developmental challenges effectively.

Historically, the Constitution of South Africa laid the foundation for this alignment in Section 153, which directs municipalities to prioritise the basic needs of communities while promoting socio-economic development through structured planning and budgeting. The Integrated Development Plan (IDP) was

introduced as a mechanism to achieve this in the Local Government Transition Act (Act 209 of 1993), evolving through subsequent legislation, including the Municipal Systems Act (MSA, Act 32 of 2000). The MSA established the IDP as the principal planning instrument of local government, requiring it to incorporate a comprehensive financial plan and a Spatial Development Framework. This integration ensures that municipal resources are allocated effectively to achieve the long-term developmental vision.



The CEF builds on these legislative imperatives by operationalising the SDF within the IDP framework. As a long-term (10-year) planning tool, the CEF quantifies infrastructure needs, consolidates them into prioritised project pipelines, and aligns them with the municipality's financial capacity as outlined in the Long-Term Financial Plan (LTFP). It ensures that infrastructure investments are not only spatially targeted but also financially sustainable, bridging the divide between visionary spatial strategies and practical implementation.

The CEF also plays a vital role in South Africa's Local Government Accountability Cycle, a governance framework defined by the Municipal Finance Management Act (MFMA, Act 56 of 2003). This cycle integrates planning, budgeting, and reporting processes to ensure transparency, accountability, and alignment with development priorities. Through informing the IDP, and so the Medium-Term Revenue and Expenditure Framework (MTREF), as well as the Service Delivery and Budget Implementation Plan (SDBIP), the CEF enables municipalities to stabilise their decision-making processes. It provides a consistent rationale for allocating resources, ensuring that both short-term operational needs and long-term developmental objectives are addressed.

Importantly, the CEF institutionalises long-term planning practices within municipalities. It encourages decision-makers to adopt a forward-looking perspective that considers future growth patterns, socio-economic trends, and financial constraints. This approach reduces the reactive nature of municipal budgeting, replacing it with proactive, evidence-based strategies that support equitable service delivery and spatial justice.

The CEF is a transformative policy instrument that integrates spatial, financial, and infrastructure planning within the legislative and operational frameworks of municipal governance. It strengthens the IDP as the single most strategic document of municipalities, ensures alignment with the SDF, and guides resource allocation through the MTREF and SDBIP. Through its structured and integrated approach, the CEF enables municipalities to achieve their developmental mandates while ensuring financial sustainability and fostering spatial transformation.

Figure 1–3: The relationship between policy instruments effecting the spatial form

1.5 Structure of this Capital Expenditure Framework

The structure of this report is outlined below to guide the reader through the key components of the Capital Expenditure Framework (CEF) and its alignment with municipal planning processes as well as the norms and standards of the CEF.

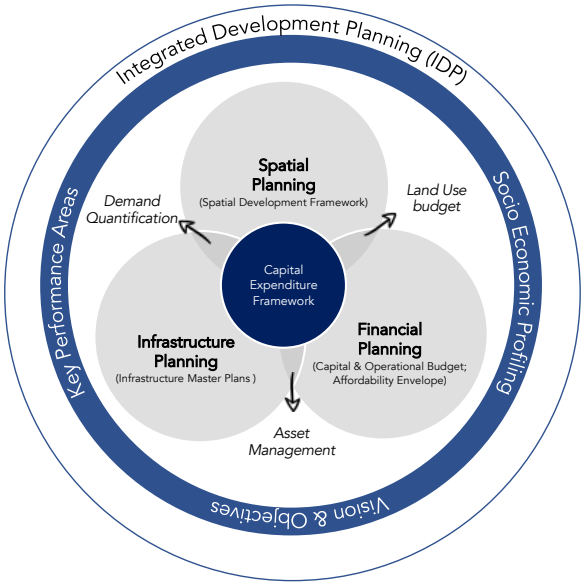
Table 1-1: Structure of this Capital Expenditure Framework

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 1: Inception and Information Gathering	Phase 1	To provide a contextualisation to the Capital Expenditure Framework. This phase comprises the inception process of the CEF as well as the information gathering process in which a comprehensive integrated infrastructure investment framework, or portfolio of projects, is collated.
Part 2: Functional Area and Spatial Category for Investment Planning Profiling and Spatial Demand Quantification	Phase 2a	This part introduces functional areas for priority investment which are defined and mapped to indicate the spatial strategy depicted in the MSDF (linked to the MSDF proposals). The identified functional areas are used to determine the future population, housing, and land demand based on existing socio-economic and related data which is used in the spatial demand quantification component.
Part 3: Infrastructure demand	Phase 2b	This part determines the investment requirements for each functional area, including operational and maintenance costs per asset class. The goal is to compare the optimal infrastructure requirements scenario with the known infrastructure demand based on current planning frameworks.
Part 4: Affordability Envelope	Phase 3	This part is a reflection of the municipality's financial health and long-term financial plan. Primarily it includes the results of the re-application of the long-term financial plan to determine the appropriate affordability envelope.
Part 5: Prioritisation and Budget Scenario	Phase 4	This part has a prioritisation framework that considers spatial, engineering, and financial factors to calculate a composite score indicating each project's relative importance in the pipeline. It also applies this framework to the budget fit process to determine how to allocate capital within the affordability envelope per project for the next 10 years.

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 6: Capital Expenditure Programme	Phase 5	This part is a breakdown of the 10-year capital expenditure framework. Essentially, it analyses the fitted project pipeline in terms of spatial alignment, asset type alignment, and other attributes to ultimately verify that the 10-year capital expenditure framework is in line with the strategic intent of the prioritisation framework and the MSDF objectives.
Part 7: Institutional Arrangements and Project Closeout	Phase 6	This phase comprises of a concluding chapter to the CEF, this part aims to identify areas of enhancement that will render the CEF not only as a compliance document but to solidify institutional change around the alignment of planning, engineering, and financial practices – with the ultimate aim to improve service delivery. Furthermore this phase contains a final close-out report detailing the project timeline and conclusions drawn.

Summary of CEF Components

Capital Expenditure Framework Summary



2026/27 CEF

Purpose of the Capital Expenditure Framework

A Capital Expenditure Framework (CEF), required by the Spatial Planning and Land Use Management Act, 2013 (SPLUMA), is a strategic tool that integrates a municipality's long-term infrastructure expenditure with its spatial and financial planning.

Embedded within the Spatial Development Framework (SDF), the CEF ensures that infrastructure priorities align with municipal budgets and development goals, providing a structured, transparent approach to managing capital investment. Linking financial planning with spatial strategies, it helps municipalities allocate resources efficiently while ensuring that infrastructure development supports broader sustainability and growth objectives.

The purpose of a CEF is to create a systematic framework for evaluating and prioritising infrastructure projects within the constraints of available financial resources. It promotes coordinated decision-making, enabling municipalities to plan infrastructure investments that are both sustainable and aligned with long-term development strategies.

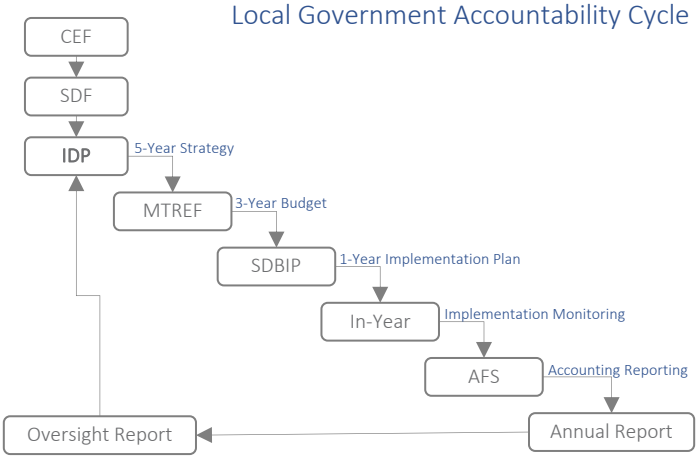
Socio Economic Profiling

Functional Areas

Demand Quantification

Portfolio of Projects

Long Term Financial Model



Prioritisation Framework

Budget Scenario

Objectives

- Analyse Socio-Economic Trends: Assess long-term socio-economic dynamics to inform municipal planning.
- Quantify Infrastructure Needs: Define infrastructure requirements based on land use budgets, growth projections, and existing backlogs.
- Align with the SDF: Translate spatial strategies into priority development areas to guide infrastructure investment.
- Ensure Financial Sustainability: Integrate affordability considerations from the LTFM to maintain fiscal feasibility.
- Facilitate Strategic Prioritisation: Establish a framework to rank projects based on impact, spatial targeting, and alignment with development goals.

Local Government Accountability Cycle

Socio Economic Profile Report Summary

2026/27 CEF - Component 2 of 9

Purpose of the Component

This report establishes a socio-economic baseline to support long-term infrastructure planning and investment prioritisation within the municipality. By analysing socio-economic trends and spatial dynamics, it provides a foundation for assessing functional areas, estimating infrastructure demand, and informing the budgeting process. Given the limited quantification in existing Spatial Development Frameworks (SDFs), the report strengthens evidence-based planning by integrating socio-economic profiling into the Capital Expenditure Framework (CEF). It identifies structural challenges affecting infrastructure development and ensures capital investment decisions are aligned with growth projections and service delivery needs. The findings contribute to a comprehensive and structured approach to municipal financial and spatial planning.

What to expect from this Report

- Population Characteristics
- Household Dynamics
- Migration Trends
- Education and Employment Statistics
- Land Use and Settlement Patterns
- Infrastructure and Service Access
- Community and Social Facilities
- Economic and Industrial Indicators
- Municipal Performance and Governance

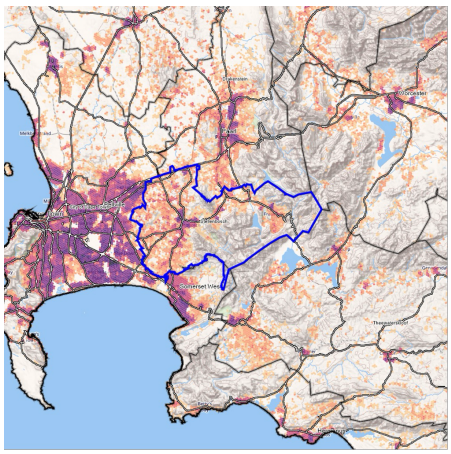
Salient Points:

- Population growth is 2% while the high poverty rate affects sixty-seven per cent of households.
- Unemployment at 10.72% creates a high risk for the future municipal revenue collection base.
- The indigent household proportion of 16.5% requires robust and consistent billing integrity programs.
- The sixty-seven percent poverty classification requires careful evaluation of future service level affordability.

Population$_{2022}$
175 411

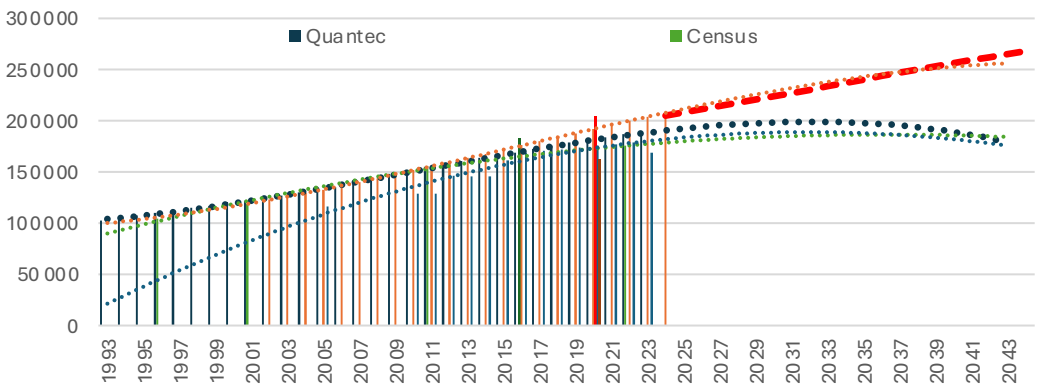
Future Population$_{2032}$
213 998

Population Growth Rate
2%



Building Surface Area$_{1995\text{-}2020}$
14 455 728 m²

Main Economic Driver
Agriculture



Water Service$_{2022}$
86.39% of Households

Growing Sector
Logistics, 3%

Audit Outcomes
Unqualified with No Findings

Household Growth Scenarios

Concluding Remarks

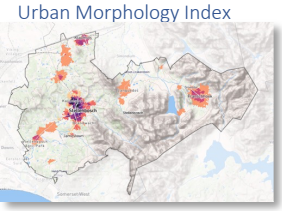
Rapid household formation outpaces population growth, creating density-driven infrastructure connection problems necessitating prioritised neighbourhood-level investments to maintain service standards

Large indigent populations combined with unemployment create high risks for revenue collection, requiring robust billing integrity programs to protect the municipality.

Economic strategies must prioritise movement efficiency within high-value visitor and hospitality precincts to support the diversified local trade and business-support sectors.

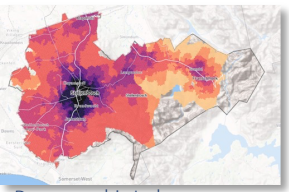
Functional Area Report Summary

2026/27 CEF - Component 3 of 9



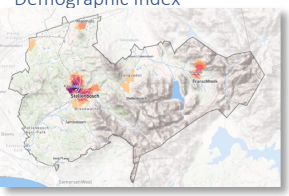
Purpose of the Component

This report defines Functional Areas to guide infrastructure planning and investment. By analyzing socio-economic trends and spatial dynamics, it strengthens evidence-based planning within the Capital Expenditure Framework (CEF). It identifies service demand, growth projections, and investment priorities, ensuring alignment with Spatial Development Frameworks (SDFs) and financial constraints. The findings support a structured, strategic approach to municipal planning and equitable resource allocation

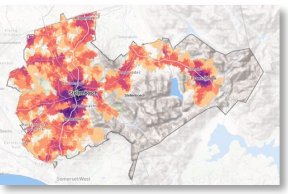


What to expect from this Report

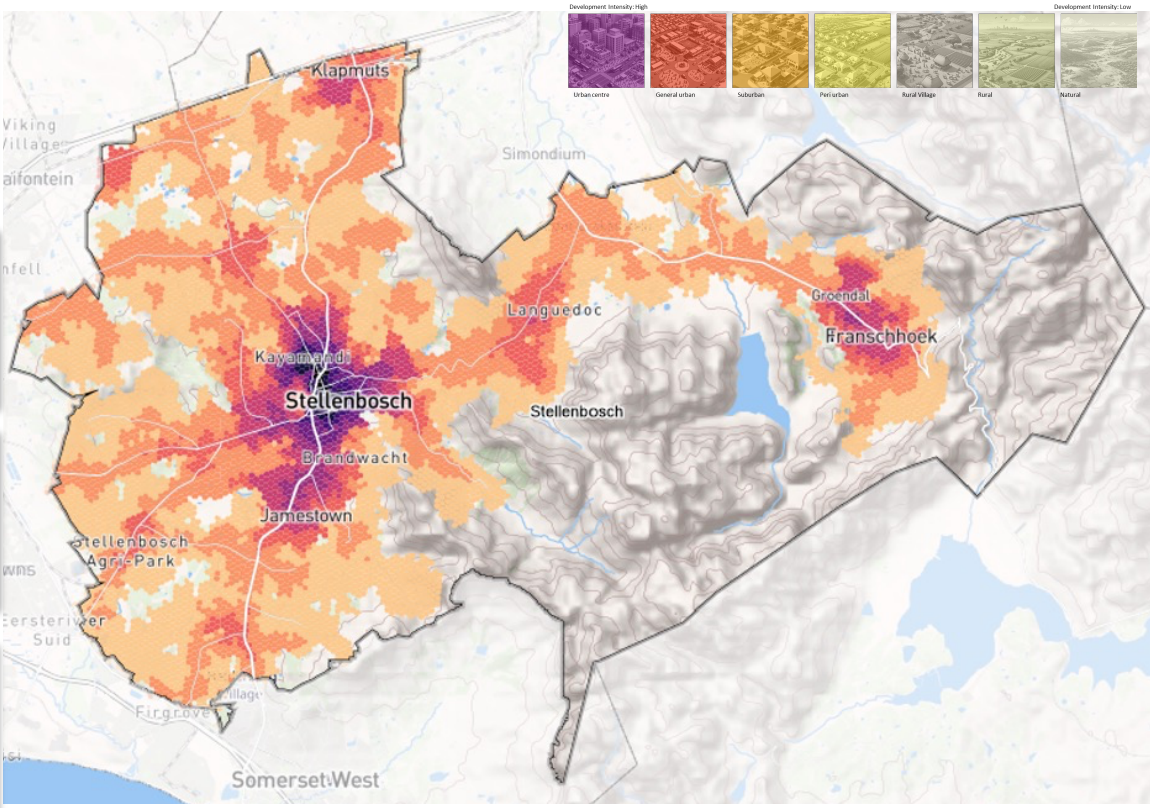
- Urban Morphology Index
- Social Facilities Coverage Index
- Demographic Distribution Index
- Economic Drivers Index
- Urban Transect Modelling Results
- Functional Area Profiles
- Service Access per Functional Area
- Land Cover per Functional Area
- Dwelling Frame per Functional Area



Urban Morphology Index



Social Facilities Index



Demographic Index

Economic Index

Concluding Remarks

Strict Urban Edge adherence is essential to prevent unsustainable rural sprawl while protecting high-value agricultural land through node-oriented capital investment strategies.

Infrastructure investments should concentrate on infill and intensification within serviceable nodes where bulk capacity exists, avoiding the funding of passive spatial ambition.

Project spatial data must be reconciled with municipal typologies to improve indicator-based profiling and resolve mismatches in technical prioritisation and reporting.

Demand Quantification Report Summary

2026/27 CEF - Component 4 of 9

Purpose of the Component

This report quantifies service demand by identifying three main drivers of investment need: existing service backlogs, infrastructure renewal requirements, and growth-driven demand from new households and economic expansion.

To assess long-term investment needs, the report analyses population-based demand, the affordability implications of Level of Service (LOS) choices, and land use impacts on capital and operating costs. Treating the municipality as an integrated system, it aligns spatial planning with financial realities, offering a structured framework for resource allocation and service delivery. This comprehensive approach supports sustainable infrastructure decisions that meet both current and future municipal demands.

What to expect from this Report

- Service Delivery Mandate
- Addressing Infrastructure Backlogs
- Demand Created Through Growth
- Population Growth as a Basis for Modelling
- Modelling Outcomes & Financial Summaries
- Assessing Service Access & Growth Demand
- Future Infrastructure Demand
- Future Land Requirements
- Impact of Policy on Financial Sustainability

Salient Points:

- Maintenance at R86.6 million remains materially below depreciation levels of R204.5 million annually.
- Renewals represent the single largest capital expenditure component within the infrastructure demand envelope.
- Bulk electricity purchases at 77.8% exceed the seventy per cent norm and compress margins.
- Selective growth horizons limit core service capital expenditure to roughly R285 million per year.

Service Population

2024	2025	2026	2027	2028	2029	2030	2031	2032	2033
3 091	6 214	9 367	12 552	15 767	19 014	22 291	25 600	28 940	32 244

Average Stand Size

2024	2025	2026	2027	2028	2029	2030	2031	2032	2033
681	682	693	689	691	695	693	691	695	694

2024	2025	2026	2027	2028	2029	2030	2031	2032	2033
1 193	2 424	3 664	4 924	6 198	7 452	8 742	10 049	11 372	12 641

Cumulative Opex Implication (R'000)

2024	2025	2026	2027	2028	2029	2030	2031	2032	2033
40 644	82 496	125 380	168 180	211 665	254 938	298 513	342 956	388 380	431 600

Total Capex Requirements

Concluding Remarks

Asset renewal must be elevated as a primary objective because the Council is currently consuming its physical assets faster than replacement.

Repairs and maintenance proxies remain materially below depreciation levels, indicating a critical need to shift strategic focus toward system reliability and preservation.

All large-scale infrastructure projects must include fully funded post-commissioning operational expenditure plans to manage the substantial long-term operating impact tail.

Portfolio of Projects Report Summary

2026/27 CEF - Component 5 of 9

Purpose of the Component

This report provides a detailed assessment of all infrastructure projects needed in the municipality over the next decade, drawing from consultations with officials and key documents like the Integrated Development Plan (IDP), Infrastructure Master Plans, Sector Plans, and the Municipal Spatial Development Framework (MSDF). It encompasses projects at both municipal and settlement levels, including new developments, renewals, and maintenance. The goal is to compile these needs into a unified set to enhance strategic decision-making within the Capital Expenditure Framework (CEF). The result is a consolidated table outlining the municipality's 10-year capital project portfolio and its expenditure requirements.

What to expect from this Report

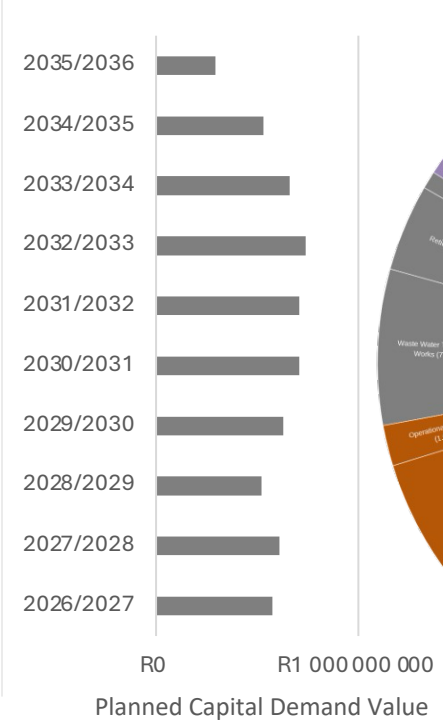
- Comprehensive Review of informants
- Compilation of Extracted Projects
- Temporal Analysis of Project Requirements
- Departmental Requirements
- Asset Type Breakdown
- Geospatial Assessment of Project Locations

Salient Points:

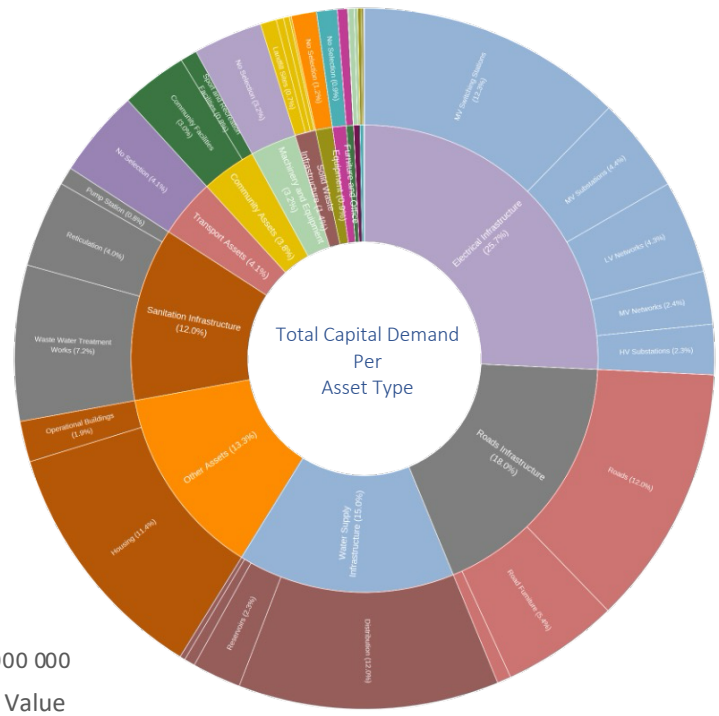
- Infrastructure Services represent 74% of total capital demand across more than 160 projects.
- Four engineering departments account for over 60% of total municipal capital demand.
- Transport services form a key secondary category, supporting municipal mobility and economic activity.
- Housing development is the largest non-engineering category, reflecting commitment to spatial transformation.

Number of Projects

266



Total Capital Demand



R 5 979 830 789

Spatially Referenced

97%

Planned Expenditure Per Year

Concluding Remarks

Demand within Infrastructure Services highlights comparatively limited capital programming in other municipal functions, suggesting a need to strengthen project development capacity across other service departments.

A noticeable front-loading pattern is observed with demand concentrated in earlier years, requiring careful operational expenditure planning to ensure long-term municipal sustainability.

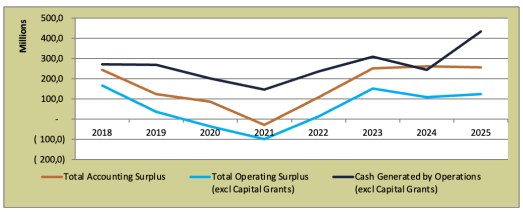
The portfolio's tapering in outer years suggests a continued requirement for regular master plan reviews to maintain a robust and credible future project pipeline.

Long-Term Financial Model & Affordability Envelope Report Summary

2026/27 CEF - Component 6 of 9

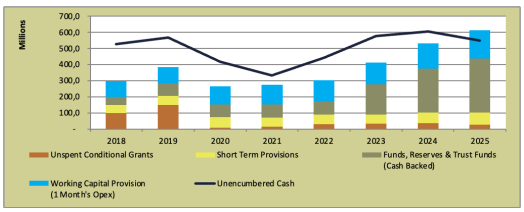
Purpose of the Component

This report presents the findings from an independent financial assessment and a long-term financial model to support the Capital Expenditure Framework (CEF). The Long-Term Financial Strategy aims to ensure the municipality's future financial sustainability by recommending policies based on historical performance and operating context, forecasting cash flows and affordable capital expenditure. Its key outcome is defining the municipality's 10-year affordability envelope and capital funding mix, detailed in the subsequent section.



What to expect from this Report

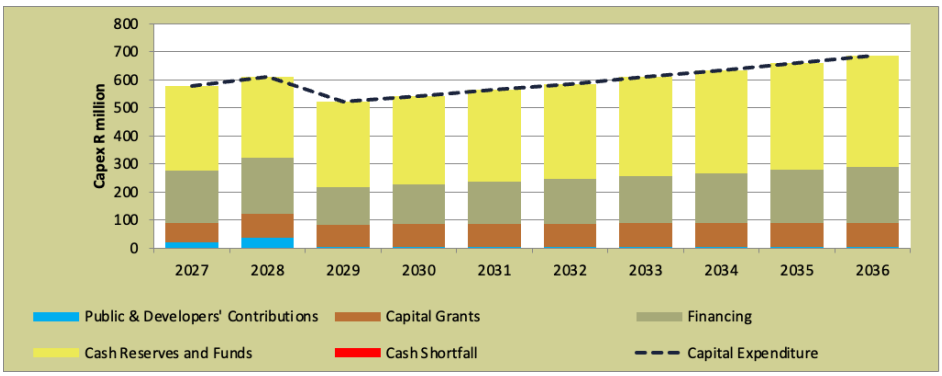
- Long-Term Financial Model Overview
- Historical Financial Analysis
- Financial Forecast Outcomes
- Scenario-Based Projections
- Long Term Financial Model Forecast
- Affordability Envelope Assessment



Salient Points:

- A 95% collection rate assumption underpins the municipality's long-term fiscal planning baseline.
- Bad debt provisions exceed aged debtor balances, reflecting prudent credit risk management.
- The 10-year affordable capital investment envelope is estimated at approximately R5.9 billion.

Analysis of surpluses and deficits



Minimum liquidity requirements

LTFM Scenario Outcome

2026/27 – 2035/36 Affordability Envelope

R5 911 million

Concluding Remarks

Financial sustainability depends on maintaining collection rates near ninety-seven percent, as scenario modelling shows that a decline toward the ninety-five percent benchmark would materially weaken the municipality's cash position and reduce the affordable

High receivables impairment coverage signals that a significant portion of billed revenue remains uncertain, requiring quarterly monitoring dashboards linking losses to decision-making.

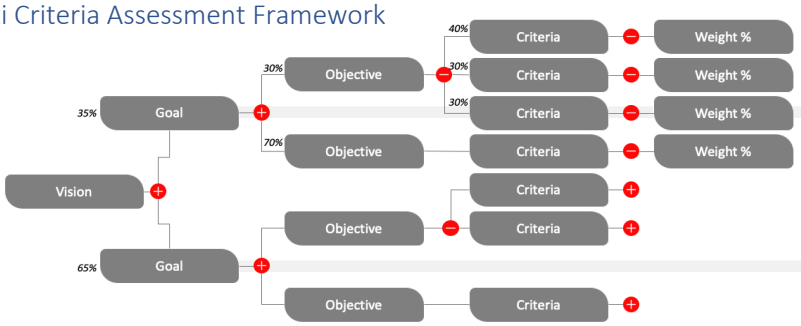
The municipality should explore alternative financing mechanisms for infrastructure while balancing own-reserve utilisation with borrowing to protect long-term liquidity.

Capital Prioritisation Framework Report Summary

2026/27 CEF - Component 7 of 9

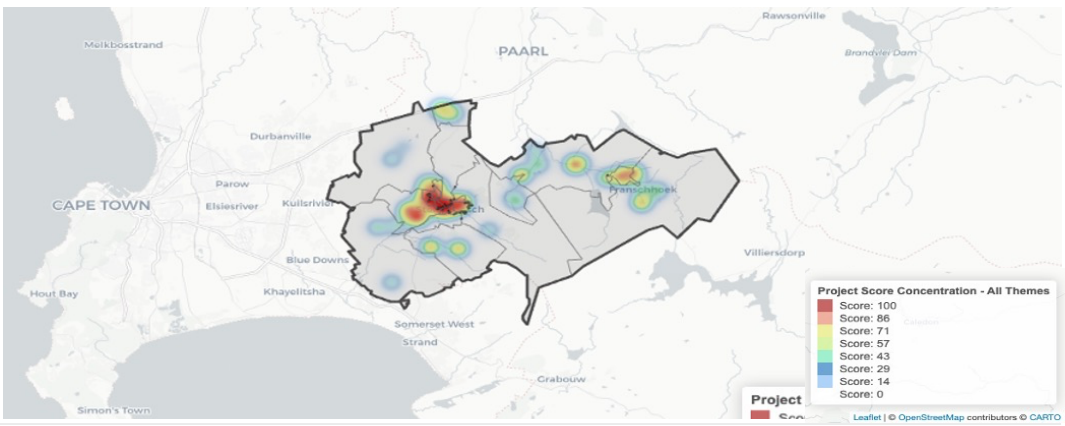
Purpose of the Component

Prioritisation within a Capital Expenditure Framework involves ranking investment projects by strategic importance to efficiently allocate limited resources and achieve organisational goals in the budget scenario. It employs multi-criteria assessment frameworks to systematically evaluate projects across dimensions like financial, spatial, economic, social, technical and environmental alignment. Each project is scored against weighted criteria, producing an overall rank to guide prioritisation, tailored to the organisation's objectives. This approach enhances decision-making, allowing the municipality to balance trade-offs, ensuring optimal resource use and improve alignment with strategic priorities.



What to expect from this Report

- Prioritisation Rationale
- Strategic Documentation & Informants
- Prioritisation Criteria
- Prioritisation Tool
- Multi-Criteria Assessment Framework
- Prioritisation Results per Theme
- Project Distribution Analysis
- Project Score Spread per Department
- Spatial Project Score Spread



Salient Points:

- Few projects achieve very high scores, confirming the framework's rigorous evaluation criteria.
- Infrastructure Services projects score highest, confirming strong alignment with core strategic infrastructure priorities.
- Most projects score moderately, requiring sequencing within the affordability envelope and implementation pipeline.
- Lower-scoring projects reflect weaker alignment and may require deferral or further planning refinement.

Multi Criteria Assessment Framework

SDF Aligned Spatial Score Distribution

Concluding Remarks

Future cycles should adopt lifecycle sufficiency constraints, ranking projects higher where they demonstrably reduce total lifecycle costs per household or business.

Score distribution shows only five projects exceed 60 points, confirming demanding thresholds for exceptional strategic alignment.

Future cycles should adopt lifecycle sufficiency constraints, ranking projects higher where they demonstrably reduce total lifecycle costs.

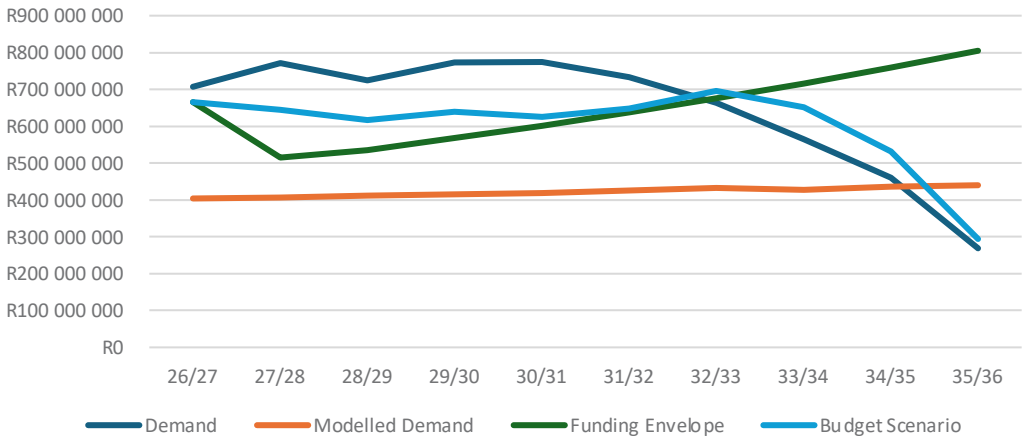
Budget Scenario & Expenditure Programme Report Summary

2026/27 CEF - Component 8 of 9

Purpose of the Component

This report outlines the budget scenario process, a crucial component of annual capital planning that ensures efficient resource allocation within the 10-year Capital Expenditure Framework (CEF) and, when optimally applied, informs the draft budget. By aligning modelled demand, planned expenditure, and affordability, it facilitates integrated and informed financial decision-making, building on insights from preceding reports.

The report's primary output is a 10-year project pipeline, serving as a foundation for downstream actions in the Local Government Accountability Cycle. Additionally, it provides a long-term perspective on potential project realities, supporting strategic planning and fiscal sustainability.



What to expect from this Report

- Budget Scenario Rule set Discussion
- Budget Scenario Input
- Budget Scenario Spatial Distribution Analysis
- Budget Scenario Asset Type Analysis
- Budget Scenario Departmental Analysis
- Project Based 10-year Expenditure Framework

Salient Points:

- Project sequencing ensures the capital programme remains aligned with the municipality's affordability envelope.
- MTREF allocations of R571.3m, R605.0m, and R512.8m support stable capital implementation across three years.
- New asset creation at 28.82% exceeds the 10–20% benchmark, reflecting ongoing infrastructure expansion needs.
- Renewal investment at 9.47% remains below the 15% benchmark, requiring continued asset lifecycle monitoring.

	Planned Demand	Modelled Demand	Funding Envelope	Budget Scenario
26/27	R 576 301 851	R 1 190 374 000	R 579 296 000	R 571 301 851
27/28	R 610 030 198	R 1 596 850 000	R 610 026 000	R 605 030 198
28/29	R 520 771 404	R 2 008 347 000	R 521 021 000	R 512 771 404
29/30	R 627 581 768	R 2 423 361 000	R 541 896 000	R 538 148 491
30/31	R 708 512 005	R 2 842 596 000	R 563 591 000	R 601 342 072
31/32	R 708 326 015	R 3 267 858 000	R 586 148 000	R 583 656 082
32/33	R 740 801 328	R 3 699 792 000	R 609 600 000	R 624 467 666
33/34	R 661 807 825	R 4 127 754 000	R 633 983 000	R 633 660 816
34/35	R 531 603 395	R 4 534 302 464	R 659 332 000	R 472 875 441
35/36	R 294 095 000	R 4 954 232 679	R 685 685 000	R 436 661 939
Total	R5 979 830 789	R30 645 467 143	R5 990 578 000	R5 579 915 960

Concluding Remarks

Pronounced front-loading of the budget addresses urgent backlogs but creates operational risks that must be managed through disciplined long-term commitment management.

Proactive fiscal strategies are required to prevent the continued deferral of high-priority projects postponed due to the significant 44.55% fitted-with-delay portfolio burden.

Approximately R1.86 billion of identified demand remains outside the affordability envelope, necessitating careful evaluation of lower-scoring initiatives for potential strategic exclusion.

MTREF Budget Scenario Report Summary

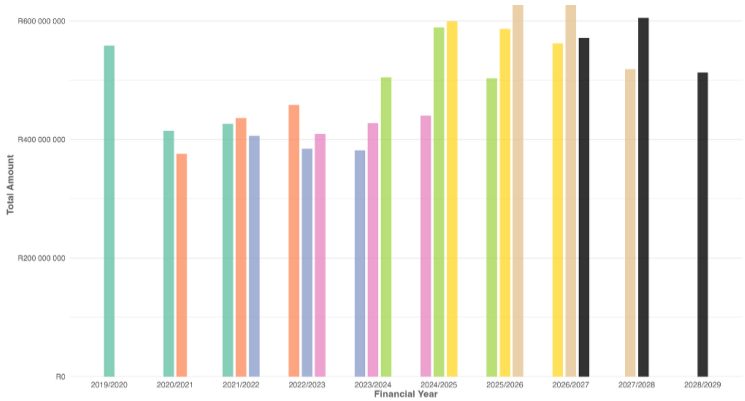
2026/27 CEF - Component 9 of 9

Purpose of the Component

The Medium-Term Revenue and Expenditure Framework (MTREF) is a three-year rolling budget tool that shapes municipal spending within an affordability framework, integrated into the Capital Expenditure Framework (CEF). This section details the MTREF Budget Scenario Results, showing how capital projects align with strategic goals, financial capacity, and spatial priorities, based on the Capital Expenditure Programme (CEP). It projects expenditure across years, departments, asset types, and functional areas, balancing immediate and long-term needs through data-driven prioritisation.

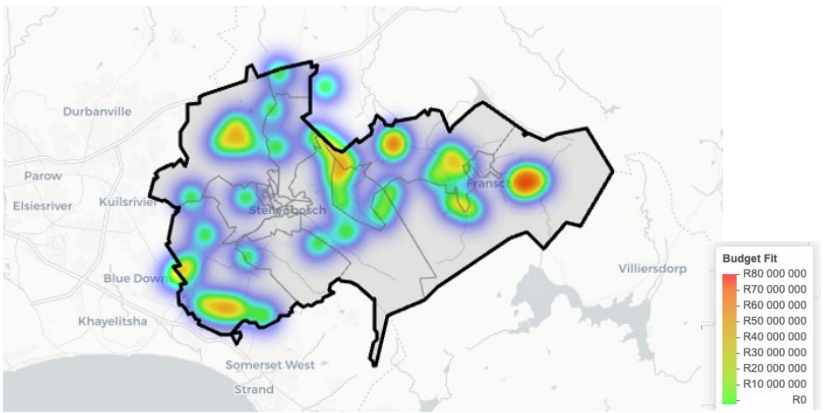
As a dynamic model, the budget scenario can adapt annually to new data, priorities, and funding, ensuring ongoing refinement within the iterative CEF and MTREF processes.

What to expect from this Report



- MTREF Budget Scenario Analysis
- MTREF Budget Scenario Temporal View
- MTREF Budget Scenario per Department
- MTREF Budget Scenario per Asset Type
- MTREF Budget Scenario per Functional Area
- MTREF Budget Scenario vs Historic MTREFs

Salient Points:



- R1.69 billion is allocated across 2026/27–2028/29, reflecting disciplined alignment with affordability constraints.
- Expenditure is balanced across three years at 33.82%, 35.82%, and 30.36% respectively.
- Infrastructure Services receive R1.31 billion, representing 77.7% of total MTREF capital investment.
- Electricity, water, and sanitation together account for over 55% of total MTREF investment.

MTREF Trend

- 19/20 MTREF
- 20/21 MTREF
- 21/22 MTREF
- 22/23 MTREF
- 23/24 MTREF
- 24/25 MTREF
- 26/27 MTREF Scenario

Spatial Targeting

Concluding Remarks

The MTREF demonstrates strong spatial planning maturity, with the majority of projects spatially mapped, enabling effective alignment between infrastructure investment and municipal development strategy.

The capital programme reflects a balanced emphasis on upgrading existing infrastructure, strengthening the municipality's capacity to enhance service reliability whilst extending asset lifespans.

Moderate MTREF growth compared to historical trends demonstrates disciplined alignment with the municipality's long-term financial model, supporting fiscally sustainable infrastructure delivery.

Recommendations Per Component

3 2026/2027 Capital Expenditure Framework Recommendations

3.1 Contextualisation

The Capital Expenditure Framework (CEF) is informed by a series of structured reports, each offering specialised insights, observations, and recommendations to support the municipality's long-term infrastructure planning and financial sustainability. These reports cover multiple facets of municipal operations, addressing spatial, financial, socio-economic, and institutional factors that shape capital investment priorities. While each report delves into specific subject matter, together they form a cohesive framework that enhances strategic decision-making and responsible capital expenditure planning.

Beyond the technical analysis contained within individual reports, several cross-cutting recommendations and institutional observations emerge, highlighting key considerations for improving municipal efficiency, financial discipline, and infrastructure alignment. This section presents a high-level synthesis of these insights, ensuring that critical takeaways from each report are captured within the broader CEF structure.

To provide a structured recap of the components of this framework, the following table summarises the focus areas of each report and their relevance to the overall Capital Expenditure Framework.

Table 3-1: Components of this Capital Expenditure Framework

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 1: Inception and Information Gathering	Phase 1	To provide a contextualisation to the Capital Expenditure Framework. This phase comprises the inception process of the CEF as well as the information gathering process in which a comprehensive integrated infrastructure investment framework, or portfolio of projects, is collated.
Part 2: Functional Area and Spatial Category for Investment Planning Profiling and Spatial Demand Quantification	Phase 2a	This part introduces functional areas for priority investment which are defined and mapped to indicate the spatial strategy depicted in the MSDF (linked to the MSDF proposals). The identified functional areas are used to determine the future population, housing, and land demand based on existing socio-economic and related data which is used in the spatial demand quantification component.
Part 3: Infrastructure demand	Phase 2b	This part determines the investment requirements for each functional area, including operational and maintenance costs per asset class. The goal is to compare the optimal infrastructure requirements scenario with the known infrastructure demand based on current planning frameworks.
Part 4: Affordability Envelope	Phase 3	This part is a reflection of the municipality's financial health and long-term financial plan. Primarily it includes the results of the re-application of the long-term financial plan to determine the appropriate affordability envelope.
Part 5: Prioritisation and Budget Scenario	Phase 4	This part has a prioritisation framework that considers spatial, engineering, and financial factors to calculate a composite score indicating each project's relative importance in the pipeline. It also applies this framework to the budget fit process to determine how to allocate capital within the affordability envelope per project for the next 10 years.
Part 6: Capital Expenditure Programme	Phase 5	This part is a breakdown of the 10-year capital expenditure framework. Essentially, it analyses the fitted project pipeline in terms of spatial alignment, asset type alignment, and other attributes to ultimately verify that the 10-year capital expenditure framework is in line with the strategic intent of the prioritisation framework and the MSDF objectives.

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 7: Institutional Arrangements and Project Closeout	Phase 6	This phase comprises of a concluding chapter to the CEF, this part aims to identify areas of enhancement that will render the CEF not only as a compliance document but to solidify institutional change around the alignment of planning, engineering, and financial practices – with the ultimate aim to improve service delivery. Furthermore this phase contains a final close-out report detailing the project timeline and conclusions drawn.

3.2 Socio-Economic Profiling

Stellenbosch faces a structural "connections problem" where household formation significantly outpaces general population growth, leading to a rise in settlement density. The municipality must respond to this demographic shift by prioritising neighbourhood-level infrastructure and additional service connections per capita to maintain current service standards. Growth strategies should explicitly guide spatial form toward higher-density, node-oriented development to ensure the fiscal sustainability of long-term network maintenance.

The substantial indigent population, representing 16.5% of households, combined with a 10.72% unemployment rate, creates a medium-to-high risk for future revenue collection and municipal billing stability. Protecting the municipality's cash position requires the immediate implementation of a revenue quality program that focuses on billing integrity, aggressive arrears segmentation, and consistent enforcement.

Economic diversification has been a strength of the region, yet the local economy remains sensitive to the performance of trade and business-support functions. Development strategies must prioritise the functionality and movement efficiency of economic precincts to support the visitor and hospitality economy, which provides leisure services at scale.

3.3 Functional and Priority Area Profiling

Spatial investment must strictly adhere to the Urban Edge strategy to prevent unsustainable rural sprawl and protect the municipality's high-value agricultural land. The municipality should focus its capital on infill and intensification within serviceable nodes where bulk infrastructure capacity is already established, rather than funding passive spatial ambition.

The simplicity of the current three-category functional area framework (Rural, Rural Node, Urban Node) may reduce analytical resolution and mask underlying service delivery mismatches. Reconciling these municipal typologies with project-derived spatial data is essential to improve indicator-based profiling and technical prioritisation.

Large allocations to "Farm" areas within the current MTREF, which dramatically exceed 10-year proportions, require rigorous strategic justification. These investments must be clearly linked to supporting wine estate operations and the specific infrastructure needs of the agricultural economic base.

3.4 Demand Quantification

Asset renewal must be elevated as the primary strategic objective to stabilise the municipality's operating base, particularly as the Council is currently consuming its assets faster than they are being restored.

Maintenance proxies remain materially below depreciation levels, signalling a critical need to shift focus from service expansion to system reliability and asset preservation.

A policy-led exercise is required to define "acceptable" service levels and quantify the resulting backlogs using an auditable, data-driven methodology. This process must address network-wide public infrastructure, which currently drives the majority of both capital and future operating exposure.

Capital programming must be managed as a joint CAPEX–OPEX instrument to account for the substantial "operating tail" associated with high-service-level networks. The municipality should enforce a formal requirement that all large-scale projects include fully funded post-commissioning operational expenditure plans.

Demand management should be anchored in connection-led growth logic, ensuring that land release and zoning progressions are staged behind proven operating affordability and institutional delivery capacity.

3.5 Portfolio of Projects

The strong concentration of demand within Infrastructure Services (approximately 74% of total demand) confirms the municipality's continued focus on strengthening core engineering infrastructure. While this reflects a robust technical project pipeline, it also highlights comparatively limited capital programming within other strategic and administrative functions. Departments with smaller capital portfolios may therefore require targeted institutional support to translate their mandates into viable capital projects that contribute to broader municipal objectives.

The dominance of electrical, water, sanitation, and transport infrastructure within the portfolio reflects the municipality's prioritisation of essential service delivery systems. Continued strengthening of sector planning frameworks and infrastructure master plans will ensure that project identification remains credible and aligned with long-term spatial development strategies across the full ten-year planning horizon.

Project data maturity within the portfolio remains strong, with the vast majority of projects spatially referenced and linked to functional areas. This enables effective alignment between capital investment decisions and spatial development priorities. However, the tapering of project identification in the outer planning years indicates that more frequent master plan updates and infrastructure demand reviews will be required to sustain a credible long-term project pipeline.

Project readiness can be further strengthened through the development of a structured project preparation pipeline. Strengthening feasibility preparation, design readiness, and procurement planning will reduce implementation delays, minimise year-end unspent balances, and improve overall stability in capital programme execution.

3.6 Long-Term Financial Model & Affordability Envelope

Financial sustainability within the long-term financial model is tested against a 95% collection rate scenario, representing the conservative threshold at which the municipality can continue sustaining its

financial position. The modelling demonstrates that maintaining collection performance at or above this level remains critical to preserving the affordable capital investment trajectory. Although the municipality currently achieves a collection rate above this benchmark, any sustained deterioration below the 95% level would place immediate pressure on cash balances, constrain the affordable capital envelope, and weaken the municipality's ability to fund critical infrastructure. The municipality should therefore continue consolidating its liquidity position through prudent utilisation of reserves while maintaining a balanced funding mix between internal resources, borrowing, and grant funding.

Revenue risk indicators highlight the importance of closely monitoring revenue performance across key services. Although impairment coverage adequately provides for aged debtor balances, a portion of billed revenue cannot be regarded as fully bankable for long-term funding assumptions. Continued monitoring of electricity and water revenue performance, including loss management and billing accuracy, should therefore remain a priority. Strengthened reporting mechanisms linking revenue recovery initiatives to both operational management and capital planning processes will improve financial resilience.

The updated 10-year affordability envelope of approximately R5.9 billion defines the municipality's sustainable capital investment capacity over the planning horizon. Maintaining this investment envelope ensures that liquidity ratios, gearing levels, and debt service obligations remain within National Treasury benchmark ranges. Preserving these prudential limits protects the municipality's financial stability while maintaining borrowing capacity to support future infrastructure expansion.

Strategic infrastructure growth should therefore continue to be phased and financially disciplined. Sustained fiscal prudence, strengthened revenue management, and a balanced capital funding mix will allow the municipality to progressively expand its capital programme while maintaining resilience across the planning horizon.

3.7 Capital Prioritisation Framework

The Capital Prioritisation Model (CPM) should be institutionalised as a standing component of the annual budget cycle to ensure resources are consistently allocated to the most impactful projects. The framework effectively differentiates strategic service delivery from purely operational administrative requirements, as demonstrated by the strong performance of Infrastructure Services.

Future prioritisation cycles must adopt a "lifecycle sufficiency" constraint, ranking projects higher where they demonstrably reduce lifecycle costs per household or business served. Hard affordability gates should be applied to all projects above a defined value threshold to prevent the advancement of projects with unsustainable operational implications.

The high degree of spatial mapping allows for sophisticated location-based prioritisation, but urgent resolution of coordinate deficits in MTREF projects is required to validate compliance with Urban Edge objectives.

Criteria for prioritisation should be periodically reviewed to better weight contemporary imperatives such as climate adaptation, digital infrastructure, and renewable energy pathways.

3.8 Budget Scenario and Capital Expenditure Programme

The MTREF capital programme demonstrates a balanced distribution across the three-year planning horizon, rather than pronounced front-loading. This phased approach supports stable infrastructure implementation while ensuring that expenditure remains aligned with the municipality's financial affordability envelope. The presence of projects scheduled in outer years highlights the importance of sustained long-term fiscal planning to progressively bring high-priority projects into the funded capital programme.

The municipality should continue monitoring the balance between infrastructure and non-infrastructure investment, ensuring that adequate resources support institutional capacity, digital systems, and climate-related planning functions. Relatively modest allocations to categories such as Stormwater Infrastructure and Information and Communication Infrastructure indicate potential opportunities to strengthen future investment supporting climate resilience and smart municipal management.

Continued refinement of spatial classification within the MTREF budget will further strengthen the credibility of spatial targeting and ensure that infrastructure investment clearly aligns with the municipality's spatial development priorities and settlement hierarchy.

Renewal investment remains comparatively modest relative to typical industry benchmarks and therefore requires ongoing validation against infrastructure condition assessments and long-term asset lifecycle management requirements. Strengthening asset management practices will assist in balancing the need for infrastructure expansion with the preservation of existing municipal assets.

Optimising limited financial resources will require adaptive capital planning and systematic reprioritisation of projects over time. Maintaining flexibility within the capital programme will ensure continued alignment with spatial transformation objectives, equitable service delivery, and long-term municipal financial sustainability.

Institutional Arrangements

4 Institutional Arrangements

4.1 Contextualisation

A Capital Expenditure Framework (CEF) provides a structured approach to guiding municipal capital investments over the long term. However, it is essential to recognise that the capital budgeting process is inherently dynamic. Economic conditions, policy priorities, financial constraints, and service delivery needs evolve over time, necessitating periodic updates and refinements to the CEF. The effectiveness of the CEF, therefore, lies not in its ability to prescribe fixed infrastructure investment decisions, but rather in its adaptability to emerging municipal realities and strategic shifts.

While the CEF captures a snapshot of capital investment priorities at a given moment, it should not be seen as a static document. Instead, it serves as a strategic reference framework, offering decision-makers a high-level roadmap that must remain responsive to shifting local demands, infrastructure requirements, and external funding opportunities. New infrastructure needs may emerge, funding sources may shift, and external investment trends may influence municipal priorities. A well-structured CEF, therefore, ensures that municipalities have the institutional flexibility to adjust their capital planning strategies while maintaining financial sustainability and alignment with long-term development objectives.

To maintain relevance and effectiveness, municipalities should embed the CEF within existing legislated governance structures, financial oversight mechanisms, and spatial planning processes. Rather than existing as an isolated planning tool, the CEF should function as an active decision-support mechanism, integrated into multi-year budgeting processes (MTREF), Integrated Development Plans (IDPs), and the Municipal Spatial Development Framework (MSDF). This institutional embeddedness enhances the municipal capacity to adapt investment priorities in response to socio-economic changes, infrastructure demands, and legislative requirements.

Furthermore, national policy instruments such as the Integrated Urban Development Framework (IUDF) and Municipal Finance Management Act (MFMA) reinforce the need for alignment between municipal capital planning, financial forecasting, and spatial transformation objectives. Municipalities that embed their CEF into broader strategic frameworks benefit from stronger financial predictability, enhanced infrastructure delivery coordination, and improved access to external funding mechanisms.

The contextualisation of the CEF lies in its institutional integration and strategic adaptability. By ensuring that capital expenditure planning is continuously reviewed and aligned with municipal reporting structures, financial policies, and service delivery imperatives, municipalities can safeguard the long-term sustainability and impact of their infrastructure investments.

4.2 Linking with Existing Municipal Reporting Structures

Effective capital expenditure planning requires seamless integration between the Capital Expenditure Framework (CEF) and existing municipal reporting structures. Municipalities operate within a regulated governance environment where financial planning, spatial development, and service delivery must align with national, provincial, and municipal reporting cycles. Embedding the CEF within these structures

ensures that capital investments are strategic, financially viable, and aligned with long-term municipal development goals.

A well-integrated CEF enhances coordination between municipal departments, providing a structured mechanism to link capital budgeting, financial forecasting, infrastructure investment, and service delivery mandates. This alignment is particularly crucial given the multi-year nature of capital planning, which often spans beyond a single budget cycle and must remain adaptable to changing economic conditions, evolving municipal priorities, and funding availability.

At a minimum, the CEF must align with three key municipal reporting mechanisms:

- The Local Government Accountability Cycle – Ensuring that capital investment decisions are informed by Integrated Development Plan (IDP) priorities, Medium-Term Revenue and Expenditure Framework (MTREF) budgets, and municipal performance monitoring requirements.
- National Treasury Business Processes – Integrating the CEF into financial reporting frameworks such as the Municipal Standard Chart of Accounts (mSCOA), Budget Reporting Regulations, and long-term financial sustainability assessments.
- Periodic Review Processes – Establishing structured review and update cycles to ensure that the CEF remains relevant, aligns with infrastructure backlogs, service delivery needs, and financial sustainability imperatives.

4.2.1 Local Government Accountability Cycle

A municipality's ability to strategically plan, budget, and implement infrastructure projects is rooted in the Local Government Accountability Cycle, which establishes the processes and reporting mechanisms necessary for effective governance. This cycle, as defined by the Municipal Finance Management Act (MFMA), 2003, and other legislative instruments, ensures transparency, fiscal responsibility, and alignment between municipal financial planning and service delivery objectives.

The Capital Expenditure Framework (CEF), as a long-term planning tool, must be embedded within this accountability cycle to ensure that capital investment decisions align with municipal development priorities, budgetary realities, and performance evaluation mechanisms. By integrating the CEF within the accountability cycle, municipalities can effectively transition long-term infrastructure priorities into actionable, budgeted capital projects while maintaining compliance with financial management regulations and oversight processes. The Local Government Accountability Cycle consists of six interrelated components:

- Integrated Development Plan (IDP) – Defines the municipality's strategic vision and development priorities over a five-year period.
- Medium-Term Revenue and Expenditure Framework (MTREF) Budget – Translates IDP priorities into a structured three-year municipal budget, guiding resource allocation for operational and capital expenditure.
- Service Delivery and Budget Implementation Plan (SDBIP) – Establishes quarterly and monthly implementation targets for service delivery and capital project execution.

- In-Year Reporting – Provides monthly, quarterly, and mid-year financial and non-financial performance reports, ensuring budget adherence and project progress tracking.
- Annual Financial Statements and Annual Reports – Reflects the municipality's financial position, budget implementation progress, and service delivery outcomes.
- Oversight Reporting – A council-led review process that ensures accountability and informs subsequent planning cycles.

a. Integrated Development Plan (IDP)

The Integrated Development Plan (IDP) serves as the strategic roadmap guiding municipal development over a five-year period. It integrates spatial, economic, and social planning, ensuring that municipal objectives align with national and provincial policy frameworks. The Capital Expenditure Framework (CEF) plays a fundamental role in the IDP by providing a structured, evidence-based approach to prioritising long-term infrastructure investments. By identifying critical infrastructure needs, service delivery gaps, and financial feasibility, the CEF informs the capital projects included in the IDP, ensuring that planned infrastructure development is financially sustainable and aligned with municipal growth objectives. Without this alignment, municipalities risk unfunded mandates, misaligned priorities, and ineffective service delivery.

b. Medium-Term Revenue and Expenditure Framework (MTREF) Budget

The Medium-Term Revenue and Expenditure Framework (MTREF) translates IDP priorities into a structured three-year municipal budget, setting the parameters for both capital and operational expenditure. The CEF directly informs the MTREF by ensuring that infrastructure investments are phased over multiple years, preventing overcommitment of financial resources while maintaining fiscal discipline. By linking capital projects identified in the CEF to budget projections in the MTREF, municipalities can better allocate own-source revenues, grant funding, and external financing to meet long-term infrastructure needs. This structured integration ensures that large-scale infrastructure projects receive consistent funding over multiple budget cycles, avoiding delays and incomplete projects due to funding shortfalls.

c. Service Delivery and Budget Implementation Plan (SDBIP)

The Service Delivery and Budget Implementation Plan (SDBIP) acts as the operational tool that converts budgetary allocations into tangible service delivery outputs. It details the quarterly and monthly implementation targets for capital and operational projects, ensuring alignment with IDP priorities and MTREF allocations. The CEF strengthens the SDBIP by providing a long-term infrastructure roadmap, enabling municipalities to structure their capital programs in a phased, implementable manner. This results in realistic project timelines, clear performance indicators, and predictable cash flow requirements, reducing inefficiencies and improving the overall execution of infrastructure development plans.

d. In-Year Reporting

The in-year reporting system ensures that municipalities continuously track financial performance and project implementation, providing monthly, quarterly, and mid-year financial and non-financial reports.

The CEF enhances this reporting process by establishing long-term performance benchmarks for capital projects, enabling municipalities to assess whether infrastructure investments are progressing according to strategic plans and financial forecasts. By integrating CEF indicators into in-year reporting mechanisms, municipalities can identify budget deviations, project delays, and service delivery challenges early on, allowing for corrective measures to be implemented before they escalate.

e. Annual Financial Statements and Annual Reports

The Annual Financial Statements and Annual Reports provide a comprehensive review of municipal financial health, infrastructure spending, and service delivery performance. The CEF directly contributes to this reporting process by ensuring that capital expenditure remains aligned with long-term financial projections and strategic priorities. By comparing actual infrastructure investments against planned CEF targets, municipalities can evaluate financial sustainability, assess infrastructure performance, and refine investment strategies. This alignment strengthens municipal transparency, ensuring that stakeholders, including council members, National Treasury, and the public, can evaluate whether capital spending supports economic growth, spatial transformation, and service delivery improvements.

f. Oversight Reporting

The final component of the accountability cycle involves municipal council oversight and governance reviews to ensure that capital investments and financial decisions align with the municipality's strategic vision. The CEF informs this oversight process by providing a clear framework for assessing capital project viability, funding efficiency, and long-term service delivery impact. By embedding CEF-driven investment priorities within municipal oversight mechanisms, councils and regulatory bodies can hold decision-makers accountable, ensuring that infrastructure spending is transparent, effective, and supports sustainable municipal development.

4.2.2 Periodic Review: Integrated Development Plan Process Plan Alignment

The Capital Expenditure Framework (CEF) is a dynamic planning instrument that must remain adaptable to municipal priorities, financial conditions, and evolving infrastructure demands. As municipalities operate in a changing environment, periodic reviews of the CEF ensure that it remains relevant, actionable, and aligned with broader integrated development, financial sustainability, and service delivery objectives. Without regular assessment and refinement, municipalities risk investing in projects that may no longer be financially feasible, strategically aligned, or responsive to shifting service delivery needs.

To maintain its relevance, the CEF review process must be synchronised with the Integrated Development Plan (IDP) process plan annually. This alignment ensures that capital planning and budgeting processes influence each other rather than existing in isolation. The IDP serves as the municipality's overarching development strategy, while the CEF translates this strategy into a structured, long-term capital investment framework. When the IDP undergoes its annual review, the CEF should also be assessed to determine whether capital investment priorities need to be adjusted based on infrastructure performance, funding availability, or new strategic considerations. Additionally, updates to the Medium-Term Revenue

and Expenditure Framework (MTREF) should reflect any adjustments made to the CEF, ensuring that long-term investment planning aligns with budgetary realities.

The effectiveness of periodic reviews must be measurable to provide municipalities with the necessary insights for informed decision-making. This is best achieved by integrating Key Performance Indicators (KPIs) into the CEF review process. Municipalities should track the capital budget utilisation rate to measure the percentage of planned capital expenditure that has been successfully implemented. A high utilisation rate indicates efficient financial management and project execution, while a low rate may signal bottlenecks in implementation. The project implementation rate serves as another important metric, measuring the number of completed projects against those originally planned in the CEF. If implementation rates are low, it may indicate project delays, inefficiencies, or budgetary constraints that need to be addressed in the review process.

Another critical measure is spatial targeting effectiveness, which evaluates whether infrastructure investments are being made in alignment with the municipality's Spatial Development Framework (SDF). This ensures that capital spending supports spatial transformation objectives, particularly in areas where infrastructure backlogs exist. Additionally, municipalities should assess funding sustainability, examining the extent to which capital projects rely on stable, long-term funding sources. A well-reviewed CEF should reflect a realistic financing strategy, ensuring that capital projects are not planned in excess of available financial resources.

For a periodic review process to be effective, it must be structured, data-driven, and inclusive. Municipalities should start by assessing emerging infrastructure needs, financial constraints, and service delivery gaps. This should be followed by an evaluation of capital project performance, analysing expenditure trends and risk factors that may impact implementation. A review of financial and spatial planning alignment is also necessary, ensuring that updates to the CEF remain consistent with the IDP, MTREF, and SDF. Engagement with key municipal stakeholders—including financial managers, planners, infrastructure specialists, and community representatives—provides further validation of capital investment priorities. The final step is the formalisation of the revised CEF, ensuring that the updated framework is embedded into municipal financial planning, budget cycles, and development processes and strategies.

4.3 Towards Continued CEF Maintenance

Ensuring the long-term sustainability of municipal infrastructure investments requires a proactive approach to continued maintenance, asset management, and financial planning. While the Capital Expenditure Framework (CEF) focuses on strategic investment and capital development, it must also account for the ongoing maintenance and lifecycle management of municipal assets. Without adequate planning for infrastructure upkeep, municipalities risk service delivery failures, financial inefficiencies, and asset deterioration, which ultimately erode the value of capital investments.

A well-structured maintenance strategy ensures that newly developed and existing infrastructure assets remain functional, efficient, and financially sustainable. This requires municipalities to embed maintenance planning within the CEF, ensuring that capital investments are funded not only for construction but also for long-term operation, maintenance, and renewal. By integrating planned

maintenance strategies into budgeting, reporting, and operational planning, municipalities can reduce infrastructure backlogs, optimise service delivery, and extend asset lifespans.

This section explores the key institutional mechanisms necessary for municipalities to achieve effective CEF maintenance.

4.3.1 Capital Planning Forum

A Capital Planning Forum (CPF) serves as a critical structure within the municipality, ensuring collaborative development, implementation, and oversight of the Capital Expenditure Framework (CEF). Given that capital planning is a multi-disciplinary process, the CPF fosters a structured approach to decision-making by bringing together key municipal departments, particularly Finance, Engineering, and Town Planning, to align capital investment priorities with strategic development objectives.

The CPF ensures that the CEF is not developed in isolation but rather through an integrated and cross-departmental approach that reflects the municipality's infrastructure needs, budget realities, and spatial priorities. It provides a formalised platform to streamline capital project identification, prioritisation, and budgeting while also ensuring that the process remains dynamic and responsive to emerging needs and municipal priorities.

a. Why Establish a Capital Planning Forum?

The CPF strengthens internal coordination by embedding capital planning into the Local Government Accountability Cycle, enabling:

- Stronger interdepartmental collaboration, ensuring that Finance, Engineering, and Planning departments work towards a unified capital investment strategy.
- Enhanced alignment between long-term financial planning and spatial planning, ensuring projects are both fiscally sustainable and spatially justifiable.
- A structured approach to capital project selection and prioritisation, reducing ad-hoc decision-making and ensuring that projects are vetted using objective criteria.
- Greater transparency and accountability, as the CPF serves as a platform for tracking progress, reporting on capital investment performance, and refining the CEF over time.

b. Structuring the Capital Planning Forum

To operate effectively, the CPF should be structured as a multi-departmental working group with clear roles and responsibilities assigned across departments. A recommended composition of the CPF includes:

- Chairperson: A senior municipal official, often from the Finance or Planning department, responsible for facilitating CPF meetings and ensuring accountability.
- Core Members: Representatives from Engineering (water, roads, electricity, etc.), Finance, Town Planning, and key service delivery units.

- Technical Support Staff: GIS specialists, asset management officials, and financial analysts supporting data-driven decision-making.

c. Key Functions of the CPF

The CPF should be responsible for managing and coordinating all aspects of capital expenditure planning within the municipality. The following key functions define its role:

- Process Management
  - Facilitate the municipality's annual capital budget planning process, ensuring integration with the IDP and MTREF.
  - Manage all stages of capital planning, from data collection to council approval.
  - Identify areas where capital planning practices can be improved, ensuring efficiency in project selection and resource allocation.
- Project Identification
  - Review infrastructure needs, integrating data from master plans, sector plans, and community engagement processes.
  - Guide departments in submitting capital project proposals, ensuring projects are well-defined and supported by accurate data.
  - Ensure all projects include key attributes, such as project location, cost estimates, and funding sources, in line with CEF standards.
- Project Prioritisation
  - Develop and apply transparent criteria to assess and rank projects, ensuring alignment with strategic goals, financial feasibility, and service delivery priorities.
  - Ensure that projects are prioritised based on need, affordability, and long-term sustainability rather than political or ad-hoc decision-making.
  - Validate prioritisation outcomes with technical stakeholders, ensuring broad agreement on investment decisions.
- Budget Development
  - Align CEF priorities with the Long-Term Financial Model (LTFM), ensuring that investment scenarios match the municipality's financial capacity.
  - Prepare the MTREF capital budget, ensuring that prioritisation feeds directly into municipal budgeting.
  - Conduct scenario planning exercises, exploring different funding and implementation strategies to optimise capital investment.
- Stakeholder Engagement and Communication
  - Serve as a platform for structured engagement with council, departments, and external partners, ensuring shared ownership of the CEF.

- Provide regular updates on capital investment progress, keeping all stakeholders informed.
- Foster collaboration across departments, ensuring cross-functional integration in capital planning.

- Monitoring and Evaluation
  - Track and review project implementation against approved budgets and strategic objectives.
  - Identify delays, budget overruns, or inefficiencies, making recommendations for corrective action.
  - Provide annual reporting on capital expenditure performance, informing future capital planning decisions.

4.3.2 System Support

Effective capital planning and infrastructure maintenance require municipalities to leverage robust financial management systems that support long-term project prioritisation, budgeting, and expenditure tracking. National Treasury mandates that all municipalities adopt core Financial Management Systems (FMS) that adhere to a series of standardised business processes, ensuring transparency, efficiency, and compliance with financial regulations. These systems serve as the backbone of municipal financial governance, integrating budgeting, planning, expenditure control, and reporting mechanisms into a centralised digital framework.

Particularly relevant to the Capital Expenditure Framework (CEF) is the Integrated Development Plan (IDP) and Strategic Planning Business Process, which ensures that long-term infrastructure investments align with development priorities, financial sustainability, and service delivery goals. As part of this process, municipalities must have the technical capability to manage a prioritised portfolio of capital projects, ensuring that infrastructure investments are not only strategically identified but also systematically funded and monitored over multiple years.

National Treasury has outlined that core Financial Management Systems must provide municipalities with the ability to manage a long-term, prioritised portfolio of projects within a dedicated sub-module of the FMS. This feature enables municipalities to track capital expenditure across multiple budget cycles, assess project viability, and align financial commitments with revenue projections. By ensuring that their FMS includes CEF-specific functionalities, municipalities can enhance their capital planning capacity, improve financial forecasting accuracy, and strengthen oversight on infrastructure spending.

Municipalities should proactively assess and upgrade their financial management systems to include these functionalities, ensuring compliance with National Treasury's financial planning requirements. This will enable them to institutionalise data-driven decision-making, streamline infrastructure investment tracking, and improve coordination between capital planning, maintenance, and financial reporting.

4.4 Towards an Improved Data Ecosystem

The Capital Expenditure Framework (CEF) is inherently data-intensive, requiring municipalities to rely on accurate, comprehensive, and well-structured data to drive informed decision-making, financial planning, and infrastructure prioritisation. Given the complexity of capital investment planning, municipalities must ensure that the quality, consistency, and accessibility of their data ecosystems are continuously improved.

The CEF provides a structured framework for municipalities to identify gaps in input data, enhance data governance, and implement standardised data management practices.

A well-functioning data ecosystem is essential for municipalities to effectively integrate long-term capital investment planning with financial sustainability and spatial development objectives. This requires an ongoing focus on three key data elements:

- Population Data – Ensuring that demographic trends and service delivery needs are accurately captured to inform infrastructure investment priorities.
- Financial Data – Aligning budget allocations, funding sources, and expenditure tracking to ensure financial sustainability in capital planning.
- Capital Project Data – Enhancing project tracking, costing, and implementation monitoring to improve execution efficiency and accountability.

Strengthening these core data components enables municipalities to enhance the credibility, effectiveness, and transparency of their CEF processes, leading to more efficient capital planning, improved service delivery, and better alignment with national and provincial financial frameworks.

4.4.1 Maintenance on Input Data

A structured approach to data maintenance is critical for municipalities to ensure the accuracy and reliability of infrastructure investment decisions. Municipalities must prioritise standardising and centralising infrastructure data, creating a single, integrated platform that consolidates spatial, financial, and project-related information. This will allow for the seamless integration of data across municipal departments, improving coordination in capital project planning, budgeting, and implementation.

Another key aspect of data maintenance is the review and modernisation of outdated infrastructure planning instruments. Many municipalities still rely on legacy master plans and sectoral infrastructure strategies that may not reflect current service delivery realities, population growth trends, or evolving spatial development priorities. By updating and aligning these planning instruments, municipalities can ensure that capital investment decisions are based on the most relevant and accurate information available.

4.4.2 Current Data Cleanup

Municipalities must implement frequent project pipeline data assessments to ensure that capital projects remain aligned with financial sustainability and strategic planning objectives. A structured approach to data cleanup will improve decision-making accuracy and capital project execution efficiency. Key areas that require continuous assessment include:

- Spatial Information: Ensuring that capital project locations are accurately mapped (Longitude & Latitude).
- Project Costing: Verifying that infrastructure project cost estimates are realistic and market-related.

- Implementation Timelines: Regularly reviewing project planned implementation timelines and actual progress to ensure that capital projects remain on schedule, identifying delays, and addressing any bottlenecks in execution.
- mSCOA Alignment: Ensuring that all capital project records adhere to the Municipal Standard Chart of Accounts (mSCOA) classification framework, improving transparency, reporting accuracy, and regulatory compliance.

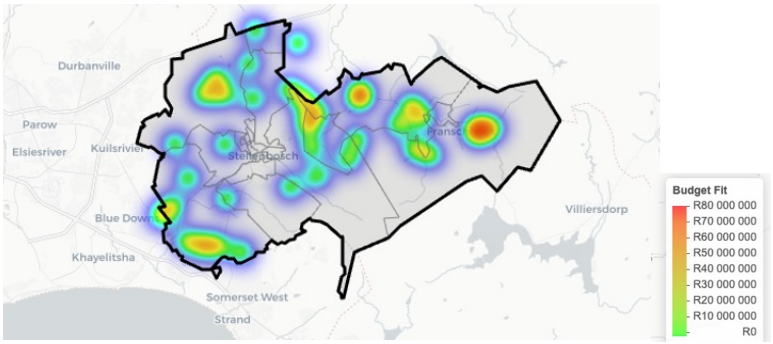
4.5 Concluding Remark

The Institutional Arrangements outlined in this section provide a structured foundation for municipalities to effectively plan, implement, and manage capital expenditure in a way that ensures long-term financial sustainability, spatial transformation, and improved service delivery. By embedding the Capital Expenditure Framework (CEF) within municipal governance, financial management, and spatial planning processes, municipalities can enhance decision-making, accountability, and investment efficiency.

A well-integrated CEF aligns with the Local Government Accountability Cycle, National Treasury business processes, and periodic review mechanisms, ensuring that capital investments are financially viable, strategically prioritised, and effectively monitored. The structured approach to infrastructure maintenance and system support, along with a focus on data integrity and continuous improvement, reinforces the importance of evidence-based planning and resource optimisation.

Ultimately, municipalities that institutionalise the CEF as a core decision-support tool will be better positioned to navigate financial uncertainties, optimise infrastructure investments, and align capital projects with broader developmental objectives. The success of municipal capital planning will not be measured by fixed infrastructure targets alone but by the ability to adapt to changing conditions, integrate across governance structures, and deliver sustainable, impactful urban development for communities. The fundamental institutional arrangements can, therefore be summarised as follows:

- Establish a Capital Planning Forum (CPF) to foster collaboration across departments and ensure structured oversight of the CEF.
- Integrate the CEF into municipal governance structures such as the Integrated Development Plan (IDP), Medium-Term Revenue and Expenditure Framework (MTREF), and Service Delivery and Budget Implementation Plan (SDBIP).
- Update the 10-year CEF and a 3-year capital programme to guide long-term infrastructure planning and ensure eligibility for funding mechanisms.
- Implement system support by adopting Financial Management Systems (FMS) that enable long-term project tracking and alignment with municipal financial planning.
- Improve the municipal data ecosystem by standardising, centralising, and regularly updating infrastructure-related data to ensure accuracy and relevance.
- Conduct periodic annual reviews of the CEF in sync with the IDP process plan.
- Plan for continued infrastructure data maintenance to ensure long-term sustainability.



Project List

Project Implementation Pipeline

2026/27 - 2035/36 CEF

About the Project Implementation Pipeline

The Project Implementation Pipeline provides a structured roadmap for executing capital projects over a defined period. It ensures that prioritised infrastructure investments transition smoothly from planning to execution, aligning with budget availability, regulatory approvals, and municipal strategic goals. By sequencing projects based on readiness, funding, and impact, the pipeline enhances efficiency, accountability, and long-term service delivery sustainability.

Table of Contents

1 Part 1: Introduction 1-1

1.1 What is a Capital Expenditure Framework 1-1
1.2 Aim of Capital Expenditure Framework 1-2
1.3 Objectives of Capital Expenditure Framework 1-3
1.4 Role of the Capital Expenditure Framework as a policy instrument 1-3
1.5 Structure of this Capital Expenditure Framework 1-5

2 Demography & housing 1

2.1 Basic population characteristics 1
2.1.1 Population and gender 1
2.1.2 Population groups 2
2.1.3 Age groups 2
2.1.4 Population – Comparative data from different sources 4
2.1.5 Language groups 9
2.1.6 Mid-year estimates - Population and households 9
2.1.7 Population – long-term change 1996 to 2022 11
2.2 Household characteristics 13
2.2.1 Households, size and density 13
2.2.2 Head of household 16
2.2.3 Household income 16
2.2.4 Dwelling type 17
2.2.5 Dwelling ownership 18

3 Migration 23

3.1 Country of origin 23
3.2 Province of previous residence 23

4 Education 25

5 Employment 26

6 Summary and conclusions: Demography and housing 27

7 Economic development indicators 30

7.1.1 Gross value added (GVA) 30
7.1.2 Location quotient – the drivers in the local economy 30
7.1.3 Tress index based on 22 sectors of the Standard Industrial Classification 32

8 Summary and conclusions: Economic development indicators 33

9 Land cover and settlement footprints 35

9.1 Land cover 35

9.1.1 Land cover for natural elements *35*
9.1.2 Land cover for primary economic activities *35*
9.1.3 Land cover for human settlement *38*
9.2 Building based data 40
9.2.1 Building surface area (m2) *41*
9.2.2 Building Volume (m3) *45*
9.2.3 Average building height (m) *49*
9.3 Points of interest summary 53
9.3.1 Primary economic activities *53*
9.3.2 Offices, retail, entertainment and commercial *53*
9.3.3 Multiple residential *54*
9.3.4 Community and social facilities *54*
9.3.5 Government, Infrastructure and Transport *55*
9.3.6 Tourism, recreation, accommodation and natural features *56*
9.4 Summary and conclusions: Land and settlement footprint 57
10 Access to infrastructure services 60
10.1 Access as reported in the national census data 60
10.1.1 Water services *60*
10.1.2 Sanitation services *61*
10.1.3 Electricity services *62*
10.1.4 Refuse removal *62*
10.1.5 Road network *63*
10.2 Access as reported in the Non-Financial Census of municipalities 64
11 Summary and conclusions: Access to infrastructure 66
12 Education facilities 68
12.1 Health Facilities 69
12.2 SAPS Stations 69
12.3 Lower Courts 69
13 Summary and conclusions: Access to community and social facilities 74
14 Audit Outcomes 75
14.1 Non-financial municipal indicators 76
14.1.1 Employment indicators *76*
14.1.2 Councillors and the Executive *77*
14.1.3 Staffing and Employment *77*
14.1.4 Manager and total employment *78*
14.1.5 Departmental staffing and employment *79*
14.1.6 Service access indicators *84*
14.1.7 Service delivery policy indicators *86*
14.1.8 Policy frameworks and agreements *91*

15 Summary and conclusions: Municipal non-financial indicators 92

Notes on data, the use and presentation thereof

Spatial analysis and profiling areas depend on quality, detail and geographical data sets. The challenge is to present and use data in such a way that it conveys a message based on facts. The analyst's duty and skill are to combine different datasets and extract value from the process.

There are three challenges to overcome. The first is that data represents a picture at a specific time. These time or date differences make direct comparisons very challenging. Secondly, data have a particular granularity depending on the spatial scale in which the data was generated or presented. This makes the disaggregation of data to a more advanced level of granularity more challenging. The third issue is that related data are generated from different bases, often for different purposes. For example, what is the difference between a family unit, a household or a residential customer in a municipality? They are all related and might even be the same, but they have different interpretations, whether one does social, economic, or financial analyses.

There are three basic ways to overcome these challenges. The first is mapping to do pattern recognition within the timeframe of rates of change. For example, quoting the Census 2011 number of population values can no longer be valid in 2022. However, a map depicting the distribution of population language majorities may still allow the spatial analyst to make every valid observation and essential conclusion because these patterns are slow to change. Secondly, the approach is to do trend analysis by plotting temporal data and then statistically calculating and determining the trend the data values represent at different points in time. Finally, the third option is spatial or numerical cross-comparisons between different and unrelated datasets to draw inferences on trends and outcomes developing in the area.

The approach remains to find the most recent and credible data but to supplement it with historical or comparative data to extract the maximum value from the data. As a word of caution, simply quoting a figure is meaningless if it is not put in context or if the implications thereof are assessed.

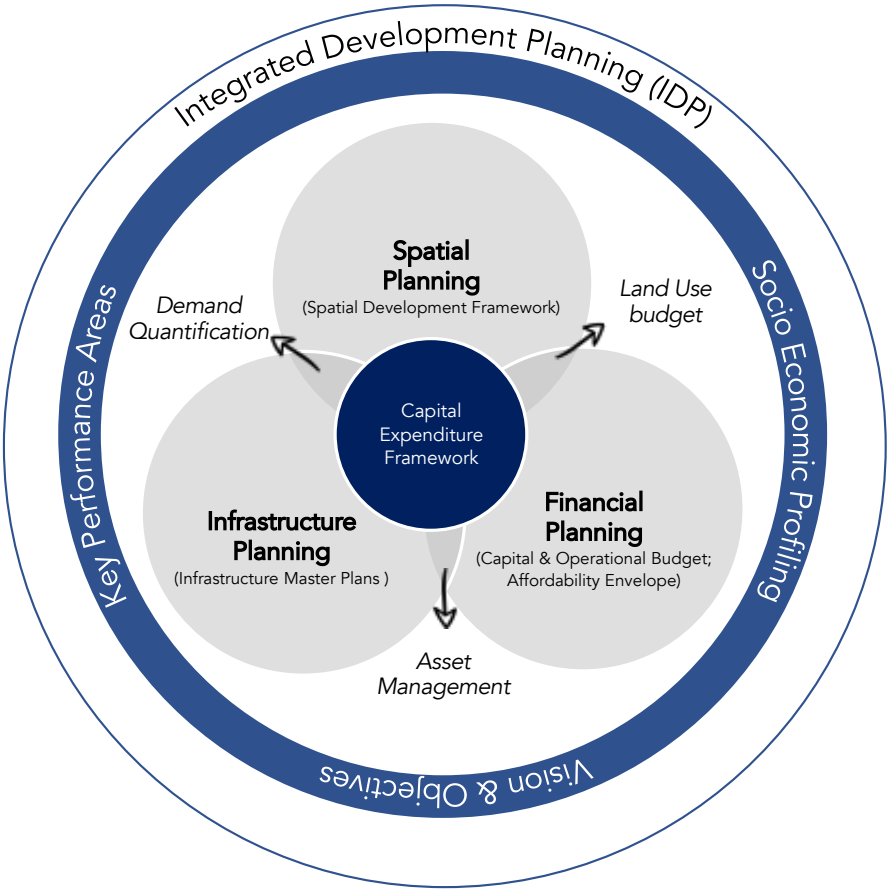
The use of place names

Place names used in this document are the place names reflected in official national and provincial datasets. Official names are designated through the South African Geographical Names Council. The official governing body of South Africa advises the central government's executive branch (in the form of the Minister of Arts and Culture) on new geographical names and the changing of existing ones. The South African Geographical Names Act 118 of 1998 established the Council. We are aware that there are often discrepancies between official and local names. Using official names is practical and should not be construed as disrespecting local names, customs and traditions.

Phase 1

Introduction

1 Part 1: Introduction



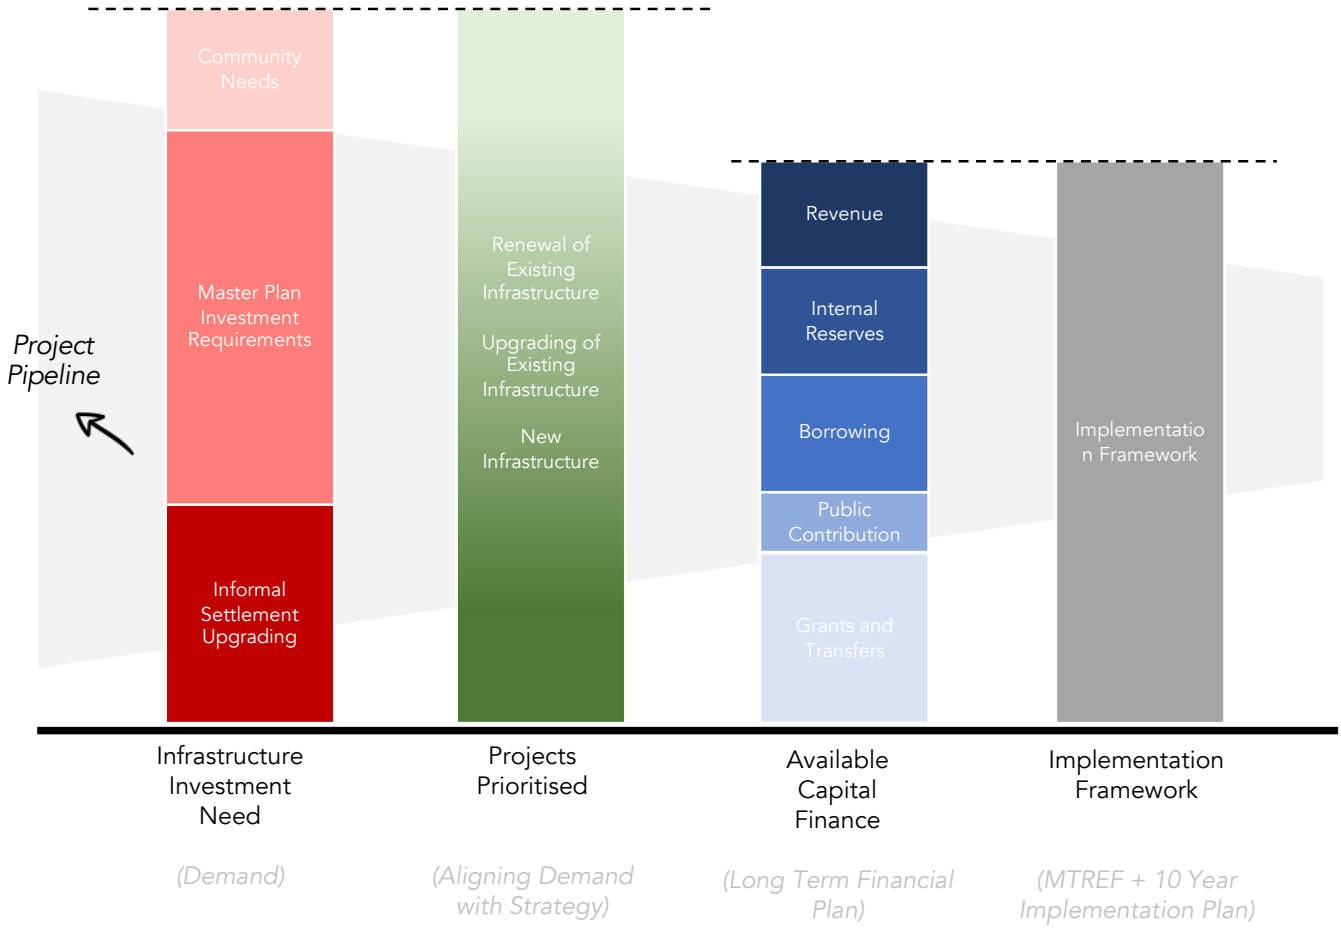
1.1 What is a Capital Expenditure Framework

According to the Department of Cooperative Governance and Traditional Affairs (COGTA) guidelines, a Capital Expenditure Framework (CEF) is a consolidated, high-level view of a municipality's long-term infrastructure investment needs. It ensures that infrastructure priorities are spatially aligned with municipal strategic objectives, budgetary realities, and development plans. The framework is grounded in principles of sustainability, financial feasibility, and strategic alignment, balancing immediate infrastructure needs with long-term development goals, the relationships between these spheres of planning and principles is illustrated in Figure 1–1.

The Spatial Planning and Land Use Management Act, 2013 (SPLUMA) mandates the inclusion of a CEF within a municipality's Spatial Development Framework (SDF). Specifically, Section 21(n) of SPLUMA requires that an SDF "determine a Capital Expenditure Framework for the municipality's development programmes, depicted spatially." This legislative requirement underscores the importance of integrating spatial planning with financial planning, ensuring that the spatial strategies articulated in the SDF are implemented through practical and affordable infrastructure investments.

A Capital Expenditure Framework links spatial development strategies with budgetary constraints and infrastructure demands. It provides a transparent mechanism for prioritising projects, promoting the efficient allocation of resources, and aligning capital expenditure with the municipality's long-term strategic vision.

Figure 1–1: The Capital Expenditure Framework within the built environment context



1.2 Aim of Capital Expenditure Framework

The aim of a Capital Expenditure Framework (CEF) is to create a structured and strategic approach to municipal infrastructure expenditure. The CEF is intended to align the municipality's spatial development strategies with its financial resources and capacity, ensuring that long-term growth and development objectives are achievable, and informs operational activities of a municipality.

A CEF aims to provided a municipality with the means to inform financial planning with infrastructure planning and spatial priorities identified in the Spatial Development Framework (SDF). It aims, furthermore, to establish a clear methodology for municipalities to evaluate, prioritise, and inform implementation processes of infrastructure projects within their affordability envelope, supporting both immediate and long-term development goals.

From Figure 1–2one can see the illustration that infrastructure investment need, expressed as projects, usually exceeds available capital finance, and therefore it is an imperative for municipalities to partake in a prioritisation process to determine which projects are best aligned with the strategy of the municipality, together with a budget scenario process to determine which projects are affordable and should be implemented when.

Figure 1–2: Relationship between infrastructure investment needs, affordability envelope, prioritisation process, and budget scenario process

1.3 Objectives of Capital Expenditure Framework

The key objectives of a CEF is to:

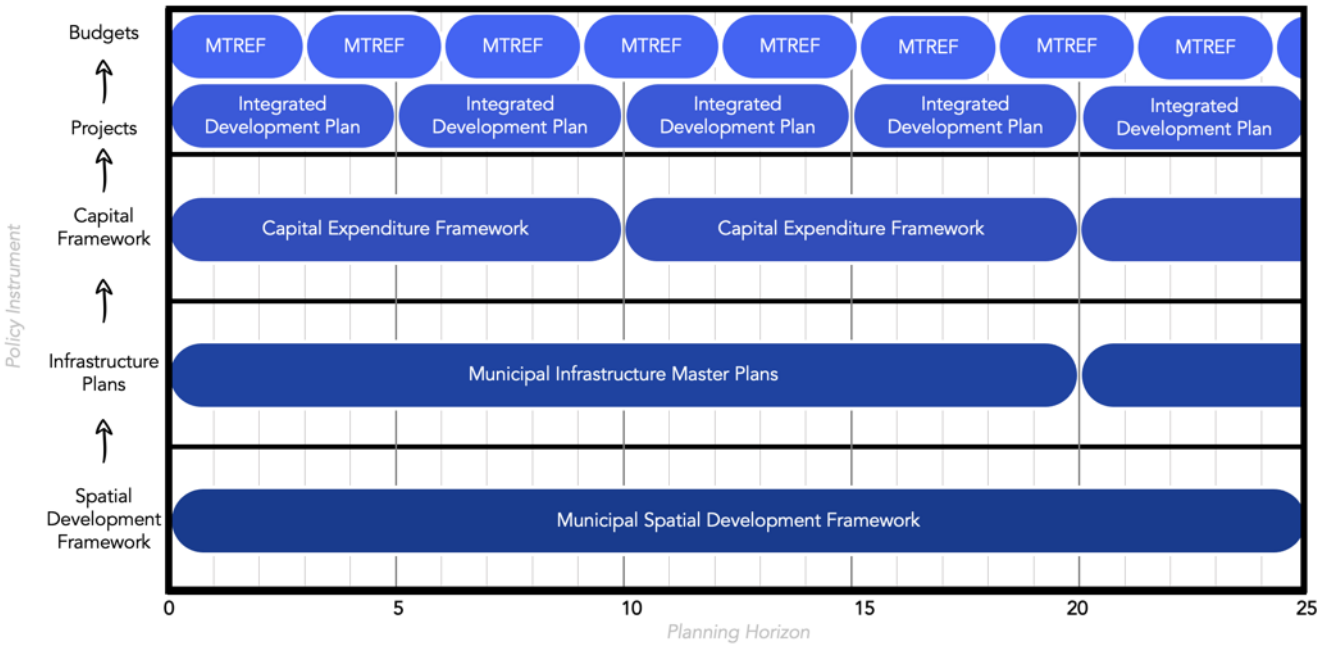
- Socio-economic trends: Understand the socio-economic trends in a municipality over the long term;
- Quantify Infrastructure Needs: Assess and detail the municipality's long-term infrastructure requirements based on an SDF-informed land use budget, infrastructure standards, anticipated socio-economic growth, existing infrastructure, and backlogs;
- Align with the Spatial Development Framework (SDF): Translate the spatial vision and strategic priorities outlined in the SDF into priority development areas which informs prioritisation practices;
- Consolidate Infrastructure Demand: Create a comprehensive list of infrastructure projects across various sectors in line with the municipality's mandate, reflecting the municipality's overall infrastructure demands;
- Contextualise Financial Affordability: Integrate the municipality's affordability envelope, derived from the Long-Term Financial Model (LTFM), to ensure infrastructure expenditure are financially sustainable over the planning horizon;
- Facilitate Prioritisation: Establish a framework to evaluate and rank projects based on strategic alignment, socio-economic impact, and spatial targeting amongst others, ensuring that resources are allocated to the most critical and impactful projects;
- Determine a Budget Scenario: Offer a structured, evidence-based approach to infrastructure planning and budgeting, improving decision-making processes and accountability to stakeholders - amongst others, to indicate project-level responses per asset type per functional area;
- Enable Spatial Transformation: Direct infrastructure investments toward spatial transformation goals, focusing on reducing inequalities, improving access to services, and promoting inclusive economic growth, and;
- Bridge Short-Term and Long-Term Planning: Ensure a coherent link between the short-term MTREF cycles, Medium-term Integrated Development Plan (IDP) cycles and the municipality's long-term development vision, embedding sustainability and foresight into the planning process.

1.4 Role of the Capital Expenditure Framework as a policy instrument

The Capital Expenditure Framework (CEF) is a cornerstone of municipal planning, grounded in South Africa's legislative framework and designed to bridge the gap between long-term spatial development strategies and actionable infrastructure expenditure. The concept of the CEF was formalised under the Spatial Planning and Land Use Management Act (SPLUMA, Act 16 of 2013), specifically in Section 21(n), which mandates municipalities to determine a spatially referenced CEF as part of their Spatial Development Framework (SDF). This legislative requirement reflects the increasing emphasis on aligning planning and budgeting processes to address developmental challenges effectively.

Historically, the Constitution of South Africa laid the foundation for this alignment in Section 153, which directs municipalities to prioritise the basic needs of communities while promoting socio-economic development through structured planning and budgeting. The Integrated Development Plan (IDP) was introduced as a mechanism to achieve this in the Local Government Transition Act (Act 209 of 1993),

evolving through subsequent legislation, including the Municipal Systems Act (MSA, Act 32 of 2000). The MSA established the IDP as the principal planning instrument of local government, requiring it to incorporate a comprehensive financial plan and a Spatial Development Framework. This integration ensures that municipal resources are allocated effectively to achieve the long-term developmental vision.



The CEF builds on these legislative imperatives by operationalising the SDF within the IDP framework. As a long-term (10-year) planning tool, the CEF quantifies infrastructure needs, consolidates them into prioritised project pipelines, and aligns them with the municipality's financial capacity as outlined in the Long-Term Financial Plan (LTFP). It ensures that infrastructure investments are not only spatially targeted but also financially sustainable, bridging the divide between visionary spatial strategies and practical implementation.

The CEF also plays a vital role in South Africa's Local Government Accountability Cycle, a governance framework defined by the Municipal Finance Management Act (MFMA, Act 56 of 2003). This cycle integrates planning, budgeting, and reporting processes to ensure transparency, accountability, and alignment with development priorities. Through informing the IDP, and so the Medium-Term Revenue and Expenditure Framework (MTREF), as well as the Service Delivery and Budget Implementation Plan (SDBIP), the CEF enables municipalities to stabilise their decision-making processes. It provides a consistent rationale for allocating resources, ensuring that both short-term operational needs and long-term developmental objectives are addressed.

Importantly, the CEF institutionalises long-term planning practices within municipalities. It encourages decision-makers to adopt a forward-looking perspective that considers future growth patterns, socio-economic trends, and financial constraints. This approach reduces the reactive nature of municipal budgeting, replacing it with proactive, evidence-based strategies that support equitable service delivery and spatial justice.

The CEF is a transformative policy instrument that integrates spatial, financial, and infrastructure planning within the legislative and operational frameworks of municipal governance. It strengthens the IDP as the single most strategic document of municipalities, ensures alignment with the SDF, and guides resource allocation through the MTREF and SDBIP. Through its structured and integrated approach, the CEF enables municipalities to achieve their developmental mandates while ensuring financial sustainability and fostering spatial transformation.

Figure 1–3: The relationship between policy instruments effecting the spatial form

1.5 Structure of this Capital Expenditure Framework

The structure of this report is outlined below to guide the reader through the key components of the Capital Expenditure Framework (CEF) and its alignment with municipal planning processes as well as the norms and standards of the CEF.

Table 1-1: Structure of this Capital Expenditure Framework

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 1: Inception and Information Gathering	Phase 1	To provide a contextualisation to the Capital Expenditure Framework. This phase comprises the inception process of the CEF as well as the information gathering process in which a comprehensive integrated infrastructure investment framework, or portfolio of projects, is collated.
Part 2: Functional Area and Spatial Category for Investment Planning Profiling and Spatial Demand Quantification	Phase 2a	This part introduces functional areas for priority investment which are defined and mapped to indicate the spatial strategy depicted in the MSDF (linked to the MSDF proposals). The identified functional areas are used to determine the future population, housing, and land demand based on existing socio-economic and related data which is used in the spatial demand quantification component.
Part 3: Infrastructure demand	Phase 2b	This part determines the investment requirements for each functional area, including operational and maintenance costs per asset class. The goal is to compare the optimal infrastructure requirements scenario with the known infrastructure demand based on current planning frameworks.
Part 4: Affordability Envelope	Phase 3	This part is a reflection of the municipality's financial health and long-term financial plan. Primarily it includes the results of the re-application of the long-term financial plan to determine the appropriate affordability envelope.
Part 5: Prioritisation and Budget Scenario	Phase 4	This part has a prioritisation framework that considers spatial, engineering, and financial factors to calculate a composite score indicating each project's relative importance in the pipeline. It also applies this framework to the budget fit process to determine how to allocate capital within the affordability envelope per project for the next 10 years.

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 6: Capital Expenditure Programme	Phase 5	This part is a breakdown of the 10-year capital expenditure framework. Essentially, it analyses the fitted project pipeline in terms of spatial alignment, asset type alignment, and other attributes to ultimately verify that the 10-year capital expenditure framework is in line with the strategic intent of the prioritisation framework and the MSDF objectives.
Part 7: Institutional Arrangements and Project Closeout	Phase 6	This phase comprises of a concluding chapter to the CEF, this part aims to identify areas of enhancement that will render the CEF not only as a compliance document but to solidify institutional change around the alignment of planning, engineering, and financial practices – with the ultimate aim to improve service delivery. Furthermore this phase contains a final close-out report detailing the project timeline and conclusions drawn.

Phase 2a

Socio Economic Profiles

2 Demography & housing[1]

The basis for assessment is expected changes in the municipality's demographic profile. The core of this assessment is the relationship between population and households as the basis of the council's customer base.

A range of factors impacts the demographic profile of the municipality. These factors interact horizontally and, importantly, have a hierarchical relationship with national, provincial and regional demographics. Therefore, variables are analysed on a comparative basis by exploring relationships between demographic variables and the demographics' relationship with economic development.

2.1 Basic population characteristics

Population dynamics, such as changes in population size, structure and distribution, and the associated demographic factors of births, deaths, and migration, affect all facets of human life. Planners in every sector should carefully examine the population attributes of their planning areas and address their sector plans regarding the relevant population issues. This report provides the necessary base data to draw inferences about the municipality's population dynamics.

2.1.1 Population and gender

The total population is the starting point. For any planning assessment, the total population is fundamental to the current and long-term demand for services and facilities. The table below shows the population for the four census periods and Community Survey 2016 with a gender split. The 2020 figures are derived from WorldPop.org open-source data. From the time-related figures, inferences can be drawn on population growth or decline. Gender also serves as a proxy for economic conditions. Generally speaking, male absenteeism can indicate that a municipality is shedding workers, while a surplus of males might indicate that the area is attracting migrant labour and, hence, higher expectations regarding economic growth and job creation. The table on age groups below will shed more light on this matter.

Table 2: Population and gender

	1996	2001	2011	2016	2020	2022
Males	51,208	57,862	76,133	89,929	99,717	85,071

[1] The reports shows the data for Census 2022 that is currently available. The figures for 2020, applicable, comes from WorldPop.org data.

	1996	2001	2011	2016	2020	2022
Females	53,392	61,138	79,508	92,956	100,581	90,339
Population density (p/ha)	1.14	1.39	1.82	2.14	2.3	2.05
Total Population	104,600	119,001	155,641	182,886	200,642	175,411

2.1.2 Population groups

Population groups need not be a central issue in development analysis. However, the composition of the local population might help explain current dynamics based on historical population settlement patterns.

Table 3: Population groups

	1996	2001	2011	2016	2022
Black	16,241	24,231	43,716	80,690	64,902
White	27,024	26,231	28,738	22,790	40,819
Coloured	59,003	68,269	81,261	79,226	66,315
Indian/Asian	264	269	620	181	842
Other	2,068	NA	1,307	NA	2,449
Unspecified	NA	NA	NA	NA	85
Total	104,600	119,001	155,641	182,886	175,411

2.1.3 Age groups

Statistics South Africa

Age groups are significant in any demographic assessment. The population's age structure directly indicates the long-term demand for community and social services, housing and infrastructure. The table below only reflects four age categories. The first category is the preschool population, and the second category is the extent of the school population, the third category is the economically active population, and the last group is the elderly population.

Table 4: Age groups

	1996		2001		2011		2016		2022[2]	
	Male	Female	Male	Female	Male	Female	Male	Female		
<5	5,679	5,527	8,008	7,858	5,735	5,812	7,318	7,754	13,267	
5 to 20	15,403	16,104	19,802	20,730	17,528	18,213	23,169	22,224	36,332	
20 to 65	27,777	28,708	45,413	46,874	32,522	34,303	56,073	58,595	114,782	
>65	1,636	2,411	2,910	4,047	2,078	2,811	3,368	4,383	11,024	
Unspecified	714	642	0		0		0		0	
Total	51,208	53,392	57,862	61,138	76,133	79,508	89,929	92,956	85,071	90,339
	104,600		119,001		155,641		182,886		175,411	

In considering age groups, the 20 to 65-year cohort is very significant. The male-female ratio in this age group is important. As explained above, male absenteeism or a male surplus is a good proxy for migrant labour. Furthermore, the number of women in this age group also indicates the expected number of households in an area. However, one should treat such a figure with care. For example, the proxy is not as accurate in KwaZulu-Natal as, for example, it is in Limpopo, as polygamous marriage customs are more prevalent in KwaZulu-Natal.

WorldPop Demographic data

The next table was compiled from WorldPop data and shows age and gender per age category. It is a finer breakdown, as shown below, and aligns with significant age cohorts in the municipality.

Table 5: Breakdown of Demographics 2020

Age Group	Description	Male	Female	Total
0 - 5	Preschool age	7,646	7,588	15,234
6 - 13	Primary school age	11,809	11,918	23,726

[2] No gender breakdown given per age group

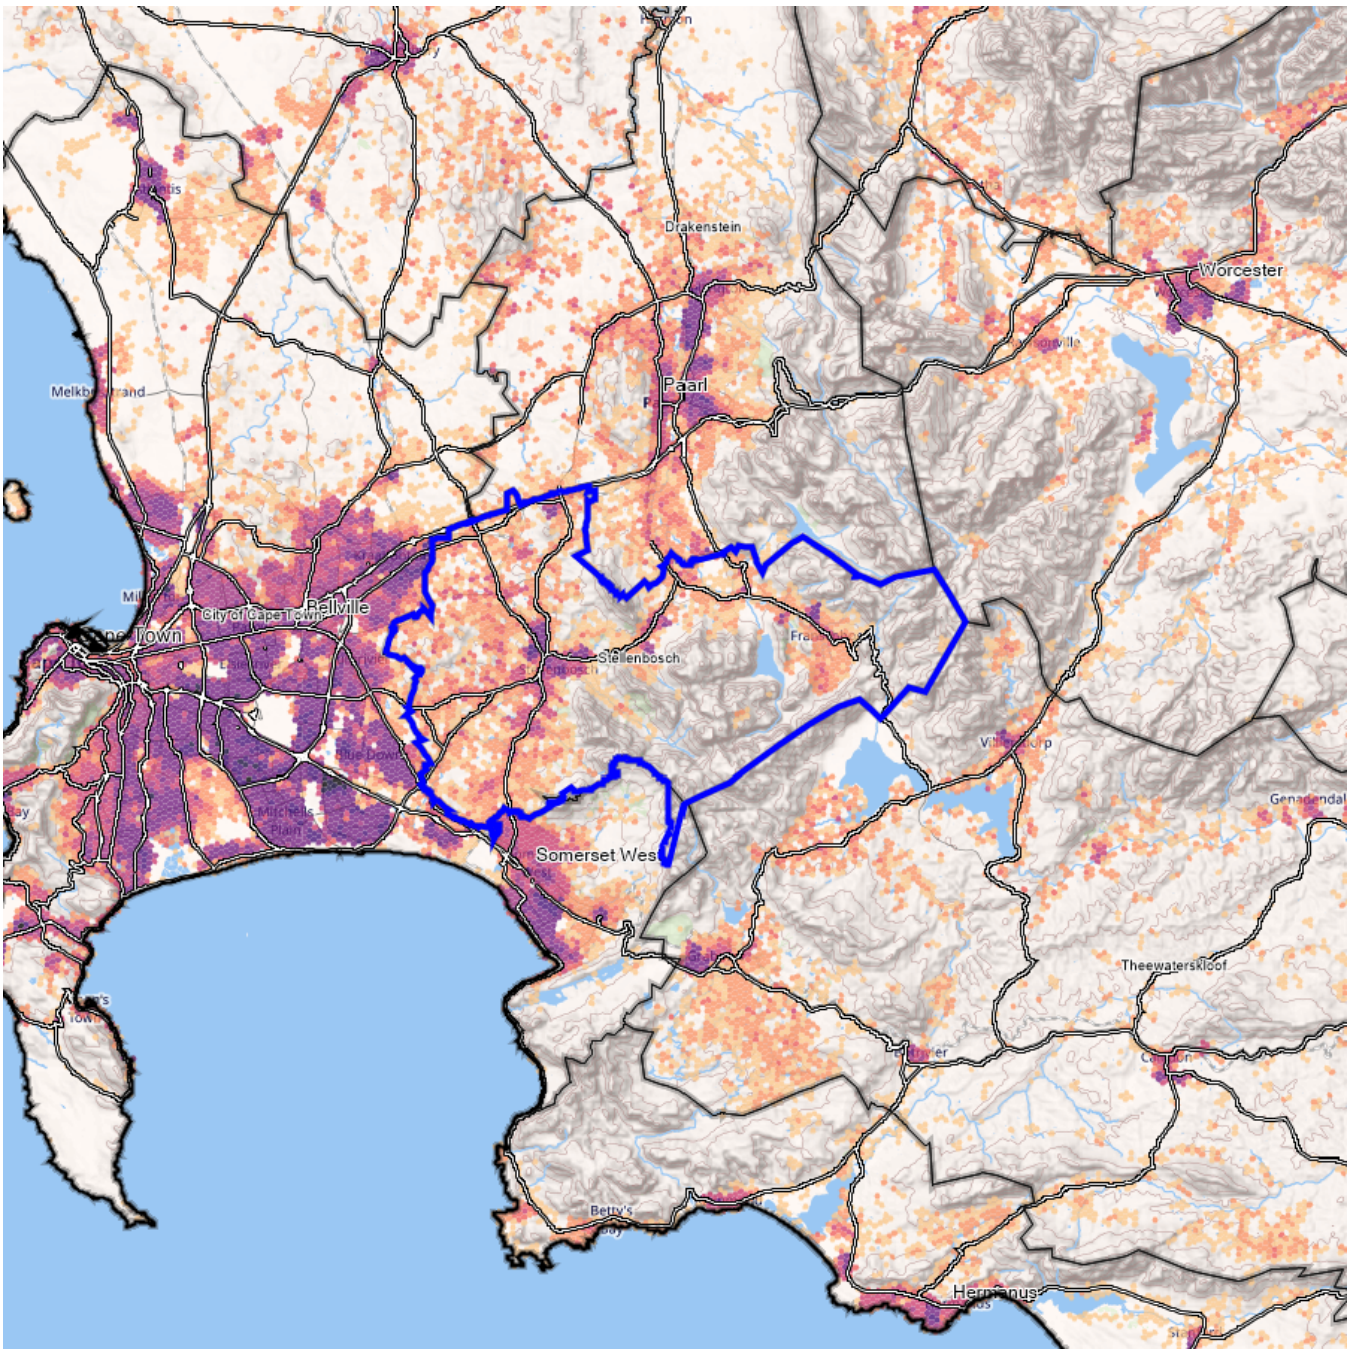
Age Group	Description	Male	Female	Total
14 - 18	Secondary school age	8,118	8,708	16,826
19 - 35	Young adults	33,558	33,489	67,047
36 - 65	Adults	33,523	33,063	66,586
66 - 75	Senior adults	3,628	4,037	7,665
75 and up	Elderly	1,435	1,779	3,558
	Total	99,717	100,581	200,642

2.1.4 Population – Comparative data from different sources

This section draws from a range of population data for different years from various sources. Our system integrates a range of reputable population datasets to ensure comprehensive, accurate, and up-to-date demographic information. The following sources are utilised:

- StatsSA (Statistics South Africa): Includes Census data (collected every 10 years), Community Survey data (mid-cycle demographic snapshots), and Mid-Year Population Estimates (annual estimates based on demographic modelling).
- Quantec EasyData: A commercial database providing processed and modelled South African demographic and socioeconomic data, derived from official sources such as StatsSA and supplemented with consistent time series formatting.
- WorldPop: A global open-access population dataset providing high-resolution (typically 100m or 1km) gridded population estimates, using geospatial modelling based on census data and ancillary inputs.
- WorldPop Projection (Beta): A forward-looking version of the WorldPop dataset, offering experimental population projections using machine learning and spatial modelling approaches, aligned with global demographic trends.
- Kontur Meta: A global population dataset created from aggregated mobile data and open sources, providing high-resolution population counts at a 400m hex grid level, designed for near real-time spatial analysis.
- LandScan: Developed by Oak Ridge National Laboratory, LandScan offers global population distribution data at approximately 1km resolution, representing ambient (average over 24 hours) population estimates using a combination of census and geospatial data.

Table 6: Summary of population changes



Year	Census	Community survey	Midyear population estimates	Quantec	WorldPop	WorldPop projection (BETA)	Kontur	Meta	LandScan
1993				108,700					
1994				111,526					
1995				113,711					
1996	104,600			116,423					
1997				119,112					
1998				122,051					
1999				124,133					
2000				127,563					71,594
2001	119,001			129,396					
2002			123,173	132,015					
2003			126,136	134,365

2013			163,802	170,165					146,050

Year	Census	Community survey	Midyear population estimates	Quantec	WorldPop	WorldPop projection (BETA)	Kontur	Meta	LandScan
2014			167,825	173,907					169,355
2015			171,956	175,702	131,431	170,288			161,657
2016		182,886	176,178	179,043		173,454			169,355
2017			180,027	182,717		173,043			170,715
2018			183,857	186,249		175,148			172,433
2019			187,797	189,720		176,695			172,703
2020			191,821	192,837	204,934	178,784	185,330	161,932	175,908
2021			195,837	195,374		180,632	168,919		177,521
2022	175,411		199,852	198,485		511,690	164,664		177,897
2023			203,978	198,707		184,372	207,681		168,105
2024			208,273	200,906	179,151	185,739			
2025						187,355			
2026						188,773			
2027						190,500			
2028						191,248			
2029						193,050			
2030						194,675			

When using and interpreting population data from diverse sources like StatsSA, Quantec, WorldPop, and others, it's important to understand the methodological, spatial, and temporal differences that can impact accuracy, comparability, and suitability for specific use cases. The key Considerations for Use and Interpretation.

- Data Source and Methodology*: Each dataset is built using different methodologies, ranging from direct enumeration (e.g., Census) to modelled estimates (e.g., WorldPop, LandScan). Understanding how the data was collected and processed is essential for correct interpretation.
- Spatial Resolution: Datasets vary in spatial granularity—from national or subnational aggregates (e.g., Quantec, StatsSA) to high-resolution gridded data (e.g., WorldPop, Kontur). High-resolution data enables fine-scale analysis but may involve greater modelling assumptions.
- Temporal Relevance: Population figures reflect different points in time. Some are periodic (e.g., the Census every 10 years), while others are updated annually or continuously modelled. Always verify the reference year and update frequency.
- Population Definitions: Be aware of what is being measured—de facto (present at time of enumeration), de jure (usual residence), or ambient population (average over 24 hours). For example, LandScan represents ambient population, while Census data typically reflects de jure populations.
- Modelled vs. Observed Data: Modelled datasets (e.g., WorldPop, LandScan) use statistical and geospatial modelling, which may introduce uncertainty, especially in data-scarce regions. These should be validated or triangulated where possible.
- Data Licensing and Usage Rights: Some datasets (e.g., Quantec) are commercial or restricted, while others (e.g., WorldPop, Kontur) are open-access. Ensure compliance with licensing conditions.
- Uncertainty and Accuracy: All datasets have inherent uncertainty. Consider error margins, especially in projections and interpolated data, and avoid over-interpreting precision in modelled outputs.

2.1.5 Language groups

Language groups display robust spatial patterns in South Africa. These patterns and distributions affect education, labour markets, and relations. However, its impact on the demand for community services, infrastructure and social facilities is insignificant for the planner.

Table 7: Language groups

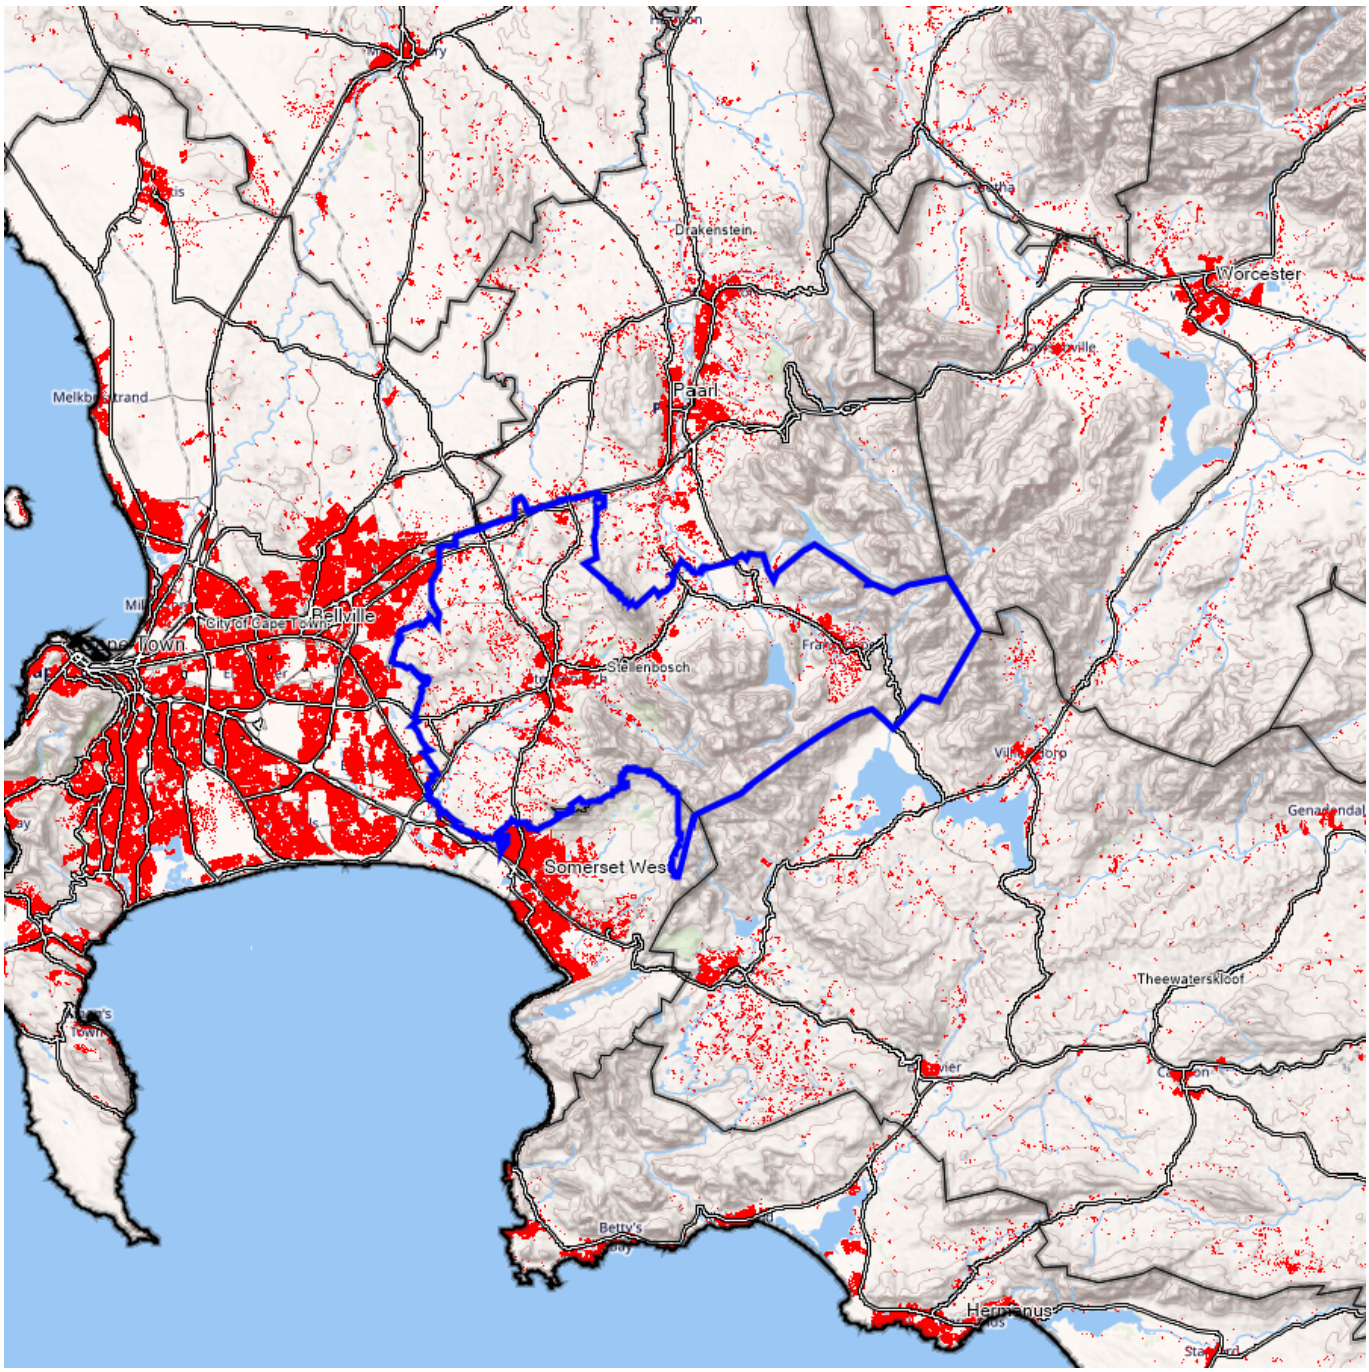
2.2 Household characteristics

Population numbers relate to the demand for community and or social facilities. On the other hand, households determine the demand for infrastructure and housing. Furthermore, many planning indicators are measured regarding household sizes and densities.



2.2.1 Households, size and density

Households are usually assessed in the context of the total population, resulting in density ratios and household sizes. The number of households determines the overall demand for infrastructure services and housing. Household density is an essential indicator of settlement efficiency and is important in urban planning and development strategies. Household size impacts the extent of consumption of goods and services. One should note that housing support strategies have affected household formation to the extent that there are often different rates of change between households and populations. The basic household profile for the assessment area is shown in the table below.

Table 11: Total households, size and density

	1996	2001	2011	2016	2022
Total households	26,147	35,170	43,322	55,338	59,626
Household density (households/ha)	0.29	0.41	0.51	0.65	0.70
Ave household size	4.00	3.38	3.59	3.30	3

Map 3: Google Open Buildings - Building structures

LEGEND

The building structures in the municipality

- Building structures

Map 4: Building Structures per km2 (kernel densities)

Building Units per km^2

LEGEND

Building Units per km^2

Kernel density shows the density of features in a neighbourhood around those features. Unlike point mapping, which focuses on mapping the location of individual events, hotspot mapping focuses on highlighting areas with a higher than average incidence of events. These have come to be known as 'hotspots.'

2.2.2 Head of household

Gender is an important aspect of any **development** environment. The gender of household heads relates to many socio-economic and cultural practices and factors. Therefore, the data below should be interpreted within the context of the environment that is being assessed.

Table 12: Head of household by gender

	1996	2001	2011	2016	2022
Male head of household	19,174	23,213	28,314	34,988	Not available
Female head of household	6,843	11,957	15,008	20,350	Not available
Unspecified	130	0	0	0	Not available
Total	26,147	35,170	43,322	55,338	59,626

2.2.3 Household income

Household income is used as one of the main poverty indicators in South Africa. Social support and subsidy systems are often based on household income parameters. When comparing household income, it is important to discount the impact of inflation. The figures in the table below were adjusted to 2011 Rand values. These figures are not available from the Community Survey 2016.

Table 13: Household income per month in 2011 Rand values

Income group (Rands)	1996	2001	2011	2022
<1200	3,574	8,492	13,498	Not available
1 200 – 2 000	38	3,766	4,362	Not available
2 000 – 5 000	163	4,206	7,151	Not available
5000 – 10 000	791	6,601	7,376	Not available
10 000 – 20 000	2,040	8,210	5,096	Not available
20 000 – 50 000	7,578	2,572	3,678	Not available
>50 000	11,966	1,323	2,161	Not available
Total	26,147	35,170	43,322	59,626

The following income comparisons can be drawn between the Censuses:

Table 14: Household income indicators per month in 2011 Rand values

	1996	2001	2011	2022
Total income in the municipality (per month)	902,806,078	221,519,308	459,513,986	Not available
Income per capita (per month)	8,631	1,862	2,952	Not available
Income per ha (per month)	9,871	2,595	5,383	Not available
Ave household income (per month)	34,611	11,567	10,600	Not available

2.2.4 Dwelling type

Housing backlogs and the demand for housing were and will always remain an issue in South Africa's development and social support strategies. The following table shows the different dwelling types in the municipality under assessment.

Table 15: Dwelling type

	1996	2001	2011	2016	2022
Traditional	467	768	254	371	398
House made of bricks/Formal	14,130	18,685	24,807	31,722	52063.05
Flat	3,026	2,959	4,353	1,456	Not reported
Multiple housing	2,509	1,198	2,643	2,812	Not reported
Dwelling in backyard	1,185	554	445	290	Not reported
Room/ granny flat	700	265	279	208	Not reported
Informal	2,937	3,480	7,500	16,261	7051.01
Informal dwelling in backyard	601	1,111	2,443	2,092	Not reported
Other	591	6,150	598	124	114

	1996	2001	2011	2016	2022
Total	26,147	35,170	43,322	55,338	59626.06

2.2.5 Dwelling ownership

Dwelling ownership data must be treated with circumspect. The data from the census below is based on the occupant's perceptions. There are many ownership systems available. If ownership is interpreted as freehold ownership in terms of a title deed, most areas in South Africa are excluded from this form of ownership. This applies to tribal land and many of the townships in South Africa that were surveyed but never proclaimed. The table below reflects the position as reported in the censuses.

Table 16: Dwelling ownership3

Tenure	2001	2011	2016	2022
Rented	8,547	12,997	10,387	Not available
Owned but not yet paid off	4,533	4,313	4,625	Not available
Occupied rent-free	8,211	12,568	10,345	Not available
Owned and fully paid off	7,848	11,086	23,619	Not available
Other	6,031	2,357	6,362	Not available
Total	35,170	43,322	55,338	59626.06

[3] 1996 census data is not comparable to the 2001 and 2011 census and Community Survey 2016 does not provide this information.

Households, buildings and structures comparative data

To support accurate spatial and demographic analysis, our system integrates both household and building count datasets from authoritative and high-resolution sources. The following datasets are used:

- Household Data Sources
    - StatsSA Census: Provides comprehensive data on household counts, types, and characteristics collected every 10 years through a nationwide enumeration.
    - StatsSA Community Survey: A large-scale household survey conducted between censuses, offering mid-cycle updates on household demographics and living conditions.
    - StatsSA Mid-Year Population Estimates: Annual estimates that include modelled household numbers based on demographic trends and census benchmarks.
    - StatsSA Dwelling Frame: A geo-referenced database of known dwelling structures across South Africa, used as a sampling frame for surveys and censuses.
    - Quantec Regional Data: A commercial dataset that includes processed and harmonised household statistics at regional levels, sourced from StatsSA and enriched with historical time series.
- Building Count Data Sources
    - Eskom Spot Building Counts: A high-resolution spatial dataset developed by Eskom, providing precise counts and locations of buildings, particularly in rural and electrified areas. This initiative was terminated and flowed into the SatsSA Dwelling Frame initiative.
    - WorldPop Building Counts: Modelled building footprint data derived from satellite imagery and population distribution modelling, helpful in estimating settlement density and infrastructure needs.
    - Google Open Buildings (v3): A global dataset of building footprints extracted from high-resolution satellite imagery using machine learning, offering accurate building outlines and metadata (e.g., area, confidence).
    - Overture: A collaborative open data project that includes validated, harmonised building footprints and points of interest, designed for consistency and integration across platforms.

The table below shows the details for the area under assessment

Table 17: Summary of household and building changes

Year	Household data					Total building structures			
	StatsSA Census	StatsSA Community survey	StatsSA Mid-year population estimates	StatsSA Dwelling Frame	Quantec Regional Data	Eskom Spot Building Counts	WorldPop building counts	Google Open Buildings(v3)	Overture

When interpreting household and building count data, it's essential to be aware of specific technical, methodological, and contextual factors that can influence the accuracy, comparability, and usefulness of the data. Below is a list of key considerations specific to these data types:

- Definition of a household or building
    - Household definitions can vary slightly across surveys (e.g. number of people, shared meals, or shared living arrangements).
    - Building definitions may include only structures with roofs, exclude incomplete or mobile structures, or vary based on use (residential vs. non-residential).
- Source and methodology
    - StatsSA household data is derived from enumerated surveys and censuses, while Quantec processes and models this data for regional consistency.

    - Building datasets (e.g., Google Open Buildings, WorldPop) use satellite imagery and machine learning—results depend on image quality, classification algorithms, and training data.
- Coverage and completeness
    - Some datasets (e.g., Eskom Spot Building Counts) may have stronger rural or electrified area coverage, while others (e.g., Google Open Buildings) are more complete in urban areas.
    - Dwelling Frames may not capture recent informal or unregistered developments.
- Spatial Resolution and Accuracy
    - Satellite-based building data may have high spatial resolution but can misclassify non-buildings (e.g. rocks, vehicles).
    - GPS accuracy, projection systems, and boundary definitions can affect data alignment between datasets.
- Data Confidence and Uncertainty
    - Some datasets (e.g., Google Open Buildings) include confidence scores. Lower confidence may indicate potential errors in classification.
    - Modelled estimates (e.g., WorldPop building counts) carry inherent uncertainty, especially in under-surveyed areas.

3 Migration

Migration is an important issue in a country where urbanisation is pivotal in long-term development strategies and where the local economy is open.

3.1 Country of origin

Migration into the municipality from abroad is shown in the following table.

Table 18: Migration - country of origin

Migration	1996	2001	2011	2016	2022

4 Education

Education is pivotal in the development process. Skill levels are derivatives of levels of education. The next table shows the profile of the highest level of education for the area.

Table 20: The highest level of education

	1996	2001	2011	2016	2022
Under 5	9,239	9,586	22,169	Not reported	Not reported

5 Employment

Employment and unemployment are the most challenging aspects of the South African development environment. The following table shows how employment and related factors have changed since 1996.

Table 21: Employment within the municipality

Employment	1996	2001	2011	2022
Employed	40,126	44,185	56,910	Not available

Total	104,600	119,001	155,641	175,411

6 Summary and conclusions: Demography and housing

The demographic and housing profile shows a municipality that expanded strongly over the long term, with growth translating into a larger service base, rising settlement intensity, and steadily increasing demand for housing and bulk infrastructure. Over the full period from the mid-1990s to the most recent census, the population grew at an average annual rate of about 2.0% per year, while the number of households grew faster at about 3.2% per year. This widening gap between household growth and population growth is consistent with ongoing household formation and declining average household size, which typically drives up demand for serviced stands, dwelling units, and network capacity even when population growth moderates. The overall trend is therefore toward a larger, more spatially concentrated customer base, with pressures shifting from "more people" to "more households" and the associated need for additional connections, internal reticulation, solid waste services, and access to adequate housing opportunities.

Basic population characteristics point to a municipality that became more densely settled and economically "pull-oriented" for a substantial portion of the period, followed by a more mixed recent signal that requires careful interpretation. The gender split remains broadly balanced with a slight female majority, suggesting a relatively stable resident population rather than an overwhelmingly male, temporary labour influx; however, the planning implication is not the absence of migration, but rather that in-migration is likely family-based and linked to longer-term settlement decisions, which increases demand for schools, clinics, and family-sized housing. Population density increased markedly over time, indicating intensification of settlement patterns and potentially more efficient service delivery footprints in some areas, but also greater strain on existing infrastructure if upgrades lag behind growth. The composition of population groups shifted in ways that suggest changing settlement dynamics and potentially changing housing market segments, with growth in historically underrepresented groups during the expansion phase and a more diversified profile later on. The age structure signals a strong and expanding working-age base over time, alongside a clear rise in the older cohort, meaning the municipality must plan simultaneously for economic opportunity (jobs, skills, transport access, land for enterprise) and for social service needs associated with ageing (health services, accessible public environments, and appropriate housing options). Youth and school-age cohorts remain significant, reinforcing the need for ongoing investment in education-related infrastructure and safe, affordable neighbourhood environments. Language patterns show a historically dominant language group remaining prominent while other languages expanded strongly, consistent with internal migration and urbanisation dynamics; for planners, this matters less as a direct driver of infrastructure demand, and more as a signal for how municipal communication, community engagement, and service access should be designed to be inclusive and effective.

Household characteristics and housing conditions show the clearest "service delivery" story: household numbers rose faster than the population, and average household size declined, meaning the municipality needs more housing units, more service connections, and more neighbourhood-level infrastructure per person than before. Household density increased over time, which can support more efficient network provision and public transport potential in well-located areas, but also increases the urgency of maintaining and upgrading ageing infrastructure and managing local

congestion, stormwater impacts, and public space quality. The head-of-household profile indicates rising female-headed households across earlier periods, which often correlate with differentiated vulnerability and access constraints and typically require housing and basic services strategies that are sensitive to affordability, safety, and proximity to livelihoods and social services. The housing stock shifted toward a stronger formal/brick housing base over time, suggesting consolidation and some improvement in housing quality, but the trajectory of informal dwellings points to a period of significant growth in informality up to the mid-2010s, followed by a reduction by the most recent census—still leaving a material informality footprint and therefore an ongoing need for upgrading, serviced sites, and incremental housing strategies. The small traditional dwelling component remained comparatively limited and stable, implying that the dominant housing challenge is not traditional settlement per se, but rather the balance between formal provision, affordability, and the pace of household formation. Tenure data (where available) shows a shift away from a simple rent/own binary toward a mix of arrangements, with growth in fully paid-off occupancy and continued relevance of rent-free occupation and other tenure forms, which is typical in contexts where formal title, township establishment histories, and varied settlement typologies coexist. Income indicators (noting the data gaps and reporting changes) suggest a municipality experiencing structural changes over time, where poverty and low-income households remain a critical concern while higher income segments also emerge, implying a dual housing market: continued demand for subsidised and affordable housing on the one hand, and growing demand for gap and market housing on the other—each with different implications for land release, bulk capacity, and location efficiency.

Migration trends reinforce the interpretation of a municipality shaped primarily by internal South African movement rather than international inflows, while still showing that cross-border migration exists and increased during the period for which data are available. The overwhelming share of residents originates within South Africa, with a smaller but notable component from the SADC region and other parts of the world, indicating some labour and opportunity-driven migration, but not at a scale that eclipses domestic mobility. Interprovincial patterns show movement dominated by within-province origins, alongside contributions from other provinces that fluctuate over time, consistent with changing economic conditions, shifting opportunity structures, and household relocation decisions as the municipality urbanised and expanded. From a planning perspective, the most important implication is that migration is likely to continue to shape settlement growth in specific nodes and corridors rather than evenly across the municipality, intensifying pressure in hotspots where housing affordability, job access, and service availability align. This reinforces the need for spatially targeted infrastructure investment, proactive land assembly and release in well-located areas, and upgrading approaches that match how people actually settle—often incrementally and close to livelihoods. It also underscores the importance of maintaining credible, regularly updated local demographic monitoring, because even modest changes in net migration can materially affect household formation and housing demand.

Education indicators show a strong long-term shift toward higher educational attainment, despite changes in how categories are reported over time. The overall trend is a reduction in the share of residents with no schooling and growth in the share achieving matric and post-matric qualifications, pointing to improving human capital and an expanding base of residents with the potential to

participate in more diverse labour markets. At the same time, the persistence of large cohorts with only partial primary or secondary education implies that the skills pipeline remains uneven, with a meaningful portion of the population still vulnerable to exclusion from higher-productivity employment. For municipal planning, this has two linked implications: first, social infrastructure planning must continue to support early childhood development, schooling capacity, and safe access to education across settlements; second, local economic development strategies need to align with the evolving skills profile by supporting work-integrated learning, vocational pathways, and partnerships that translate education gains into employment outcomes. Education trends also intersect directly with housing: as educational attainment rises, household aspirations and housing preferences diversify, increasing demand for a broader mix of housing typologies and better located neighbourhoods with reliable services, while affordability constraints still anchor a large segment of demand in subsidised and incremental housing solutions.

Employment data, while incomplete for the most recent census year in this section, suggests that labour market pressure remains a central development challenge even as the number of employed people increased over the longer period. Unemployment and discouragement also rose in earlier periods alongside growth in the non-economically active population, indicating that job creation has not kept pace with the expanding working-age cohort and that labour absorption is a binding constraint on socio-economic outcomes. This pattern is typical where urbanisation and in-migration increase the labour supply faster than local economic restructuring can generate stable employment, and where participation dynamics are influenced by education, household responsibilities, and broader macroeconomic conditions. For service delivery and capital planning, the implications are significant: persistent unemployment constrains household ability to pay for services, increases reliance on subsidies and indigent support, and can elevate risks around revenue collection, informal service connections, and the sustainability of operating budgets. It also increases demand for municipal interventions that support access to opportunity—such as reliable transport routes, well-located affordable housing, serviced land for small enterprise, and public environment improvements that enable local trade. In practical terms, the municipality's infrastructure and housing strategy should be treated not only as a response to growth, but as an economic platform: prioritising investments that improve location efficiency, reduce household transport costs, support densification where infrastructure can carry it, and direct upgrading and serviced sites toward areas that connect residents to jobs, education, and public services.

7 Economic development indicators

This section contains economic data from Quantec's (www.quantec.co.za) regional indicator database. The base data covers the period from 1993 to 2019. For practical considerations, only key data elements for 2018 are provided in this report. Due to technical constraints, the data is based on 2011 municipal demarcations. If the municipality profiled in this report had significant boundary changes, such as amalgamations or subdivided in 2016, the data must be used cautiously.

7.1.1 Gross value added (GVA)

GVA is a measure of the value of economic production. GVA thus adjusts gross domestic product (GDP) by the impact of subsidies and taxes (tariffs) on products.

Table 22: Gross value added at basic prices (R'million)

	Agriculture	Mining	Manufacturing	Utilities	Construction	Trade	Logistics	Business services	Community services	Government services	Total
2015	902	20	2758	178	771	2504	1452	3855	1870	878	15188
2020	1011	17	2377	163	609	2385	1402	4295	1793	909	14961
2023	1007	16	2492	155	587	2600	1841	4657	1842	884	16082

7.1.2 Location quotient – the drivers in the local economy

The location quotient (also called a basic/non-basic ratio) is a ratio between employment within a sub-sector of the economy divided by the total employment within the local/regional/national economy. A ratio greater than one suggests that the specific economy employs proportionally more people within the local economy than the economy it is being compared to. As a result, it generates more than what can be consumed locally, and the sector is thus a net exporting sector. This implies that it generates income for the local economy (i.e. a comparative advantage and key driver). The opposite is then true for ratios smaller than one.

Comparing location coefficients (basic/non-basic ratios) over different time periods is important for understanding how a region's economic structure and competitiveness evolve. The basic/non-basic ratio represents the proportion of a region's economic activity that is driven by exports (basic activities) versus local consumption (non-basic activities).

The tables below shows the coefficients for 2015, 2020 and 2023, The purpose o fthese figures are:

- Track Economic Changes: By comparing these ratios over time, analysts can track shifts in a municipality's economic base. A rising basic/non-basic ratio may indicate increasing export-driven growth, suggesting that the region is becoming more competitive and integrated into global markets.

- Identify Structural Shifts: Changes in the ratio can signal shifts in the local economy—such as the growth or decline of key industries—that impact employment, wages, and overall economic health.

The value of this anlaysis lies in the fact that it helps policymakers assess whether economic development strategies are working, and whether industries that are driving growth are becoming more or less reliant on external markets. Furtheremore, investors can use this data to assess the future potential of a region. A high and rising basic ratio could suggest an economy with strong export potential, making it attractive for investment, and, lastly, it provides insights into the sustainability of local growth. A heavy reliance on non-basic activities might signal economic fragility or over-dependence on local demand. In short, comparing these ratios over time helps gauge a region's economic health, its integration into broader markets, and the long-term sustainability of its growth.

Table 23: Location quotient – the drivers in the local economy 2015

7.1.3 Tress index based on 22 sectors of the Standard Industrial Classification

The size of the economy and sectors driving the local economy are important. However, the vulnerability of the local economy is equally important, and the ability of the economy to sustain itself through economic cycles will determine sustainability at many levels of development and operations. Economic diversity is one of the significant factors that determine risk. It simply implies that the more diverse an economy is, the more resilient it is when one or more sectors are affected by external change and pressures on the local economy. Diversity in an economy is measured through the tress index. A tress index of zero represents a completely diversified economy. On the other hand, the higher the index (closer to 100), the more concentrated or vulnerable the region's economy is to exogenous variables, such as adverse climatic conditions, commodity price fluctuations, etc

Table 26: Level of specialisation in the local economy

1995	2000	2005	2010	2015	2020	2021	2022	2023
53.4	52.8	50.4	48.9	47.4	49	49.6	49.7	49.8

8 Summary and conclusions: Economic development indicators

The gross value added profile shows an economy whose overall output grew only modestly across the period, with a clear shift in what drives that output. Ignoring the 2020 figures, the total economy trends upward from the mid-2010s to the early 2020s, but at a relatively slow pace, resulting in an average annual growth rate of about 0.7% over the period. Under that calm headline, the structure changes: activity linked to distribution and a modernising services base strengthens over time, with logistics and business services showing the most consistent upward momentum (about 3.0% and 2.4% per year respectively), alongside steady, low growth in trade (about 0.5% per year) and gradual improvement in agriculture (about 1.4% per year). In contrast, construction and manufacturing weakened over the same period (roughly -3.4% and -1.3% per year), suggesting that fixed investment and industrial output did not keep pace with expansion in the service-and-movement economy. Community-related services remain broadly stable with a slight softening, and government services are essentially flat. The planning implication is that the municipality's economic trajectory is increasingly shaped by mobility, market access, and business-support functions rather than by a strong expansion of building activity or industrial production, meaning that land use management, transport efficiency, freight-friendly routes, and reliable utilities become as important to economic performance as traditional industrial zoning or greenfield expansion.

The location quotient results reinforce this structural interpretation by showing where the municipality holds a comparative advantage relative to the district, province, and national economy, and how stable those advantages are. Comparing 2015 with 2023 (and ignoring 2020), the local economy's strongest "export base" signals remain centred on manufacturing and trade, with logistics and business services also staying above the threshold that indicates net-exporting capacity at the district comparison level; this suggests a local economy that not only serves its own residents but also supplies goods, distribution, and services beyond its boundaries. Over time, the advantage in logistics strengthens, pointing to an increasing role as a movement-and-connection economy, while the advantage in business services remains positive but narrows slightly, implying slower relative gains in higher-value services compared to peers. Agriculture appears relatively underrepresented in the district economy, but becomes a strong comparative advantage relative to the province and especially the national economy, indicating that the municipality's agricultural base is more significant than typical South African averages, even if it is not the dominant driver within its immediate district context. Mining remains marginal across comparisons, and community services trend from slightly above to around (or just below) the "self-sufficiency" threshold, implying that these services largely track local demand rather than exporting capacity. Overall, the ratios are notably stable across time, which signals an economy that is not rapidly reindustrialising or diversifying into entirely new specialisations, but is gradually deepening an established structure, particularly around logistics, trade, and business-support functions, so development strategies should prioritise improving competitiveness in these areas (movement efficiency, precinct functionality, skills alignment, and service reliability) rather than relying on a single "big bet" sectoral shift.

The Tress index shows that the municipality's economy became progressively more diversified from the mid-1990s through the mid-2010s, reducing vulnerability to shocks concentrated in a single

sector, but that this diversification plateaued and partially reversed thereafter. The long downward trend through the mid-2010s indicates improving resilience and a broader mix of activity, typically associated with greater stability in municipal revenues, labour markets, and household livelihoods. From the mid-2010s onward, the index rises again and then levels out, indicating a mild increase in concentration, still more diversified than the mid-1990s baseline, but less steadily improving than before. Read with the GVA and location quotient patterns, the most plausible interpretation is not a sudden collapse into a one-sector economy, but a relative strengthening of a few leading functions (notably logistics and business services) while weaker sectors (like construction and parts of manufacturing) lose share, producing a slightly more concentrated profile. For spatial and infrastructure planning, this means resilience will depend on protecting the enabling conditions of the leading sectors, transport and freight performance, stable utilities, safe and functional commercial/industrial areas, and workforce development, while also pursuing deliberate diversification actions that broaden the base (enterprise support, value-chain development linked to agriculture and manufacturing niches, and investment attraction that complements the logistics-and-trade platform rather than competing with it).

9 Land cover and settlement footprints

9.1 Land cover

This section deals with land cover. The dataset has been derived from multi-seasonal Landsat 8 imagery, using operationally proven, semi-automated modelling procedures developed specifically for this dataset's generation based on repeatable and standardised modelling routines. The data is presented at 30m a resolution, and as a result, the accuracy of the query results is affected accordingly.

The following table lists the extent of land cover in the municipality. The results are expressed as hectares covered by a category. The data for 1990 and 2014 are directly comparable. However, the categories were changed for the 2018 and 2022 land cover. The outcomes must be compared only with great caution.

9.1.1 Land cover for natural elements

Table 27: Landcover4: Natural elements

Landcover category	Extent of cover 1990 (ha)	Extent of cover 2014 (ha)	Extent of cover 2018 (ha)	Extent of cover 2022 (ha)
Erosion dongas				
Waterbodies	3512.96	3708.57	2774.14	2772.11

9.1.2 Land cover for primary economic activities

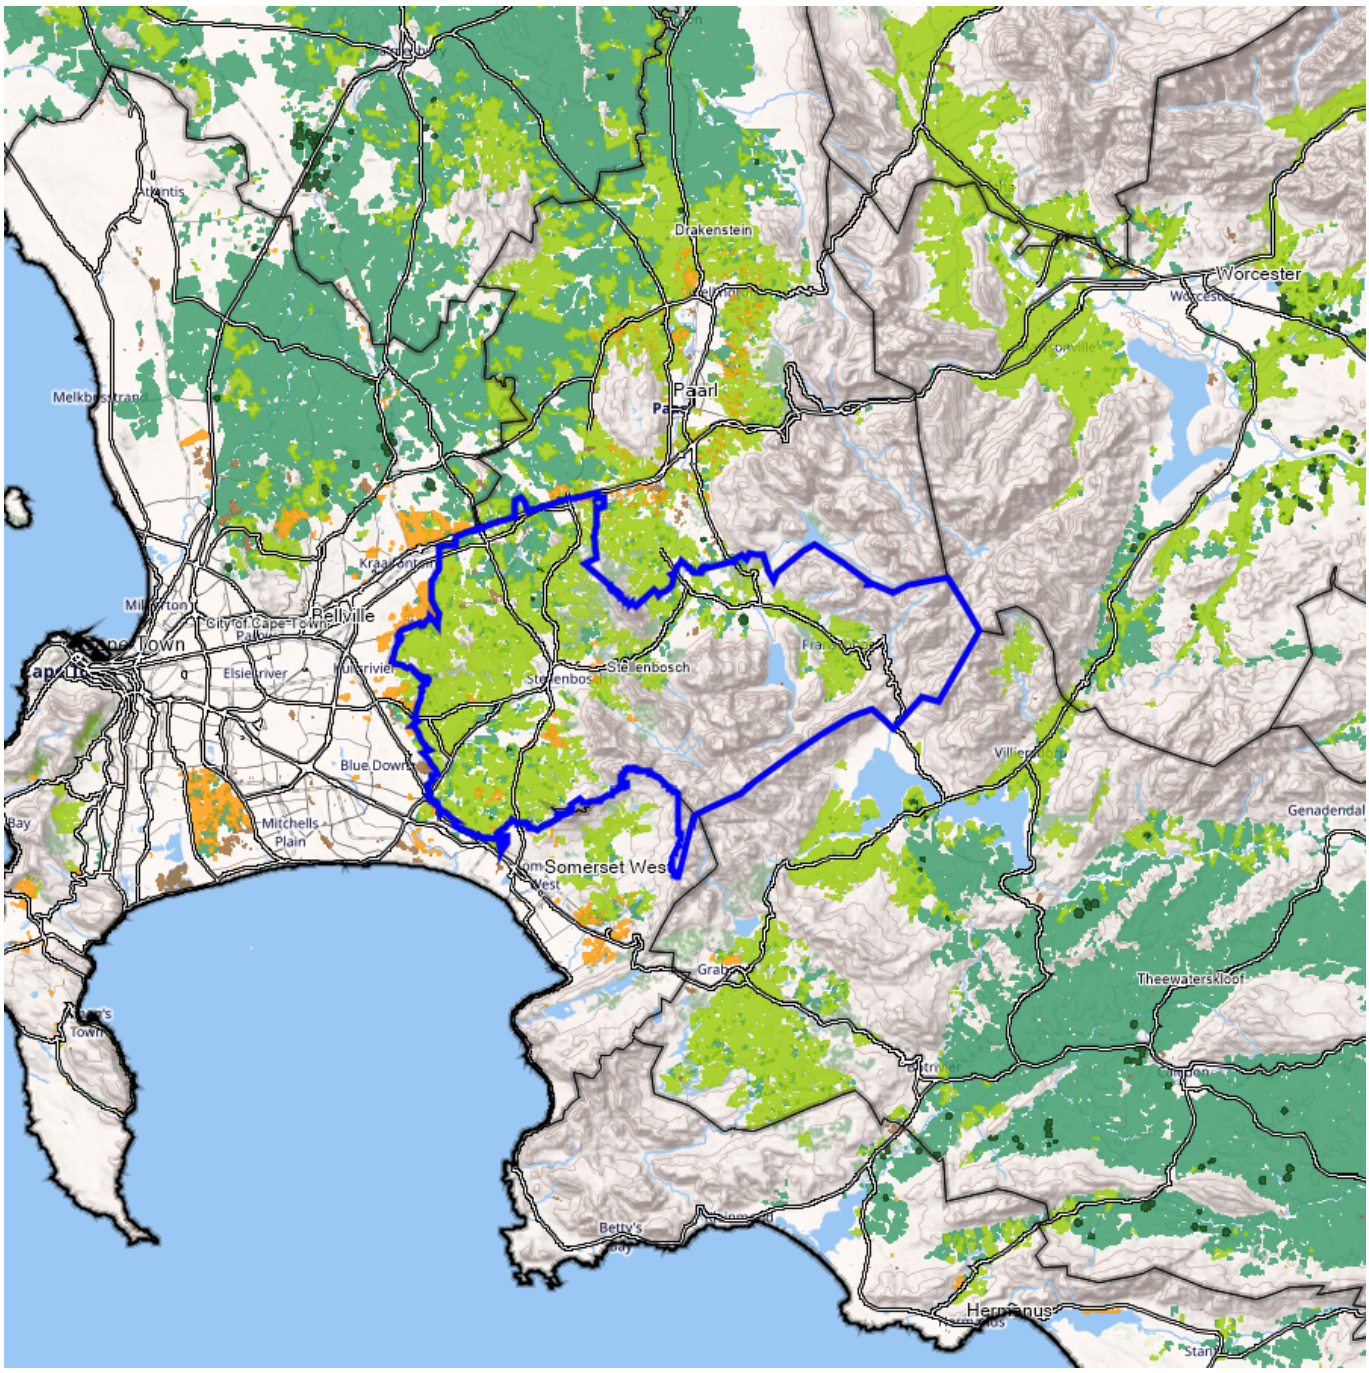

Table 28: Landcover5: Primary economic activities

Landcover category	Extent of cover 1990 (ha)	Extent of cover 2014 (ha)	Extent of cover 2018 (ha)	Extent of cover 2022 (ha)
Cultivated commercial fields	4215.32	3992.55	7638.2	7749.17
Cultivated commercial pivot		84.11	150.36	149.64

[4] No data against a category implies that in a particular land cover category does not occur the assessment area.
[5] No data against a category implies that in a particular land cover category does not occur the assessment area.

Landcover category	Extent of cover 1990 (ha)	Extent of cover 2014 (ha)	Extent of cover 2018 (ha)	Extent of cover 2022 (ha)

9.2 Building based data

In the realm of spatial planning in South Africa, integrating new, open, and inclusive data presents a transformative opportunity. This report uses advanced data and methodologies within the Global Human Settlement Layer (GHSL) framework to assess and comprehend humanity's impact, resource accessibility, and risk exposure. By employing the GHSL framework, governments, organizations, and individuals can derive actionable insights for informed decision-making.

The GHSL project, spearheaded by the European Commission's Joint Research Centre, is a pivotal initiative addressing the need for spatially detailed information on population and settlements. At the core of the GHSL framework are three pillars aligning with recent advancements in the scientific-technological landscape:

- Abundance of Open Data: The GHSL framework leverages a remarkable surge in free and open data, incorporating Earth Observation from satellites such as Landsat and Copernicus Sentinel and volunteered geographic information from platforms like OpenStreetMap. This vast pool of global-scale data forms the foundation for comprehensive analyses.
- Technological Advancements in Data Processing: Accompanying the data surge is a substantial boost in data technology, encompassing online cloud storage, high-performance computing for efficient processing, and methodological development through artificial intelligence and machine learning. These technological enhancements enable the GHSL framework to deliver accurate and timely insights.
- Promotion of Open Collaboration: The GHSL framework promotes open collaboration, emphasizing coordinated and sustained data sharing. Initiatives like the Group on Earth Observations (GEO) are vital in establishing infrastructure for improved research, policy-making, decisions, and actionable measures. This collaborative approach enhances the efficacy of spatial planning initiatives in line with international agreements such as the 2030 Development Agenda, the Sendai Framework for Disaster Risk Reduction, the Sustainable Development Goals, the Paris Climate Agreement, and the New Urban Agenda.

In this context, the GHSL framework emerges as a cornerstone for effective monitoring and strategic planning, fostering a data-driven approach to address the complex challenges of spatial planning in South Africa.

It is important to note that the data shows all structures with no distinction between residential and non-residential structures.

9.2.1 Building surface area (m2)

Building coverage data plays a crucial role in urban and spatial planning, providing essential information about the distribution, density, and usage of buildings within a given area. The ability to measure changes in coverage over time is equally significant for several reasons.

Firstly, building coverage data aids in understanding the current state of urban development and land utilization. By analyzing the spatial distribution of buildings, planners can identify patterns, trends, and areas of concentration. This information is invaluable for making informed decisions about zoning, infrastructure development, and resource allocation. Secondly, monitoring changes in building coverage allows planners to assess the impact of urban development projects and policies. This includes tracking the expansion of built-up areas, identifying redevelopment areas, and evaluating the effectiveness of land-use regulations. Understanding these changes is essential for adapting plans and policies to accommodate the evolving needs of a growing population and changing economic conditions.

Furthermore, building coverage data is essential for assessing the environmental impact of urban development. It helps in evaluating factors such as the extent of impervious surfaces, green space distribution, and overall environmental sustainability. This information is vital for implementing measures to mitigate the environmental effects of urbanization, such as managing stormwater runoff and preserving natural habitats.

In summary, building coverage data and measuring changes in coverage are essential tools for informed decision-making in urban and spatial planning. They provide valuable insights into current urban patterns, help assess the effectiveness of planning policies, and enable proactive adjustments to accommodate the dynamic nature of urban development while considering environmental sustainability.

Table 30: Total building surface area in the area (m2)

	1995	2015	2020
Building surface (m2)	7,785,950	12,594,736	14,455,728

The next three maps show the average building coverage per hectare for 2015 and 2020 and the difference in coverage between the two years.

(Note: Due to the scale and extent of municipal areas, the spatial extent of the building surface data is not always clear.)

9.2.2 Building Volume (m3)

Utilizing building volumes per hectare (ha) in spatial planning is a critical aspect that offers nuanced insights into urban development, guiding planners in optimizing space, enhancing infrastructure efficiency, and fostering sustainable environments. Measuring building volumes per hectare provides a more comprehensive understanding of spatial utilization than surface-level coverage alone. This metric accounts for horizontal and vertical dimensions, offering a three-dimensional perspective on urban density. This nuanced approach is crucial for optimizing land use in increasingly dense urban environments.

The importance of building volumes per hectare lies in its ability to inform urban planners about the intensity of development within specific areas. High building volumes suggest vertical growth, indicating efficient land use and potentially reducing urban sprawl. On the other hand, low building volumes may signal underutilization of space, prompting planners to explore strategies for densification and mixed-use development.

Spatial planning benefits significantly from considering building volumes per hectare when assessing infrastructure requirements and understanding how vertical density aids in evaluating the demand for services such as transportation, utilities, and public amenities. Efficient vertical development can alleviate pressure on horizontal expansion, contributing to more sustainable, compact, and accessible urban environments. Moreover, the three-dimensional perspective offered by building volumes per hectare is instrumental in creating visually appealing and cohesive urban landscapes. Striking a balance between horizontal and vertical development ensures that cities evolve with aesthetic coherence, fostering a sense of place and community.

Analyzing building volumes per hectare in environmental sustainability facilitates more accurate assessments of energy efficiency, green space preservation, and overall ecological impact. It enables planners to integrate green infrastructure effectively, promoting biodiversity and mitigating the urban heat island effect.

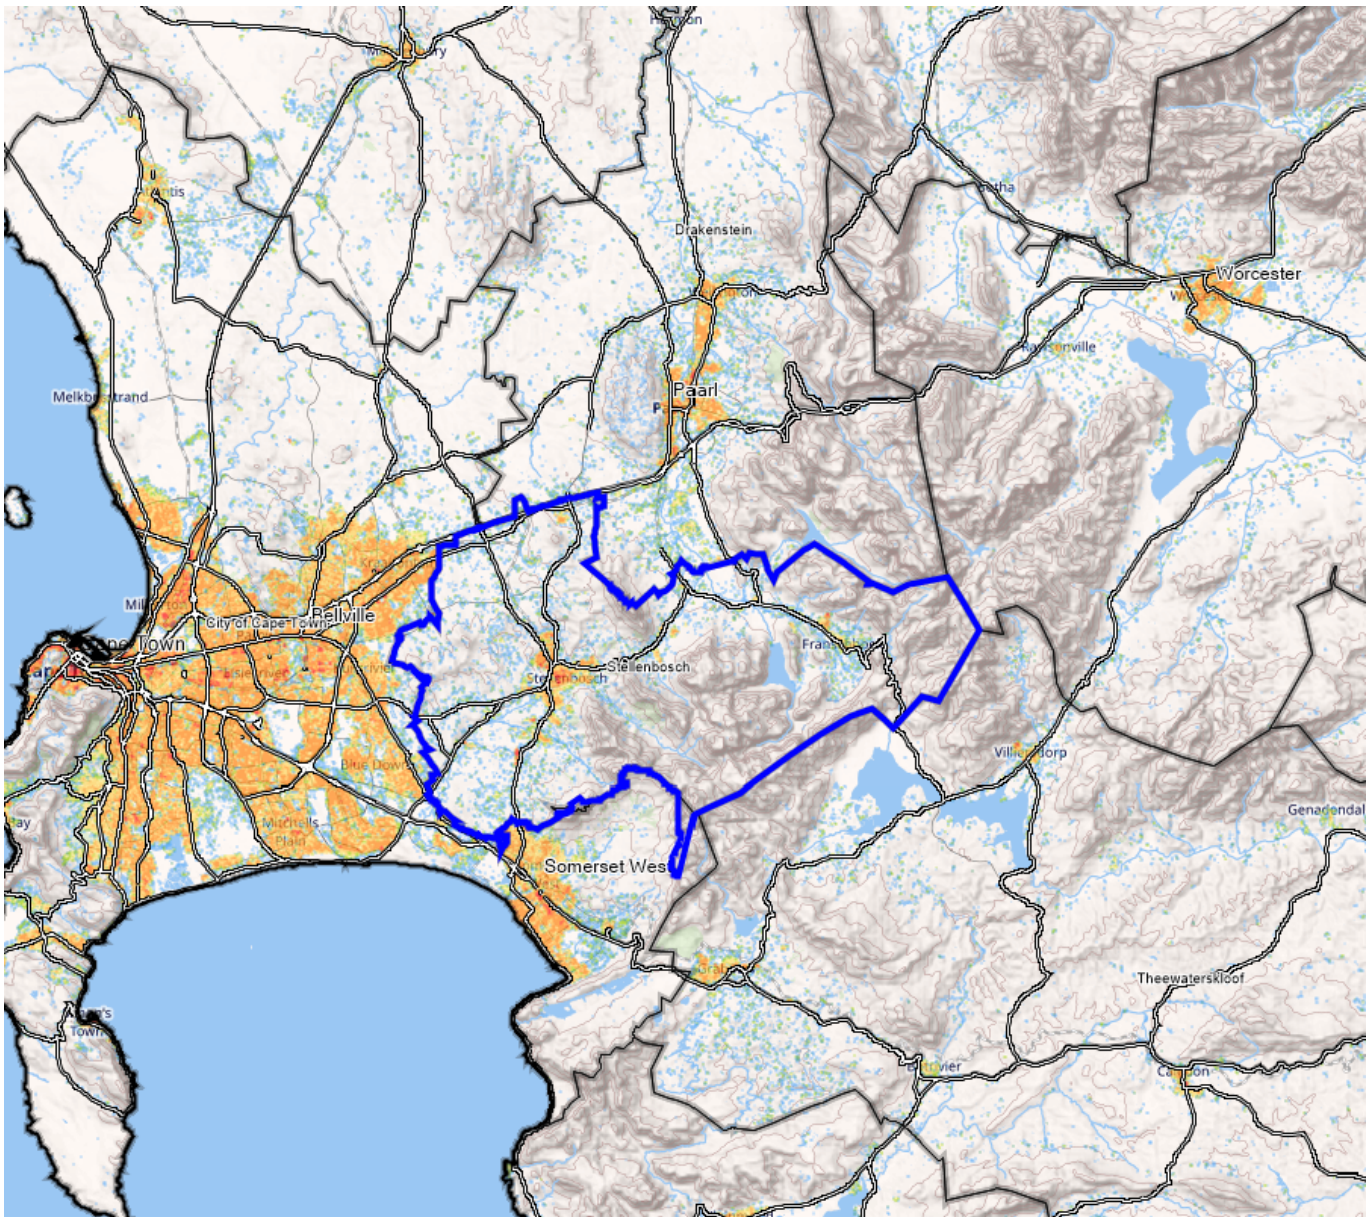

Table 31: Total building volume in the area (m^3)

9.2.3 Average building height (m)

In spatial planning, data on average building heights per hectare (ha) is a pivotal tool, bridging the gap between surface coverage and three-dimensional volumes. This metric contributes nuanced insights that are indispensable for optimizing urban landscapes, fostering sustainable development, and ensuring efficient land use.

Understanding the average building heights per hectare is crucial for achieving a balanced and visually harmonious urban environment. While surface coverage and building volumes provide essential information, incorporating average building heights enriches the spatial planning process by offering a detailed perspective on vertical development. This consideration helps avoid monotony in the skyline, promotes architectural diversity, and contributes to creating aesthetically pleasing urban spaces. Moreover, data on average building heights per hectare is instrumental in optimizing urban density. Balancing horizontal and vertical growth is vital to preventing urban sprawl and preserving green spaces. By analyzing the height dimension, planners can encourage responsible vertical development, which, when integrated with appropriate infrastructure and amenities, enhances accessibility and promotes walkable, compact city layouts.

Considering average building heights per hectare also plays a crucial role in infrastructure planning. Taller buildings may necessitate different transportation and utility considerations than lower structures. This data informs decisions on transportation networks, water and sewage systems, and energy distribution, ensuring that infrastructure is tailored to the specific demands of the urban form.

Environmental sustainability is another area where average building heights per hectare data proves invaluable. By understanding the vertical dimension of development, planners can strategically incorporate green roofs, rooftop gardens, and sustainable building practices, contributing to improved energy efficiency, biodiversity, and overall ecological resilience.

Incorporating data on average building heights per hectare in spatial planning enriches decision-making by adding a vertical dimension to surface coverage and building volume considerations. This holistic approach enables planners to create dynamic, visually appealing, and sustainable urban environments that efficiently utilize available space while respecting the natural and built environment.

9.4 Summary and conclusions: Land and settlement footprint

Land cover results provide a broad, municipality-wide picture of environmental assets and how the landscape is used, but the interpretation needs to remain grounded in the dataset's limitations: 30 m resolution and changes in category definitions between earlier and later land-cover vintages. With that in mind, the most defensible trend for natural elements is that water coverage appears broadly stable over the long term, with only modest fluctuations that could reflect seasonal conditions, inter-annual rainfall variability, dam and wetland dynamics, or classification sensitivity rather than a clear directional shift. The practical planning takeaway is less about "change in water area" and more about recognising that surface water remains a persistent structuring element of the municipal landscape and should continue to be treated as both a constraint and an opportunity: a constraint in terms of flood risk, riparian buffers, and infrastructure protection, and an opportunity in terms of ecological functioning, recreation, and water-security planning.

The primary economic land-cover categories indicate a municipality that remains strongly shaped by productive landscapes, yet shows internal rebalancing across different agricultural forms and land uses over time. The older comparable period suggests that orchard/vine-type cultivation is a long-standing backbone land use, while cultivated field agriculture becomes more prominent in the later land-cover outputs, which may reflect real shifts in agricultural practice, intensification, or classification differences that separate "fields" more distinctly than before. Smallholding-type land uses show signs of expansion in the earlier comparable period, followed by a modest contraction thereafter, consistent with consolidation pressures, changes in the land market, or the conversion of peri-urban agricultural smallholdings into other uses. The most striking "apparent" change is in forests and plantations, which shows a large swing between periods; given the category changes and the known sensitivity of plantation mapping to spectral and seasonal variation, this should be read cautiously as a signal that plantation/woody cover is spatially dynamic and potentially clustered, rather than as a definitive measure of net gain or loss. Mining-related land cover remains marginal in the dataset, reinforcing the idea that extraction has a smaller land-cover footprint than agriculture and settlement. Overall, the economic interpretation is that the municipality's rural production base is still substantial and spatially defining, and land-use management should prioritise the protection of high-value agricultural areas, the servicing and logistics connections that support the agri-value chain, and careful handling of land-use transitions in peri-urban fringes where productive land and settlement pressures tend to collide.

The human-settlement land-cover outputs show a clear direction of travel toward an expanding and more complex settlement footprint, but the most reliable comparison is between the earlier directly comparable years, while the later years should be treated as indicative patterns rather than precise "before/after" change. In the comparable period, the settlement system shows incremental expansion of urban activities overall, a strengthening residential footprint, and a marked growth in informal settlement land cover from a very small base, signalling that the urbanisation process has included both formal consolidation and informality-driven growth. Over the same period, township-type categories expand, aligning with continued household formation and likely ongoing outward growth of established settlement areas. Recreation-related urban land (such as sports and golf) also

increases, suggesting either real expansion of such facilities, improved identification in the classification, or both; school and similar grounds show a softer signal and may reflect classification differences and the difficulty of cleanly separating these land uses at 30 m resolution. In the later land-cover outputs, the settlement categories shift substantially, and one category shows a step-change that is far more consistent with redefinition than sudden real-world urban expansion; the correct inference here is that the municipality's built environment is now being captured differently, and any detailed change analysis needs either harmonised categories or a consistent reclassification approach. Even with that caveat, the planning implication remains strong: settlement land uses have broadened and intensified over time, and the municipality should expect continued pressure on well-located land, infrastructure networks, and the environmental interface, especially where informal settlement growth and residential expansion occur near economic corridors, service nodes, or constrained landscapes.

The building-based dataset provides a more direct lens on built-form intensity than land-cover categories alone, as it captures the scale of structures across the municipal space without attempting to label their functions. Ignoring the 2020 values as requested, the long-term trend from the mid-1990s to the mid-2010s is one of substantial growth in total building footprint, translating into a sustained rise in impervious coverage and built-up intensity across the municipality. Over that period, the implied average annual growth rate in building surface area is about 2.4%, consistent with a municipality steadily adding structures and expanding the physical fabric of settlements. This has direct infrastructure consequences: increased runoff and stormwater burden, greater maintenance requirements for roads and drainage systems, greater demand for network capacity, and a growing need to protect and manage ecological corridors and open space as settlement footprints intensify. Spatially, the mapping approach (building surface per hectare) is particularly valuable for identifying where densification is occurring versus where growth is largely expansive, which is critical for targeting capital investment, sequencing bulk upgrades, and prioritising infill and redevelopment in areas where infrastructure can carry additional load.

Building volume, again excluding 2020, increases in step with building surface but adds an important nuance: it reflects the "three-dimensional" intensity of development and therefore the functional load that built form can place on local systems. The implied average annual growth rate in total building volume is about 2.0%, reinforcing that the municipality has been intensifying its built form in aggregate, though not necessarily through a strong shift toward verticality. This matters because the same amount of additional floor space can be delivered through different urban forms with very different infrastructure and mobility outcomes. A volume increase driven mainly by more low-rise buildings tends to imply greater land consumption, longer networks per household or per job, and greater transport distances, while a volume increase driven by more compact multi-storey development can support shorter trips and more efficient service provision. The dataset, therefore, provides a practical basis for distinguishing where the municipality is growing "outward" versus "upward," and where future spatial policy should encourage consolidation, mixed use, and corridor reinforcement to reduce long-term operating burdens.

Average building height provides the clearest signal about the form of growth. Ignoring 2020, the average height declines modestly from the mid-1990s to the mid-2010s, implying an average annual decline of about 0.4%. In other words, even as the municipality adds building footprint and volume overall, the built form becomes slightly more horizontal on average, consistent with predominantly low-rise expansion, incremental settlement growth, and a built environment dominated by single- to two-storey structures rather than substantial vertical densification. This pattern is important for planning because it tends to increase the spatial footprint of growth and push up the per-capita cost of infrastructure over time, especially where expansion occurs in fragmented patches that are expensive to service. It also has design and resilience implications: lower-rise, dispersed growth can reduce certain risks associated with high-rise systems, but it typically increases reliance on private transport, stretches municipal service coverage, and makes it harder to deliver efficient public transport and walkable access to jobs and services unless growth is carefully channelled into nodes and corridors. The combined surface/volume/height story therefore points to a municipality that is building more, spreading more, and only marginally intensifying vertically, suggesting that future policy levers should focus on location efficiency, infill incentives, and infrastructure-led densification in appropriate areas rather than continuing a predominantly extensive pattern.

The points-of-interest summary adds a functional "service and amenity" layer that helps interpret settlement footprints beyond physical cover, indicating where the economy and daily life are concentrated and what types of destinations residents and firms rely on. The dominant pattern is that office, retail, and business-service type destinations far outnumber other categories, which aligns with an economy whose everyday functioning is anchored in commerce, personal services, finance, and professional activities, supported by a substantial commercial/industrial destination layer tied to construction, logistics-related activity, and manufacturing-linked functions. The accommodation and tourism-related categories are also strongly represented, suggesting a meaningful visitor economy and a settlement system that provides hospitality and leisure services at scale. Community and social facilities are present across a wide spread, indicating an established base of civic, religious, health, safety, and association infrastructure, while education-related destinations form an important component of the social facility landscape, consistent with a municipality where access to schooling and education infrastructure remain key service-delivery concerns. Government, transport, and infrastructure points are present but comparatively fewer in number, which is typical because these assets are fewer, larger, and more network-based rather than "many small sites." The overall planning implication is that the municipality has a relatively mature service economy footprint with strong retail and office presence, a visible visitor/accommodation layer, and a broad spread of social facilities, so capital investment should be targeted toward strengthening the accessibility and quality of the key functional areas (movement corridors, town centres, commercial clusters, and tourism precincts), closing gaps in social facility access where residential expansion is occurring, and aligning land-use management with the reality that economic activity is increasingly shaped by clusters of destinations rather than single land-use zones.

10 Access to infrastructure services

Access to infrastructure services is a driving force for the betterment of all communities in South Africa. It is a core function of government, and since 1994, access to services for previously disadvantaged communities has been emphasised to the extent that it has become the driving force of most government delivery policies. Initial approaches were to meet the health requirements of the World Health Organisation, hence the adoption of the so-called RDP standards later referred to as access to basic services. However, these policies have evolved over time for many reasons, to the extent that many of the services currently contemplated by the government at all levels exceed the initial norms and standards.

10.1 Access as reported in the national census data

The way that access to services was presented in the four available censuses varies from one another. Annexure B gives a summary of how the different services have been categorised into basic, intermediate and full services to allow for comparison between the censuses.

10.1.1 Water services

Water services have been a very high priority in service delivery strategies over the past two decades. It is one of the key Millennium Goals adopted in 2000, which stated that countries should aim to halve the proportion of people without access to safe drinking water and basic sanitation by 2015. In terms of these goals, at least 50% of households should have access to at least basic services.

The table below shows the access to water has changed.

Table 39: Access to water services

		Full	Intermediate	Basic	Below Basic	None	Total
1996	Total	19,575	2,794	2,879	660	240	26,147
	%	74.86 %	10.69 %	11.01 %	2.52 %	0.92%	100 %

	%	86.39 %	4.51 %	7.73 %	1.37 %	Not reported	100 %

10.1.2 Sanitation services

Access to appropriate sanitation services is a very high health priority. Although sanitation services receive a high priority from the government, there are always challenges, and this service has not achieved the same level of success as improved access to water services. This section shows the sanitation access for the municipal area.

Table 40: Access to sanitation services

		Full	Intermediate	Basic	Below Basic	None	Total
1996	Total	21,954	NA	NA	2,347	1,846	26,147
	%	83.96 %	NA	NA	8.97 %	7.06 %	100 %

	%	96.77 %	0.31 %	0.12 %	3.10 %	Not reported	100 %

10.1.3 Electricity services

Although electricity does not have the same implications for health as water and sanitation, access to electricity is essential for general development, especially education. Access to electricity was, therefore, always a high priority. The table below shows how access to electricity has changed since 1996. This table is based on access to lighting as a proxy for access to electricity.

Table 41: Access to electricity services

		Full access	Intermediate access	No access	Total
1996	Total	23,523	NA	2,624	26,147
	%	89.96 %	NA	10.04 %	100 %
2001	Total	32,365	NA	2,804	35,170
	%	92.03 %	NA	7.97 %	100 %
2011	Total	40,296	NA	3,026	43,322
	%	93.02 %	NA	6.98 %	100 %
2016	Total	51,367	68	3,903	55,338
	%	92.82 %	0.12 %	7.05 %	100 %
2022	Total	57,775	283	1,567	59,626
	%	96.90 %	0.47 %	2.63 %	100 %

10.1.4 Refuse removal

Solid waste management and refuse removal are important for health and environmental considerations. The table below shows how access to refuse removal services was reported in the previous three censuses.

Table 42: Access to refuse removal services

		Full	Intermediate	Basic	Below Basic	None	Total
1996	Total	19,937	256	2,419	2,629	906	26,147

2016	Total	39,812	4,127	8,554	1,555	1,290	55,338
	%	71.94 %	7.46 %	15.46 %	2.81 %	2.33 %	100 %
2022	Total	52,033	488	3,817	3,286	Not reported	59,626
	%	87.27 %	0.82 %	6.40 %	5.51 %	Not reported	100 %

10.1.5 Road network

Access to road services is not recorded in the censuses. The next table shows the available road data for the municipality.

Table 43: Road services in the municipality

Road type	Paved road (km)	Unpaved road (km)	Total road length (km)
Major road (National Major roads of a country, including all freeways)	25.24	N/A	25.24
Main road (Provincial roads and major city through routes)	192.62	0.00	192.62
Secondary road (Secondary roads including slipways)	19.77	5.19	24.95
Suburban road (Formal suburban roads including slipways)	584.44	42.38	626.82

Road type	Paved road (km)	Unpaved road (km)	Total road length (km)
Informal roads (Alleys, Access ways, roads in informal settlements and squatter camps, farm and other small dirt roads)	18.19	818.40	836.59
Tracks (Non-routable roads: including 4x4 tracks	N/A	N/A	208.96
Trails (Pedestrian walkways in cities and towns, walking and hiking trails)	N/A	N/A	0.00
Totals	844.34	865.97	1,919.27

10.2 Access as reported in the Non-Financial Census of municipalities

StatsSA releases a non-financial census of municipalities showing the position at the end of June of each year. The date coincides with the end of the municipal financial year. The census provides information that serves as a framework for policymakers and other stakeholders for analysis, planning and monitoring in terms of service delivery of water, electricity, solid waste management, sewerage and sanitation.

In using the data, one should consider that:

- This publication is not necessarily comparable with the Stats SA population census of 2011, the community survey of 2016, and/or household survey data, mainly due to:
    - The data source is municipalities as opposed to households.
    - The different definitions of 'household'. Most municipalities do not have a system for identifying multiple households served by one billing unit or delivery point.
    - Different reporting periods.
- The term 'consumer unit' or 'billing unit' (as used by the municipality for their recording purposes) is not directly comparable with other Stats SA household-based surveys.

Table 44: Number of consumer units receiving services from municipalities

	Water	Sanitation	Electricity	Solid waste
2017	48008	41235	48008	48008
2018	52225	41298	52374	49072
2019	52225	41298	52696	49072
2020	52235	41298	52723	49072

	Water	Sanitation	Electricity	Solid waste
2021	53374	43904	52723	49300
2022	54309	48681	52723	49649

One should note that in instances with no data for water and sanitation services, the municipality is not the Water Service Provider in terms of the Water Services Act of 1997 (Act 108 of 1997). In these cases, the District Municipality is usually the WSDP. This is usually the case in the Eastern Cape, Kwa Zulu Natal and Limpopo.

Table 45: Number of consumer units receiving free basic services

	Water	Sanitation	Electricity	Solid waste
2017	5686	5686	5686	5686
2018	6453	6453	11670	6453
2019	6817	6817	6817	6817
2020	2291	2291	2291	2291
2021	7283	7283	7283	7283
2022	4681	4681	4982	4681

11 Summary and conclusions: Access to infrastructure

Water access shows a clear long-term improvement in overall service levels, but with an important mid-period dynamic in which the expansion of the household base appears to have outpaced the immediate conversion of all connections to the highest service standard. Across earlier censuses, full-service access remains the dominant category but dips in relative terms, while basic access rises, consistent with rapid household formation, settlement expansion, and the extension of minimum service packages to new areas as an interim step. According to the most recent census, the pattern shifts decisively toward a much higher share of households enjoying full-service access and a much smaller "below basic" footprint, indicating that the municipality has not only expanded coverage but also upgraded service levels over time. The remaining risk implied by the distribution is that any residual pockets of lower service are likely concentrated in more marginal settlement areas, often informal or peri-urban, where reticulation extensions, capacity constraints, and topographic or distance factors tend to delay upgrades. From a planning perspective, the trajectory is positive, but future capital planning should focus on targeted backlog mopping-up and on reinforcing bulk capacity and system reliability so that higher coverage translates into consistent quality and continuity of supply.

Sanitation access is similarly high overall and improves strongly over time, but the trend is best described as "near-universal improved access with a persistent residual problem" rather than a perfectly linear improvement. Earlier periods show a meaningful minority still reliant on inadequate or no sanitation, followed by a strong shift toward full-service outcomes as the dominant norm, indicating sustained investment and the effective rollout of improved systems. In the most recent census, full-service sanitation remains very high, but the reappearance of a larger "below basic" component (with the "none" category not reported) suggests either data categorisation effects, settlement growth pressure, infrastructure performance issues in certain areas, or slower upgrading in specific pockets. The practical implication is that sanitation remains a higher-risk service than water because it is more sensitive to household density, network integrity, maintenance, and informal settlement dynamics; even small shares of inadequate sanitation have disproportionate public health and environmental consequences. Capital planning should therefore prioritise the identification of remaining low-service clusters, the condition and capacity of sewer networks and treatment works, and the operational resilience of sanitation systems in fast-growing or environmentally sensitive areas.

Electricity access shows steady improvement toward near-universal coverage, with a clear reduction over time in households reporting no access. The pattern is consistent with a municipality that has progressively extended electrification to most residential areas and tightened the remaining gaps, which typically yields strong development co-benefits in education, household productivity, safety, and overall quality of life. The small remaining "no access" share implied by the latest census is likely associated with informal settlements, remote rural dwellings, or areas where connections lag behind household growth. For infrastructure strategy, the key shift now moves from "expanding access" to "ensuring adequacy and reliability," especially given rising household counts, changing energy use patterns, and the potential growth in small enterprise demand. This means future priorities are likely to include network reinforcement, reducing technical and non-technical losses, ensuring safe connections in informal areas, and planning for distributed energy options where grid extension or capacity upgrades are constrained.

Refuse removal and solid waste services show long-term improvement but remain more volatile and sensitive to reporting changes than the other basic services, and the data itself signals a measurement issue in the latest census output. Earlier censuses show a gradual strengthening of full-service coverage and shrinking of the lowest-access categories, followed by a mid-period dip where the share recorded as full service declines while intermediate and basic categories increase, an outcome that often reflects rapid settlement growth, service model changes (for example communal collection points or varying collection frequency), and the difficulty of providing uniform waste services in dispersed or informal areas. In the most recent census, the totals and implied shares are internally inconsistent, strongly suggesting a definitional or reporting anomaly rather than an actual increase in refuse removal beyond the number of households. The robust conclusion is therefore that solid waste services have generally expanded but remain uneven, with some areas likely still reliant on lower-standard arrangements. For municipal operations and capital planning, waste services require integrated investment: vehicle fleets and transfer capacity, route optimisation, formalisation of collection in growing settlements, and the protection of environmental assets through effective disposal and recycling systems. The highest risk is that uneven waste coverage tends to concentrate environmental and public health burdens in precisely the areas already facing service deficits.

Road access is not captured in the censuses, but the road network profile indicates a municipality with a substantial overall network, where a large share of the length is unpaved and informal roads and tracks make up a significant component of connectivity. The presence of strong national and main road infrastructure provides a strategic backbone for regional access and economic movement, while the extensive suburban and local road system reflects established settlement patterns. However, the dominance of unpaved segments in informal roads and parts of the local network signals high ongoing maintenance liabilities, access vulnerability during adverse weather, and service delivery challenges in settlements that rely on low-standard roads for emergency response, refuse collection, and public transport operations. From a spatial planning perspective, this network structure reinforces two priorities: first, targeted upgrading of key unpaved links that function as critical service corridors into settlements; and second, the management of informal access routes in fast-growing areas to prevent uncontrolled sprawl while still enabling basic mobility and service reach. Road investment strategy should therefore be explicitly linked to settlement footprint dynamics and to the location of backlogs in water, sanitation, and waste services, because road standards often determine the practicality and cost of extending and maintaining those services.

The non-financial census of municipalities provides a complementary operational view by tracking municipal "consumer units" rather than households, typically showing an increase in the number of serviced connections over time and offering a useful lens on service reach from a municipal recording perspective. Across the period presented, consumer units receiving water, sanitation, electricity, and solid waste services generally increase, consistent with both population/household growth and a wider service footprint. The pattern also shows that sanitation connections, in particular, may lag or behave differently relative to other services, which is common when sanitation infrastructure depends more heavily on bulk capacity, topography, and treatment works performance. Importantly, the document's caution about definitional differences matters for interpretation: consumer units can undercount multiple households behind a single billing point, and therefore the municipal series should be used to understand direction

and system workload rather than as a one-to-one proxy for household access rates. For planning, the key value is that rising consumer units imply growing operating demands—more meters, more maintenance points, more collection routes, more fault responses—which must be matched by operating budgets, asset management capacity, and renewal planning if service reliability is to be sustained as coverage expands.

Free basic services data highlights a second critical service-delivery dynamic: indigent support and affordability are not static, and the recorded number of consumer units receiving free basic services fluctuates sharply over time. This kind of volatility typically reflects changes in indigent policy, registration drives, billing system updates, verification processes, and sometimes fiscal constraints that influence how municipalities apply subsidies. The planning implication is that affordability pressure and social support needs remain significant even when physical access is high, and that the municipality's ability to sustain universal service quality depends not only on infrastructure rollout but also on revenue management, accurate customer databases, and credible indigent targeting. For capital expenditure planning, this matters because high or rising free basic service loads can tighten operating margins and reduce the funding available for asset renewal and upgrades, making it essential to align infrastructure investment with realistic long-term operating and maintenance capacity. In practical terms, the municipality should treat the service-access story as "maturing infrastructure with residual backlog and affordability stress," and prioritise the next phase of investment toward reliability, targeted gap closure in hard-to-serve areas, and system strengthening that reduces lifecycle costs while protecting the gains already made in expanded access.

Access to Social and community facilities

12 Education facilities

Education facilities include primary, secondary, and intermediate schools, as listed in the National Department of Education database. Generally, the queries list educational facilities within the area.

Table 46: Education Facilities

School Type	Number of Schools	Total Learners	Total Teachers	Learners/Education
Primary	30	19957	725	27.53
Secondary	14	12193	483	25.24
Intermediate	3	736	37	19.89
Combined	6	2775	273	10.16

12.1 Health Facilities

A distinction is made between public and private health facilities in the assessment.

Table 47: Health Facilities

Type of Facility	Number of Facilities
Public Facilities	12
Private Facilities	1

12.2 SAPS Stations

The municipality's total number of SAPS stations and precincts is described below. One should note that police precincts do not align with municipal boundaries.

Table 48: SAPS stations and precincts

Number of SAPS stations	Number of SAPS precincts
5	14

12.3 Lower Courts

The courts of South Africa are the civil and criminal courts responsible for the administration of justice in South Africa. There are 2 lower courts in the municipality.

13 Summary and conclusions: Access to community and social facilities

Education facilities indicate a reasonably established schooling network with a strong emphasis on primary provision and a substantial secondary component, which is consistent with a municipality that must serve both a large child population and a continuing pipeline into youth and working-age cohorts. The distribution suggests that primary schools form the broad base of access, while secondary schools provide the next tier at fewer sites, implying that secondary learners are likely drawn from wider catchments and may face longer travel distances and greater reliance on transport. The intermediate and combined school categories add flexibility to the overall system, potentially serving smaller settlements, transitional grades, or specific local needs, and they can be particularly important in dispersed or peri-urban areas where standalone secondary provision is not always viable. The learner-to-teacher ratios across school types are broadly in the mid-range, typical of functioning public systems, with combined schools showing notably smaller ratios, which may indicate smaller enrolments per site, different staffing models, or less pressure relative to other categories. From a planning and service delivery perspective, the key trend signal is not simply the number of facilities, but the implied pressure points: primary provision carries the highest total learner load and therefore tends to drive demand for classroom expansion, safe pedestrian access, scholar transport management, and supporting community infrastructure; secondary provision, with fewer sites and high enrolment, tends to drive transport, safety, and facility condition priorities. The maps referenced for education facilities are therefore critical for identifying spatial gaps, areas where settlement growth has outpaced school location patterns, and for prioritising land reservation and expansion opportunities in fast-growing residential zones.

Health facilities show a service landscape heavily reliant on the public system, with a limited private footprint, suggesting that the majority of residents depend on public clinics and related services for primary healthcare. The number of public facilities relative to the municipality's settlement footprint implies a network designed for broad coverage, but the adequacy of access will hinge on spatial distribution, travel times, and facility capacity rather than facility count alone. A minimal private presence often correlates with affordability constraints and a patient load concentrated in public facilities, which can translate into longer waiting times and greater operational strain, especially in areas with rapid household growth, informal settlement expansion, or high burdens of disease and injury. For planning purposes, the most important implication is that capital and operational coordination with the health sector must focus on where population growth and settlement densification are occurring, ensuring that clinic catchments remain reasonable, emergency response is not compromised by road access limitations, and facility upgrades keep pace with changing demand. The health facilities map serves as a practical tool for identifying underserved pockets and aligning municipal infrastructure investments, particularly roads, lighting, stormwater, water reliability, and sanitation, with the functioning of the health network.

Safety and security coverage, as reflected in the number of SAPS stations and precincts, indicates a structured policing presence but also highlights a common governance reality: functional policing geographies do not neatly align with municipal boundaries. The relationship between stations and precincts suggests that operational areas are subdivided for management and response, which can improve coverage but can also complicate coordination for municipal planning, especially when growth areas sit near the edges of precinct boundaries or when rapidly changing settlement footprints create

new safety hotspots. The practical trend signal is that safety planning must be spatially targeted: policing presence alone does not guarantee perceived or actual safety if settlement growth outpaces patrol capacity, if informal areas remain poorly lit or poorly accessible, or if economic nodes experience rising opportunity-driven crime. The safety and security map is therefore central for integrating municipal actions that materially influence policing effectiveness, improved street lighting, maintained road access, clear addressing and wayfinding, formalisation of key routes in informal settlements, and the design of public environments that reduce risk through visibility and activity. In this sense, safety outcomes are closely linked to infrastructure investment choices and settlement management, rather than relying solely on SAPS resourcing.

Lower court provision is limited to a small number of facilities, which is typical because courts serve larger catchments and operate as higher-order services in the settlement hierarchy. The implication is that access to justice is likely concentrated in one or two nodes, requiring travel for many residents and placing a premium on transport connectivity, public safety around the court precincts, and the availability of complementary services such as legal aid, policing coordination, and administrative functions. The courts map helps determine whether courts are located within the primary urban centres or in locations less accessible to the widest share of residents. From a planning standpoint, the trend is toward increasing reliance on a few strategic civic nodes as the municipality grows: as population and households expand and socio-economic pressures evolve, the demand for justice-related services can rise, and the performance of these facilities becomes more dependent on the quality of supporting municipal infrastructure and the functionality of the surrounding precinct.

Municipal institutional indicators

This section describes the overall performance of the municipality based on various indicators.

14 Audit Outcomes

Three months after the end of every municipal financial year, the Auditor General of South Africa (AGSA) receives financial statements from municipalities to express various audit opinions that relate mainly to financial affairs. This process primarily serves to deter poor financial management and misuse of municipal funds, which could strengthen accountability and enhance municipal service delivery and clean administration.

Table 49: Municipal Audit Outcomes

Financial Year	Audit outcome
FY 2010/11	Unqualified with findings
FY 2011/12	Unqualified with findings
FY 2012/13	Unqualified with findings

Financial Year	Audit outcome
FY 2013/14	Unqualified with findings
FY 2014/15	Unqualified with no findings
FY 2015/16	Unqualified with no findings
FY 2016/17	Unqualified with no findings
FY 2017/18	Unqualified with findings
FY 2018/19	Unqualified with findings
FY 2019/20	Audit not finalised at legislated date
FY 2020/21	Unqualified with no findings
FY 2021/22	Unqualified with no findings
FY 2022/23	Unqualified with no findings

14.1 Non-financial municipal indicators

StatsSA conducts an annual municipal census to determine non-financial performance indicators. The results reflect the position at the end of a municipal financial year. This survey covers selected non-financial information for all municipalities. The census provides information that can serve as a framework for policymakers and other stakeholders to analyse, plan and monitor service delivery of water, electricity, solid waste management, sewerage and sanitation, indigent households and employment.

The information is collected annually from all municipalities through questionnaires. Inaccuracies may occur because of imperfections in reporting by municipalities. Every effort is made to reduce errors to a minimum by carefully designing the questionnaire, undertaking pilot studies/workshops and editing processes. Results are generally comparable between financial years.

14.1.1 Employment indicators

The following tables show key employment statistics.

14.1.2 Councillors and the Executive

Table 50: Number of councillors

	Fulltime		Part-time		Vacant posts	Total (Including vacancies)
	Male	Female	Male	Female		
2017	5	3	19	15	0	42

15 Summary and conclusions: Municipal non-financial indicators

Audit outcomes show a generally strong and improving trajectory of financial governance, with the municipality consistently achieving unqualified audit opinions over the period and progressively reducing findings in multiple consecutive years. The pattern suggests that internal controls and financial reporting stabilised notably in the mid-2010s, after which a short phase of regression occurred, during which findings re-emerged, followed by a return to clean outcomes in the most recent completed years. The single year where the audit was not finalised by the legislated date stands out as an administrative and compliance risk signal rather than a change in the audit opinion itself, and it highlights that timeliness can become a vulnerability even when audit quality is otherwise maintained. The planning implication is that the municipality's financial management platform is comparatively credible for service delivery and capital budgeting, but that periodic slippage in findings and audit timeliness can still undermine procurement confidence, delay project implementation, and increase the risk of conditional grant underperformance if not proactively managed. Overall, the trend supports a view of improving institutional reliability, which is a key enabler for multi-year infrastructure programmes and for maintaining public trust in delivery.

Political governance indicators, as reflected in councillor and executive mayor reporting, show a stable overall structure and staffing complement over time, with shifts in gender representation that indicate gradual diversification of leadership roles. Councillor numbers remain constant, implying institutional continuity in the political oversight structure, while the balance between full-time and part-time councillors fluctuates, suggesting adjustments in how the municipality configures political work allocation rather than changes in representation itself. Executive leadership shows alternation in gender across years, which is less a performance signal than an indicator of changing political leadership composition and the municipality's capacity to support leadership transitions without destabilising the overall governance system. From a service delivery standpoint, the main issue is that stable political structures can support consistent prioritisation and budget alignment, while shifts in leadership can introduce changes in emphasis, which makes it important that long-term capital programmes are anchored in adopted plans and objective prioritisation criteria rather than being overly personality- or term-dependent.

Senior management stability appears comparatively strong at the Section 56 level, with a small complement that remains largely filled and only occasional vacancies. This stability is important because Section 56 roles typically drive administrative accountability, institutional performance, and delivery coordination, and sustained occupancy supports continuity in budgeting, contract management, and intergovernmental engagement. In contrast, the wider managerial cohort (excluding Section 56) shows a pronounced deterioration in staffing completeness over time, with a sharp rise in vacancies and a sustained period where the majority of posts are recorded as vacant. This is a significant institutional risk trend: high vacancy rates at the middle-management level often translate into weaker project preparation, slower procurement and contract oversight, reduced maintenance planning, and less effective performance management across departments. The municipality's ability to convert budgets into delivery outcomes is frequently constrained more by these "engine room" capabilities than by the presence of top leadership alone, so the trend signals a need to stabilise the organisational structure, fill critical posts, and reduce reliance on acting arrangements that can dilute accountability.

Total employment positions (including managerial roles) exhibit fluctuating staffing levels and persistent vacancies, with a notable peak in overall post totals in the late 2010s, followed by a period of higher volatility. The presence and persistence of vacancies are the most important trend signals, because they point to capacity constraints that can manifest as service response delays, weaker customer management, and backlogs in routine operations—particularly in technical services, where skills are scarce. The emergence of part-time employment positions in later years suggests changes in staffing models, potentially reflecting budget pressures, shifting service models, or attempts to increase flexibility. For capital expenditure planning, this matters directly: infrastructure delivery depends on credible in-house client capacity to plan, procure, supervise, and operate assets, and high vacancy rates can lead to under-spending, poor-quality workmanship, incomplete projects, and higher lifecycle costs. The institutional story in the employment tables therefore reads as "stable top layer, fragile middle layer," a common pattern in municipalities that often requires targeted organisational development rather than simply increasing headcount.

Departmental staffing trends (where reported) suggest significant restructuring and expansion in certain functions during the late 2010s, but their usefulness is constrained by the abrupt loss of departmental detail in later years. Where data exist, community and social services and finance/administration show strong increases in staffing and a rise in vacancies, pointing to growing functional scope and possibly a response to service and governance demands, as well as to recruitment or retention challenges. Technical departments such as electricity, roads, waste, wastewater, and water management show changes that imply rebalancing of operational capacity, with some functions expanding rapidly in the reported years, while others contract or fluctuate. The absence of reporting after 2019 prevents a clear reading of whether these changes were consolidated, reversed, or simply reclassified, but the broader implication remains: municipal delivery capability is uneven across functions and may be exposed in key technical services if staffing is not stable. In practical terms, the trend flags the need for a "critical skills" approach, ensuring that core engineering, project management, financial controls, and operations roles are filled and retained, because these are the roles most tightly linked to infrastructure performance and compliance outcomes.

Service responsibility and service model indicators suggest that the municipality positions itself as directly responsible for core services in the years where reporting is available, with limited reliance on outsourcing or commercialisation, except for a specific electricity-related indication in one year. This implies a predominantly in-house service delivery model, which can support accountability and integration across services, but also increases the municipality's exposure to internal capacity constraints, fleet and plant availability, and maintenance backlogs. The main trend signal is less about a shift to outsourcing and more about the consistency of being the service authority/provider, which elevates the importance of internal asset management, preventative maintenance systems, and operational budgeting. The missing reporting in later years is itself a governance signal: when institutional data becomes patchy, it becomes harder for stakeholders to monitor performance and for the municipality to demonstrate credibility, which can affect planning confidence and external support.

Consumer unit trends show a steady rise in the number of connections or service points recorded across water, sanitation, electricity, and solid waste over time, which aligns with household growth and

expanding service footprints. The composition of water service points shows a strong dominance of on-site or "inside yard" provision, with the remaining share largely within a short-distance threshold and virtually no households recorded beyond the farthest threshold in later years, indicating that access is increasingly formalised and proximate, even where full internal connections may not exist. Sanitation service points are dominated by flush systems connected to sewerage, with septic systems forming a smaller but persistent component and minimal presence of lower-tier technologies, implying that the municipality's sanitation platform is relatively formal and network-based. A notable recent jump in non-domestic sanitation consumer units stands out as a structural change, potentially reflecting improved registration, economic activity, or refinements to the billing system, and it has operational implications because non-domestic demand can materially affect network loads and maintenance requirements. The overall trend is of growing system workload and a broader customer base, which increases the importance of lifecycle renewal planning and of ensuring that operating budgets and technical capacity scale with connection growth, not just with capital rollouts.

Free basic services policy indicators show consistent formal adoption across all major services throughout the period, signalling an institutional commitment to indigent support and affordability. The operational data, however, indicates that the number of recorded beneficiaries fluctuates sharply year-to-year, which is a strong sign that indigent registration, verification, policy thresholds, or billing system practices are changing rather than the underlying poverty profile swinging dramatically. This volatility is important because it influences municipal revenue stability and the sustainability of service delivery: large swings in the recorded indigent base can create budgeting uncertainty, complicate tariff modelling, and affect the municipality's ability to fund maintenance and renewal. The targeting approach is consistently self-targeting across multiple services, suggesting a policy design that relies on household application/registration rather than geographic or property-based proxies. This can improve fairness but also raises the stakes for effective administration and outreach. The indigent income threshold trends show that the municipality adjusts its cut-offs over time, implying periodic recalibration to local socio-economic conditions, inflation, and policy alignment. This is appropriate in principle but requires strong communication and consistent implementation to avoid exclusion errors or administrative churn.

Policy frameworks and agreements reported for the earlier years indicate a relatively mature compliance posture, with key planning and sectoral instruments in place and core monitoring functions recorded as active. This suggests an institutional environment that, at least in the reported years, has a formal governance architecture to support integrated planning, compliance with water services, waste management, and public health policy commitments. The latter absence of reporting again becomes the main trend signal: missing data does not necessarily mean missing policies, but it does weaken transparency and can mask implementation gaps. For strategic planning and capital programming, the implication is that the municipality appears to have the foundational governance systems needed to deliver, but that sustaining performance will depend on rebuilding the middle-management capacity layer, stabilising staffing vacancies, improving the consistency of non-financial reporting, and aligning indigent support administration with financial sustainability, so that the municipality can maintain clean governance outcomes while scaling service delivery and infrastructure investment.

Strategic and cross-cutting issues

This section draws together the main threads from the demographic and housing profile, economic structure, land cover and settlement change, infrastructure access, social facilities, and institutional capacity to identify the cross-cutting strategic issues that will most influence service delivery performance and capital expenditure outcomes. While each section describes a specific domain, they are tightly interconnected in practice: rapid household growth changes infrastructure demand faster than population growth; settlement footprint expansion and informality shape the cost and feasibility of network upgrades; economic structure influences the municipality's revenue base and ability to fund operations and renewals; and institutional capacity determines whether budgets translate into delivered projects. The ten issues below, therefore, focus on the highest-leverage constraints and enablers, those that, if addressed, most improve the municipality's ability to provide reliable services, close backlogs, and deliver credible, financially sustainable capital programmes.

Household growth outpacing population growth (the "connections problem")

The most structural driver across the entire assessment is that households have been increasing faster than the population, alongside declining household size and rising settlement density. This creates a service-delivery reality in which demand for connections (water meters, sanitation connections, electricity points, refuse collection routes) grows faster than "people-based" planning assumptions. For capital expenditure planning, this shifts the centre of gravity from simply expanding bulk capacity to also expanding the number and spatial reach of reticulation-level connections and the supporting operating systems. It increases the cost of service provision per additional resident and raises the priority of network densification strategies, infill-friendly land release, and incremental upgrading where formal township establishment cannot keep pace. If this dynamic is not explicitly incorporated into forecasting, the municipality risks chronic "infrastructure lag," where reported access appears high but actual service reliability deteriorates due to overloaded local systems. The capex implication is that multi-year investment plans must be built around household projections and connection growth, with explicit funding for reticulation extensions, pressure management, valve and meter programmes, and the renewal of ageing local networks, rather than just headline bulk projects.

Settlement footprint expansion and the cost of low-rise, dispersed growth

Land cover and building-based indicators point to a built environment that has expanded materially over time, with growth largely horizontal rather than vertically intensive. This pattern tends to drive higher lifecycle costs: longer pipe runs per household, more road kilometres to maintain per serviced area, and higher energy and transport burdens for residents and the municipality. It also makes service delivery more fragile because dispersed areas are harder to maintain and to respond to during disruptions. For capital planning, the cross-cutting issue is the need to manage spatial form as a financial strategy. Infrastructure investment should be used to reinforce a more compact, corridor-and-node-oriented development pattern, prioritising upgrades where densities and demand justify them, and sequencing development so that new growth areas are opened only where bulk and reticulation capacity exist. In practice, this means using the SDF, land-use management, and infrastructure master plans as a single, enforceable growth-management package, supported by capital budgeting rules that favour infill, consolidation, and upgrading over scattered greenfield expansion.

Residual informality and uneven service standards despite high overall access

Across water, sanitation, electricity, and refuse removal, the long-term direction is improved access, but the patterns show that remaining deficits are likely concentrated in specific pockets, often informal settlements, peri-urban fringes, and areas with poor road access. These pockets drive disproportionate health, environmental, and reputational risks, and they also inflate costs because incremental servicing and emergency responses are more expensive than planned network extensions. The sanitation profile in particular signals that even small shortfalls have outsized impacts, while refuse removal data hints at unevenness and measurement challenges that often accompany service delivery in rapidly changing settlement environments. The capex implication is that "backlog eradication" must be reframed as "targeted gap closure plus upgrading of interim services," with clear, spatially explicit programmes: informal settlement upgrading (in-situ where possible), prioritised service corridors, communal-to-full service progression, and the alignment of service upgrades with land regularisation and tenure pathways. Without this integrated approach, the municipality risks repeatedly funding short-term fixes rather than durable solutions.

Bulk capacity and system reliability now matter more than coverage

As access approaches near-universal levels for several services, the binding constraint shifts from coverage to reliability, quality, and asset condition. High service access is not equivalent to reliable service if bulk systems, treatment works, pump stations, and main networks are operating near capacity or are inadequately maintained. Water and sanitation improvements will stall, and public trust will erode, if interruptions, leak losses, sewer spills, and plant failures become more frequent as the customer base expands. For capital expenditure planning, this demands a deliberate pivot toward asset management: renewal programmes, condition assessments, pressure and leakage reduction, sewer rehabilitation, treatment capacity upgrades, and standby power/resilience investments. It also requires protecting operating budgets for maintenance, because deferred maintenance can lead to larger future capex needs and higher emergency costs. The strategic issue is therefore to balance new infrastructure expansion with systematic renewal and reliability investments that safeguard the gains already achieved.

Road and access constraints undermine the effectiveness of all other services

The road network profile shows a municipality with an extensive network and a large component of unpaved and informal roads, particularly in the areas that are typically hardest to serve. Roads are a cross-cutting "enabler service": they determine whether refuse collection can occur regularly, whether maintenance crews can reach assets, whether emergency services and health access are reliable, and whether upgrading projects can be implemented efficiently. Poor access increases operating costs and delays, and raises the capex cost of extending services (because construction logistics, stormwater management, and stabilisation requirements increase). The capex implication is that the municipality should treat targeted road upgrading, especially key unpaved links and access spines into growth and informal areas, as part of the infrastructure backlog response, not as a separate transport agenda. A prioritised "service access road" programme can be one of the highest-return investments because it multiplies the effectiveness of spending in water, sanitation, solid waste, health response, and public safety.

Economic structure shapes revenue resilience and infrastructure affordability

The economy shows slow overall growth but a strengthening role for logistics, trade, and business services, alongside weakening construction and some manufacturing softness. This matters for service delivery because it influences municipal revenue stability, the affordability of tariffs for households and businesses, and the future spatial pattern of demand. A logistics- and trade-oriented economy places pressure on roads, freight routes, industrial precinct services, and reliable electricity and water supply. At the same time, slow growth constrains how much the municipality can rely on expanding its own revenue to fund upgrades and renewals. The strategic issue is to align capital investment with the sectors that underpin the local economy, protecting competitive enabling infrastructure in key corridors and nodes, while avoiding "white elephant" projects that assume rapid growth. Capex planning should incorporate a clear affordability and revenue lens: lifecycle costs, ability to recover costs through tariffs, and the municipal fiscal capacity to operate and maintain assets over time.

Social facility access must track settlement change, not legacy location patterns

Education and health facility networks appear established, but their adequacy depends on spatial distribution relative to where households are growing. As residential footprints expand and densify in particular areas, facilities (especially secondary schools and public health services) can become overstretched, and the burden shifts to transport systems and safety risks for learners and patients. Since the private health footprint is limited, the public system carries most demand and is therefore more sensitive to municipal infrastructure performance (roads, lighting, stormwater, water reliability). The cross-cutting issue is that social facilities are not "standalone sector assets"; they require municipal enabling infrastructure and safe accessibility. Capex planning should therefore integrate social facility catchment analysis with settlement growth hotspots, ensuring land is reserved for expansions where needed, and prioritising municipal infrastructure upgrades around schools and clinics to improve functionality, safety, and access.

Safety, public order, and the built environment are mutually reinforcing

The safety and security profile indicates an established policing presence, but functional precinct boundaries do not align neatly with municipal planning areas, and policing effectiveness is heavily shaped by the physical environment. Informal settlement layouts, poor lighting, poor road access, weak addressing systems, and degraded public spaces can undermine response times and increase crime opportunities. This directly affects service delivery because unsafe environments reduce staff effectiveness, increase vandalism and theft of infrastructure, and raise operational costs (security, repairs, downtime). The capex implication is that a portion of infrastructure spending must be dedicated to "crime-sensitive design": public lighting, rationalised street layouts in upgrading areas, secure infrastructure compounds, improved access routes, and the design of active public environments in key nodes. Treating safety as a spatial and infrastructure issue, rather than only a policing issue, can materially improve service sustainability and protect municipal assets.

Institutional capacity constraints, especially at middle management, threaten delivery

Audit outcomes suggest generally credible financial governance, but the staffing indicators reveal a critical delivery risk: severe and persistent vacancies in the broader managerial layer. This is the layer that typically drives project preparation, procurement oversight, contract management, performance monitoring, and operational coordination. Even with good audits, high vacancies can produce under-

spending, delays, poor-quality work, weak maintenance planning, and increased reliance on consultants without strong municipal client capability. The strategic issue is that institutional capacity is a capex constraint: without stabilising the "engine room," capital plans remain aspirational. The practical implication is that the municipality should prioritise filling critical posts related to infrastructure delivery (engineering, PMO, SCM, contract management, asset management, billing, and customer management) and establish delivery support mechanisms to address vacancies. Capacity-building should be treated as an investment with measurable delivery outcomes, not as overhead.

Affordability, indigent policy volatility, and operating sustainability

Free basic services are consistently implemented, but beneficiary numbers fluctuate sharply, indicating administrative churn, shifting thresholds, or database and verification issues. This matters because operating sustainability underpins capital sustainability: if revenue collection is unstable or indigent targeting is inconsistent, the municipality will struggle to fund maintenance and renewal, leading to service failures and escalating future capex. Volatility can also signal gaps in customer data systems and in the alignment between billing units and actual households, which undermines both planning and financial management. The capex implication is that "infrastructure delivery" must include investments in enabling systems, such as customer databases, metering, loss reduction, revenue management, indigent registration processes, and transparent policy communication. Stabilising the indigent system and improving billing accuracy can unlock operating space for maintenance and co-funding of capital programmes, directly improving service reliability and reducing lifecycle costs.

Taken together, these issues point to a single strategic conclusion for service delivery and capital planning: the municipality has achieved major gains in access and governance credibility, but the next phase of development will be determined by whether it can manage household-driven demand growth, guide settlement form toward affordability, close residual pockets of informality, and shift from "coverage expansion" to "system reliability and renewal", all while strengthening middle-management delivery capacity and stabilising operating sustainability through better customer and indigent systems.

Annexure A. Data extraction and data mining

This report is based on queries generated from the MapAble® database by Spatial Data Services NPC. The data sources are indicated in the table below. All the data utilised is in the public domain and can be sourced from the respective data custodians.

The bulk of the data comes from census data from Statistics South Africa. Each census is queried at the smallest data level at which a census was released. The 1996 census was released at the enumerator area (EA) level while the 2001 census was only released at a sub-place level. A sub-place consists of a number of EAs. The 2011 census was released as a small area layer (SAL). Small areas are larger than EA's but smaller than sub-places. It is important to note that the censuses are not consistent insofar as data categories are concerned.

Data partitioning is used in MapAble® to determine values for the selected areas. Data partitioning calculates the proportional ratios of underlying data sets (data linked to polygons such as EA's or sub-places) within a selected query area (municipality, municipality, farm portion, etc.). Data partitioning is used to overcome the need for information on census demographics for areas that are not consistent with the standard boundaries themselves, or as the case in this report, where boundaries change from time to time and area profiles are not directly comparable. The proportions are based on the area of the intersecting themes.

Data partitioning allows for comparisons between datasets, which each have their own unique demarcations, and data that is not necessarily spatially comparable or compatible.

Notes on data, the use and presentation thereof

Spatial analysis and profiling areas depend on quality, detail and geographical data sets. The challenge is to present and use data in such a way that it conveys a message based on facts. The analyst's duty and skill are to combine different datasets and extract value from the process.

There are three challenges to overcome. The first is that data represents a picture at a specific time. These time or date differences make direct comparisons very challenging. Secondly, data have a particular granularity depending on the spatial scale in which the data was generated or presented. This makes the disaggregation of data to a more advanced level of granularity more challenging. The third issue is that related data are generated from different bases, often for different purposes. For example, what is the difference between a family unit, a household or a residential customer in a municipality? They are all related and might even be the same, but they have different interpretations, whether one does social, economic, or financial analyses.

There are three basic ways to overcome these challenges. The first is mapping to do pattern recognition within the timeframe of rates of change. For example, quoting the Census 2011 number of population values can no longer be valid in 2022. However, a map depicting the distribution of population language majorities may still allow the spatial analyst to make every valid observation and essential conclusion because these patterns are slow to change. Secondly, the approach is to do trend analysis by plotting temporal data and then statistically calculating and determining the trend the data values represent at different points in time. Finally, the third option is spatial or numerical cross-comparisons between different and unrelated datasets to draw inferences on trends and outcomes developing in the area.

The approach remains to find the most recent and credible data but to supplement it with historical or comparative data to extract the maximum value from the data. As a word of caution, simply quoting a figure is meaningless if it is not put in context or if the implications thereof are assessed.

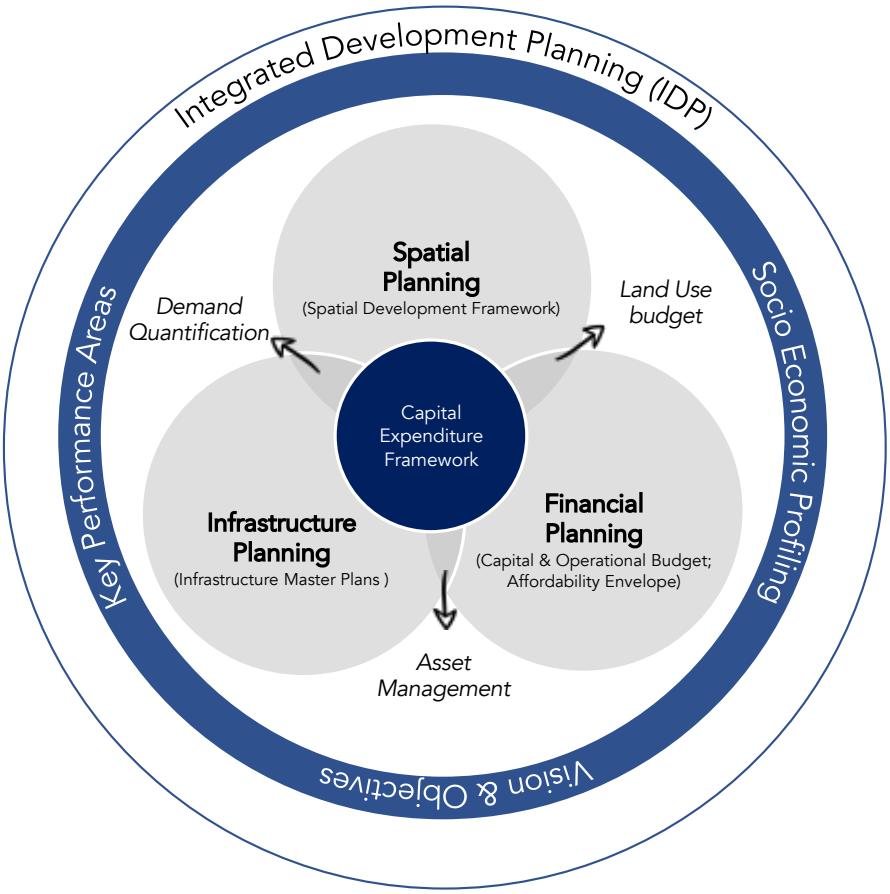
The use of place names

Place names used in this document are the place names reflected in official national and provincial datasets. Official names are designated through the South African Geographical Names Council. The official governing body of South Africa advises the central government's executive branch (in the form of the Minister of Arts and Culture) on new geographical names and the changing of existing ones. The South African Geographical Names Act 118 of 1998 established the Council. We are aware that there are often discrepancies between official and local names. Using official names is practical and should not be construed as disrespecting local names, customs and traditions.

Phase 1

Introduction

1 Part 1: Introduction



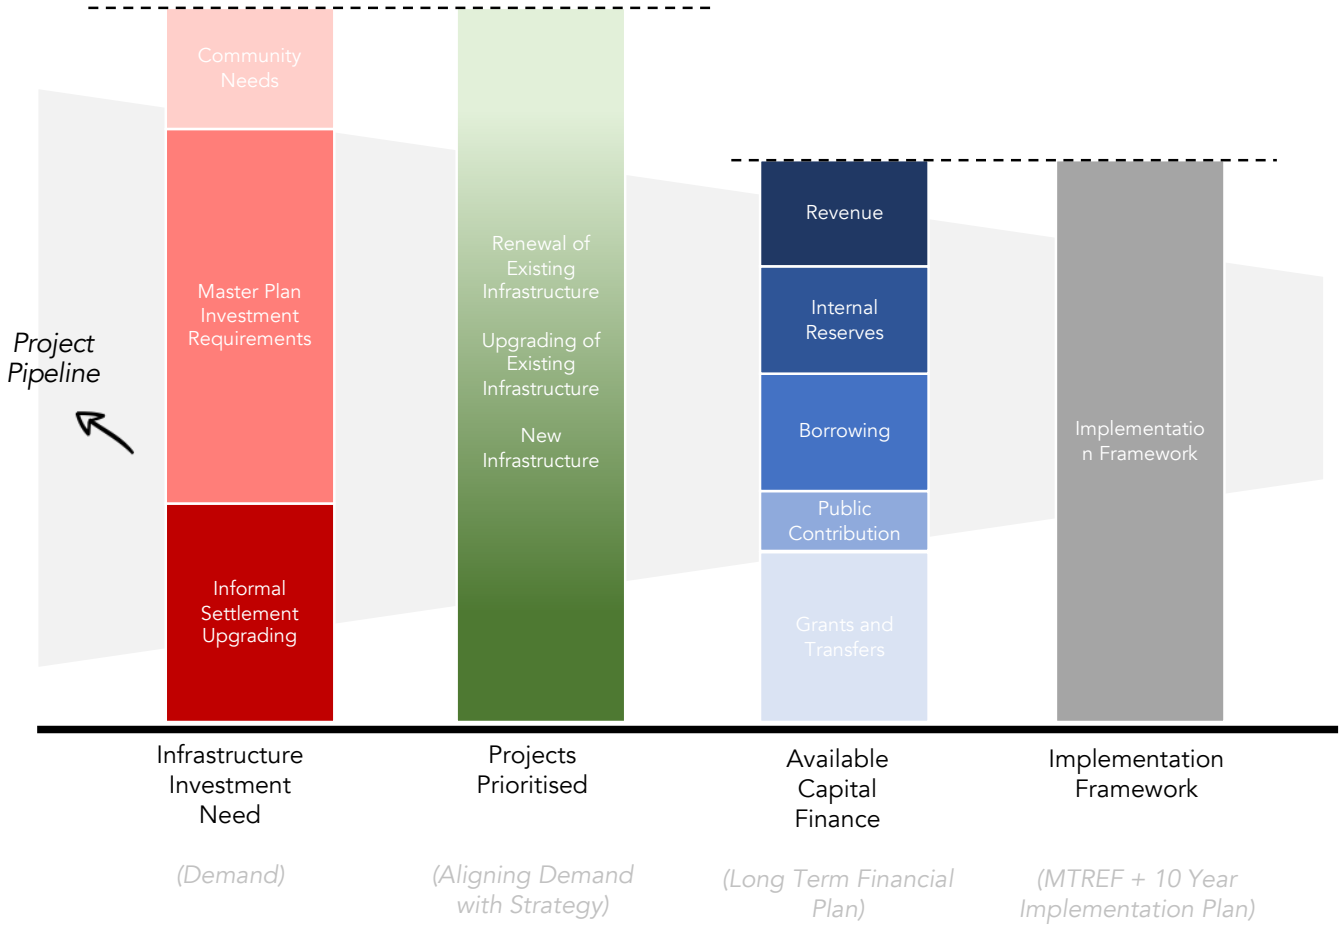
1.1 What is a Capital Expenditure Framework

According to the Department of Cooperative Governance and Traditional Affairs (COGTA) guidelines, a Capital Expenditure Framework (CEF) is a consolidated, high-level view of a municipality's long-term infrastructure investment needs. It ensures that infrastructure priorities are spatially aligned with municipal strategic objectives, budgetary realities, and development plans. The framework is grounded in principles of sustainability, financial feasibility, and strategic alignment, balancing immediate infrastructure needs with long-term development goals, the relationships between these spheres of planning and principles is illustrated in Figure 1–1.

The Spatial Planning and Land Use Management Act, 2013 (SPLUMA) mandates the inclusion of a CEF within a municipality's Spatial Development Framework (SDF). Specifically, Section 21(n) of SPLUMA requires that an SDF "determine a Capital Expenditure Framework for the municipality's development programmes, depicted spatially." This legislative requirement underscores the importance of integrating spatial planning with financial planning, ensuring that the spatial strategies articulated in the SDF are implemented through practical and affordable infrastructure investments.

A Capital Expenditure Framework links spatial development strategies with budgetary constraints and infrastructure demands. It provides a transparent mechanism for prioritising projects, promoting the efficient allocation of resources, and aligning capital expenditure with the municipality's long-term strategic vision.

Figure 1–1: The Capital Expenditure Framework within the built environment context



1.2 Aim of Capital Expenditure Framework

The aim of a Capital Expenditure Framework (CEF) is to create a structured and strategic approach to municipal infrastructure expenditure. The CEF is intended to align the municipality's spatial development strategies with its financial resources and capacity, ensuring that long-term growth and development objectives are achievable, and informs operational activities of a municipality.

A CEF aims to provided a municipality with the means to inform financial planning with infrastructure planning and spatial priorities identified in the Spatial Development Framework (SDF). It aims, furthermore, to establish a clear methodology for municipalities to evaluate, prioritise, and inform implementation processes of infrastructure projects within their affordability envelope, supporting both immediate and long-term development goals.

From Figure 1–2one can see the illustration that infrastructure investment need, expressed as projects, usually exceeds available capital finance, and therefore it is an imperative for municipalities to partake in a prioritisation process to determine which projects are best aligned with the strategy of the municipality, together with a budget scenario process to determine which projects are affordable and should be implemented when.

Figure 1–2: Relationship between infrastructure investment needs, affordability envelope, prioritisation process, and budget scenario process

1.3 Objectives of Capital Expenditure Framework

The key objectives of a CEF is to:

- Socio-economic trends: Understand the socio-economic trends in a municipality over the long term;
- Quantify Infrastructure Needs: Assess and detail the municipality's long-term infrastructure requirements based on an SDF-informed land use budget, infrastructure standards, anticipated socio-economic growth, existing infrastructure, and backlogs;
- Align with the Spatial Development Framework (SDF): Translate the spatial vision and strategic priorities outlined in the SDF into priority development areas which informs prioritisation practices;
- Consolidate Infrastructure Demand: Create a comprehensive list of infrastructure projects across various sectors in line with the municipality's mandate, reflecting the municipality's overall infrastructure demands;

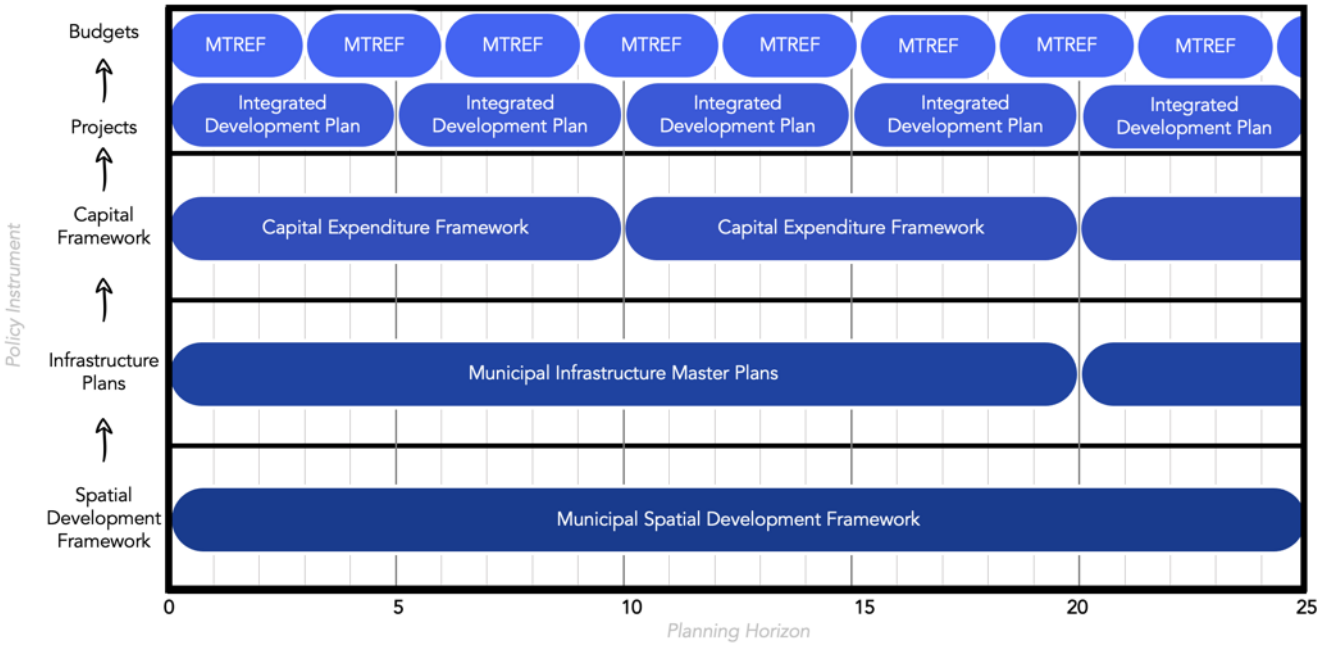
- Contextualise Financial Affordability: Integrate the municipality's affordability envelope, derived from the Long-Term Financial Model (LTFM), to ensure infrastructure expenditure are financially sustainable over the planning horizon;
- Facilitate Prioritisation: Establish a framework to evaluate and rank projects based on strategic alignment, socio-economic impact, and spatial targeting amongst others, ensuring that resources are allocated to the most critical and impactful projects;
- Determine a Budget Scenario: Offer a structured, evidence-based approach to infrastructure planning and budgeting, improving decision-making processes and accountability to stakeholders - amongst others, to indicate project-level responses per asset type per functional area;
- Enable Spatial Transformation: Direct infrastructure investments toward spatial transformation goals, focusing on reducing inequalities, improving access to services, and promoting inclusive economic growth, and;
- Bridge Short-Term and Long-Term Planning: Ensure a coherent link between the short-term MTREF cycles, Medium-term Integrated Development Plan (IDP) cycles and the municipality's long-term development vision, embedding sustainability and foresight into the planning process.

1.4 Role of the Capital Expenditure Framework as a policy instrument

The Capital Expenditure Framework (CEF) is a cornerstone of municipal planning, grounded in South Africa's legislative framework and designed to bridge the gap between long-term spatial development strategies and actionable infrastructure expenditure. The concept of the CEF was formalised under the Spatial Planning and Land Use Management Act (SPLUMA, Act 16 of 2013), specifically in Section 21(n), which mandates municipalities to determine a spatially referenced CEF as part of their Spatial Development Framework (SDF). This legislative requirement reflects the increasing emphasis on aligning planning and budgeting processes to address developmental challenges effectively.

Historically, the Constitution of South Africa laid the foundation for this alignment in Section 153, which directs municipalities to prioritise the basic needs of communities while promoting socio-economic development through structured planning and budgeting. The Integrated Development Plan (IDP) was introduced as a mechanism to achieve this in the Local Government Transition Act (Act 209 of 1993), evolving through subsequent legislation, including the Municipal Systems Act (MSA, Act 32 of 2000). The MSA established the IDP as the principal planning instrument of local government, requiring it to incorporate a comprehensive financial plan and a Spatial Development Framework. This integration ensures that municipal resources are allocated effectively to achieve the long-term developmental vision.

The CEF builds on these legislative imperatives by operationalising the SDF within the IDP framework. As a long-term (10-year) planning tool, the CEF quantifies infrastructure needs, consolidates them into prioritised project pipelines, and aligns them with the municipality's financial capacity as outlined in the Long-Term Financial Plan (LTFP). It ensures that infrastructure investments are not only spatially targeted but also financially sustainable, bridging the divide between visionary spatial strategies and practical implementation.



The CEF also plays a vital role in South Africa's Local Government Accountability Cycle, a governance framework defined by the Municipal Finance Management Act (MFMA, Act 56 of 2003). This cycle integrates planning, budgeting, and reporting processes to ensure transparency, accountability, and

alignment with development priorities. Through informing the IDP, and so the Medium-Term Revenue and Expenditure Framework (MTREF), as well as the Service Delivery and Budget Implementation Plan (SDBIP), the CEF enables municipalities to stabilise their decision-making processes. It provides a consistent rationale for allocating resources, ensuring that both short-term operational needs and long-term developmental objectives are addressed.

Importantly, the CEF institutionalises long-term planning practices within municipalities. It encourages decision-makers to adopt a forward-looking perspective that considers future growth patterns, socio-economic trends, and financial constraints. This approach reduces the reactive nature of municipal budgeting, replacing it with proactive, evidence-based strategies that support equitable service delivery and spatial justice.

The CEF is a transformative policy instrument that integrates spatial, financial, and infrastructure planning within the legislative and operational frameworks of municipal governance. It strengthens the IDP as the single most strategic document of municipalities, ensures alignment with the SDF, and guides resource allocation through the MTREF and SDBIP. Through its structured and integrated approach, the CEF enables municipalities to achieve their developmental mandates while ensuring financial sustainability and fostering spatial transformation.

Figure 1–3: The relationship between policy instruments effecting the spatial form

1.5 Structure of this Capital Expenditure Framework

The structure of this report is outlined below to guide the reader through the key components of the Capital Expenditure Framework (CEF) and its alignment with municipal planning processes as well as the norms and standards of the CEF.

Table 1-1: Structure of this Capital Expenditure Framework

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 1: Inception and Information Gathering	Phase 1	To provide a contextualisation to the Capital Expenditure Framework. This phase comprises the inception process of the CEF as well as the information gathering process

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
		in which a comprehensive integrated infrastructure investment framework, or portfolio of projects, is collated.
Part 2: Functional Area and Spatial Category for Investment Planning Profiling and Spatial Demand Quantification	Phase 2a	This part introduces functional areas for priority investment which are defined and mapped to indicate the spatial strategy depicted in the MSDF (linked to the MSDF proposals). The identified functional areas are used to determine the future population, housing, and land demand based on existing socio-economic and related data which is used in the spatial demand quantification component.
Part 3: Infrastructure demand	Phase 2b	This part determines the investment requirements for each functional area, including operational and maintenance costs per asset class. The goal is to compare the optimal infrastructure requirements scenario with the known infrastructure demand based on current planning frameworks.
Part 4: Affordability Envelope	Phase 3	This part is a reflection of the municipality's financial health and long-term financial plan. Primarily it includes the results of the re-application of the long-term financial plan to determine the appropriate affordability envelope.
Part 5: Prioritisation and Budget Scenario	Phase 4	This part has a prioritisation framework that considers spatial, engineering, and financial factors to calculate a composite score indicating each project's relative importance in the pipeline. It also applies this framework to the budget fit process to determine how to allocate capital within the affordability envelope per project for the next 10 years.
Part 6: Capital Expenditure Programme	Phase 5	This part is a breakdown of the 10-year capital expenditure framework. Essentially, it analyses the fitted project pipeline in terms of spatial alignment, asset type alignment, and other attributes to ultimately verify that the 10-year capital expenditure framework is in line with the strategic intent of the prioritisation framework and the MSDF objectives.
Part 7: Institutional Arrangements and Project Closeout	Phase 6	This phase comprises of a concluding chapter to the CEF, this part aims to identify areas of enhancement that will render the CEF not only as a compliance document but to solidify institutional change around the alignment of planning, engineering, and financial practices – with the ultimate aim to improve service delivery. Furthermore this phase contains a final close-out report detailing the project timeline and conclusions drawn.

Phase 2a

Functional Areas

The methodology and approach to defining Functional Areas

2 Introduction

In terms of Section 152 (1) (b), (c) and (d) of the constitution, a municipality must ensure the provision of services to communities in a sustainable manner, promote social and economic development and promote safe and healthy environments. It continues and states in 152 (2) that a municipality must achieve the objectives set out in 152 (1) within its financial and administrative capacity.

The current developmental pressures experienced within the South African context, specifically the lack of available resources to address the infrastructure demand faced by municipalities, together with the legislative framework as set out in the constitution and other planning documents, led to the implementation of the principle of spatial targeting. Spatial targeting refers to the deliberate focus of particular actions on a specific spatial area. This concept is currently prevalent in the planning and urban management environment. It is a beneficial and efficient principle to apply when dealing with limited resources and when a municipality aims to address spatial injustices in a focussed and integrated manner. Therefore, this section seeks to define and delineate different Functional Areas. The section provides a brief background to Functional Areas and an overview of the methodology used. This chapter also presents the various development indices used to delineate the Functional Areas as well as the final functional areas and their descriptions.

3 Approach and methodology

Defining the municipality's Functional Areas requires a clear, rational and consistent methodology. The methodology adopted for this purpose relies on multi-criteria GIS analysis supported by two specific technical tools to achieve the desired results. The process is quantitative and evidence-based. The tools used in this process are described below.

3.1 Key policies and themes driving the approach

Spatial planning in South Africa has undergone significant transformation since the end of apartheid, driven by a series of policy frameworks and legislative acts aimed at redressing historical inequalities and promoting sustainable development. Key policies that have shaped spatial planning include the White Paper on Reconstruction and Development (1994), the Development Facilitation Act of 1995, the National Urban Development Framework of 1997, the Municipal Systems Act 32 of 2000, the Municipal Planning and Performance Management Regulations (2001), the National Spatial Development Perspective of 2006, the National Development Plan 2030, the Spatial Planning and Land Use Management Act of 2013, and the Integrated Urban Development Framework of 2016.

From the foundational focus on meeting basic needs and promoting human resource development in the RDP to the advanced, integrated urban strategies of the IUDF, South African spatial planning policies demonstrate a consistent commitment to creating sustainable and inclusive urban environments. The alignment of objectives across various policy frameworks reflects a strategic emphasis on enhancing transport and mobility, promoting mixed land uses, increasing population densities, and improving access to economic and social opportunities. These efforts are vital in fostering spatial integration and addressing the persistent inequalities rooted in the country's historical spatial divides.

Therefore, the approach and methodology presented in this working paper attempt to address these key overarching themes. Using the latest available spatial data and advanced GIS analysis techniques, this approach can spatially quantify how these themes manifest within the municipal area.

3.2 Understanding the concept of Functional Areas

According to the CEF Guidelines, a Functional Area is a region with similar developmental and service demand characteristics. A typical example is demarcating all areas with rural traits because they have more or less similar challenges (low density, lack of high-order services, remote locations, and dependence on the primary sector for employment). Each Functional Area also requires a unique development strategy to address the area's development challenges.

The ability to sustain any function or service is based on a demand threshold. The threshold population, for example, to support a small café, is entirely different from the threshold population to sustain a hospital. Matters such as the threshold population's income, mobility, and many other factors complicate matters. Nevertheless, the crucial issue is that functional boundaries vary and do not necessarily coincide with municipal boundaries. Municipal boundaries describe administrative jurisdictions, but municipalities cannot plan for areas outside their mandated service delivery areas. In the same way that development efforts are focused on selected nodal areas, the demand for services and uses is determined and generated by the broader Functional Area that a node serves rather than

the extent of development within the node only. Different demand thresholds, functional linkages and characteristics necessitate a distinction between Functional Areas in a municipality.

3.3 Analysis approach

Before the multi-criteria, GIS analysis depended on two components that made this exercise possible. The first is developing a suitable hexagon grid system, and the second is a place syntax approach for analysing data. In combination, these two elements allow for rational analysis within a consistent approach. The process results in a development potential index integrating the impact of a range of factors on any location in a municipality.

The following section briefly overviews the two aspects that form the basis for developing Functional Areas.

- **The hexagon-grid** overlay made it possible to describe the status quo consistently and comparably through data partitioning and data bucketing. The hexagon grid makes this analysis possible and is a much improved and sufficient way of analysing large data sets, in more detail, at a regional scale.
- **Space syntax** is the approach used to analyse vast amounts of data used in this analysis. It uses the hexagon grid base and spatial data to present the data variables in terms of attraction and accessibility.

3.4 The hexagon grid base

Grid systems are critical to analysing sizeable spatial data sets and partitioning areas of a region into identifiable grid cells. With this in mind, a 250m hexagon grid was used[1] for the study area to analyse, explore, compare and visualise data.

Deriving information and insights from data requires analysing data of different types and forms across the municipality. Because cities and spatial data are geographically diverse, this analysis needs to happen at a fine granularity. Analysis at the finest granularity, the exact location of an event, is exceedingly complex and expensive. Analysis of areas, such as neighbourhoods within a city, is much more practical.

For this reason, the hexagon grid was developed to bucket events and data into hexagonal areas. The hexagons approach was an essential choice because data changes over time, units of measure change, and it is often not presented consistently in terms of spatial manifestation. An example is the ever-changing ward boundaries in a municipality. Hexagons also minimise the quantisation error introduced when these data changes take place. Hexagons also allow us to approximate radiuses easily.

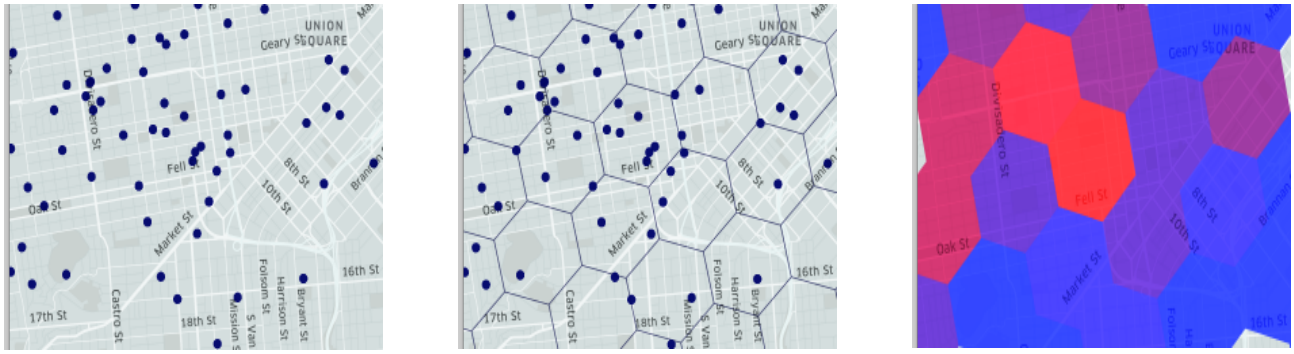


Figure 4: The data' bucketing' process

Choosing the hexagon as the basis of the analysis is important. The first consideration is the size of the hexagon. A 250m hexagon balances the level of detail needed and the data types used in the analysis. The 250m hexagons also relate to what is considered a good size representing urban granularity. They provide a grain of information that is easy to process, analyse and visually present.

Another consideration is that hexagons have only one distance between a hexagon's centre point and its neighbours, compared to two distances for squares or three distances for triangles. This property greatly simplifies performing analysis and smoothing over gradients (Figure 5).

[1] The 250m hexagon grid was developed by Spatial Data Services Afica (www.sdsafrica.net) and 22 million hexagons cover the entire South Africa.

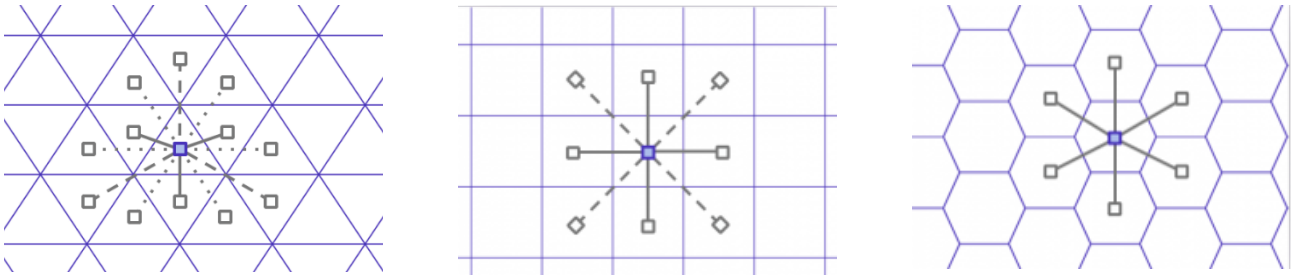

Figure 5: Distances from a triangle to its neighbours (left), a square to its neighbours (centre), and a hexagon to its neighbours (right)

3.4.1 Place syntax

A place syntax approach was used to combine the space syntax description of urban environments with conventional descriptions of attraction into a combined accessibility analysis to measure centrality. Measuring centrality can be done in several ways. The two most prominent ways are Integration or closeness centrality or betweenness centrality or choice. These measures can be defined as follows:

- Integration (or closeness centrality) is a measure that describes relativised asymmetry in the graph network.
- Choice measures movement flows through spaces. Spaces that record-high general choice is located on the shortest paths from all origins to all destinations.

Within this context, one can use various ways to apply these methodologies. They include:

- Angular integration analysis
- Angular betweenness analysis, and
- Accessibility analysis.

For this project, the focus was on using the accessibility analysis method. Two types of accessibility analysis were used: attraction distance and attraction reach.

Attraction distance captures proximity and measures the distance from the 'origin' points, such as addresses, or in this case the centroid of each hexagon, to some kind of attraction, such as primary schools.

Attraction reach measures the total amount of attractions that can be reached within a certain distance from the points of origin. Thus, this kind of density measure indicates how many schools, shops or people can be reached within a neighbourhood (defined by distance).

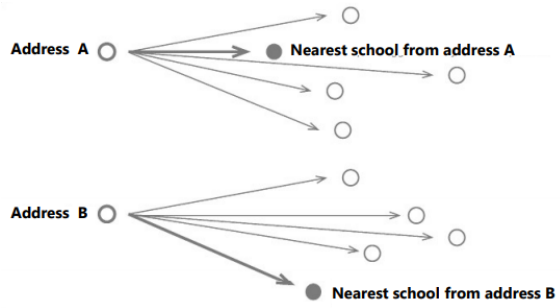

Figure 6: Measuring attraction distance

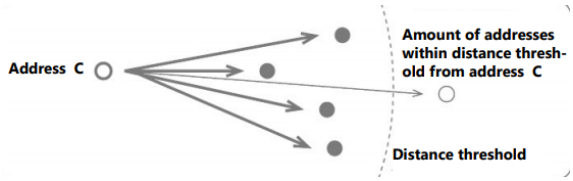

Figure 7: Measuring attraction reach

Attraction analysis can also be seen as a description of the presence (or absence) of society and answers questions such as: "Which services are available within walking distance?" or "How equal is service distributed in a specific area.

3.5 Functional Area index modelling

The Functional Areas are based on existing data and information to ensure a link between current conditions and future development. This index should serve as an essential input into the decision-making process to guide development and direct the Capital Expenditure Framework's priorities.

The aggregate of the Functional Areas describes a development potential framework. It provides a realistic representation of the municipality's current situation to compare and measure the spatial efficiency of the existing municipal spatial policies and strategies.

3.5.1 Steps in a multi-criteria analysis

Below are the necessary steps followed in a multi-criteria evaluation.

- **Define the problem/question:** Clearly define the goal or issue that the analysis needs to address.
- **Determine the criteria:** What are the factors and constraints that need to be considered?
- **Standardise the factors:** Normalisation process that allows various criteria to be compared with one another. Normalisation is typically done by ranking the factors in an index (i.e. 1 to 10) from high to low or good to bad.
- **Determine each factor's weight:** Decide the impact that each factor has and express it as a weighted percentage against the other factors.
- **Aggregate the criteria:** Various methods are used, of which *weighted overlay* or *arithmetic overlay* is most commonly used to get a final suitability result.
- **Validate/verify the result:** Involves checking the results and adjusting the criteria' weightings if needed.

3.5.2 The Functional Area model methodology

The suitability model is presented in Figure 8. The final index comprises five (5) primary criteria (sub-indexes), each comprising several data and information inputs. Each criterion has a weighting out of 100, which shows its impact on the final results.

The five main criteria include urban morphology, access to facilities, demographic influence, economic influence, and environmental impact.

The subsequent sub-section and maps show the results of the analysis. The maps show the results of the variables considered in the development of each index map.

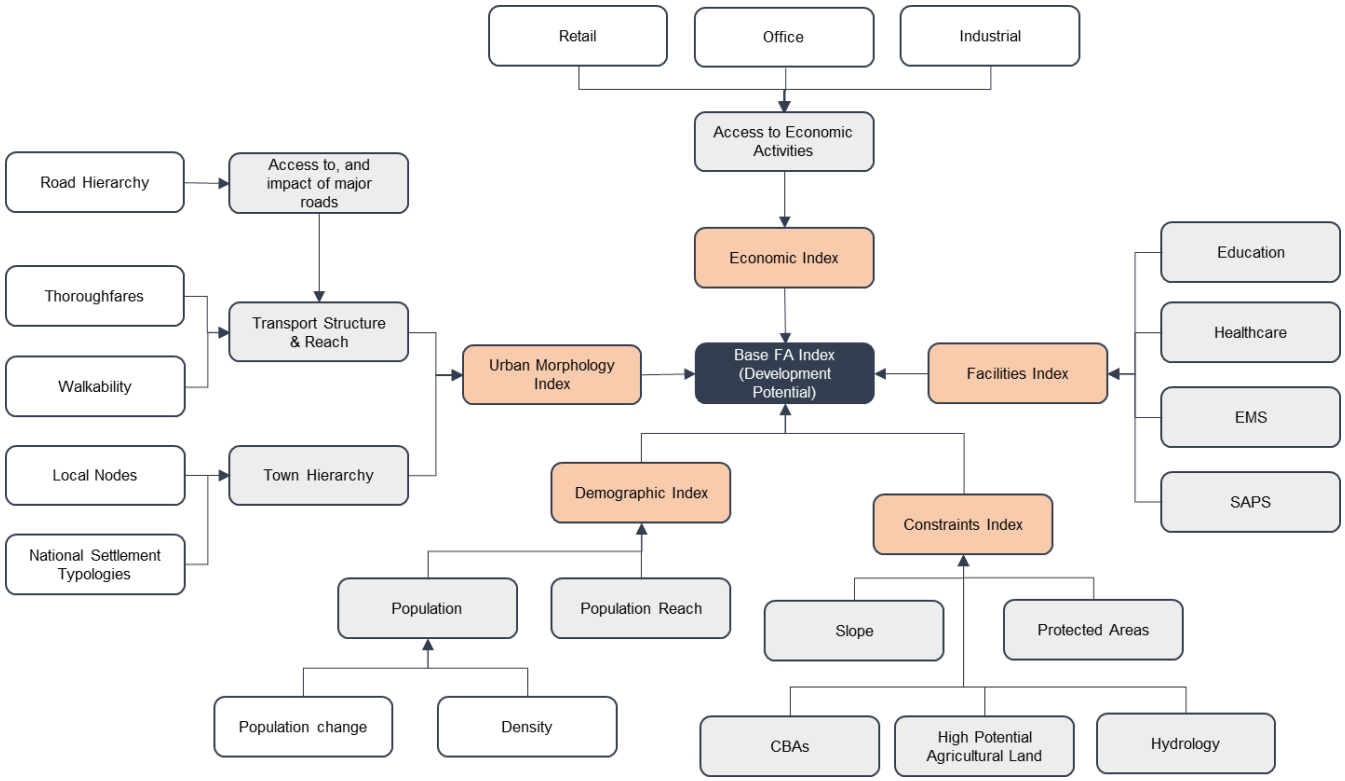

Figure 8: Development of potential modelling methodology

3.6 The functional area index results

3.6.1 Urban morphology index

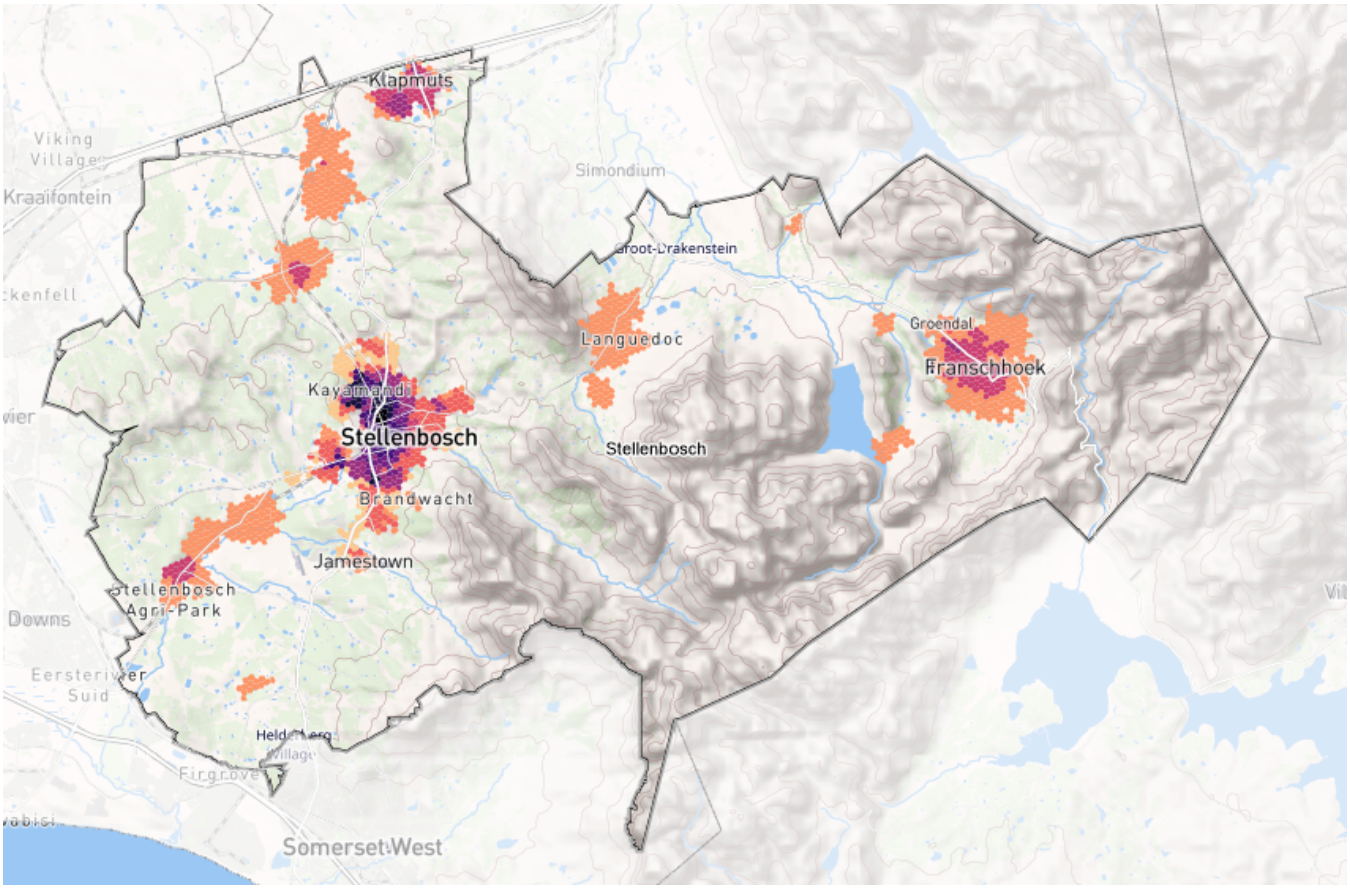
The urban morphology index considers some of the most significant physical and human-made structuring elements that impact development. Two main aspects are analysed. The first includes the accessibility, hierarchy and impact of existing towns, and the second aspect consists of the effects of access and mobility features. The road network, its hierarchy and walkability are all factors in the analysis. The combined results of the analysis are presented in Map 1 below.

3.6.2 Social facilities index

The social facility index measures the distance factor from schools, hospitals, clinics, emergency services and SAPS stations. These elements consider the relevant distance factor from each facility described in the CSIR guidelines for social facilities provision. An attraction reach analysis was also done to identify how each hexagon cell in the municipality is served and how many facilities a location can access. The combination of the analysis results for different facilities provided an overall facility index for the municipal area. The facilities index generally shows a centralisation of facilities, as shown in Map 2.

3.6.3 Demographic index

The demographic index considers three aspects. It firstly assesses the spatial density and distribution of people. The second aspect is where and to what extent population change has occurred between 1996 and 2020. The third aspect is how accessible the population is. This accessibility to people is essential, especially for service delivery and the people's general well-being. Map 3 shows the population index.



3.6.4 Economic index

Map 4 shows the results of the economic index. The index assesses people's ability to reach areas of employment or specific commercial and industrial activities.

3.6.5 The combined development index

The Functional Area index is a combination of the previous four indices. It considers all the above aspects and combines them to form a final index. Each of the abovementioned indices carries an assigned weight as part of the process. The weighting is derived from policy documents such as the IDP and SDF that guide the municipality's spatial vision and priorities. The final index result is presented in Map 5.

The analysis results and the development of the indices now provide a base for identifying appropriate Functional Areas. These Functional Areas are derived based on a solid quantifiable approach. The following section describes how appropriate Functional Areas were delineated based on the indices developed in this chapter.

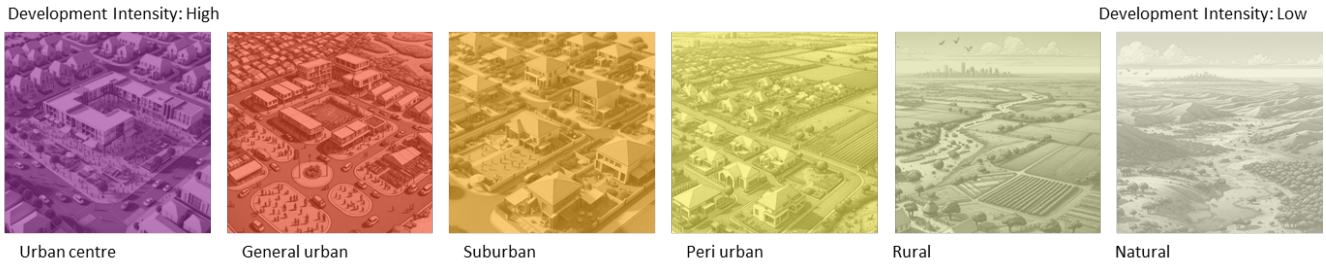
4 Defining the Functional Areas

4.1 A transect approach to defining Functional Areas

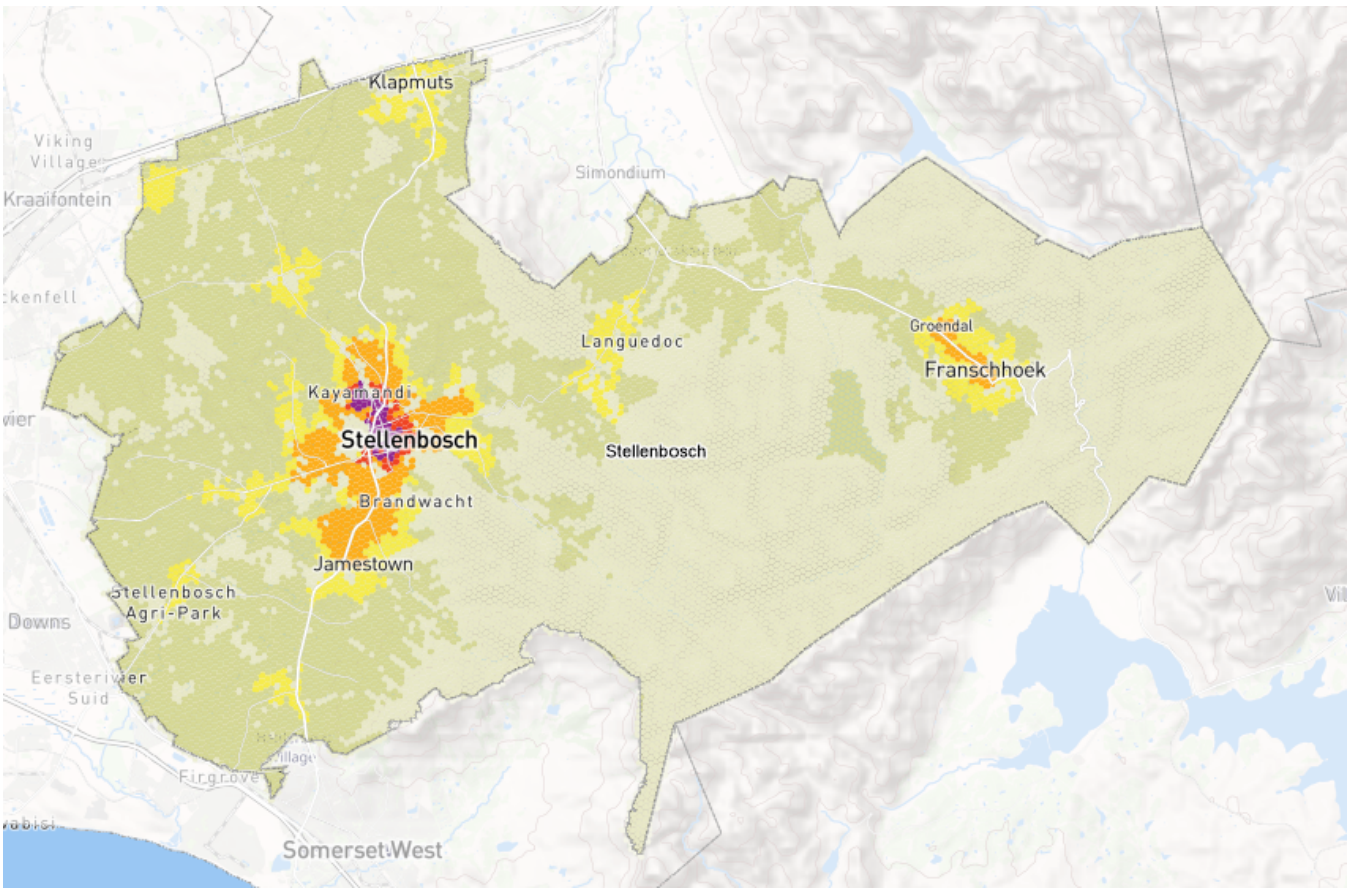
A robust theoretical foundation was necessary to derive Functional Areas from the index developed in the preceding section. The transect concept provided a suitable approach. Transects, or sections through a landscape, are not exclusive to regional planning. They have been employed in environmental sciences to study the changes in biological populations across habitats and to assess human roles within socio-ecological systems.

The use of a transect as an analytical tool can be traced to early planning theorists, such as Ebenezer Howard and Patrick Geddes. New Urbanists have since adopted a rural-to-urban transect as a basis for development regulations aimed at creating sustainable and liveable urban forms. This approach seeks to organise elements of urbanism—such as buildings, lots, land use, streets, and other physical components of the human habitat—in ways that maintain the integrity of various urban and rural environments.



The transect method has been further advanced through manuals and guidelines designed to repair sprawl and promote the development of cohesive, efficient, and liveable communities. Such resources provide practical strategies for transforming fragmented and inefficient developments into complete, robust neighbourhoods.

In South Africa, the transect approach has been advocated as a framework for spatial planning and land use management at both regional and local levels. It is argued that a transect model, based on criteria such as land use, density or intensity, and agricultural suitability, can be effectively tailored to the South African context.



Research indicates that this approach offers both flexibility and focus, enabling decision-makers to adapt each transect zone to local conditions while monitoring essential elements aligned with planning guidelines. It accommodates change by allowing for amendments to transect zones as areas undergo urbanisation or formalisation. Moreover, the transect approach aligns well with SPLUMA, as it can generate broad, nuanced land-use zones to meet planning requirements.

4.2 Functional area descriptions

The final step in the process was the development of the Functional Areas. Classifying Functional Areas was achieved by grouping the index categories of the assessment into eight (8) Functional Areas. The index categories were grouped into the different transects using statistical categorisation techniques. After each categorisation of the index, a ground-truthing process took place. This entailed comparing the results to aerial imagery to test the different outcomes. The Functional Areas attempt to group locations of similar character to provide a unique development approach to each. The resulting Functional Areas are:

The delineation of the functional areas for the municipality are presented in Map 6 below, while a short description of each functional area is provided in the subsequent pages.

Functional Areas

- Peri-Urban
- Sub-Urban
- General Urban
- Urban Centre

Map 6: Functional Areas

4.2.1 Urban Centre

The urban centre is highly urbanised, featuring a mix of uses that supports a vibrant urban life. This zone includes areas that serve as a primary centre within a city, offering a mix of residential, commercial, and cultural uses. It is designed to be pedestrian-friendly and accessible, promoting an active urban lifestyle.

4.2.2 General urban

General urban areas are primarily residential in nature, with a moderate mix of housing types and local amenities. Density is lower than in urban centres, but a variety of services, schools, and parks are available within walking or short driving distances. These areas offer a balance between suburban comfort and urban convenience, fostering a cohesive community environment.

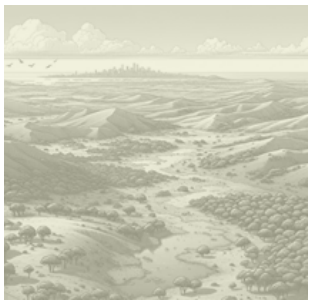
4.2.3 Suburban

Suburban zones are lower-density residential areas, often dominated by single-family homes, with more reliance on private vehicles for transportation. These areas are characterised by, local shopping centres, and schools, with significant green spaces.

Suburban zones offer a quieter lifestyle with less direct access to urban amenities compared to more central zones. Some suburban areas incorporate new / mid-rise apartments and townhouses as plot consolidation will allow, and as some of these areas are under pressure for redevelopment.

4.2.4 Peri-urban

This zone bridges suburban development and rural areas, featuring low-density residential uses, small agricultural holdings, and open landscapes. It is characterised by mixed land uses, including small farms, rural estates, and local service nodes. Peri-urban areas often serve as a buffer zone, accommodating recreational spaces and preserving environmental assets.



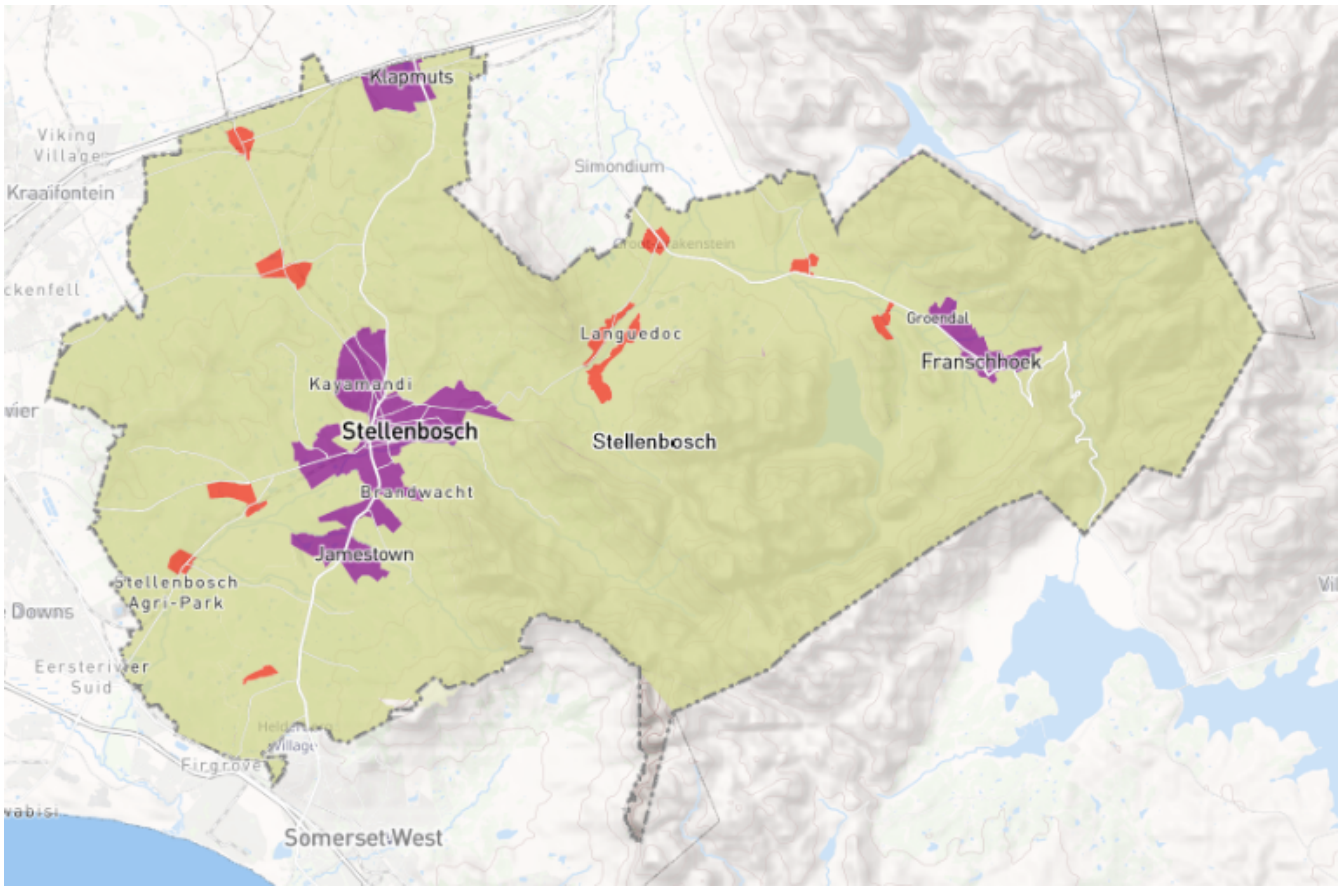
These zones can also include areas that have similar characteristics as suburban areas but are isolated in small towns with little access to a variety of facilities and amenities.

4.2.5 Rural and Agriculture

Rural and extensive agriculture zones are characterised by large, open tracts of land primarily used for farming, grazing, and other extensive agricultural activities. Settlements are sparse, and infrastructure is minimal, with a focus on preserving the rural landscape and supporting agricultural productivity.

4.2.6 Natural

The natural areas includes parts that are predominantly untouched by urban development, such as critical biodiversity areas, or protected areas. These zones are crucial for conservation efforts, providing habitat for wildlife and offering ecosystem services.



These areas provide critical ecosystem services, support biodiversity, and offer opportunities for recreation and tourism. Development is strictly controlled to preserve ecological integrity.

4.3 The Stellenbosch Municipal Functional Areas

To support alignment and defensible capital prioritisation, the CEF assesses both the municipality's Functional Area framework (Rural, Rural Node, Urban Node) and the project-derived Functional Areas developed through the standard CEF methodology. The municipal typology has clear strengths: it is institutionally embedded, easy to communicate, and practical for internal decision-making and reporting. However, the simplicity of three categories can reduce analytical resolution, potentially masking meaningful variation within rural areas and within nodes, and may be less responsive to changing development pressures if not updated regularly.

By contrast, the project-derived Functional Areas provide a stronger evidence base for investment targeting because they are typically informed by measurable spatial signals (e.g., settlement patterns, demand intensity, accessibility, and infrastructure constraints). This approach offers higher spatial sensitivity and often aligns more directly with how infrastructure systems function (catchments, networks, thresholds, and service backlogs), improving project packaging and sequencing. These benefits come with trade-offs: the method is more data- and interpretation-intensive, can be perceived as more technical, and may introduce complexity for municipal implementation if categories and boundaries do not align neatly with established municipal conventions.

The comparison between the two delineations will be used constructively in the CEF. Municipal categories and project-derived Functional Areas will be spatially overlaid to quantify overlap and identify mismatches, supported by indicator-based profiling to assess how well each delineation explains observed conditions and investment pressures. This will be translated and tested in the Demand Quantification. Where differences occur, the CEF will define clear reconciliation rules, typically using municipal categories to maintain governance and reporting alignment, while applying the project-derived delineation to strengthen technical prioritisation.

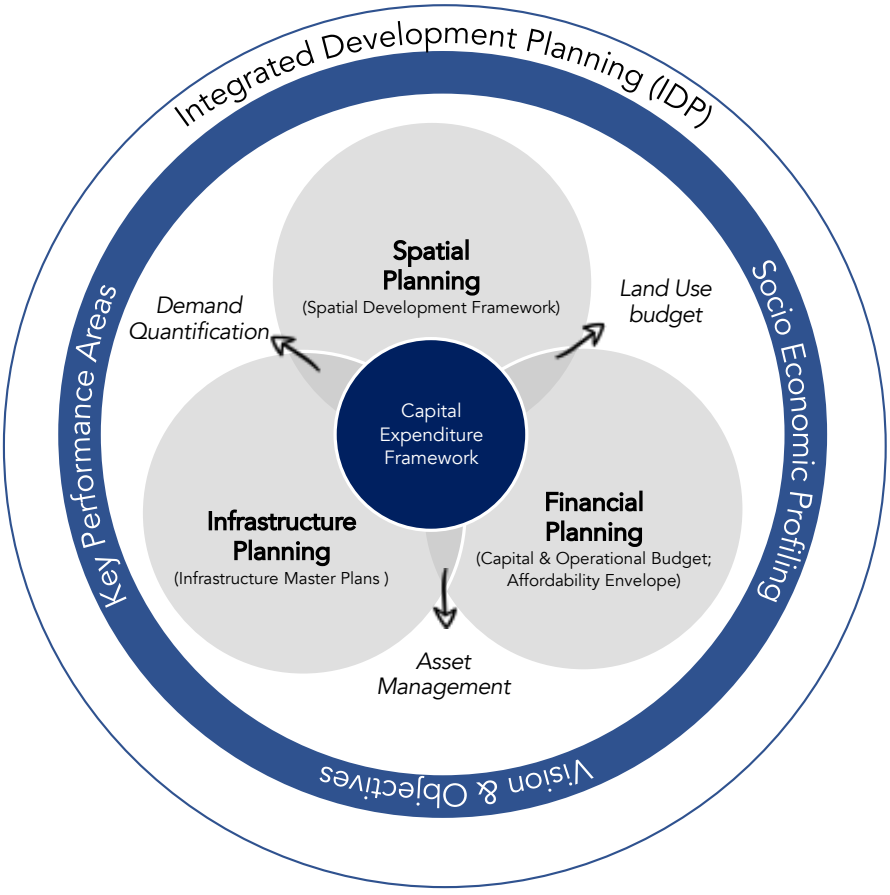
Phase 1

Introduction

1 Part 1: Introduction



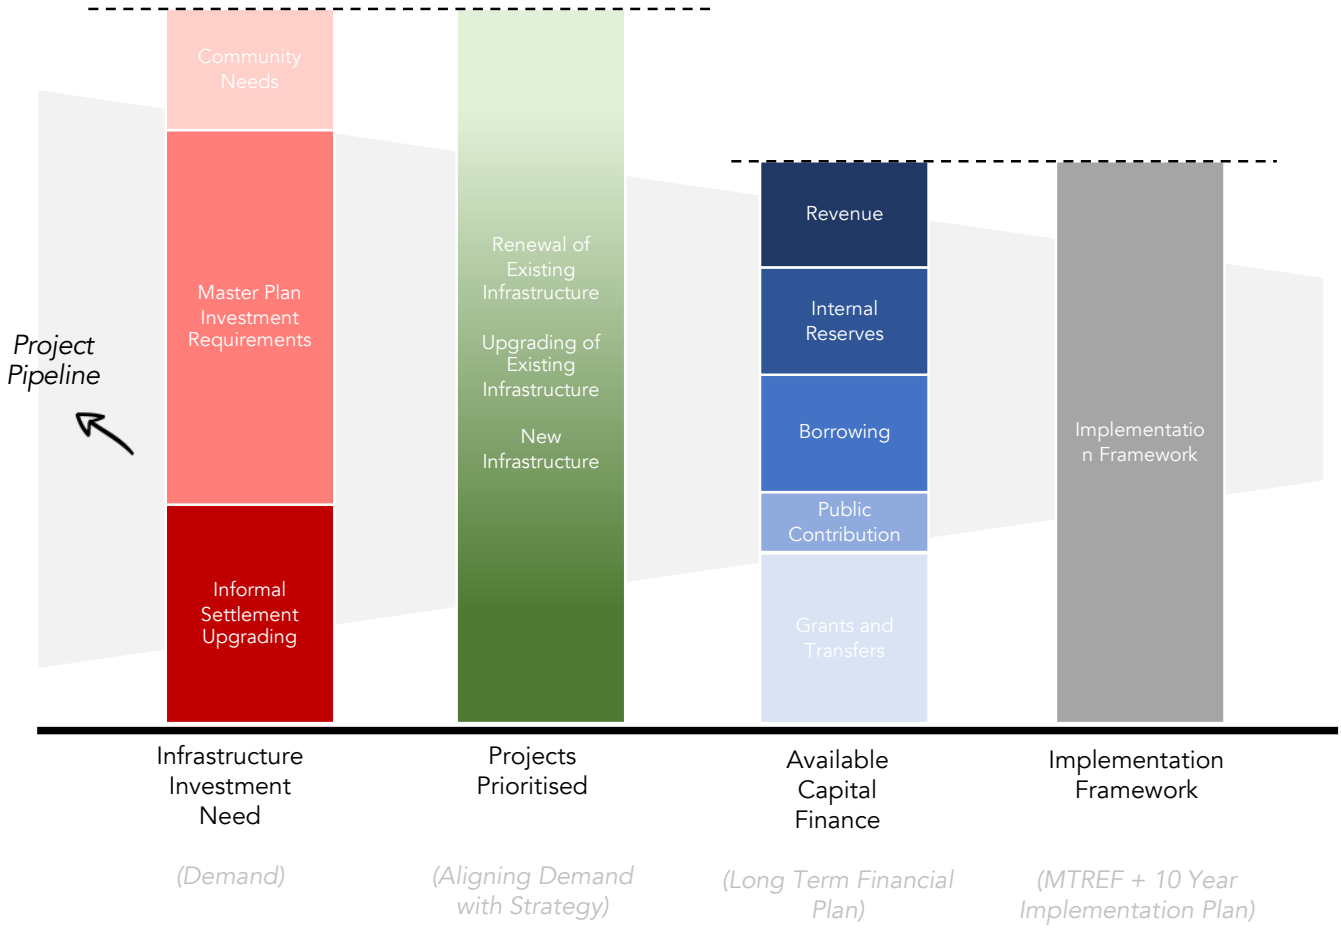
1.1 What is a Capital Expenditure Framework

According to the Department of Cooperative Governance and Traditional Affairs (COGTA) guidelines, a Capital Expenditure Framework (CEF) is a consolidated, high-level view of a municipality's long-term infrastructure investment needs. It ensures that infrastructure priorities are spatially aligned with municipal strategic objectives, budgetary realities, and development plans. The framework is grounded in principles of sustainability, financial feasibility, and strategic alignment, balancing immediate infrastructure needs with long-term development goals, the relationships between these spheres of planning and principles is illustrated in Figure 1–1.

The Spatial Planning and Land Use Management Act, 2013 (SPLUMA) mandates the inclusion of a CEF within a municipality's Spatial Development Framework (SDF). Specifically, Section 21(n) of SPLUMA requires that an SDF "determine a Capital Expenditure Framework for the municipality's development programmes, depicted spatially." This legislative requirement underscores the importance of integrating spatial planning with financial planning, ensuring that the spatial strategies articulated in the SDF are implemented through practical and affordable infrastructure investments.

A Capital Expenditure Framework links spatial development strategies with budgetary constraints and infrastructure demands. It provides a transparent mechanism for prioritising projects, promoting the efficient allocation of resources, and aligning capital expenditure with the municipality's long-term strategic vision.

Figure 1–1: The Capital Expenditure Framework within the built environment context



1.2 Aim of Capital Expenditure Framework

The aim of a Capital Expenditure Framework (CEF) is to create a structured and strategic approach to municipal infrastructure expenditure. The CEF is intended to align the municipality's spatial development strategies with its financial resources and capacity, ensuring that long-term growth and development objectives are achievable, and informs operational activities of a municipality.

A CEF aims to provided a municipality with the means to inform financial planning with infrastructure planning and spatial priorities identified in the Spatial Development Framework (SDF). It aims, furthermore, to establish a clear methodology for municipalities to evaluate, prioritise, and inform implementation processes of infrastructure projects within their affordability envelope, supporting both immediate and long-term development goals.

From Figure 1–2one can see the illustration that infrastructure investment need, expressed as projects, usually exceeds available capital finance, and therefore it is an imperative for municipalities to partake in a prioritisation process to determine which projects are best aligned with the strategy of the municipality, together with a budget scenario process to determine which projects are affordable and should be implemented when.

Figure 1–2: Relationship between infrastructure investment needs, affordability envelope, prioritisation process, and budget scenario process

1.3 Objectives of Capital Expenditure Framework

The key objectives of a CEF is to:

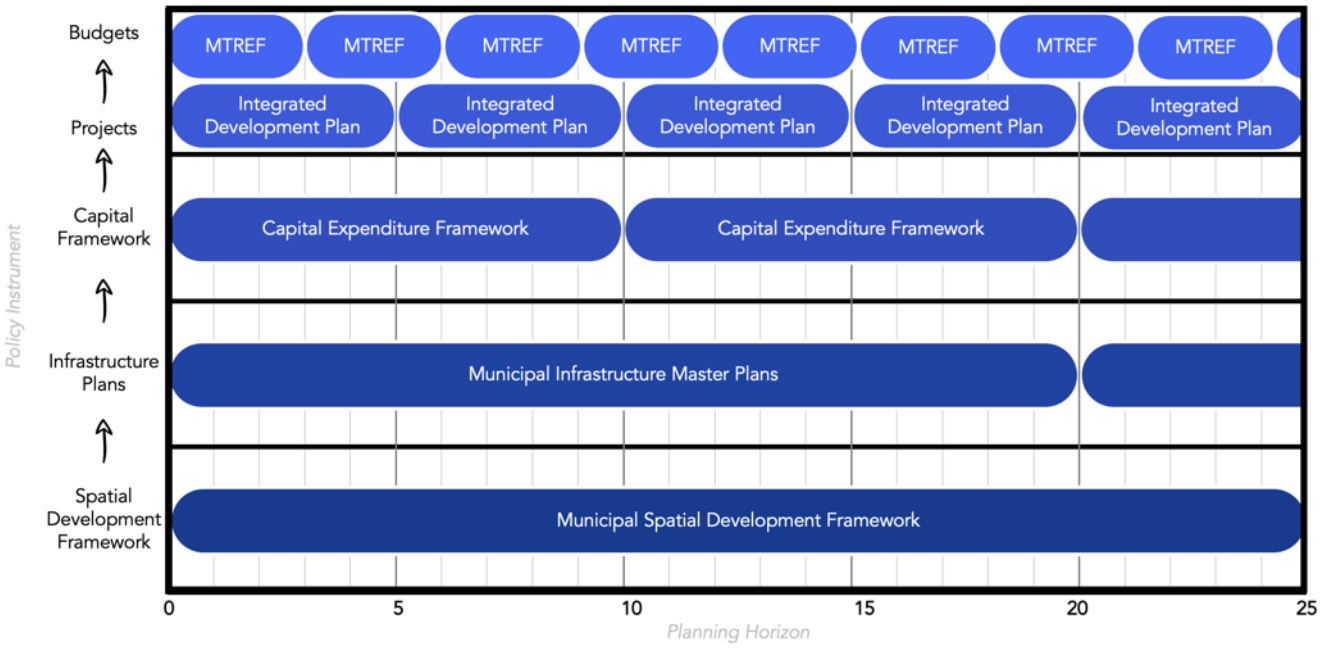
- Socio-economic trends: Understand the socio-economic trends in a municipality over the long term;
- Quantify Infrastructure Needs: Assess and detail the municipality's long-term infrastructure requirements based on an SDF-informed land use budget, infrastructure standards, anticipated socio-economic growth, existing infrastructure, and backlogs;
- Align with the Spatial Development Framework (SDF): Translate the spatial vision and strategic priorities outlined in the SDF into priority development areas which informs prioritisation practices;
- Consolidate Infrastructure Demand: Create a comprehensive list of infrastructure projects across various sectors in line with the municipality's mandate, reflecting the municipality's overall infrastructure demands;
- Contextualise Financial Affordability: Integrate the municipality's affordability envelope, derived from the Long-Term Financial Model (LTFM), to ensure infrastructure expenditure are financially sustainable over the planning horizon;
- Facilitate Prioritisation: Establish a framework to evaluate and rank projects based on strategic alignment, socio-economic impact, and spatial targeting amongst others, ensuring that resources are allocated to the most critical and impactful projects;
- Determine a Budget Scenario: Offer a structured, evidence-based approach to infrastructure planning and budgeting, improving decision-making processes and accountability to stakeholders - amongst others, to indicate project-level responses per asset type per functional area;
- Enable Spatial Transformation: Direct infrastructure investments toward spatial transformation goals, focusing on reducing inequalities, improving access to services, and promoting inclusive economic growth, and;
- Bridge Short-Term and Long-Term Planning: Ensure a coherent link between the short-term MTREF cycles, Medium-term Integrated Development Plan (IDP) cycles and the municipality's long-term development vision, embedding sustainability and foresight into the planning process.

1.4 Role of the Capital Expenditure Framework as a policy instrument

The Capital Expenditure Framework (CEF) is a cornerstone of municipal planning, grounded in South Africa's legislative framework and designed to bridge the gap between long-term spatial development strategies and actionable infrastructure expenditure. The concept of the CEF was formalised under the Spatial Planning and Land Use Management Act (SPLUMA, Act 16 of 2013), specifically in Section 21(n), which mandates municipalities to determine a spatially referenced CEF as part of their Spatial Development Framework (SDF). This legislative requirement reflects the increasing emphasis on aligning planning and budgeting processes to address developmental challenges effectively.

Historically, the Constitution of South Africa laid the foundation for this alignment in Section 153, which directs municipalities to prioritise the basic needs of communities while promoting socio-economic development through structured planning and budgeting. The Integrated Development Plan (IDP) was introduced as a mechanism to achieve this in the Local Government Transition Act (Act 209 of 1993),

evolving through subsequent legislation, including the Municipal Systems Act (MSA, Act 32 of 2000). The MSA established the IDP as the principal planning instrument of local government, requiring it to incorporate a comprehensive financial plan and a Spatial Development Framework. This integration ensures that municipal resources are allocated effectively to achieve the long-term developmental vision.



The CEF builds on these legislative imperatives by operationalising the SDF within the IDP framework. As a long-term (10-year) planning tool, the CEF quantifies infrastructure needs, consolidates them into prioritised project pipelines, and aligns them with the municipality's financial capacity as outlined in the Long-Term Financial Plan (LTFP). It ensures that infrastructure investments are not only spatially targeted but also financially sustainable, bridging the divide between visionary spatial strategies and practical implementation.

The CEF also plays a vital role in South Africa's Local Government Accountability Cycle, a governance framework defined by the Municipal Finance Management Act (MFMA, Act 56 of 2003). This cycle integrates planning, budgeting, and reporting processes to ensure transparency, accountability, and alignment with development priorities. Through informing the IDP, and so the Medium-Term Revenue and Expenditure Framework (MTREF), as well as the Service Delivery and Budget Implementation Plan (SDBIP), the CEF enables municipalities to stabilise their decision-making processes. It provides a consistent rationale for allocating resources, ensuring that both short-term operational needs and long-term developmental objectives are addressed.

Importantly, the CEF institutionalises long-term planning practices within municipalities. It encourages decision-makers to adopt a forward-looking perspective that considers future growth patterns, socio-economic trends, and financial constraints. This approach reduces the reactive nature of municipal budgeting, replacing it with proactive, evidence-based strategies that support equitable service delivery and spatial justice.

The CEF is a transformative policy instrument that integrates spatial, financial, and infrastructure planning within the legislative and operational frameworks of municipal governance. It strengthens the IDP as the single most strategic document of municipalities, ensures alignment with the SDF, and guides resource allocation through the MTREF and SDBIP. Through its structured and integrated approach, the CEF enables municipalities to achieve their developmental mandates while ensuring financial sustainability and fostering spatial transformation.

Figure 1–3: The relationship between policy instruments effecting the spatial form

1.5 Structure of this Capital Expenditure Framework

The structure of this report is outlined below to guide the reader through the key components of the Capital Expenditure Framework (CEF) and its alignment with municipal planning processes as well as the norms and standards of the CEF.

Table 1-1: Structure of this Capital Expenditure Framework

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 1: Inception and Information Gathering	Phase 1	To provide a contextualisation to the Capital Expenditure Framework. This phase comprises the inception process of the CEF as well as the information gathering process in which a comprehensive integrated infrastructure investment framework, or portfolio of projects, is collated.
Part 2: Functional Area and Spatial Category for Investment Planning Profiling and Spatial Demand Quantification	Phase 2a	This part introduces functional areas for priority investment which are defined and mapped to indicate the spatial strategy depicted in the MSDF (linked to the MSDF proposals). The identified functional areas are used to determine the future population, housing, and land demand based on existing socio-economic and related data which is used in the spatial demand quantification component.
Part 3: Infrastructure demand	Phase 2b	This part determines the investment requirements for each functional area, including operational and maintenance costs per asset class. The goal is to compare the optimal infrastructure requirements scenario with the known infrastructure demand based on current planning frameworks.
Part 4: Affordability Envelope	Phase 3	This part is a reflection of the municipality's financial health and long-term financial plan. Primarily it includes the results of the re-application of the long-term financial plan to determine the appropriate affordability envelope.
Part 5: Prioritisation and Budget Scenario	Phase 4	This part has a prioritisation framework that considers spatial, engineering, and financial factors to calculate a composite score indicating each project's relative importance in the pipeline. It also applies this framework to the budget fit process to determine how to allocate capital within the affordability envelope per project for the next 10 years.

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 6: Capital Expenditure Programme	Phase 5	This part is a breakdown of the 10-year capital expenditure framework. Essentially, it analyses the fitted project pipeline in terms of spatial alignment, asset type alignment, and other attributes to ultimately verify that the 10-year capital expenditure framework is in line with the strategic intent of the prioritisation framework and the MSDF objectives.
Part 7: Institutional Arrangements and Project Closeout	Phase 6	This phase comprises of a concluding chapter to the CEF, this part aims to identify areas of enhancement that will render the CEF not only as a compliance document but to solidify institutional change around the alignment of planning, engineering, and financial practices – with the ultimate aim to improve service delivery. Furthermore this phase contains a final close-out report detailing the project timeline and conclusions drawn.

Phase 2b

Demand Quantification

2 Investment demand and growth

Investment demand is a function of three core processes: the investment required to address backlogs in service access, the investment required to renew assets and address asset renewal backlogs, and the investment required to meet demand created by growth.

The purpose of this section in the report is to contextualise the elements of the demand quantification process. It shows how the critical aspects of infrastructure demand relate to each other and how they manifest in the municipal area. Investment demand is a function of three core processes, namely:

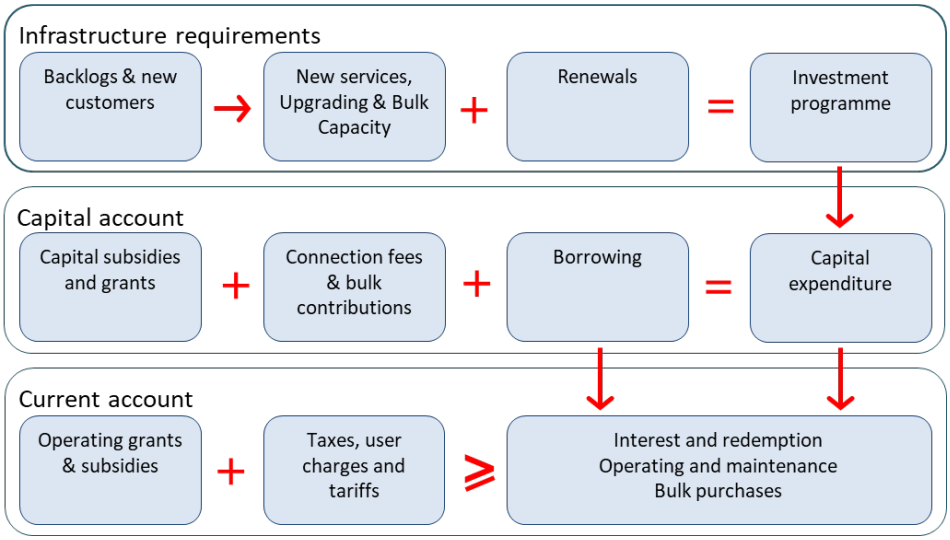
- The investment required to address backlogs in service access
- Investment to address the required renewal of assets and renewal backlogs
- The investments that are necessary to address the demand created through growth

The project scope determines the extent to which this report can deal with these elements.

3 The infrastructure planning equation

Long-term customer growth is usually one of the biggest drivers of investment demand. The ability to address growth ensures, at a minimum, that backlog increases do not occur. However, it increases operating expenditures and the service provider's maintenance burden, which must be offset against income and revenue streams.

The services, infrastructure delivery, and the relationship with demand and supply within a sustainable framework are embedded in the analytical framework shown in Figure 4.



This framework describes the relations between:

- **Infrastructure requirements** are determined by the extent of existing backlogs and residential and non-residential growth (new customers). Customer growth translates into demand for new services, upgrades to existing services, and sufficient bulk capacity. When the requirements for renewing existing services are added to the equation, the result is the total investment programme.
- **The capital account** shows the funding sources to meet the capital expenditure requirements resulting from the investment programme. Developing a funding framework for the investment programme usually prioritises capital grants and subsidies. Customer-paid connection fees supplement capital grants and subsidies. However, borrowing money in the open market is the only alternative if there is still a gap between the funding sources and the investment programme. Many factors impact a Council's ability to balance an investment programme's requirements and the capital account's capacity. The factors that affect the extent of the investment programme are:
- The extent of urbanisation
- Economic growth cycles
- Service delivery policies and specifically the levels of services
- Cost recovery and service pricing
- Life cycle cost management of the infrastructure asset base

The level of capital expenditure is a function of available funding (i.e. the affordability envelope) and access to funding sources (i.e. optimal funding mix). The investment programme must be appropriately funded, which may imply replanning, reprioritising investment projects and addressing the impact of service delivery and indigent policies.

- ***The current account*** shows the impact of the investment program and capital account on the Council's cash flow. To balance this equation, the impact of capital expenditure, interest and redemption, operating and maintenance, and bulk purchases must be no greater than the total income sources. Financial sustainability implies that this equilibrium must be maintained over the long term. The CEF addresses these issues over a ten-year horizon, but the cumulative impact of investment decisions on the current account may not manifest until the long term. Inappropriate investment policies and strategies often result in irreversible structural impediments.

Figure 4: Infrastructure investment planning equation

4 The infrastructure and service delivery mandate of the Council

Local municipalities in South Africa are constitutionally mandated to provide their residents with essential infrastructure services. According to Schedules 4B and 5B of the Constitution of South Africa (1996), these responsibilities include water supply, sanitation, electricity distribution, solid waste management, and the construction and maintenance of roads and stormwater drainage. These services form the backbone of local governance and are critical for promoting economic development, ensuring public health, and improving the quality of life in communities.

Depending on provincial policies, water and sanitation services may be the responsibility of district municipalities. The Council is responsible for all services. When a local municipality is responsible for all infrastructure services, including water and sanitation, it is considered a Water Services Authority (WSA) under the Water Services Act (Act 108 of 1997). This means the municipality has full control over the planning, funding, implementation, and maintenance of water supply and sanitation infrastructure within its jurisdiction. The municipality is expected to ensure that water and sanitation services are provided sustainably, equitably, and affordably, in line with national policy objectives and service level standards.

In addition to water and sanitation, local municipalities with a full-service mandate must also manage:

- **Electricity Distribution:** Local municipalities distribute electricity in areas where they hold the electricity reticulation license, as issued by the National Energy Regulator of South Africa (NERSA). They must maintain substations, transformers, and distribution networks while ensuring affordability for residents.
- **Solid Waste Management:** Municipalities oversee waste collection, landfill sites, and recycling initiatives, ensuring that waste is disposed of safely to prevent pollution and health hazards.
- **Roads and Stormwater Management:** Local municipalities are responsible for the development and upkeep of local roads and stormwater drainage systems, ensuring accessibility and mitigating flood risks.

From a capital expenditure perspective, municipalities with a full-service mandate must allocate funds across multiple infrastructure sectors, often balancing competing priorities within constrained budgets. Funding sources include municipal own revenue (rates and tariffs), government grants (e.g., the Municipal Infrastructure Grant - MIG), and external borrowing. Given the high capital intensity of infrastructure investment, municipalities must develop multi-year capital investment plans to ensure financial sustainability and effective service delivery.

These municipalities must also undertake long-term infrastructure planning through instruments such as the Integrated Development Plan (IDP), Spatial Development Framework (SDF), and Built Environment Performance Plan (BEPP) to align infrastructure projects with broader developmental goals. A key challenge in this model is ensuring technical and financial capacity for delivering and maintaining all infrastructure services, especially in smaller or resource-constrained municipalities.

5 Setting a data baseline for assessment

The backlog data shown below (Paragraph 6) are extracts based on official data. The biggest challenge lies in estimating both households settled in informal structures and those occupying informal structures and rooms in the backyards of existing formal houses.

5.1 Terminology to suit a specific purpose

The different data sets provide a pool of data. However, each element and its presentation have different meanings, and nuances depend on who is handling and presenting the data. The following should be considered. The following data elements are used in the municipal service delivery environment and are closely related but not similar. Depending on the approach to the issues, seemingly similar data sources can render essential differences based on interpretation and understanding. The following terms are important:

- ***Household*** is an economic concept specifically defined by StatsSA. It means a group of people living from a single budget. It can refer to any number of people, an extended family, or, often, a single person, such as a student in a residence or a worker in a hostel.
- ***Structures*** in a municipality usually represent residential and non-residential structures. Structures may refer to different types of buildings.
- ***Customer units*** can demand services from the Council and legally enter into service agreements to receive and pay for those services.
- ***Debtors*** are the customers reflected in the financial system and often do not reflect all the potential customers in a municipality.
- ***Erven or stands*** are related to all the above but describe cadastral units occupied by single or multiple customers.
- ***Service connections*** are related to stands and debtors but provide a technical perspective. Service connection to customers may vary according to the type of service.
- ***Levels of services*** refer to the different technologies used to provide customers, households, and non-residential entities with access to services. Service levels are quantitative, while service standards reflect the qualitative aspects of service delivery.
- ***Urban / Non-urban*** impact service areas and can differ depending on service type and approach. The issue is further complicated by tribal areas and areas previously part of homelands. Different service delivery regimes may exist for each of them.
- ***Family*** is a social concept, but has a specific connotation regarding housing typologies and, for example, government policies to convert hostels into family units.
- ***Informal structures*** are an essential element as they relate to service delivery and housing. An informal structure can be serviced but still form part of a housing backlog. Importantly, the approach to in-situ upgrading versus relocating households also directly describes and quantifies households and service demand. Furthermore, informality may either refer to the top structure, as it is recorded in the censuses, or the legal status of the structure in terms of its location.
- ***Backyard settlement*** has many forms, ranging from formal housing, such as granny flats, a room in a backyard, to informal structures attached to households. A council's policy on backyard settlement directly affects how it addresses service demand. If backyard settlement is an acceptable housing

typology, it eliminates the need for CAPEX, but it may overextend the design capacities of water, sanitation, and electricity services.

These elements are all related but can render vastly different outcomes when interpreted or often used interchangeably.

5.2 Aligning and integrating data for assessment purposes

A credible demand quantification depends on credible baseline figures to work from. The demand quantification aims to determine the extent and cost (CAPEX and OPEX) of future service delivery based on socio-economic change variables.

The basic process is very simple:

- Select a base year
- Use available data to make long-term projections of households and population growth.
- Apply land use norms and standards to determine long-term growth demand

The result of this process is that the land requirements, the number of stands, and the customer units can be estimated.

By assigning service levels to each land use based on unit rates, future CAPEX and OPEX demand can be determined.

These steps are easy; the only critical factors are the base year population and households. However, the Council is responsible for housing and infrastructure provision, but does not do so for all households in the municipality. For example, one might assume that the Council does not provide housing or infrastructure for commercial farms. Therefore, households residing on farms must be excluded from the assessment.

Furthermore, some households residing in backyards technically have access to services. If backyard settlement is accepted as a housing typology, households in backyards can be excluded from future CAPEX (not counted as backlogs). However, this depends on the Council's housing and service delivery policy. There are also households residing in institutions such as nursing homes or hostels. How do we deal with them? Typically, they will be excluded from the demand equation.

Once all these adjustments, inclusions and exclusions are made, a population and household baseline will be available for quantification.

The next step in the process is to relate service access to the baseline in order to determine service backlogs. Municipalities report in a set format on service levels and access. However, the Council does not report on service levels in its Integrated Development Plan (IDP) or its Annual report. However, some references to Census 22 do not provide the required details.

Our biggest challenge is the complete inconsistency and figures quoted from different sources. The tables below show figures extracted from various sources. However, the figures must be reconciled to do a sensible demand quantification.

6 Dealing with infrastructure backlogs

Infrastructure services are crucial for the betterment of all communities in South Africa. It is a core function of government, and since 1994, access to services for previously disadvantaged communities has been emphasised to the extent that it has become the driving force behind most government delivery policies. Initial approaches were to meet the health requirements of the World Health Organisation and hence the adoption of the so-called "RDP standards", later referred to as access to basic services. However, service delivery policies have remained intact for the past 25 years, but the application has evolved, and the services currently provided exceed the initial norms and standards.

Since 1996, South Africa has had relatively good datasets describing access to services. However, the challenges with Census 22, including inconsistencies in population and household data, left the figures and service access data in question. It creates uncertainty in planning infrastructure delivery and in addressing investment demand in municipalities. The reliance on "official" figures has also led municipalities to lack alternative means of determining the extent of service delivery in their area and the existing access and delivery gaps. The available figures are presented below to determine a high-level path for future delivery. However, it is incumbent on municipalities to develop processes and approaches for managing their data to increase confidence in long-term planning.

6.1 Water services

Water services have been a high priority in service delivery strategies over the past two decades. One of the Millennium Goals adopted in 2000 stated that countries should aim to halve the proportion of people without access to safe drinking water and basic sanitation by 2015. At least 50% of households should have access to basic services to meet these goals.

The table below shows how access to water has changed between 1996 and 2022. The data is presented within the framework applied prior to the change in the Water and Sanitation Regulations. The new regulations set the basic services at a yard connection for water and wastewater sanitation in areas with a density of more than 10 units per hectare. The necessary adjustments are made during the modelling process to comply with these guidelines or the Council's own service-level policies.

Table 2: Access to water services

		Full	Intermediate	Basic	Below Basic	None	Total
1996	Total	19,575	2,794	2,879	660	240	26,147
	%	74.86 %	10.69 %	11.01 %	2.52 %	0.92%	100 %
2001	Total	25,010	4,067	2,706	3,142	245	35,170
	%	71.11 %	11.56 %	7.69 %	8.93 %	0.70 %	100 %
2011	Total	31,327	3,522	6,234	1,835	404	43,322
	%	72.31 %	8.13 %	14.39 %	4.24 %	0.93 %	100 %
2016	Total	37,230	2,459	12,865	2,588	196	55,338
	%	67.28 %	4.44 %	23.25 %	4.68 %	0.35 %	100 %
2022	Total	51,511	2,690	4,611	814	Not reported	59,626
	%	86.39 %	4.51 %	7.73 %	1.37 %	Not reported	100 %

The data show that the Council targets full, which represents a house-to-house connection to all households.

Table 3: Number of consumer units receiving water services

	Number of domestic consumer units served through a delivery point				Total number of non-domestic consumer units receiving water services	Total number of consumer units receiving water services
	Inside the yard	Less than 200m from a yard	More than 200m from a yard	Total number of domestic consumer units receiving water services		
2017	39 044	6 231	1 830	47 105	903	48 008
2018	41 623	9 699	0	51 322	903	52 225
2019	41 623	9 699	0	51 322	903	52 225
2020	41 633	9 699	0	51 332	903	52 235
2021	41 716	10 504	0	52 220	1 154	53 374
2022	44 909	8 214	0	53 123	1 186	54 309

Source: StatsSA Non-financial census data

The figures vary from year to year, and the reason for these fluctuations is unclear. The number of customers is different from the official household figures reported in Census22.

The table below shows the position with free basic services in the Council area. The self-targeting approach is acceptable and might be preferred to a blanket free basic services policy. This is extremely low and may be due to local metering and billing practices, as well as credit control regimes (or the lack thereof).

Table 4: Free basic water services

	Customers receiving services from the municipality	Receiving free basic services	Does the Council have a free basic services policy?	Mechanisms for providing Free basic services
2017	48 008	5 686	Yes	Self-targeting approach
2018	52 225	6 453	Yes	Self-targeting approach
2019	52 225	6 817	Yes	Self-targeting approach
2020	52 235	2 291	Yes	Self-targeting approach
2021	53 374	7 283	Yes	Self-targeting approach
2022	54 309	4 681	Yes	Self-targeting approach

Source: StatsSA Non-financial census data

6.2 Sanitation services

Access to appropriate sanitation services is a high health priority. Although sanitation services are a high priority for the government, there are always challenges. This section shows the municipality's sanitation access.

Table 5: Access to sanitation services

		Full	Intermediate	Basic	Below Basic	None	Total
1996	Total	21,954	NA	NA	2,347	1,846	26,147
	%	83.96 %	NA	NA	8.97 %	7.06 %	100 %
2001	Total	31,137	113	596	1,067	2,257	35,170
	%	88.53 %	0.32 %	1.69 %	3.03 %	6.42 %	100 %
2011	Total	39,432	319	206	2,331	1,034	43,322
	%	91.02 %	0.74 %	0.47 %	5.38 %	2.39 %	100 %
2016	Total	54,078	95	1	692	472	55,338
	%	97.72 %	0.17 %	0.00 %	1.25 %	0.85 %	100 %
2022	Total	57,703	183	72	1,851	Not reported	59,626
	%	96.77 %	0.31 %	0.12 %	3.10 %	Not reported	100 %

There is a clear policy to provide waterborne sanitation. However, this approach is costly and water-intensive, which may pressure water and sanitation infrastructure. The extent of sanitation backlogs is small, but the number of households receiving full waterborne sanitation may create affordability problems (households receiving a level of service they cannot afford), which may contribute to cash flow problems for the Council in the future.

The table below shows that the figures the Council to StatsSA reported differ from the census and community survey trends. This illustrates the need to cross-correlate data from different sources and the risks of relying on a single data source. This data does not align with the data in the previous table. The reason is unclear.

Table 6: Number of consumer units receiving sanitation services[1]

	Flush toilets connected to public sewerage system	Flush toilets connected to septic tank	Bucket system	Ventilated improved pit latrines	Other	Total number of domestic consumer units receiving sanitation services	Total number of non-domestic consumer units receiving sanitation services	Total number of consumer units receiving sanitation services
2017	37 939	1 079	0	0	1 193	40 211	1 024	41 235
2018	38 027	1 079	0	0	1 267	40 373	925	41 298
2019	38 027	1 079	0	0	1 267	40 373	925	41 298
2020	38 027	1 079	0	0	1 267	40 373	925	41 298
2021	41 716	1 079	0	0	1 84	42 979	925	43 904

[1] These figures do not add up, but as they are reported in StatsSA Non-financial census data.

	Flush toilets connected to public sewerage system	Flush toilets connected to septic tank	Bucket system	Ventilated improved pit latrines	Other	Total number of domestic consumer units receiving sanitation services	Total number of non-domestic consumer units receiving sanitation services	Total number of consumer units receiving sanitation services
2022	44 909	1 079	0	0	1 84	46 172	2 509	48 681

The table below shows the reported number of customers receiving free basic services. The numbers are Inconsistent with census and community survey figures.

Table 7: Free basic sanitation services

	Customers receiving services from the municipality	Receiving free basic services	Does the Council have a free basic services policy?	Mechanisms for providing Free basic services
2017	41 235	5 686	Yes	Self-targeting approach
2018	41 298	6 453	Yes	Self-targeting approach
2019	41 298	6 817	Yes	Self-targeting approach
2020	41 298	2 291	Yes	Self-targeting approach
2021	43 904	7 283	Yes	Self-targeting approach
2022	48 681	4 681	Yes	Self-targeting approach

6.3 Electricity services

Although electricity does not have the same health implications as water and sanitation, access to electricity is essential for overall development, especially in education. Access to electricity was, therefore, always a high priority. The table below shows how access to electricity has changed since 1996. This table uses access to lighting as a proxy for access to electricity.

Table 8: Access to electricity services

		Full access	Intermediate access	No access	Total
1996	Total	23,523	NA	2,624	26,147
	%	89.96 %	NA	10.04 %	100 %
2001	Total	32,365	NA	2,804	35,170
	%	92.03 %	NA	7.97 %	100 %
2011	Total	40,296	NA	3,026	43,322
	%	93.02 %	NA	6.98 %	100 %
2016	Total	51,367	68	3,903	55,338
	%	92.82 %	0.12 %	7.05 %	100 %
2022	Total	57,775	283	1,567	59,626
	%	96.90 %	0.47 %	2.63 %	100 %

The Council's electricity supply area does not cover the total municipal area, and Table 8 and Table 9 are not comparable. However, it shows good coverage and progress in providing access to electricity.

Table 9: Free basic electricity services

	Customers receiving services from the municipality	Receiving free basic services	Does the Council have a free basic services policy?	Mechanisms for providing free basic services
2017	48 008	5 686	Yes	Self-targeting approach
2018	52 374	11 670	Yes	Self-targeting approach
2019	52 696	6 817	Yes	Self-targeting approach
2020	52 723	2 291	Yes	Self-targeting approach
2021	52 723	7 283	Yes	Self-targeting approach
2022	52 723	4 982	Yes	Self-targeting approach

6.4 Refuse removal

Solid waste management and refuse removal are essential for health and environmental considerations. The table below shows how access to refuse removal services was reported in the previous censuses and the 2016 Community Survey of StatsSA.

Table 10: Access to refuse removal services

		Full	Intermediate	Basic	Below Basic	None	Total
1996	Total	19,937	256	2,419	2,629	906	26,147
	%	76.25 %	0.98 %	9.25 %	10.05 %	3.46 %	100 %
2001	Total	28,647	561	1,320	4,443	2,257	35,170
	%	81.45 %	1.60 %	3.75 %	12.63 %	0.57 %	100 %
2011	Total	37,678	1,068	1,346	2,044	1,187	43,322
	%	86.97 %	2.46 %	3.11 %	4.72 %	2.74 %	100 %
2016	Total	39,812	4,127	8,554	1,555	1,290	55,338
	%	71.94 %	7.46 %	15.46 %	2.81 %	2.33 %	100 %
2022	Total	52,033	488	3,817	3,286	Not reported	59,626
	%	87.27 %	0.82 %	6.40 %	5.51 %	Not reported	100 %

Table 11: Free basic refuse removal services

	Customers receiving services from the municipality	Receiving free basic services	Has the Council a free basic services policy?	Mechanisms for providing Free basic services
2017	48 008	5 686	Yes	Self-targeting approach
2018	49 072	6 453	Yes	Self-targeting approach
2019	49 072	6 817	Yes	Self-targeting approach
2020	49 072	2 291	Yes	Self-targeting approach
2021	49 300	7 283	Yes	Self-targeting approach
2022	49 649	4 681	Yes	Self-targeting approach

6.5 Road network

Access to road services is not recorded in the censuses. It is challenging to get spatial data on roads and access roads and access roads data from a household perspective.

The following table shows the available road data for the municipality.

Table 12: Road services in the municipality

Road type	Paved road (km)	Unpaved road (km)	Total road length (km)
Major road (National Major roads of a country, including all freeways)	25.24	N/A	25.24
Main road (Provincial roads and major city through routes)	192.62	0.00	192.62
Secondary road (Secondary roads including slipways)	19.77	5.19	24.95
Suburban road (Formal suburban roads, including slipways)	584.44	42.38	626.82
Informal roads (Alleys, Access ways, roads in informal settlements and squatter camps, farm and other small dirt roads)	18.19	818.40	836.59
Tracks (Non-routable roads: including 4x4 tracks	N/A	N/A	208.96
Trails (Pedestrian walkways in cities and towns, walking and hiking trails)	N/A	N/A	0.00

Road type	Paved road (km)	Unpaved road (km)	Total road length (km)
Totals	844.34	865.97	1,919.27

6.6 Dwelling structures and households

Housing backlogs and the demand for housing will always remain an issue in South Africa's development and social support strategies. The next table shows the different dwelling types in the municipality under assessment.

Table 13: Dwelling types

	1996	2001	2011	2016	2022
Traditional	467	768	254	371	398
House made of bricks	14,130	18,685	24,807	31,722	52 063
Flat	3,026	2,959	4,353	1,456	Not reported
Multiple housing	2,509	1,198	2,643	2,812	Not reported
Dwelling in backyard	1,185	554	445	290	Not reported
Room/ granny flat	700	265	279	208	Not reported
Informal	2,937	3,480	7,500	16,261	7 051
Informal dwelling in backyard	601	1,111	2,443	2,092	Not reported
Other	591	6,150	598	124	114
Total	26,147	35,170	43,322	55,338	59,626

In the final analysis and for demand quantification purposes, households on farms, backyards, institutions and hostels were excluded from the housing demand. These exclusions amount to 20 160 households or 73 577 people. These people, however, still form part of the demand for social and community facilities.

There is no clear policy on whether informal households in backyards must be regarded as part of the backlog. Indications are that there are at least 4 530 households in backyards. Whether to accept backyard settlement as a permanent form of housing can have far-reaching implications. If backyard settlement is excluded, it will become part of the backlog and will have capital expenditure implications. However, if backyard settlement is accepted as a permanent feature, it implies that it will not require capital. However, it will increase operating demand (water use, wastewater discharge, and electricity consumption), which may exceed the design capacities of the areas where they settle, resulting in a deterioration in service standards.

6.7 Asset renewals and renewal backlog

Asset renewals and renewal backlogs are calculated from asset registers and as reported in the Council's annual financial statements. Condition assessments are central to the process. The general rule is that asset renewals should more or less equal the annual depreciation on assets based on their Expected Useful Life (EUL). Renewal backlogs are a function of an asset's condition, and renewal backlogs occur where an asset's Remaining Useful Life (RUL) is less than 45% of its Current Replacement Cost (CRC).

The following condition grading determines the text of renewal backlogs.

Table 14: Generic condition grading[2]

Grade	Description	Detailed description	Indicative RUL
1	Very good	Sound structure, well maintained. Only normal maintenance is required.	71-100% EUL
2	Good	Serves needs but minor deterioration (< 5%) Minor maintenance is required.	46-70% EUL
3	Fair	Marginal, clearly evident deterioration (10-20%). Significant maintenance is required.	26-45% EUL
4	Poor	Significant deterioration of the structure and / or appearance. Significant impairment of functionality (20-40%). Significant renewal/upgrade required.	11-25% EUL
5	Very poor	Unsound, failed needs reconstruction/ replacement (> 50% needs replacement)	0-10% EUL

Note: 'EUL' is Expected Useful Life & 'RUL' is Remaining Useful Life

The Council does not distinguish between the different infrastructure classes and only reports a total for infrastructure. The following applies to the Council's asset base.

Table 15: The Council's asset base

Asset group	Current replacement cost (CRC)	Depreciated replacement cost (DRC)	DRC as % of CRC	Renewal backlog	Renewal target years	% of CRC	Average CRC per household	CRC per serviced household
	R'000	(R'000)						
Water	2 089 347	1 464 660	70.1%	0	20	30.0%	35 666	58 341
Sanitation	1 390 204	1 062 856	76.5%	0	20	20.0%	23 732	38 818
Electricity	1 673 559	1 097 458	65.6%	0	20	24.0%	28 569	46 649
Roads & Stormwater	1 609 771	941 789	58.5%	0	20	23.1%	27 480	43 691
Refuse removal	197 403	179 473	90.9%	0	20	2.8%	3 370	5 358
Totals	6 960 284	4 746 236	68.2%	0	0	100.0%	118 816	192 856
Total asset base	8 874 887	6 182 928	69.7%					
Infrastructure as % of total	78%	77%						

There are several issues when interpreting the data. The following is important:

- Infrastructure is technically in good or very good condition but there are financial risks emerging as discussed below.
- The fixed asset register data reported the cost or replacement cost of infrastructure at R6.97 billion and the total asset base at R8.88 billion. Infrastructure represents 78% of the total asset base.

[2] The Department of Provincial and Local Government, *Guidelines for infrastructure asset management in local government 2006 – 2009*

7 Demand created through growth

In the process of determining the demand created by growth, four elements were addressed:

- Land demand as a result of growth expectations;
- Long-term capital requirements to meet the growing demand;
- Operating impact of capital expenditure and;
- Consumption and use.

7.1 Land demand

Land demand is determined by norms and standards applied to various land uses. In this respect, a distinction is made between the demand for housing (residential demand) and the demand for other land uses, including business, industrial, open space, community, and social facilities. However, the land demand for the other uses is a function of thresholds required to sustain them, and it was calculated based on the total growth demand across the municipal area. This is technically not 100% correct since the service function of these uses may exceed administrative boundaries. Nevertheless, it acknowledges that factors outside its jurisdiction may influence development demand in a municipality. In this assessment, long-term demand was calculated only based on growth expectations within the municipal area. The scope of this project does not allow for a full threshold demand analysis, and future demand was based on growth within the municipal boundaries.

7.2 Long-term capital expenditure related to growth

Long-term capital expenditure is driven by land demand and customer growth. The results show the incremental cost for bulk and reticulated infrastructure. The point of departure is assigning appropriate service levels to each user or customer category. This is essentially a policy matter. For assessment, the Council's current approach of providing higher-than-basic levels of service was adopted. The capital cost for each land use category was calculated per infrastructure service category.

7.3 The operating impact of capital expenditure

It is relatively easy to calculate capital demand. However, the critical aspect is the long-term operating impact of capital expenditure. Furthermore, over-investment in capital that does not address affordability may create structural impediments, making it challenging for the Council to meet the operating obligations of customers who cannot pay for services. This is usually one of the main contributors to cash flow constraints in municipalities. Operating costs are based on a life-cycle approach that considers maintenance and operating costs. All costs are presented as marginal costs.

7.3.1 Consumption and use

Since consumption and use norms and standards are used to calculate operating costs, the same values are used to estimate demand for water, wastewater discharge, electricity consumption, road requirements, solid waste volume, and tonnage. The results are also presented as annual increments to reflect the impact of growth.

8 Growth trends and scenario selection for demand modelling (10–20 years)[3]

The CEF has horizon of 10-years. However, given the nature of infrastructure and the longterm impact on assetrenewal and operating expenditure, all assessment were done for a 20-year period. In the results below the focus is on the 10-year CEF window. In this context, this section provides a consolidated assessment of population, household and built-form growth trends for Stellenbosch Municipality and recommends a single defendable growth scenario for use in long-term infrastructure demand quantification.

The objective is practical: infrastructure demand modelling requires one coherent baseline and growth path, even when available datasets differ materially in both absolute levels and short-term trends. The approach adopted here is therefore to:

- triangulate the most consistent series,
- test the plausibility of trends against independent built-environment indicators,
- exclude clear outliers, and
- define an explicit monitoring and data-improvement pathway so that assumptions can be tightened as local evidence improves.

8.1 Consolidated evidence on growth: what is consistent and what is not

Across the available sources, the long-run direction of change is clear. Stellenbosch experienced sustained population growth and strong household formation over the last two decades, accompanied by the physical expansion of the settlement footprint. The main uncertainty is concentrated in the post-2016 period, where some datasets indicate a slowdown, one source suggests a decline, while others show continued growth.

The Census and Community Survey anchor points indicate strong growth between 1996 and 2016. The population increases from approximately 104 600 (1996) to about 182 886 (2016), which equates to roughly 2.8% per annum compounded over twenty years. Over the same period, households rose from about 26 147 (1996) to about 55 338 (2016), implying household growth of roughly 3.8% per annum. Faster household growth is structurally consistent with declining household size, which fell from around 4.0 persons per household in 1996 to around 3.3 in 2016 and to approximately 3.0 by 2022. This point matters for demand quantification: service connections and reticulation demand tend to follow households and connections more closely than population.

The discontinuity emerges after 2016. The municipal-level population figure shown for Census 2022 is lower than the 2016 Community Survey figure, indicating a decline between 2016 and 2022. However, this implied contraction is not supported by the other time-series evidence in the same dataset extract, nor by built-environment indicators. Both the Stats SA mid-year municipal estimates and the Quantec municipal series show continued growth through 2022–2024, with levels converging around the 200,000 mark by 2022 and rising further by 2024. In contrast, LandScan presents lower totals closer to the Census-level reading, while certain gridded products vary substantially depending on the extraction method and boundary alignment. One extracted WorldPop municipal value is an order-of-magnitude outlier relative to every other source and is not suitable for municipal-level modelling without re-extraction and validation.

[3] This section is based on the profiles and data quoted in the Socio-economic Report

The practical implication is that the post-2016 municipal-level "level" of population and households cannot be taken from a single source without reconciliation. For modelling purposes, the reliable path is to prioritise internally consistent municipal time series (which can be updated annually) and to use Census/CS points as structural anchors and plausibility checks rather than as an unquestioned base-year "truth" at municipal scale.

8.2 Independent triangulation: built-form indicators confirm continued expansion

Built-environment indicators provide independent evidence that the municipality continued to expand physically in the latter 2010s, which is difficult to reconcile with a sustained population contraction. Building surface area increases from approximately 12.59 million m² (2015) to about 14.46 million m² (2020), an increase of about 14.8% over five years, or roughly 2.8% per annum compounded. Building volume increases from about 67.88 million m³ (2015) to about 73.26 million m³ (2020), roughly 7.9% over five years, or about 1.5% per annum compounded. Over the same period, average building height declines from roughly 5.39 m to about 5.07 m.

Taken together, these indicators suggest that growth has been predominantly horizontal (outward expansion and/or low-rise intensification) rather than vertical densification. This has direct infrastructure implications. Horizontal growth typically increases network length and marginal cost per additional household (pipes, roads, stormwater conveyance and LV reticulation), and it strengthens the relationship between demand growth and settlement footprint expansion rather than population growth alone.

8.3 Implications for demand modelling: the base-year and growth path must be reconciled

Given the divergences, two modelling risks must be actively managed. The first is base-year risk: a 10–15% difference in the base population and a similarly sized difference in base households translate directly into uncertainty about service connections, bulk demand, and network augmentation timelines. The second is slope risk: if near-term growth is materially higher than assumed, early augmentation requirements can be underestimated; if it is materially lower, the investment programme can be over-designed and become financially unaffordable.

To address these risks without paralysing the modelling process, a single reconciled scenario is adopted as the primary demand basis, with explicit qualifications and monitoring triggers to allow for recalibration.

8.3.1 Recommended primary scenario for demand quantification (single scenario, with tapering)

- **Base year (for FY2024/25 demand modelling):** A reconciled planning baseline is adopted using the two most coherent municipal time series in the dataset set (Quantec and Stats SA mid-year municipal estimates), supported by built-form growth evidence.

  A base population of 205,000 is adopted for FY2024/25 as a practical midpoint between the Quantec and Stats SA mid-year levels for 2024. A base household figure of 56,000 is adopted as consistent with the Quantec/mid-year household band in 2024. The Census 2022 household level (approximately 59,600) is retained as an explicit upper-bound sensitivity reference and as a monitoring trigger (see below), but is not used as the primary baseline without reconciliation to administrative counts.

- **Growth rates (phased to reflect likely deceleration over the long term):** Population growth is assumed at 1.5% per annum for 2024–2034, tapering to 1.2% per annum for 2034–2044. Household growth is assumed at 1.8% per annum for 2024–2034, tapering to 1.5% per annum for 2034–2044. Household

growth is assumed to remain above population growth due to continued reductions in average household size and ongoing settlement restructuring.

- **Implied trajectory (order-of-magnitude planning values):** Under this scenario, the population rises to approximately 237 000 by 2034 and approximately 268 000 by 2044. Households rise to approximately 66 800 by 2034 and approximately 77 600 by 2044. The implied average annual increase is approximately 3,000–3,500 people per year in the first decade and around 1,100 households per year, easing slightly thereafter due to the assumed tapering growth.

This scenario is adopted because it:

- avoids reliance on a single discontinuous municipal point estimate,
- aligns to the two most coherent and updatable municipal series in the available evidence,
- is consistent with the observed built-form expansion, and
- explicitly recognises long-run deceleration without assuming implausible reversal of growth.

8.3.2 Qualifications to protect the scenario and keep the model credible

First, the demand model is connection-led and household-driven. Population estimates primarily serve as checks on per-capita demand and sectoral multipliers, while networks and service delivery costs are driven primarily by households, connections, spatial distribution, and non-residential loads.

Second, institutional and seasonal population dynamics must be treated explicitly where applicable. Where significant student, tourism, or commuter patterns exist, the recommended approach is to model these as separate demand components using administrative or proxy indicators (e.g., campus beds, occupancy patterns, billing profiles) rather than hiding them within household-size assumptions. This was not done.

Third, the 2016–2022 discontinuity in municipal-level enumerations requires reconciliation before it can be used as a base-year benchmark for investment programming. Until reconciled, the lower municipal-level reading should be treated as a low-bound indicator for sensitivity testing rather than the backbone of the CEF demand model.

8.4 Data improvement and monitoring actions (to tighten assumptions over time)

To progressively reduce uncertainty and ensure the demand model remains defensible, the municipality should implement an annual "growth ledger" that reconciles demographic signals to administrative reality. At minimum, the ledger should track and reconcile: active service connections (water meters, electricity points, refuse accounts, sewer connections), billed customers by category, valuation roll counts and cadastral changes, development pipeline indicators (building plan approvals, completion/occupancy), and settlement footprint updates using a consistent classification method.

Monitoring triggers should be formalised. If household/connection counts deviate by more than 5% from the scenario for two consecutive years, the growth path should be recalibrated. If built-form indicators show sustained growth materially above implied household growth, the municipality should test for major non-residential expansion and adjust bulk demand assumptions accordingly. If future official municipal profile revisions materially alter base-year levels, the baseline and derived demand should be rerun.

8.5 Conclusion

Stellenbosch's long-run growth trajectory is unambiguously upward, with household formation outpacing population growth and physical expansion indicating predominantly horizontal development. The primary uncertainty lies in the post-2016 municipal-level population and household "levels", where datasets diverge, and one point estimate implies a decline that is not supported by coherent time-series evidence or built-form growth. For demand quantification, a reconciled and updatable scenario is adopted: a FY2024/25 baseline of approximately 205,000 people and 56,000 households, with phased growth assumptions of 1.5% tapering to 1.2% for population and 1.8% tapering to 1.5% for households. This provides a practical, defensible backbone for infrastructure demand modelling while remaining explicit about uncertainty and embedding clear actions and triggers to refine assumptions as local administrative evidence improves.

Modelling outcomes and growth impact forecasts

The demand quantification is the outcome of a multivariable modelling process that integrates socio-economic attributes, service-delivery variables, and growth expectations. The outcomes are presented as a probable service delivery scenario, showing land demand and the required capital and operating expenditures.

This section of the report addresses the population growth scenario, which underpins demand quantification. It describes the assumption on which the quantification is based and provides outputs within a ten-year framework to support completion of the Capital Expenditure Framework for the municipality. This section builds on the preceding Socio-economic Report, which addresses the municipality's socio-economic profile.

9 Population growth as the basis for modelling investment demand

As indicated earlier, the investment demand modelling is premised on population growth that translates into customer units. The approach and details are described in Paragraph 8 on page 8-16.

9.1 Population and household growth scenarios

The first step was a population growth forecast. The municipality is more than 90.8% urbanised, and the rural area's impact is discounted through the impact service population, which reflects demand for non-residential land uses. There are indications of stabilisation, if not a decline, in the rural population. The assumption is that the bulk of population growth will have to be accommodated in the Municipality's urban areas.

The issues and challenges with reliable population and household figures were highlighted in the previous section on the socio-economic characteristics of the municipal area. The growth scenario, as explained above, was used.

9.1.1 Population growth scenarios

The following figure presents the assessment and implications of population growth scenarios across different data sets and highlights the adopted scenario.

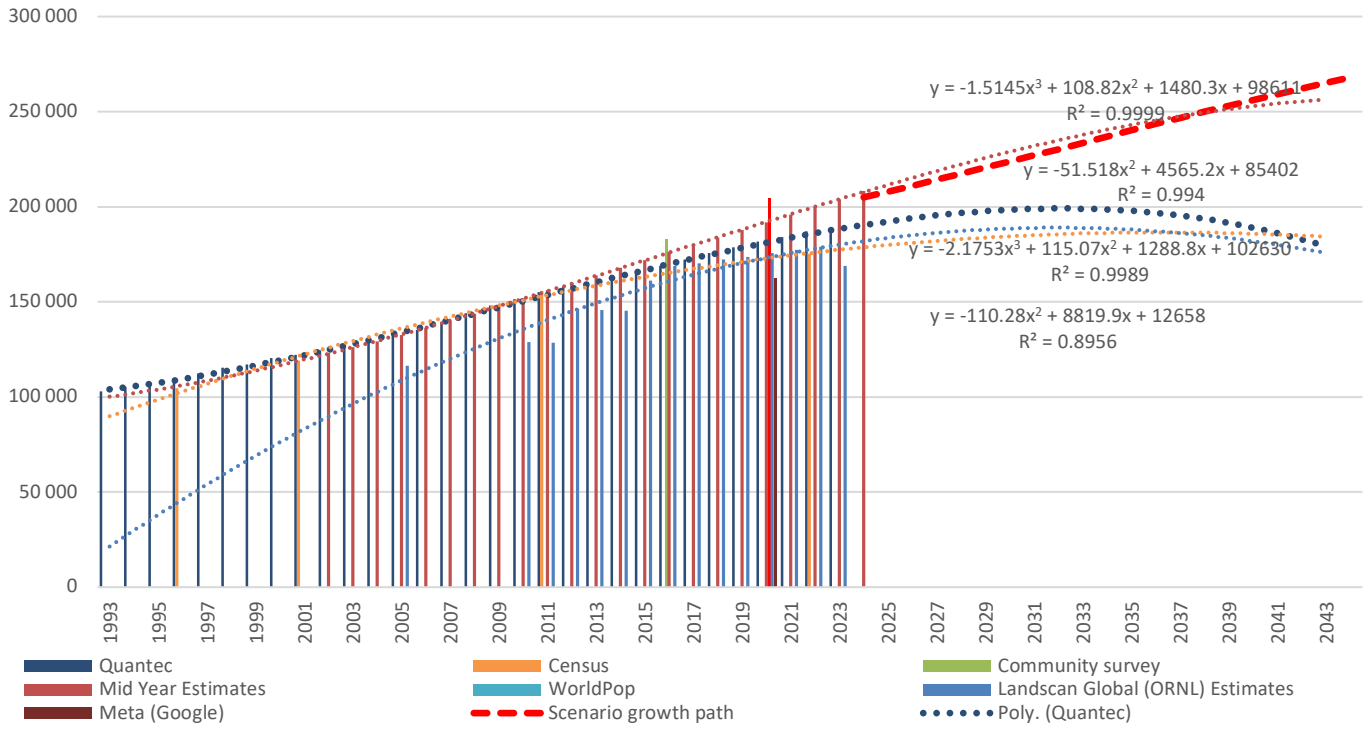


Figure 5: Population growth trends and scenarios

The population trend graph presents multiple datasets and projections, each offering different trajectories for future population growth. The population trend graph underscores the critical need for data accuracy in long-term infrastructure planning. Diverging projections necessitate a flexible, scenario-based approach to infrastructure investment to ensure adaptability to varying growth patterns. Future infrastructure strategies must also consider spatial distribution, funding implications, and scalable solutions to accommodate future demographic changes effectively.

9.1.2 Household growth scenarios

The following figure shows the assessment and implications of population growth scenarios presented by different data sets.

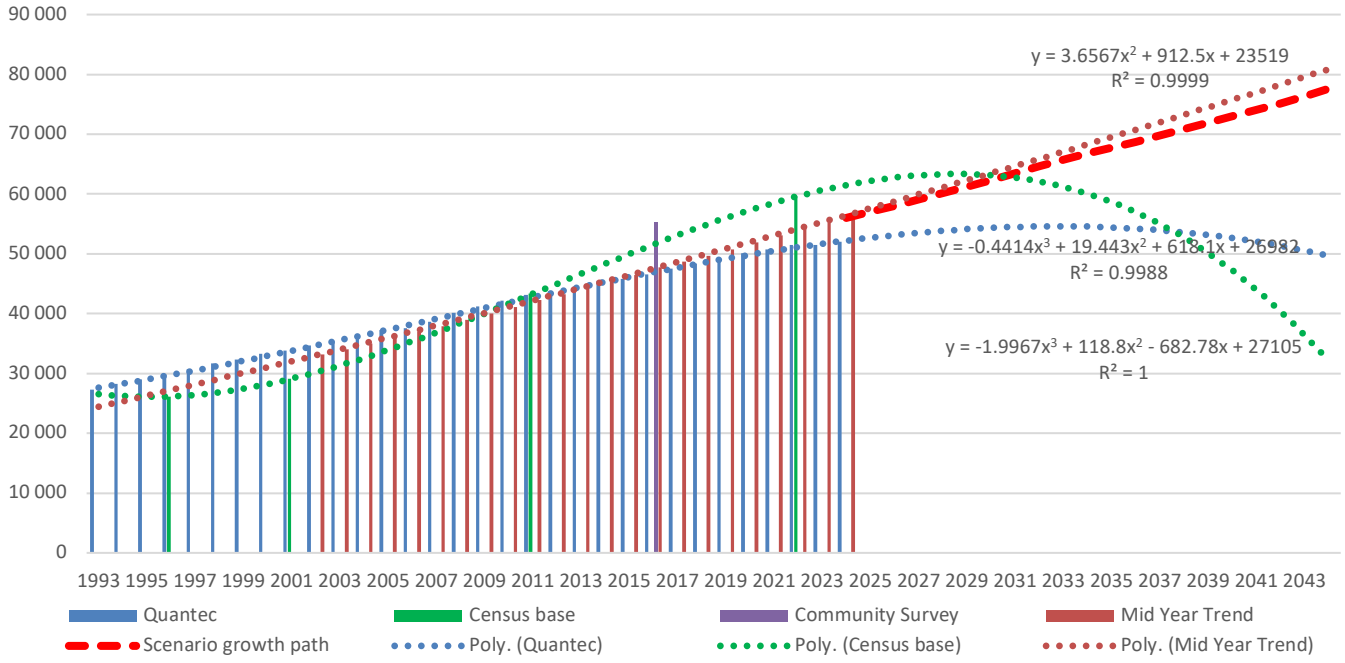

Figure 6: Household growth trends and scenarios

The household trend graph presents various data sources and projections, each illustrating different growth trajectories. The household trend graph highlights the complexities of forecasting household growth and the challenges of infrastructure investment planning. A balanced approach that incorporates scenario-based planning and flexible investment strategies is essential to ensure sustainable service delivery. Municipalities must integrate household projections with broader economic and spatial planning efforts to create resilient and adaptable infrastructure systems.

9.2 Population and household growth assumptions

Based on the adopted scenarios, the following population figures were used for modelling purpose

Table 16: The extent of population and household growth

Year	Population increment	Residential customers	Other customers	Total customer units
2 025	3 091	1 169	24	1 193
2 026	3 122	1 205	27	1 232
2 027	3 153	1 204	35	1 239
2 028	3 184	1 229	31	1 260
2 029	3 216	1 243	31	1 274
2 030	3 247	1 218	37	1 255
2 031	3 278	1 260	30	1 290
2 032	3 309	1 273	33	1 306
2 033	3 340	1 285	38	1 323
2 034	3 304	1 234	35	1 269
2 035	3 266	1 266	34	1 300

Year	Population increment	Residential customers	Other customers	Total customer units
2 036	3 226	1 245	32	1 277
2 037	3 182	1 200	30	1 230
2 038	3 136	1 222	38	1 260
2 039	3 087	1 170	32	1 202
2 040	3 035	1 182	29	1 211
2 041	2 980	1 167	38	1 205
2 042	2 922	1 128	29	1 157
2 043	2 862	1 127	32	1 159
2 044	2 893	1 123	29	1 152
Total	62 833	24 149	644	24 793

The critical growth numbers are as follows:

Figure 7: Population and household growth variables – 20 year horison

	Service demand (total municipal area)	Housing demand (total urban areas)
Average household size	3.65	3.65
Base year population	208 060	134 483
Population growth rate	1.33%	1.94%
Population estimate at the end of the programme	270 893	197 316
Households in the base year	57 008	36 848

9.3 Scenario assessment

The scenario applied for assessment tried to emulate the Municipality's current policy and strategy choices as closely as possible. However, it is essential to remember that this remains a modelling approach that crudely aims to replicate a highly complex system. Therefore, making some basic assumptions before the model was calibrated was necessary.

9.3.1 Assumptions and inputs on housing variables

As described above, the model uses population growth to determine housing demand and ancillary uses. However, several vital inputs need to be considered. They are:

- Residential typologies;
- The residential mix in terms of stand sizes and;
- Stand sizes are assigned to the different typologies.

Housing typologies for the CEF are configured around low-, medium-, and high-density residential development. Stands and household sizes were linked to each of these typologies.

Table 17 shows the input assumptions for housing typologies, stand sizes and household sizes.

Table 17: Assumptions on housing typologies, stand sizes and household sizes

Residential types	Residential mix	Stand sizes	Household size
Single Residential: Low income	45.00%	250	4.09

Residential types	Residential mix	Stand sizes	Household size
Single Residential: Medium income	17.00%	350	3.50
Single Residential: High Income	4.00%	500	2.75
Medium Density: Low Income	18.00%	2 000	3.75
Medium Density: Medium Income	12.00%	2 500	3.00
Medium Density: High Income	3.00%	2 500	1.75
High Density: Low Income	0.00%	2 000	1.90
High Density: Medium Income	0.00%	2 500	1.25
High Density: High Income	1.00%	2 500	1.50

The base distinction between income groups was derived from the 2011 census and other sources for the area. Backyard dwellers (estimated at at least 4 530 households), households in institutions and hostels (10 408) and 5 222 farm dwellings, were excluded as part of the demand for capital expenditure in the equation. However, they still affect operating costs through their use and consumption of services . It was assumed that this would remain for the entire assessment period, although there are indications that household incomes have been decreasing.

9.3.2 Norms and standards for land use budgeting

The following land use norms and standards were used in the land use budgeting process.

Table 18: Land use budgeting norms and standards

Land use	Provision unit	Provision norm - persons/cars/ children	Ruling stand size m2
Residential			
Single Residential: Low income	units per net ha (net)	40	250
Single Residential: Medium income	units per net ha (net)	29	350
Single Residential: High Income	units per net ha (net)	20	500
Medium Density: Low Income	units per net ha (net)	20	2 000
Medium Density: Medium Income	units per net ha (net)	25	2 500
Medium Density: High Income	units per net ha (net)	30	2 500
High Density: Low Income	units per net ha (net)	60	2 000
High Density: Medium Income	units per net ha (net)	60	2 500
High Density: High Income	units per net ha (net)	60	2 500
Backyard dwellings	units per household	0	0
Business

Preschool facilities	per 29500 people	1.00	3 000
Primary school	per 10000 people	1.00	32 000
Secondary school	per 15000 people	1.00	45 000
Adult education facility	per 26250 people	1.00	2 000
Tertiary/Skills training centre	per 56200 people	1.00	50 000

The norms and standards were derived from different sources. The main sources included the cadastre from the Office of the Surveyor-General, the CSIR norms and standards for social and community facilities, and the current land cover in the Municipality. The approach involved calibrating the model on local data whenever possible.

9.3.3 Service levels

Service levels relate to the technology used to supply a customer with a service. It should not be confused with a service standard that represents the qualitative aspects of service delivery.

The following describes the levels of services (LOS) available for the modelling process.

Table 19: Levels of service options for water

Level of services	Description	Policy service category	% distribution	No of CU's Residential	No upgrading	CU for upgrading or servicing
LOS00	No formal service	Below basic	1.5%	542	0	542
LOS01	Waterpoint more than 200m distance	Below basic	0.0%	0	0	0
LOS02	Communal standpipe less than 200m distance	Basic	7.7%	2 848	0	2 848
LOS03	Yard tap connection (single tap) and or limited supply with a dry on-site system	Intermediate	0.0%	0	0	0
LOS04	Yard tap connection (single tap) and or limited supply linked to waterborne sanitation	Intermediate	4.5%	1 662	1 662	0

The following service levels were assigned to the land uses in the development cost model, based on the available service options. Changes in service levels have significant impacts on capital demand and, consequently, on the Council's operating position and sustainability. The impact of different service-level choices and resulting scenarios was not tested in this report.

Table 24: Levels of service assigned per land use

Land use	Water	Sanitation	Electricity	Roads & stormwater	Refuse removal
Residential					
Single Residential: Low income	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection, with toilet structure	Grid connected and metered - Single phase 230V up to 20A or 4.6 kVA	Paved 4.5m	Weekly kerbside waste removal
Single Residential: Medium income	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection, with toilet structure	Grid connected and metered - Single phase 230V up to 20A or 4.6 kVA	Paved 4.5m	Weekly kerbside waste removal
Single Residential: High Income	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Single phase 230V up to 60A or 13.8kVA	Paved 4.5m	Weekly kerbside waste removal
Medium Density: Low Income	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection, with toilet structure	Grid connected and metered - Single phase 230V up to 20A or 4.6 kVA	Paved 4.5m	Weekly kerbside waste removal
Medium Density: Medium Income	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection, with toilet structure	Grid connected and metered - Single phase 230V up to 60A or 13.8kVA	Paved 4.5m	Weekly kerbside waste removal
Medium Density: High Income	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Single phase 230V up to 60A or 13.8kVA	Paved 4.5m	Weekly kerbside waste removal
High Density: Low Income	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Single phase 230V up to 20A or 4.6 kVA	Paved 4.5m	Weekly kerbside waste removal
High Density: Medium Income	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Single phase 230V up to 60A or 13.8kVA	Paved 4.5m	Weekly kerbside waste removal
High Density: High Income	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Single phase 230V up to 60A or 13.8kVA	Paved 4.5m	Weekly kerbside waste removal
Backyard dwellings	House/building connection unlimited metered supply	No formal service	No electricity service	Paved 4.5m	Weekly kerbside waste removal
Business					
3rd Order commercial	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 4.5m	Weekly kerbside waste removal
2nd Order Commercial	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Bulk higher than 230/400V - not exceeding 11kV (at least 25 kVA)	Paved 5.5m	Bi-weekly kerbside waste removal
1st Order Commercial	All requirements met up to 150mm pipe, 150mm connection	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Bulk - exceeding 11kV (at least 100 kVA)	Paved 6.5	Daily waste removal from site 1
Market/trading area	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 4.5m	Daily waste removal from site 1

Land use	Water	Sanitation	Electricity	Roads & stormwater	Refuse removal
Garages & filling stations	House/building connection unlimited metered supply	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Single phase 230V up to 60A or 13.8kVA	Paved 6.5	Weekly kerbside waste removal
Industrial & commercial					
Light industrial	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Bulk higher than 230/400V - not exceeding 11kV (at least 25 kVA)	Paved 6.5	Daily waste removal from site 1
Heavy industrial	All requirements met up to 150mm pipe, 150mm connection	Waterborne sewerage, discharge load is above normal limits.	Grid connected and metered - Bulk - exceeding 11kV (at least 100 kVA)	Paved heavy capacity 7.5m	Daily waste removal from site 1
Storage and warehouses	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Bulk higher than 230/400V - not exceeding 11kV (at least 25 kVA)	Paved 6.5	Bi-weekly waste removal from site 1
Public spaces: recreation					
Parks: public	House/building connection unlimited metered supply	No formal service	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 4.5m	Weekly kerbside waste removal
Parks: private	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 4.5m	Weekly kerbside waste removal
Sports fields	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 5.5m	Weekly kerbside waste removal
Stadiums	Supply volume. is limited to 100mm connection, peak flow limited and on site storage required	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved heavy capacity 7.5m	Weekly kerbside waste removal
Community facilities: municipal					
Municipal office	House/building connection unlimited metered supply	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Bulk higher than 230/400V - not exceeding 11kV (at least 25 kVA)	Paved 6.5	Weekly kerbside waste removal
Community hall	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Library	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Primary health clinic	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Fire station & Ambulance	Supply volume. is limited to 100mm connection, peak flow limited and on site storage required	Waterborne sewerage, discharge load is above normal limits.	Grid connected and metered - Bulk higher than 230/400V - not exceeding 11kV (at least 25 kVA)	Paved 6.5	Weekly kerbside waste removal
Solid waste/Mini dump/depot	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Cemeteries	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Crematorium	House/building connection unlimited metered supply	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Bulk - exceeding 11kV (at least 100 kVA)	Paved 6.5	Weekly kerbside waste removal

Land use	Water	Sanitation	Electricity	Roads & stormwater	Refuse removal
Service utilities	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Daily waste removal from site 1
Taxi ranks	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Daily waste removal from site 1
Community facilities: other					
Post office	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Lower Court	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Post collection point	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Single phase 230V up to 60A or 13.8kVA	Paved 6.5	Weekly kerbside waste removal
Police station	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
District hospital	Supply volume. is limited to 100mm connection, peak flow limited and on site storage required	Waterborne sewerage, discharge load is above normal limits.	Grid connected and metered - Bulk - exceeding 11kV (at least 100 kVA)	Paved 6.5	Daily waste removal from site 1
Community health centre	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Bi-weekly waste removal from site 1
Hospice	House/building connection unlimited metered supply	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Bi-weekly waste removal from site 1
Old age home	House/building connection unlimited metered supply	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Bulk higher than 230/400V - not exceeding 11kV (at least 25 kVA)	Paved 6.5	Weekly kerbside waste removal
Children's homes	House/building connection unlimited metered supply	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Bulk higher than 230/400V - not exceeding 11kV (at least 25 kVA)	Paved 6.5	Weekly kerbside waste removal
Thusong centre	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Place of worship	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
After school care centres	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Preschool facilities	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal
Primary school	House/building connection unlimited metered supply	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Bulk higher than 230/400V - not exceeding 11kV (at least 25 kVA)	Paved 6.5	Weekly kerbside waste removal

Land use	Water	Sanitation	Electricity	Roads & stormwater	Refuse removal
Secondary school	House/building connection unlimited metered supply	Waterborne sewer available, max connection size 150 mm or larger	Grid connected and metered - Bulk higher than 230/400V - not exceeding 11kV (at least 25 kVA)	Paved 6.5	Weekly kerbside waste removal
Adult education facility	House/building connection unlimited metered supply	Waterborne sewerage to each stand 110mm connection (no toilet structure)	Grid connected and metered - Three phase / Multi phase 230/400V up to 150A or 100kVA	Paved 6.5	Weekly kerbside waste removal

9.4 The modelling outcomes

This section documents the results of the modelling process. The outcomes are presented as a high-level summary. Note that the tables show incremental quantities that include all service elements and components. It is impossible to model the impact of major interventions, such as building a new wastewater treatment work or making significant investments to reconfigure solid waste management. Those aspects must be discounted in the project prioritisation process.

Although the results link demand to a specific year, it is still important to note budgeting processes and lead times before project implementation can commence. The figures indicate annual demand, and actual demand will be reflected in the project prioritisation process as part of the project outputs.

9.4.1 Land use demand

Table 25 shows the summary of land use demand resulting from the growth forecasts.

Table 25: Land use demand for the programme period 2025 to 2044

Land uses	No of units	% of total land	No of stand required	Area included in project (ha)
Totals	24 149	100.0%	14 867	1 262.6
Residential	24 149	57.5%	14 286	725.5
Single Residential: Low income	8 088	16.0%	8 088	202.2
Single Residential: Medium income	3 574	9.9%	3 574	125.1

The figures below show the contribution or demand of each expenditure component to total expenditure.

Figure 8: Contribution to investment demand component per infrastructure asset groups - 20 year horison

9.4.4 Summary of operating expenditure

One key element often overlooked in capital investment planning is the operating consequences of capital investment. The next two tables show the forecasted operating and maintenance costs associated with the projected capital expenditure. It is an incremental cost and does not reflect the revenue side or the cost-recovery strategies the Municipality may apply.

Table 30: Incremental operating & maintenance expenditure: All services per annum (R'000)

9.4.5 Summary of consumption and use

Service delivery is about consumption and use. The next two tables show the expected demand for water and electricity. The values are net and exclude the impact of losses in water and electricity. These numbers can be used to assess the impact of future demand on the existing capacities of bulk facilities.

Table 32: Incremental consumption and usage

Issues to be considered

This section highlights some findings from the demand quantification process.

The demand quantification was done against uncertainty and doubtful data critical to the process.

10 The customer base

Conflicting sources necessitated an estimate of demographic trends used for modelling purposes. In addition, the data reported by the Council to StatsSA sources often do not reconcile with other sources. Consequently, there remains uncertainty about the baseline figures and backlogs. Backlogs vary substantially. Besides uncertainty about figures, how backlogs are defined also plays a role. For example, is it practical to expect households in rural villages to have formal communal waste removal facilities or all have access to gravel roads?

In developing service delivery strategies, it is essential to distinguish between customers (entities with a legal or contractual claim on the Council to deliver services) and entities that do not require services from the Council. The difference between Eskom and the Council's electricity supply areas is an example. Unfortunately, the project scope does not allow for an in-depth assessment of the customer base. However, the availability of quality data in the municipality appears to be a challenge and may directly affect the Council's ability to quantify, measure, and manage change and development.

The number of households is usually the starting point, as it represents most customers. In this, households constitute an estimated 97.8% of the customer base. It may be worth working towards integrating key municipal data into a full-scale infrastructure investment strategy that accounts for the Council’s wide-ranging settlement typologies and conditions.

11 Service access and service delivery

11.1 Service access backlogs

11.1.1 Approach to service backlogs

Since 1994, South Africa has had a clear policy on service levels and the minimum acceptable service level. Basic, intermediate, and full services were derived from the World Health Organisation's standard to maintain acceptable and sustainable health conditions. Basic services address health needs, while intermediate and full services improve convenience for users. Government policy still targets basic services through the capital grant system and the operating cost of these services through the Equitable Share transfers.

In reality, Councils have shifted from providing basic services to meeting minimum acceptable service levels. For example, an in-house connection for water is preferred over a communal standpipe, and waterborne sanitation is preferred over ventilated improved pit latrines. In the process, councils abandoned the affordability and the user-must-pay principles. This eventually strained the local financial system, leading to cash-flow problems and a lack of funding for essential infrastructure maintenance. This is reflected in the extent of debt impairments and will worsen over time.

Their choices of service levels defined their own backlogs and, hence, the financial demand to deliver services. The Council data clearly shows that it opts for a full level of services and treats existing essential services as an interim measure rather than a solution.

11.1.2 Service backlogs in the municipality

Due to data uncertainty, it was impossible to give a realistic assessment of service access and service backlogs. Within the framework and approach adopted, all backlogs seems to be very low with the exception of roads and stormwater.

Roads and stormwater seem to be the Council's biggest challenge. How "backlogs" are defined is important and will directly impact long-term capital demand. However, accepting, for example, graded roads as an acceptable level of service will have a significant impact on operations and maintenance. Finding a balance between service levels and standards requires an infrastructure investment framework that quantifies the long-term impact of different policy choices for service delivery. Indications are that about 53.5% of households do not have access to a service should a surfaced road be accepted as the preferred level of service.

11.2 Growth demand

The Council have a well-structured approach to service levels aligned with its customer base. A focus on full-service offerings for customers who cannot afford them leads to increased operating shortfalls and cash-flow deficits over the long term. In addition, during prolonged economic downturns, poverty increases, and the Council faces increased structural impediments, where more customers have access to services they cannot afford. About 63.35% of households are poor, while high-income households account for only 7.35% of the customer base. It is doubtful that the extent of current cross-subsidisation would be sustainable over the long-term.

Past choices of service levels, complicated by rising poverty, have led to structural constraints, as many households cannot afford the service levels available to them. Choosing appropriate service levels for future service delivery is an essential component of a long-term infrastructure provision and service delivery policy.

11.3 Asset renewal and asset backlogs

The total capital replacement cost (CRC) per service household is R192 856. The modelled value is R189 934 per unit, based on the unit rates used for assessment. Detailed asset values were not available. However, it confirms the high levels of services provided by the municipality.

12 Population growth as the basis for demand

Population growth for the total area is very high (between 1.33% (average for the municipality) and 1.94% (urban areas) per annum. However, future growth demand will remain adrive of investment requirements over the next 10 to 20 years.

The prevailing low-density, single-house development will most likely continue. Notwithstanding calls for densification, land availability, national housing policies, and beneficiary preferences perpetuate single-residential development. Choices about preferred service levels can significantly impact CAPEX and OPEX. However, cost-recovery regimes will significantly affect the Council's long-term financial health and sustainability.

13 Notable elements of future demand

13.1 Land required

Over the next ten years, the Council will require 1 263ha to accommodate growth and development. Residential demand will be an estimated 725ha, with about 49.2% required for low- and middle-income housing.

Table 34: Summary of land use demand 20-year horizon

Land uses	No of units	Total area of uses (ha)	% of total land	No of stand required
Residential	24 149	725	57.5%	14 286
Single Residential: Low income	8 088	202	16.0%	8 088
Single Residential: Medium income	3 574	125	9.9%	3 574
Single Residential: High Income	1 070	54	4.2%	1 070

Roads totals	0	225	17.8%	0
Totals	24 149	1 263	100.0%	14 867

13.2 Capital expenditure

The following figure outlines key CAPEX relationships for the assessment and planning period.

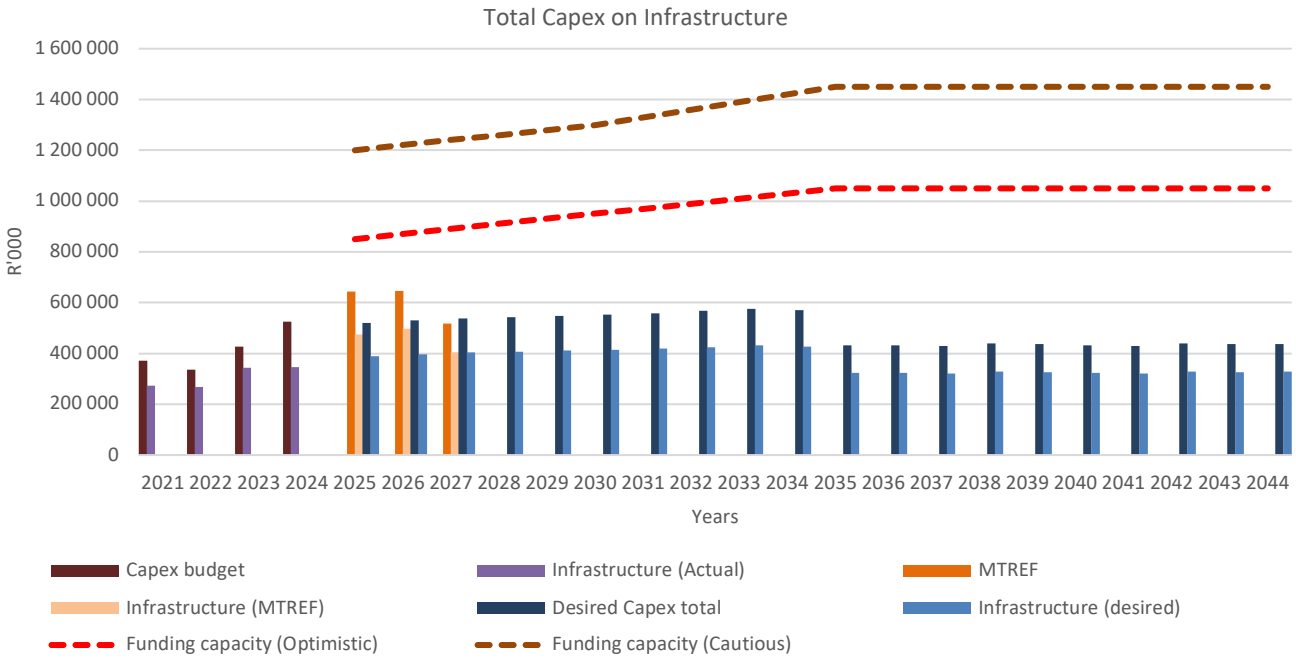

Figure 9: CAPEX relationships

The capital requirements to address growth, address backlogs, and asset renewals will average more than R369 million annually. The Council will require about R142.4 million per annum to accommodate new growth and a further R55.4 million per annum to address service backlogs. The CAPEX for backlogs is based on a 10-year program. The focus lies with asset renewals as a key to stabilising and sustaining the Council's operating base. Based on the current replacement cost (CRC), asset renewal will require R171.4 million per annum, which is 46.4% o total expenditure.

The CAPEX budget for the past four years averaged just more than R402.6 million per annum. The planned expenditure for the MTREF years averaged R602.8 million per annum. The figure below shows the anticipated CAPEX with historical patterns and trends. The actual and anticipated expenditure levels are substantially lower than the suggested affordability envelope. However, while high CAPEX levels are achievable, the operational impact may be challenging. The following should be noted:

1. Impairments are already high and may increase due to non-payment as a result of unaffordable services for a community where 67% is regarded as poor.

2. Repairs and maintenance should consistently be more than depreciation. It implies that the Council must protect its current asset base.

3. Bulk purchases of electricity service revenue are higher than the norm of 70% and decrease the margins and scope to maintain revenue as a source, and it will eventually feed through to the capacity of sustaining maintenance and asset renewal.

The desired level of capital expenditure must be viewed against its long-term operating impact. The current situation is sustainable provided that the Council develops the ability to measure the long-term impact of capital projects, but more importantly, the ability to measure the CAPEC and OPEX of its spatial development framework.

The Council was spending R994 per capita on infrastructure in 2024, which is lower than the modelled outcome of R447 per capita. The national average CAPEX is about R741 per capita per annum. These comparisons reflect on infrastructure only.

The table below shows the demand quantification outcomes for the municipality in the national context. The following should be considered:

- Unit costs are affected by the level of service mix. The national figure is a mix of areas with very low levels of services, such as rural areas, and areas with very high levels of services, such as higher-income areas. The service mix depends on the municipality's service delivery policies.
- The unit rates for the modelled outcomes are affected by access and renewal backlog eradication targets. For example, accelerating backlog eradication will imply higher front-end CAPEX. This will affect comparisons such as those in the table below

Table 35: Benchmarking modelled outcomes (2024-based figures)

Base year position	National totals & average	Stellenbosch LM	Modelled outcomes
Population	59 622 350	208 060	208 060
Households	16 613 347	36 848	36 848
Total capital expenditure (R'000)	68 808 464	642 490	519 036
Total CAPEX on infrastructure (R'000)	44 204 406	475 157	389 277
Per capita CAPEX (infrastructure)	741	2 284	1 871
Per household CAPEX (infrastructure)	2 661	12 895	10 564
Infrastructure CAPEX as % of total	64.2%	74.0%	75.0%
Benchmarked against national averages			
Per capita CAPEX	1.00	3.08	2.52
Per household CAPEX	1.00	0.21	0.25

13.3 The operating impact

The operating impact of the investment demand will accumulate to an additional R431.6 million per annum at the end of 2034. About R370.7 million (86%) of the impact will come from growth and the rest from providing service access to existing households. The following must be considered:

- The Council have little control over growth and specifically informal growth. The inability to keep up with growth will result in accumulating backlogs that will become more difficult to address in the future.
- Expected future growth also represents predominantly poor people who may be unable to pay for services, implying that the subsidy demand will increase.
- The Council has clear legislative and other challenges in applying cost recovery in rural and tribal areas. The biggest challenge to the Council is not CAPEX but sustaining its operating position.

The following figures summarise the outcomes of the demand quantification process.

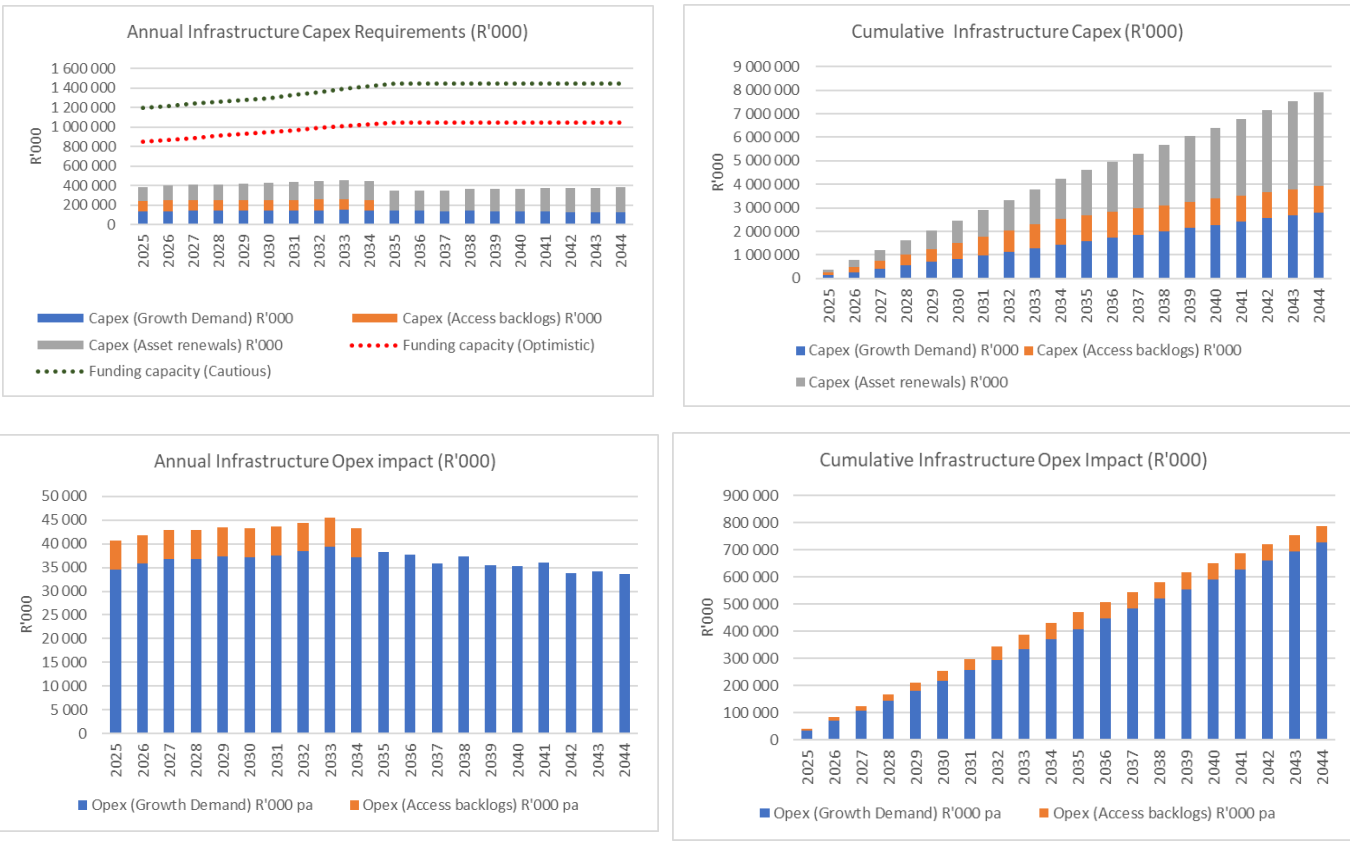

Figure 10: CAPEX and OPEX over a 20-year period

Conclusions and the way forward

14 Strategic conclusions

The demand quantification for Stellenbosch Municipality confirms that infrastructure planning over the next 10–20 years will be shaped less by "whether growth will happen" and more by three interacting realities: first, sustained household formation and outward built-form expansion; second, the long-run operating consequences of maintaining high service levels in a municipality with a large low-income customer base; and third, the municipality's ability to protect lifecycle spending (repairs, maintenance, rehabilitation and renewal) while still accommodating selective growth. The modelling approach adopted in this CEF therefore emphasises a reconciled growth path, a connection-led view of demand, and a staged affordability logic that links land release and infrastructure expansion to measurable financial resilience and delivery capacity.

On growth, the long-run trajectory remains upward, but the report's evidence shows that the post-2016 "level" of population and households is not stable across available datasets. For modelling purposes, a practical FY2024/25 baseline of approximately 205,000 people and 56,000 households is adopted, supported by the two most coherent and updatable municipal time series (Quantec and Stats SA mid-year municipal estimates) and corroborated by independent built-form indicators. Growth is assumed at 1.5% per annum for the population over 2024–2034, tapering to 1.2% over 2034–2044, while household growth is assumed at 1.8%, tapering to 1.5% over the same horizons. This implies an order-of-magnitude planning trajectory of approximately 237,000 people and 66,800 households by 2034, rising to

approximately 268,000 people and 77,600 households by 2044. These assumptions are explicitly qualified and must be treated as a monitored planning scenario rather than a fixed "truth".

On the spatial form of growth, the analysis indicates predominantly horizontal expansion and low-rise intensification. This matters because horizontal growth increases network length and marginal lifecycle cost per additional household, particularly for roads, stormwater conveyance, water reticulation and LV electrical networks. In practical terms, the municipality's infrastructure affordability is sensitive not only to how many households are added, but also to where they are added, how they are distributed, and the service levels provided to them. A growth strategy that continues to disperse new development at low densities will tend to "bake in" higher operating costs and renewal obligations, even where upfront CAPEX appears manageable.

On service levels and affordability, the report highlights a structural tension that must be made explicit in the way forward. Stellenbosch has historically gravitated to full-service levels (for example, in-house water connections and waterborne sanitation) and treats interim/basic services as temporary measures. At the same time, the customer profile indicates a large low-income segment: the analysis notes that roughly 63–67% of households are classified as poor, while high-income households account for a small share of the customer base. In an environment of slow national growth and periodic economic shocks, this mix increases the likelihood that service charges will become unaffordable for an expanding share of customers, which in turn will raise impairment levels and undermine the municipality's ability to fund operations, maintenance, and renewals. The strategic implication is that service-level policy is not a technical footnote; it is a primary determinant of long-term financial sustainability and must be evaluated alongside spatial planning choices.

In the backlogs, the modelling process could not produce a fully reliable backlog quantification because service access and backlog data sources do not consistently reconcile, and backlog definitions are not uniform across settlement typologies. Within the adopted framework, backlogs appear low for certain household services, while roads and stormwater are the dominant challenges. This finding should be treated as a risk signal rather than a final backlog estimate: it indicates that the municipality's greatest future liability is likely to lie in network-wide public infrastructure (roads and stormwater), where "acceptable" levels of service are contested and where operational implications (routine grading, drainage maintenance, surface management and renewal cycles) can be substantial. The way forward, therefore, requires a deliberate, policy-led backlog definition exercise, supported by credible data and an auditable methodology.

On renewals, the demand quantification and financial assessment converge on the same point: lifecycle sufficiency is the binding constraint, not the municipality's historic ability to spend CAPEX. The financial review shows that a maintenance proxy remains materially below depreciation (for example, approximately R86.6 million versus depreciation of R204.5 million in FY2025), which indicates that the municipality is consuming its asset base faster than it is being restored. The demand model similarly shows renewals as the single largest CAPEX component within the infrastructure envelope. The strategic conclusion is straightforward: unless repairs, maintenance, rehabilitation and renewal are protected and increased on a planned basis, future expansion will progressively erode service reliability, raise unit costs, and ultimately weaken the revenue base that funds infrastructure.

15 What the demand quantification implies for land and infrastructure investment

The land budgeting outcomes indicate that accommodating the forecasted growth path will require approximately 1,263 hectares of additional land over the programme horizon as configured in the model. Residential land accounts for about 725 hectares (57.5% of total), with a substantial portion associated with low- and middle-income housing typologies. Roads account for approximately 225 hectares (17.8%), reflecting the spatial cost of horizontal growth. Economic land demand is also material, with business land at approximately 133 hectares (10.5%) and industrial/commercial land at approximately 113 hectares (8.9%). The critical planning implication is that "land release" is inseparable from infrastructure cost: each hectare brought into the serviced urban footprint triggers a long-lived obligation to fund network operations and renewals. Land sequencing must therefore be paced to the municipality's proven ability to fund the full lifecycle cost of the networks that support it.

In the first ten years of the programme (2025–2034), the modelled incremental infrastructure CAPEX averages approximately R413 million per annum (2025 Rands), moving from roughly R389 million in 2025 to roughly R428 million by 2034. Over the decade, the cumulative requirement is approximately R4.13 billion. The internal composition of this requirement is critical. On average, growth-related investments account for approximately R143 million per annum, access/backlog-related investments approximately R111 million per annum (noting that the backlog costing and pacing must be reconciled to a defined backlog programme), and renewals approximately R159 million per annum, rising toward the end of the decade. This reinforces that renewal planning is not discretionary; it is a structural component of the investment programme.

By service, roads and stormwater dominate the infrastructure investment requirement, averaging approximately R139 million per annum over 2025–2034. Sanitation follows at roughly R92 million per annum, electricity at roughly R87 million per annum, water at roughly R79 million per annum, and refuse removal at roughly R16 million per annum. This composition aligns with the broader risk signals in the report: network-wide public infrastructure and high-service-level networks drive both CAPEX and future operating exposure. It also implies that the CEF cannot be implemented as a collection of isolated service projects; the dominant cost drivers sit at the interface between spatial form, network length, and lifecycle obligation.

The operating implications are equally decisive. The model indicates that the incremental operating and maintenance burden accumulates to approximately R431.6 million per annum by 2034, of which approximately R370.7 million (about 86%) is attributable to growth-related investments and approximately R60.9 million (about 14%) to addressing access/backlogs. Roads and stormwater again dominate the operating profile, reaching approximately R290 million per annum of incremental O&M by 2034, followed by electricity (approximately R66.8 million), sanitation (approximately R60.4 million), and water (approximately R13.3 million). This is the core strategic warning: a capital programme that is "affordable" on CAPEX alone can still become unaffordable once the operating tail is properly recognised. The CEF must therefore be managed as a joint CAPEX–OPEX instrument, not as a capital list with an implied operating assumption.

The modelled consumption and usage implications provide a practical basis for bulk planning and network stress testing. By 2034, the cumulative additional water demand in the model is approximately

15.7 Ml/day, while cumulative additional electricity demand is approximately 964.9 MWh/day, with the balance of demand being driven predominantly by growth rather than backlogs. These values should be treated as planning signals that require confirmation against system capacities, loss assumptions and customer consumption profiles, particularly given the reported level of non-revenue water and the potential for seasonal and institutional population effects (students and tourism) to alter peak demand patterns.

16 Institutionalising delivery and protecting the programme

A central recommendation from this CEF is that implementation must be institutionalised as a standing management programme rather than treated as a once-off modelling exercise. The municipality should formalise a governance arrangement that links the CEF to the MTREF, the SDF, the IDP and the asset management cycle, with explicit authority to enforce affordability gates and to recalibrate the pipeline when financial or growth indicators deviate from assumptions. The report's proposed Financial and Infrastructure Affordability Committee is an appropriate mechanism for this, provided it operates on routine performance evidence and has the mandate to defer or resequence projects when lifecycle or cash protection thresholds are threatened.

Project entry into the funded pipeline should be conditioned by a consistent hard-gate logic. At minimum, each material project must demonstrate realistic cost recovery under collection and impairment assumptions (not gross billing), a viable financing mix across internal cash, grants and debt with stress tests for delays and escalation, and a quantified operating impact over at least ten years that includes staffing, energy, chemicals, maintenance and periodic renewal. Delivery risk screening must be explicit, focusing on land/legal readiness, procurement complexity, institutional capacity and timing risk. Finally, spatial alignment must be enforced: projects that support node-based, serviceable growth and that reduce lifecycle cost per household or business served should be preferred, while projects that extend networks into low-density, high-cost areas should be treated as exceptional and justified on a full lifecycle basis.

Monitoring must also be explicit and routine. Financial indicators should include days cash, the current ratio, collection proxies, impairment ratios, CAPEX execution, the maintenance-to-depreciation relationship, and grant absorption. Infrastructure performance indicators must include water and electricity losses, service interruptions, where measured, and the execution of the renewal programme against asset condition priorities. The point of monitoring is not to report compliance; it is to provide early warning so that land release, project sequencing, and funding can be adjusted before the programme becomes unaffordable or delivery stalls.

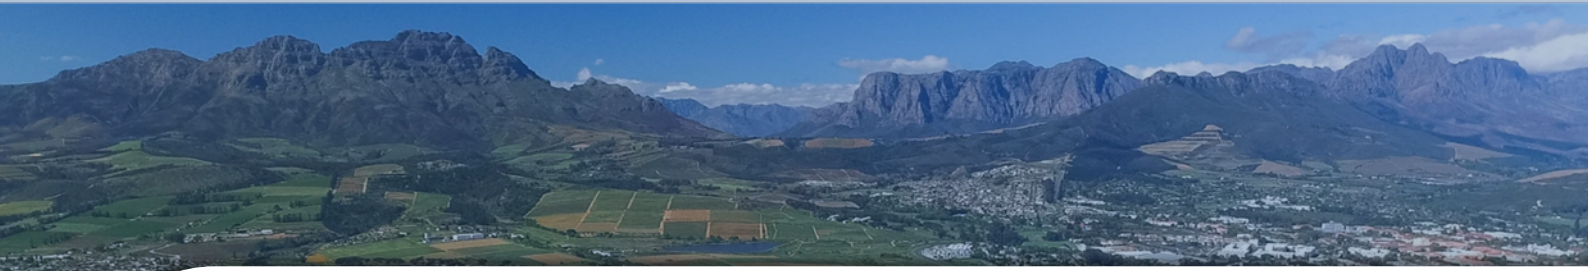
17 Data and date reliability, and the case for municipal data governance

The report's conclusions are necessarily qualified by the reliability and temporal alignment of the underlying data. Demand quantification is highly sensitive to base-year values, to the slope of growth over the next decade, to service-level assumptions, and to the spatial distribution of new development. When datasets represent different dates, different boundary interpretations, different extraction methods, or inconsistent definitions (for example, "households" versus "service households" versus "customer accounts"), the modelling outputs can shift materially without any real-world change. This is not a modelling flaw; it is a data governance problem. Without a consistent, up-to-date and internally reconciled data baseline, infrastructure planning becomes an exercise in defending assumptions rather than managing reality.

Several concrete reliability risks emerge in this work. The post-2016 population and household "levels" diverge across datasets, including one municipal-level point estimate implying decline that is not supported by coherent time series or built-form indicators. Certain gridded products vary substantially depending on boundary alignment and extraction method, and at least one extracted municipal value is an outlier relative to all other evidence and is not suitable for modelling without re-extraction and validation. Service access and backlog values do not reconcile consistently, and the definition of backlogs is not uniform across settlement typologies, which limits the defensibility of backlog costing. Detailed asset values and condition evidence were not available at the level required for a full renewal backlog quantification, and FY2025 financial information is pre-audited and therefore subject to final confirmation. These issues do not invalidate the CEF; they define the minimum data-governance agenda required to keep it credible over time.

The way forward should therefore include establishing a municipal data governance system that treats planning data as a managed corporate asset. At a minimum, the municipality should adopt a single annual "planning baseline" that is time-stamped, version-controlled and signed off, and that reconciles demographic signals to administrative counts. The report already motivates an annual growth ledger; this should be formalised as an operational dataset that reconciles active service connections (water meters, electricity points, sewer connections, refuse accounts), billed customers by category, valuation roll counts and cadastral changes, development pipeline indicators (approvals, completions and occupancy), and settlement footprint change using a consistent classification method. This baseline must be aligned to the municipal boundary definition used for reporting and must be updated on a fixed annual cycle so that the CEF can be refreshed and defended as conditions change.

Data governance must also be linked to decision triggers. If household or connection counts deviate materially from the adopted scenario (for example, by more than about five percent over two consecutive years, as proposed in the report), the growth path and the associated infrastructure demand must be recalibrated and the project pipeline resequenced. If built-form indicators show sustained growth materially above implied household growth, bulk demand assumptions should be stress-tested for major non-residential expansion and for peak-load drivers. If official profile revisions materially shift base-year levels, the demand model should be rerun. The municipality's credibility will increasingly depend on demonstrating that infrastructure investment decisions are based on a living evidence system, not on a once-off report or on unreconciled external datasets.



In summary, the strategic way forward is to treat the CEF as an implementable programme that is continuously protected by two disciplines: affordability discipline (through staged scenarios, hard gates and lifecycle protection) and evidence discipline (through a managed, reconciled and regularly updated data baseline). If the municipality institutionalises these disciplines, the demand quantification results in this report provide a defensible backbone for infrastructure investment planning. If it does not, the municipality will remain exposed to the twin risks that have undermined many councils nationally: expanding the service obligation faster than the revenue base can support, while consuming the asset base faster than it can be renewed.

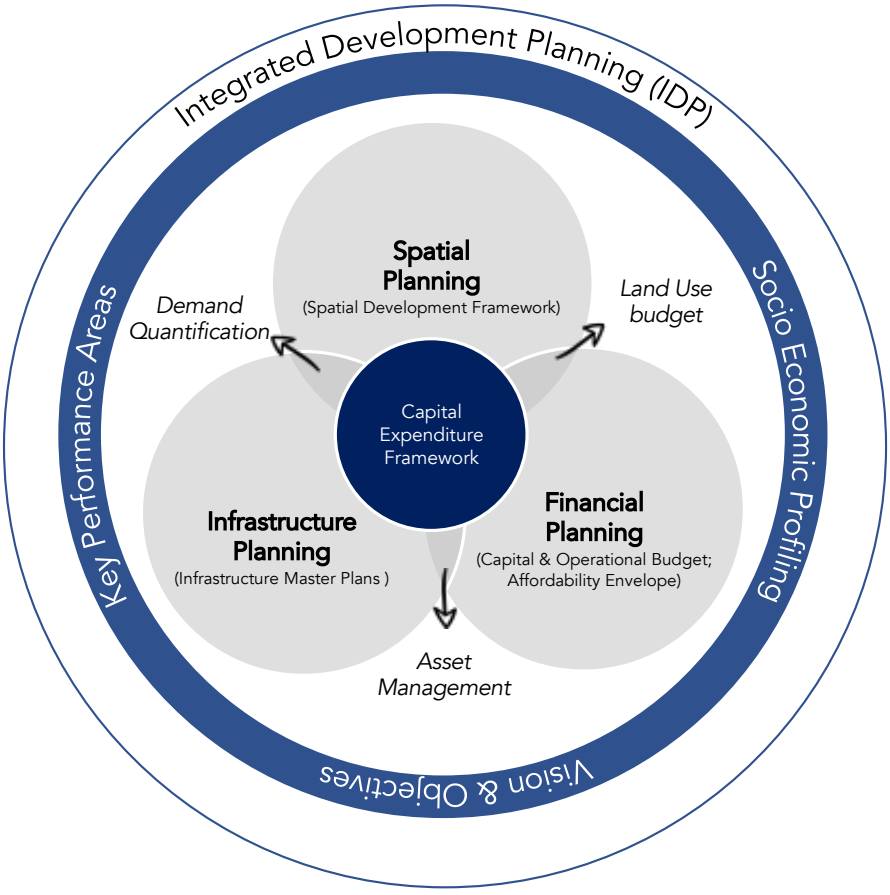
Phase 1

Introduction

1 Part 1: Introduction



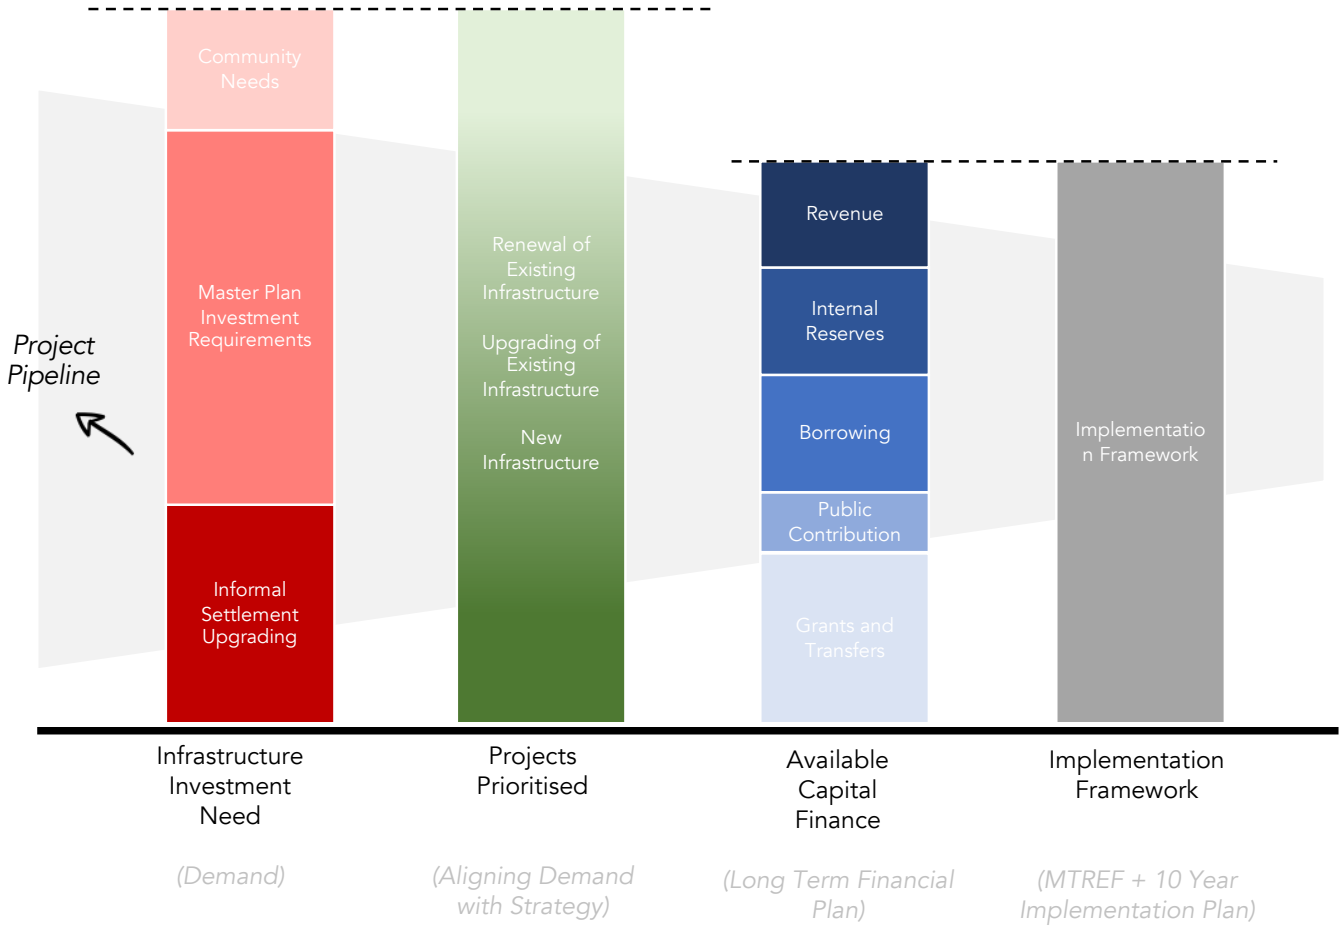
1.1 What is a Capital Expenditure Framework

According to the Department of Cooperative Governance and Traditional Affairs (COGTA) guidelines, a Capital Expenditure Framework (CEF) is a consolidated, high-level view of a municipality's long-term infrastructure investment needs. It ensures that infrastructure priorities are spatially aligned with municipal strategic objectives, budgetary realities, and development plans. The framework is grounded in principles of sustainability, financial feasibility, and strategic alignment, balancing immediate infrastructure needs with long-term development goals, the relationships between these spheres of planning and principles is illustrated in Figure 1-1.

The Spatial Planning and Land Use Management Act, 2013 (SPLUMA) mandates the inclusion of a CEF within a municipality's Spatial Development Framework (SDF). Specifically, Section 21(n) of SPLUMA requires that an SDF "determine a Capital Expenditure Framework for the municipality's development programmes, depicted spatially." This legislative requirement underscores the importance of integrating spatial planning with financial planning, ensuring that the spatial strategies articulated in the SDF are implemented through practical and affordable infrastructure investments.

A Capital Expenditure Framework links spatial development strategies with budgetary constraints and infrastructure demands. It provides a transparent mechanism for prioritising projects, promoting the efficient allocation of resources, and aligning capital expenditure with the municipality's long-term strategic vision.

Figure 1-1: The Capital Expenditure Framework within the built environment context



1.2 Aim of Capital Expenditure Framework

The aim of a Capital Expenditure Framework (CEF) is to create a structured and strategic approach to municipal infrastructure expenditure. The CEF is intended to align the municipality's spatial development strategies with its financial resources and capacity, ensuring that long-term growth and development objectives are achievable, and informs operational activities of a municipality.

A CEF aims to provide a municipality with the means to inform financial planning with infrastructure planning and spatial priorities identified in the Spatial Development Framework (SDF). It aims, furthermore, to establish a clear methodology for municipalities to evaluate, prioritise, and inform implementation processes of infrastructure projects within their affordability envelope, supporting both immediate and long-term development goals.

From Figure 1-2 one can see the illustration that infrastructure investment need, expressed as projects, usually exceeds available capital finance, and therefore it is an imperative for municipalities to partake in a prioritisation process to determine which projects are best aligned with the strategy of the municipality, together with a budget scenario process to determine which projects are affordable and should be implemented when.

Figure 1-2: Relationship between infrastructure investment needs, affordability envelope, prioritisation process, and budget scenario process

1.3 Objectives of Capital Expenditure Framework

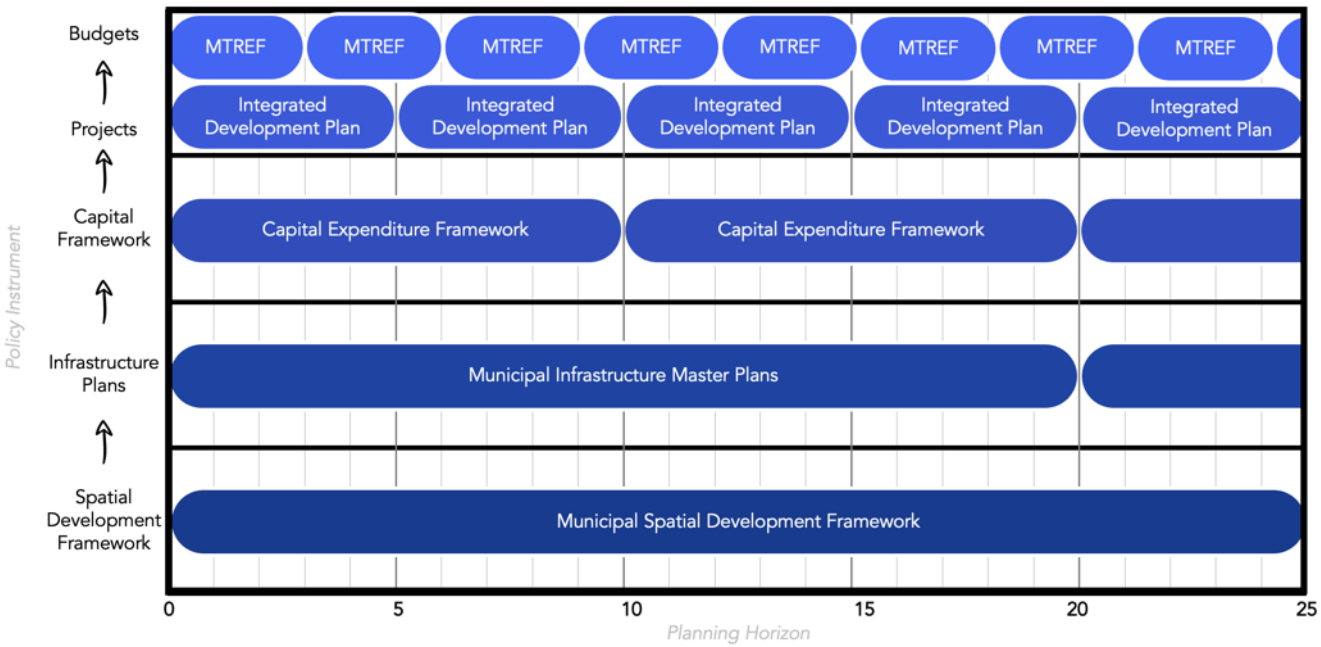
The key objectives of a CEF is to:

- Socio-economic trends: Understand the socio-economic trends in a municipality over the long term;
- Quantify Infrastructure Needs: Assess and detail the municipality's long-term infrastructure requirements based on an SDF-informed land use budget, infrastructure standards, anticipated socio-economic growth, existing infrastructure, and backlogs;
- Align with the Spatial Development Framework (SDF): Translate the spatial vision and strategic priorities outlined in the SDF into priority development areas which informs prioritisation practices;
- Consolidate Infrastructure Demand: Create a comprehensive list of infrastructure projects across various sectors in line with the municipality's mandate, reflecting the municipality's overall infrastructure demands;
- Contextualise Financial Affordability: Integrate the municipality's affordability envelope, derived from the Long-Term Financial Model (LTFM), to ensure infrastructure expenditure are financially sustainable over the planning horizon;
- Facilitate Prioritisation: Establish a framework to evaluate and rank projects based on strategic alignment, socio-economic impact, and spatial targeting amongst others, ensuring that resources are allocated to the most critical and impactful projects;
- Determine a Budget Scenario: Offer a structured, evidence-based approach to infrastructure planning and budgeting, improving decision-making processes and accountability to stakeholders - amongst others, to indicate project-level responses per asset type per functional area;
- Enable Spatial Transformation: Direct infrastructure investments toward spatial transformation goals, focusing on reducing inequalities, improving access to services, and promoting inclusive economic growth, and;
- Bridge Short-Term and Long-Term Planning: Ensure a coherent link between the short-term MTREF cycles, Medium-term Integrated Development Plan (IDP) cycles and the municipality's long-term development vision, embedding sustainability and foresight into the planning process.

1.4 Role of the Capital Expenditure Framework as a policy instrument

The Capital Expenditure Framework (CEF) is a cornerstone of municipal planning, grounded in South Africa's legislative framework and designed to bridge the gap between long-term spatial development strategies and actionable infrastructure expenditure. The concept of the CEF was formalised under the Spatial Planning and Land Use Management Act (SPLUMA, Act 16 of 2013), specifically in Section 21(n), which mandates municipalities to determine a spatially referenced CEF as part of their Spatial Development Framework (SDF). This legislative requirement reflects the increasing emphasis on aligning planning and budgeting processes to address developmental challenges effectively.

Historically, the Constitution of South Africa laid the foundation for this alignment in Section 153, which directs municipalities to prioritise the basic needs of communities while promoting socio-economic development through structured planning and budgeting. The Integrated Development Plan (IDP) was introduced as a mechanism to achieve this in the Local Government Transition Act (Act 209 of 1993), evolving through subsequent legislation, including the Municipal Systems Act (MSA, Act 32 of 2000). The MSA established the IDP as the principal planning instrument of local government, requiring it to incorporate a comprehensive financial plan and a Spatial Development Framework. This integration ensures that municipal resources are allocated effectively to achieve the long-term developmental vision.



The CEF builds on these legislative imperatives by operationalising the SDF within the IDP framework. As a long-term (10-year) planning tool, the CEF quantifies infrastructure needs, consolidates them into prioritised project pipelines, and aligns them with the municipality's financial capacity as outlined in the Long-Term Financial Plan (LTFP). It ensures that infrastructure investments are not only spatially targeted but also financially sustainable, bridging the divide between visionary spatial strategies and practical implementation.

The CEF also plays a vital role in South Africa's Local Government Accountability Cycle, a governance framework defined by the Municipal Finance Management Act (MFMA, Act 56 of 2003). This cycle integrates planning, budgeting, and reporting processes to ensure transparency, accountability, and alignment with development priorities. Through informing the IDP, and so the Medium-Term Revenue and Expenditure Framework (MTREF), as well as the Service Delivery and Budget Implementation Plan (SDBIP), the CEF enables municipalities to stabilise their decision-making processes. It provides a consistent rationale for allocating resources, ensuring that both short-term operational needs and long-term developmental objectives are addressed.

Importantly, the CEF institutionalises long-term planning practices within municipalities. It encourages decision-makers to adopt a forward-looking perspective that considers future growth patterns, socio-economic trends, and financial constraints. This approach reduces the reactive nature of municipal budgeting, replacing it with proactive, evidence-based strategies that support equitable service delivery and spatial justice.

The CEF is a transformative policy instrument that integrates spatial, financial, and infrastructure planning within the legislative and operational frameworks of municipal governance. It strengthens the IDP as the single most strategic document of municipalities, ensures alignment with the SDF, and guides resource allocation through the MTREF and SDBIP. Through its structured and integrated approach, the CEF enables municipalities to achieve their developmental mandates while ensuring financial sustainability and fostering spatial transformation.

Figure 1-3: The relationship between policy instruments effecting the spatial form

1.5 Structure of this Capital Expenditure Framework

The structure of this report is outlined below to guide the reader through the key components of the Capital Expenditure Framework (CEF) and its alignment with municipal planning processes as well as the norms and standards of the CEF.

Table 1-1: Structure of this Capital Expenditure Framework

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 1: Inception and Information Gathering	Phase 1	To provide a contextualisation to the Capital Expenditure Framework. This phase comprises the inception process of the CEF as well as the information gathering process in which a comprehensive integrated infrastructure investment framework, or portfolio of projects, is collated.
Part 2: Functional Area and Spatial Category for Investment Planning Profiling and Spatial Demand Quantification	Phase 2a	This part introduces functional areas for priority investment which are defined and mapped to indicate the spatial strategy depicted in the MSDF (linked to the MSDF proposals). The identified functional areas are used to determine the future population, housing, and land demand based on existing socio-economic and related data which is used in the spatial demand quantification component.
Part 3: Infrastructure demand	Phase 2b	This part determines the investment requirements for each functional area, including operational and maintenance costs per asset class. The goal is to compare the optimal infrastructure requirements scenario with the known infrastructure demand based on current planning frameworks.
Part 4: Affordability Envelope	Phase 3	This part is a reflection of the municipality's financial health and long-term financial plan. Primarily it includes the results of the re-application of the long-term financial plan to determine the appropriate affordability envelope.
Part 5: Prioritisation and Budget Scenario	Phase 4	This part has a prioritisation framework that considers spatial, engineering, and financial factors to calculate a composite score indicating each project's relative importance in the pipeline. It also applies this framework to the budget fit process to determine how to allocate capital within the affordability envelope per project for the next 10 years.
Part 6: Capital Expenditure Programme	Phase 5	This part is a breakdown of the 10-year capital expenditure framework. Essentially, it analyses the fitted project pipeline in terms of spatial alignment, asset type alignment, and other attributes to ultimately verify that the 10-year capital expenditure framework is in line with the strategic intent of the prioritisation framework and the MSDF objectives.
Part 7: Institutional Arrangements and Project Closeout	Phase 6	This phase comprises of a concluding chapter to the CEF, this part aims to identify areas of enhancement that will render the CEF not only as a compliance document but to solidify institutional change around the alignment of planning, engineering, and financial practices – with the ultimate aim to improve service delivery. Furthermore this phase contains a final close-out report detailing the project timeline and conclusions drawn.

Phase 1

Portfolio

2 Portfolio of Projects

2.1 Contextualisation

This report presents an extensive and comprehensive assessment of all infrastructure projects required for the forthcoming 10-year period as identified by the municipality. This evaluation consolidates projects derived from various consultations with officials, master and strategic documentation, including the Integrated Development Plan (IDP), Infrastructure Master Plans, Sector Plans, and proposals from the Municipal Spatial Development Framework (MSDF), covering both municipal-wide and settlement scale projects intended for implementation. The core purpose of this section is to collate all identified infrastructure needs, whether about new developments, renewals, or maintenance endeavours, into a unified, comprehensive set to further better strategic decision-making as part of the CEF. The output of this section culminates in the formulation of a consolidated table, detailing key attributes of infrastructure expenditure requirements of the municipality reflecting the 10-year capital project portfolio.

2.2 Portfolio Of Projects: Contextualising The Source

To determine a collated set of infrastructure needs identified by the municipality, several municipal documents need to be considered. In addition to Table 2-1 which provides a summary of all the municipality's masterplans and other related strategic documents serving as informants, to ultimately compile a collated portfolio of projects representative of the capital needs identified by the municipality.

Table 2-1: Source Document Register

Service Type	Plan Name	Updated Year	Planning Horizon
Strategic Planning	Water Services Development Plan (WSDP), with specific extracts from Topics 4 and 7	2019/2025	5-10 Year
Master Planning	Water Master Plan (WMP)	2019/2024/2025	20 Year
Master Planning	Sewer Master Plan (SEWMP)	2019/2024/2025	20 Year
Master Planning	Electrical/Energy Master Plan (MEMP)	2022/2023	20 Year
Master Planning	Comprehensive Integrated Transport Plan Freight Strategy(CITP)	2025	15-20 Year
Master Planning	Roads Master Plan	2022	20 Year
Sector Planning	Human Settlements Plan (HSP)	2023	5-10 Year
Budget/Implementation	Service Delivery and Budget Implementation Plan (SDBIP)	2025/2026	1 Year
Budget/Implementation	Capital Investment Plan (CIP)	2025	10 Year
Regional Study	Greater Cape Town Regional System Phase 2 (GCTRS)	2025/2026	Regional
Budget/Implementation	Water Services Audit	2022/2023	1 Year
Budget/Implementation	Capital Budget Book	2025-2028	3 Years
Master Planning	Master Plan Report	2015	20 Year

Table 2-1 includes master plans for various service types about strategic, master, sector, and budget planning. They are utilised to extract project information towards the collation of a consolidated portfolio of projects.

2.2.1 Water Services Development Plan

The goal of this document is to fulfil legal requirements under the Water Services Act to report on water services strategies and compliance. It provides a strategic framework for water services management, focusing on demographics, service levels, and asset management. Specific extracts detail the operations, maintenance, and financial standards required to sustain municipal infrastructure.

2.2.2 Water Master Plan

This document provides an analysis of water distribution systems by linking hydraulic computer models to treasury billing and meter data. The plan evaluates present and future water demand over a 20-to-50-year planning horizon to identify necessary system reinforcements. It details the required capital works for system augmentation to accommodate anticipated urban growth.

2.2.3 Sewer Master Plan

The goal of this plan is to provide a comprehensive evaluation and implementation framework for the sanitation network. It utilises calibrated computer models to assess the capacity of collector and outfall sewers in response to urban densification. The document identifies critical infrastructure projects phased for capital expenditure

2.2.4 Electrical/Energy Master Plan (MEMP

Developed to establish electricity pathways with a focus on decarbonisation and energy security. It analyses the potential for rooftop solar PV and renewable energy to reduce reliance on Eskom and mitigate load-shedding. The document outlines a least-cost capacity expansion plan for wind, solar, and battery storage.

2.2.5 Comprehensive Integrated Transport Plan & Freight Strategy (CITP)

The CITP serves as the framework for managing transport matters, including the integration of multi-modal passenger services. It outlines strategies to restore rail functionality and expand bus rapid transit. The embedded Freight Strategy focuses on alleviating road congestion by promoting a modal shift from road to rail.

2.2.6 Roads Master Plan

The purpose of this plan is to assist authorities in the coordinated planning and funding of transportation infrastructure. It employs a transport model to assess traffic volume trends, identifying where new roads or upgrades are essential. The plan prioritises catalyst projects designed to alleviate congestion within industrial and CBD nodes.

2.2.7 Human Settlements Plan (HSP)

The goal of this plan is to ensure all income groups have access to safe, responsible housing. It utilises a "Housing Pipeline" to manage diverse programmes, including informal settlement upgrades and social housing. The document provides a schedule of projects that coordinates land acquisition with bulk infrastructure provision.

2.2.8 Service Delivery and Budget Implementation Plan (SDBIP)

This document acts as a management tool that translates the municipality's strategies and annual budget into measurable performance targets. It outlines quarterly deliverables and tracks Key Performance Indicators (KPIs) for infrastructure projects. It is essential for ensuring accountability in the implementation of the portfolio of projects.

2.2.9 Capital Investment Plan

The goal of the CIP is to highlight long-term infrastructure requirements and allocate capital demand budgets through 2035. It provides a realistic portfolio of projects linked to a multi-year implementation framework, ensuring financial sustainability. The document identifies future sanitation and water projects necessary to meet projected demand growth.

2.2.10 Greater Cape Town Regional System Phase 2 (GCTRS)

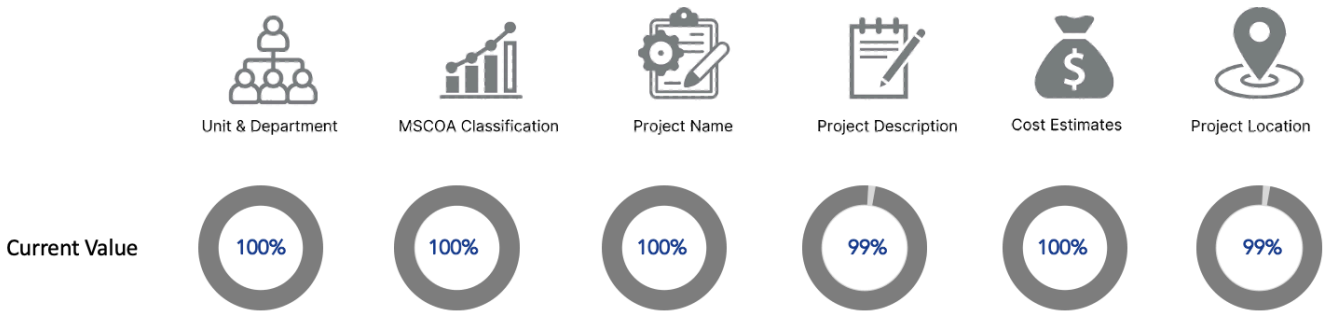
This regional study provides an evidence-based infrastructure systems analysis for the convergence of Cape Town, Drakenstein, and Stellenbosch. The last of which is of concern to this document. It focuses on regional interdependencies, such as shared water supply and transport corridors. The document aims to guide sustainable development that aligns with regional infrastructure capacity.

2.2.11 Water Services Audit

This annual report monitors municipal compliance with the Water Services Act. It provides a detailed overview of the water balance, including treated volumes and non-revenue water losses. The audit assesses the performance of services through quality compliance evaluations and Blue and Green Drop status reporting.

2.2.12 Capital Budget Book

This book details the Medium-Term Revenue and Expenditure Framework (MTREF), specifically allocating funds for infrastructure services over three years. It identifies funding sources, such as grants and external loans, and lists specific capital expenditure projects that align with master plan priorities. Of key concern when drawing from this document is ensuring duplicate checks against the SDBIP.



2.2.13 Master Plan Report

The primary goal of this report was to prepare an infrastructure master plan to guide the long-term development and renewal of the power network. It provides a condition assessment of existing assets and establishes timelines for projects based on different growth scenarios. It remains a baseline for understanding capacity limits and redundancy requirements.

2.3 Collated Portfolio of Projects

After meticulous analysis and interrogation of the various source documents, it was possible to compile a collated Portfolio of Projects and structure it in terms of several key attributes. The purpose of having one capital needs portfolio is to enable the municipality to make evidence-based, informed decisions during the process of prioritisation and capital budgeting. Figure 2-1outlines the completeness of data found in the portfolio of projects:

Figure 2-1: Breakdown of the Completeness of Portfolio

Key observations from Figure 2-1are noted below:

- Unit and department designations achieved 100% completion, although these assignments were primarily derived from the municipal organogram rather than direct departmental verification. While this ensures organisational alignment within the dataset, the municipality should review these assignments to confirm accuracy. Completeness in this category is critical, as unit and departmental attribution forms the basis for the subsequent project prioritisation and budget allocation processes.
- mSCOA classifications were completed at 100% during the compilation of the project portfolio. Required by National Treasury, these classifications capture the functional and financial nature of projects through the standardised mSCOA framework. This enables consistent reporting across the Function and Project lenses and facilitates integration with municipal financial systems during later stages of prioritisation and budgeting.
- Project names were captured at 100% completeness, providing the primary descriptor of project activities. In many cases, project names include references to locations or infrastructure types, making them a key source for spatial inference where detailed descriptions or coordinates are absent. As such, project names play an important role in supporting spatial categorisation during the CEF analysis.
- Cost estimates were captured at 100% completeness, indicating that all projects within the portfolio have associated expenditure estimates. It is important to note that these costs represent project demand rather than confirmed budget allocations and may span single or multiple financial years. Where a specific year was not indicated, costs were provisionally allocated to the first year of the CEF to maintain consistency in the dataset.
- Project descriptions were captured at 99% completeness, meaning that only a very small portion of projects lack detailed explanatory information. The high level of descriptive data significantly strengthens the interpretability of the portfolio by providing additional context regarding project scope, objectives, and intended outcomes.
- Project location data stands at 99% completeness, representing a very strong spatial information base for the subsequent CEF phases. While some locations may still rely on generalised references rather than precise geographic coordinates, the high level of spatial attribution substantially improves the

municipality's ability to conduct spatial prioritisation, assess alignment with the MSDF, and support evidence-based infrastructure planning.

2.3.1 Unpacking Projects Over Time

Unpacking projects over time provides insights into evolving demand trends, particularly when contextualised within the constraints of the Medium-Term Revenue and Expenditure Framework (MTREF), which anchors municipalities to a three-year budget cycle. This short-term focus often limits strategic foresight. The Capital Expenditure Framework (CEF), with its 10-year planning horizon, expands this perspective, enabling municipalities to align their capital planning with longer-term developmental trajectories. This approach bridges immediate fiscal constraints and the vision for sustainable infrastructure investment, ensuring alignment with broader municipal spatial strategies, such as those outlined in Integrated Development Plans (IDPs) and Spatial Development Frameworks (SDFs).

Emphasising long-range planning, the CEF nurtures a robust project pipeline grounded in sectoral and integrated municipal plans. While extending the planning horizon enhances strategic foresight, it also introduces challenges in precisely projecting capital needs, as uncertainties increase over time. This often results in a lack of planning for project-based expenditure in the latter years of the CEF. Nevertheless, collating planning initiatives across disciplines is invaluable in refining infrastructure strategies, prioritising expenditure, and informing annual budget allocations under the MTREF. Ultimately, this iterative process promotes fiscal discipline and sustainable growth while reinforcing the alignment of municipal investments with long-term spatial and developmental objectives.

Figure 2-2: Total Project Demand per Year

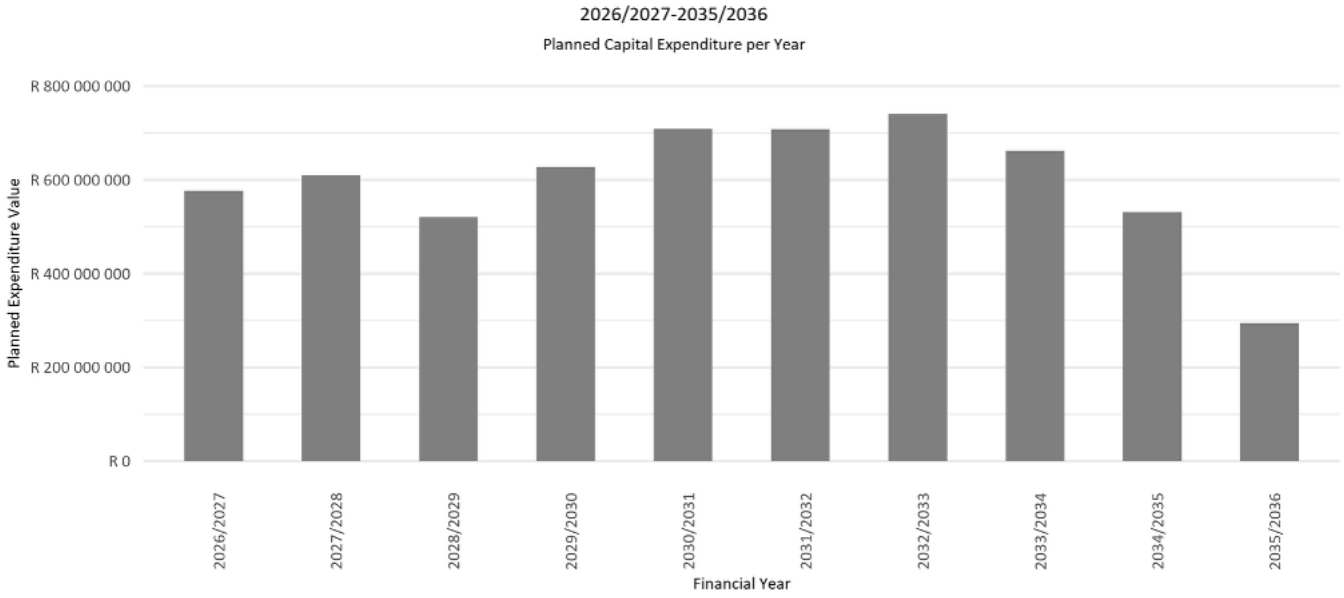


Table 2-2: Total Project Demand per year

Financial Year	Total Planned Capital Expenditure	Percentage
2026/2027	R 576 301 851	9.64%
2027/2028	R 610 030 198	10.20%
2028/2029	R 520 771 404	8.71%
2029/2030	R 627 581 768	10.49%
2030/2031	R 708 512 005	11.85%

Financial Year	Total Planned Capital Expenditure	Percentage
2031/2032	R 708 326 015	11.85%
2032/2033	R 740 801 328	12.39%
2033/2034	R 661 807 825	11.07%
2034/2035	R 531 603 395	8.89%
2035/2036	R 294 095 000	4.92%
Total	R 5 979 830 789	100%

Key observations from Figure 2-2 and Table 2-2 are noted below:

- The dataset reveals 28.55% of total 10-year demand concentrated within the MTREF cycle (2026/27-2028/29), demonstrating continued alignment between the municipality's medium-term budgeting horizon and its broader infrastructure planning pipeline. Capital demand during this period ranges between R520.8 million and R610.0 million per year, reflecting projects that are already defined within sectoral plans and municipal planning frameworks.
- Capital demand remains consistently strong during the first six years of the planning horizon. The period 2026/27-2031/32 collectively represents 62.74% of total portfolio demand, indicating that the municipality maintains a substantial medium-term project pipeline. Expenditure gradually increases during this period, reaching R708.5 million in 2030/31 and remaining stable in 2031/32 (11.85%), before moderating in the outer years as currently identified projects approach the limits of existing master plan horizons.
- The gradual reduction in planned expenditure in the outer years, from R740.8 million in 2032/33 to R294.1 million in 2035/36, reflects the natural tapering of project identification beyond the primary planning cycles of sector master plans rather than a planning deficit. The final three years collectively account for 24.88% of total demand, suggesting that while long-term planning exists, continued project identification during future master plan reviews would further strengthen the municipality's longer-term infrastructure pipeline.
- The relatively balanced distribution of capital demand across the first half of the planning period indicates a mature medium-term planning capacity, where infrastructure requirements are distributed across multiple years rather than concentrated in a single peak year. This pattern supports more predictable capital programming and allows the municipality to align infrastructure implementation with evolving service delivery priorities, spatial development objectives, and financial planning cycles.

2.3.2 Unpacking Projects Per Unit And Department

The portfolio of projects per Unit and Department, as summarised in Figure 2-3 and Table 2-3 offers valuable insights into the distribution of projects and their associated costs within the organisational structure. This perspective allows us to discern the specific Units and Departments that are more engaged in infrastructure development or have projects with a higher total cost over the analysis period. By unpacking the portfolio in this manner, we gain a comprehensive understanding of the demand for projects and the required allocation of resources across different areas of responsibility within the municipality. This view enables us to identify potential Units with a good understanding of the need for their respective services across the municipality, and conversely, areas that might require further attention or additional support. Additionally, it enables and ultimately facilitates effective project management practices, as it provides a clear maturity of understanding project-based responses required to respond to the identified need in the municipality.

Through this analysis, the municipality can identify Units that require additional support in project preparation and project-based responses to needs identified to ultimately improve prioritisation and budgeting practices in the municipality.

Figure 2-3: Total Project Demand per Unit

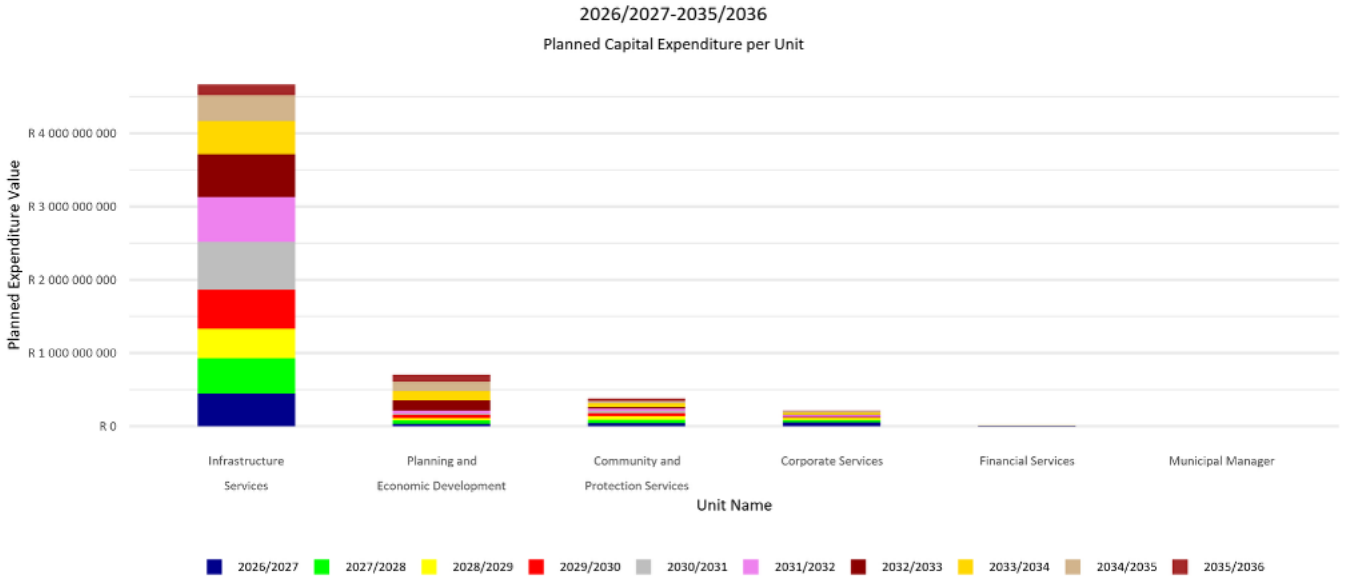

Table 2-3: Total Project Demand per Unit

Financial Year	Infrastructure Services	Planning and Economic Development	Community and Protection Services	Corporate Services	Financial Services
Number of Projects	154	25	59	22	5
2026/2027	R 445 794 308	R 33 925 761	R 40 521 782	R 52 100 000	R 3 900 000
2027/2028	R 483 504 003	R 45 553 369	R 47 512 826	R 31 150 000	R 2 250 000
2028/2029	R 401 190 990	R 32 152 739	R 55 937 675	R 31 180 000	R 250 000

%	78.08%	11.77%	6.33%	3.61%	0.19%

Notable findings from Figure 2-3 and Table 2-3 are outlined as follows:

The distribution of capital demands across municipal units provides critical insights into the municipality's strategic priorities and operational focus. This analysis examines demand patterns within departmental structures, identifying areas requiring sustained investment and their alignment with Stellenbosch's long-term spatial and developmental objectives. Key observations are noted below:

- Infrastructure Services dominates the capital portfolio, accounting for 78.08% of total demand (R4.67 billion across 154 projects). This concentration reflects the unit's mandate for core engineering services, including water and sanitation infrastructure, road networks, stormwater systems, and electricity distribution services. Planning and Economic Development represents 11.77% (R703.7 million across 25 projects), followed by Community and Protection Services at 6.33% (R378.7 million

across 59 projects). Corporate Services accounts for 3.61% (R216.1 million across 22 projects), while Financial Services represents a marginal 0.19% (R11.4 million across 5 projects). This distribution demonstrates a strong prioritisation of service delivery infrastructure while maintaining supporting investments in administrative and social infrastructure.

- Within Infrastructure Services, demand concentration reflects strategic prioritisation of bulk infrastructure serving both urban settlements and dispersed rural areas. Water and sanitation projects address service delivery requirements across residential areas, wine estates, and agricultural holdings, whilst road infrastructure supports rural connectivity, tourism accessibility, and urban mobility. Planning and Economic Development's allocation reflects investments related to housing development, spatial planning initiatives, and economic infrastructure supporting compact settlement patterns and sustainable growth.
- The capital demand distribution demonstrates strong alignment with spatial and economic development priorities articulated in the MSDF and IDP. Infrastructure Services' dominance supports the consolidation of infrastructure within existing settlement areas while extending essential services to underserved communities. Planning and Economic Development's allocation enables spatial transformation initiatives, housing development programmes, and strategic economic interventions. Community and Protection Services' allocation supports social infrastructure such as public safety facilities, parks, community amenities, and emergency services, contributing to equitable service delivery across settlements.
- Financial Services' limited allocation (0.19%) reflects the relatively low capital-intensive nature of financial management functions, with most requirements addressed through operational budgets rather than capital projects. While the concentration of capital demand within Infrastructure Services is consistent with municipal service delivery mandates, the distribution highlights opportunities to further strengthen capital programming in areas such as economic development, climate resilience, and digital infrastructure to support broader municipal development objectives.

Figure 2-4: Total Project Demand per Unit and Department

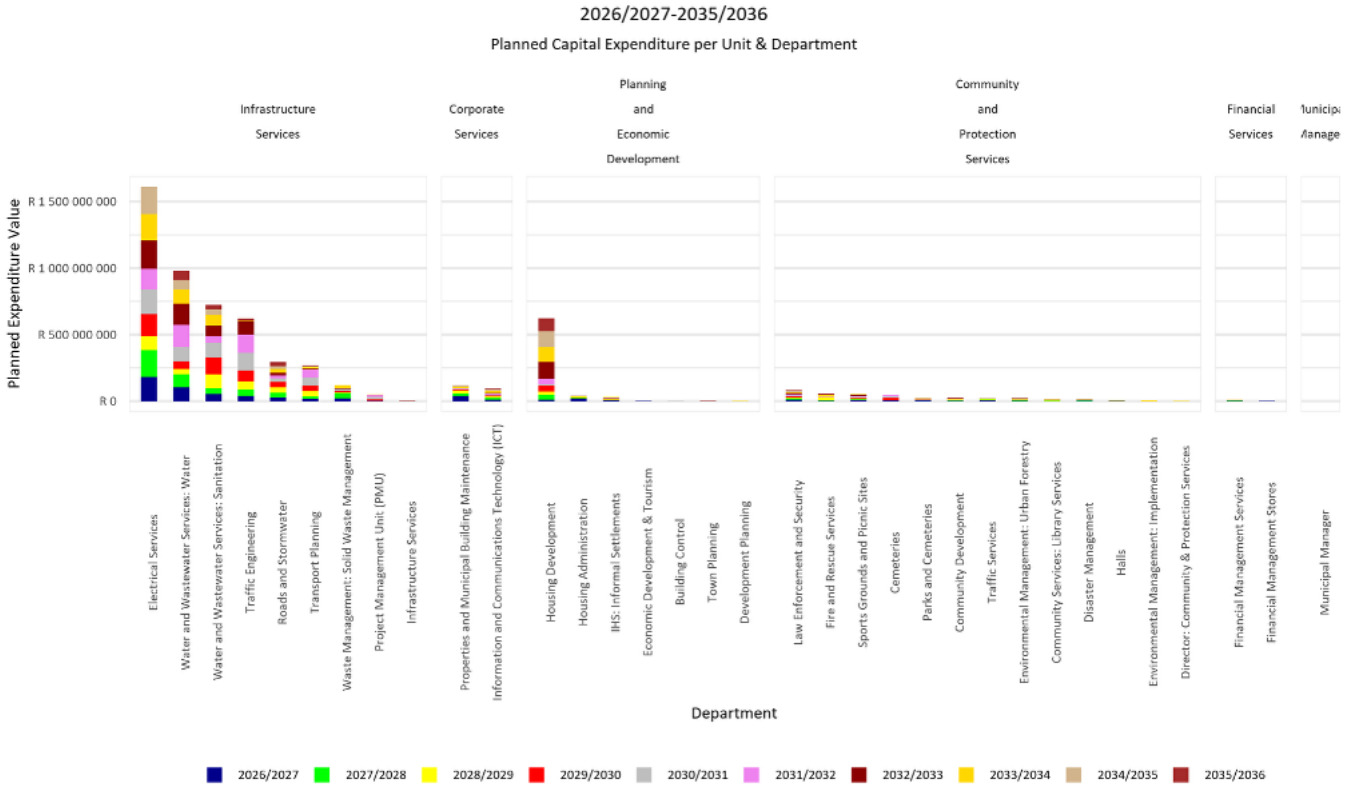

Table 2-4: Total Project Demand per Unit and Department

Unit / Department	Number of Projects	Total Planned Capital Expenditure	Percentage

Municipal Manager Total	1	R 540 000	0.01%
Total	266	R 5 979 830 789	100%

Notable findings from Figure 2-4 and Table 2-4 are outlined as follows:

- Four core infrastructure departments dominate the capital demand portfolio. Electrical Services (26.95%, R1.61 billion), Water and Wastewater Services: Water (16.42%, R982.1 million), Water and Wastewater Services: Sanitation (12.10%, R723.3 million), and Traffic Engineering (10.36%, R619.6 million) collectively account for 65.83% of total municipal demand. This strong concentration within traditional engineering functions reflects the municipality's primary mandate of delivering and maintaining essential bulk infrastructure services.
- Transport and mobility infrastructure remains a significant component of the portfolio. Traffic Engineering (10.36%, R619.6 million) and Transport Planning (4.49%, R268.7 million) together represent 14.85% of total capital demand, demonstrating a comprehensive approach to mobility infrastructure extending beyond conventional road construction to include traffic management, safety interventions, and integrated transport planning supporting spatial transformation objectives.
- Roads and Stormwater infrastructure accounts for 4.93% of total demand (R295.1 million). While smaller than electrical and water investments, these projects remain critical to maintaining network resilience and supporting urban mobility. Given increasing climate variability and storm events, the municipality may consider strengthening long-term stormwater infrastructure planning to improve flood resilience and drainage capacity.
- Within Planning and Economic Development, Housing Development dominates the unit's capital demand, accounting for 10.40% of the total municipal portfolio (R621.9 million across 10 projects). This substantial allocation reflects the municipality's commitment to addressing housing demand and supporting spatial transformation through planned housing programmes. Other planning functions such as Housing Administration (0.73%), Informal Settlements (0.53%), and Economic Development & Tourism (0.05%) represent comparatively modest investment levels.
- Community and Protection Services collectively account for 6.33% of total demand (R378.7 million), distributed across multiple social and safety-related functions. Key investments include Law Enforcement and Security (1.41%), Fire and Rescue Services (0.93%), Sports Grounds and Picnic Sites (0.92%), and Cemeteries (0.76%), reflecting investments in community safety, public amenities, and social infrastructure supporting quality of life across the municipality.
- Corporate Services represents 3.61% of total capital demand (R216.1 million), with investment split between Properties and Municipal Building Maintenance (2.01%) and Information and Communications Technology (ICT) (1.60%). These projects support institutional capacity, digital transformation, and maintenance of municipal facilities required for effective governance and service delivery.
- Financial Services accounts for only 0.19% of capital demand (R11.4 million), reflecting the limited capital-intensive requirements of financial management functions. Similarly, the Municipal Manager's office accounts for a minimal 0.01% (R540 000), indicating that most strategic and administrative functions rely primarily on operational rather than capital budgets.

2.3.3 Analysing Through The Municipal Standard Chart Of Accounts (mSCOA) Perspective

National Treasury has implemented Integrated Financial Management and Internal Control System processes for local government. Key to this is the implementation of the Regulation of a Standard Chart of Accounts, commonly referred to as the Municipal Standard Chart of Accounts (mSCOA). mSCOA makes provision for a uniform and standardised financial transaction classification framework as per the Municipal Regulations and Standard Chart of Accounts as gazetted on 22 April 2014 (Gazette No 37577). Figure 2-5 shows a summary of the Municipal Chart of Accounts regulated segment classifications. mSCOA brings several benefits to municipalities and local governments in South Africa by standardising

reporting practices. One of the key benefits is the ability to standardise the understanding of projects and facilitate meaningful comparisons.

Figure 2-5: mSCOA Segment Classification

Project Scope (using mSCOA)										
Project segment			Fund segment	Function segment		Region segment			Item Assets sub-segment	Costing segment
Expenditure			Capital	Core	Non-core	(Municipal-specific)	City-wide	Administrative HQ	Non-current assets	-
Class	Action	Type								
Sub-class	Sub-action	Sub-type								
		Detail-sub-type								
		Component-detail-sub-type								

a. Unpacking Projects per Action and Sub-Action

Examining projects per action and sub-action provides valuable insights into the distribution of the portfolio of projects. The project Action and Sub-Action component of the Project Segment within mSCOA is an umbrella term that includes a "New" or "Existing" project. Sub-actions for an "Existing" project include "Upgrade" or "Renewal". For ease of reference, the category descriptions are as follows:

- New: Capital projects to provide new assets to meet the current and future growth demands;
- Existing: Capital projects to provide an upgrade or renewal to an asset to meet the current and future demands;
- Existing – Upgrade: Upgrade projects are generated according to the requirement for the replacement of a part of an asset component to increase the current capacity of the asset, and;
- Existing – Renewal: Replacing existing infrastructure that has reached a Remaining Useful Life (RUL) of zero, while providing the same capacity and service.

This analysis allows us to determine whether the capital expenditure demand lies in new projects or is predominantly focused on existing projects, particularly those related to renewal or upgrading. By unpacking projects in this manner, we gain a comprehensive understanding of the quantum of projects falling under each action and sub-action, as well as their related expenditure requirements.

This information enables us to gauge the extent to which the municipality is emphasising infrastructure expansion versus maintaining and enhancing existing assets. It further aids in formulating strategic plans and prioritising initiatives to effectively meet the future needs of the municipality.

Figure 2-6: Total Demand per Action and Sub-Action

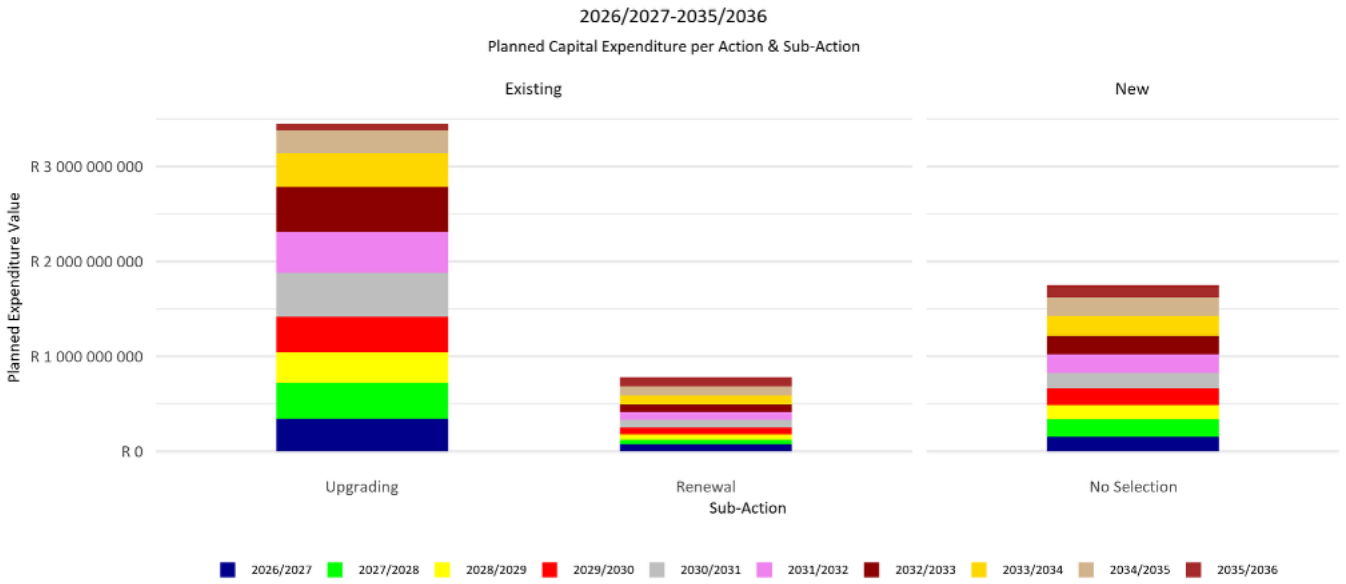

Table 2-5: Total Demand per Action and Sub-Action

Action – Sub Action	Existing - Upgrading	Existing - Renewal	New - No Selection	New:Existing Ratio
2026/2027	R 344 994 907	R 76 986 500	R 154 320 444	1:2.73
2027/2028	R 377 660 582	R 47 791 051	R 184 578 565	1:2.3
2028/2029	R 319 711 304	R 53 110 034	R 147 950 066	1:2.52
2029/2030	R 374 952 375	R 75 057 436	R 177 571 957	1:2.53
2030/2031	R 464 265 969	R 80 368 079	R 163 877 957	1:3.32
2031/2032	R 432 834 979	R 82 693 079	R 192 797 957	1:2.67
2032/2033	R 468 464 920	R 78 606 814	R 193 729 594	1:2.82
2033/2034	R 356 470 649	R 93 441 979	R 211 895 197	1:2.12
2034/2035	R 242 409 019	R 95 776 623	R 193 417 753	1:1.75
2035/2036	R 64 550 000	R 97 305 000	R 132 240 000	1:1.22
Total	R 3 446 314 704	R 781 136 595	R 1 752 379 490	1:2.41
%	57.63%	13.06%	29.30%	1:2.41

Notable findings from Figure 2-6 and Table 2-5 are outlined as follows:

The analysis of capital demand through the mSCOA asset action classification provides important insight into how the municipality balances infrastructure expansion with the stewardship of its existing asset base. By distinguishing between new asset creation, upgrading, and renewal activities, the distribution reveals the strategic orientation of the capital programme and its alignment with long-term infrastructure sustainability principles. Key observations are noted below:

- The municipality allocates 29.30% of total capital demand (R1.75 billion) to New projects, while 70.69% of demand is directed toward Existing infrastructure, comprising 57.63% for Upgrading (R3.45 billion) and 13.06% for Renewal (R781.1 million). This distribution reflects a portfolio that remains predominantly focused on strengthening existing infrastructure systems rather than pursuing extensive greenfield expansion. The prominence of upgrading investments indicates that much of the municipality's infrastructure strategy is centred on improving capacity, performance, and efficiency within established service networks.
- The 29.30% allocation to new infrastructure suggests that the municipality continues to face meaningful growth pressures and service delivery expansion requirements. While the proportion

exceeds the commonly referenced 10–20% guideline, it reflects the reality that municipalities experiencing urban growth and historical infrastructure backlogs must periodically expand their infrastructure footprint. From a financial perspective, however, each new asset introduces long-term operational commitments, including maintenance, energy consumption, and staffing requirements. Managing these lifecycle costs will therefore remain an important consideration as the municipality evaluates the affordability of future expansion.

- The substantial emphasis on upgrading existing infrastructure (57.63%) highlights a strategy focused on extracting additional value from the current asset base. Rather than replacing infrastructure prematurely or expanding networks extensively, upgrading allows the municipality to increase capacity, modernise systems, and improve service standards while making use of established infrastructure corridors. In spatially constrained environments such as Stellenbosch—where heritage protection, environmental sensitivities, and established settlement patterns influence development—this approach enables infrastructure to adapt to growth without requiring large-scale spatial expansion.
- The renewal allocation of 13.06% (R781.1 million) remains somewhat below the 15–25% range typically associated with mature municipal infrastructure portfolios. While this level of investment still represents a meaningful commitment to asset replacement, it suggests that renewal may be slightly underrepresented relative to long-term infrastructure depreciation trends. Ensuring that renewal investments remain aligned with asset condition assessments will therefore be important to avoid the gradual accumulation of deferred replacement requirements that could create larger financial pressures in future planning cycles.
- The overall New:Existing ratio of approximately 1:2.41 demonstrates that the municipality's infrastructure planning framework is fundamentally oriented toward sustaining and strengthening its existing service networks. This balance broadly aligns with good asset management practice, where infrastructure expansion is moderated by the need to maintain and optimise the performance of existing assets. Over time, however, progressively strengthening the renewal component of the programme would further enhance the long-term sustainability of the municipal infrastructure portfolio.

The temporal sequencing of these investment categories suggests that both expansion and enhancement initiatives are prioritised within the earlier years of the planning horizon, where project readiness and financial certainty are strongest. As infrastructure networks continue to age and service demands evolve, strengthening whole-of-life cost modelling, asset condition monitoring, and long-term asset management planning will help ensure that future capital investment decisions remain financially sustainable and operationally resilient.

b. Unpacking Projects per Asset Type and Sub-Type

The Municipal Standard Chart of Accounts (mSCOA) provides a structured framework for the classification of municipal projects under asset types and sub-types. This classification enables detailed analysis of project distribution and alignment with municipal financial and operational structures.

- mSCOA Asset Types: Asset types are high-level categories that group municipal assets for coherent planning, budgeting, and reporting. These ensure consistent alignment across all municipal transactions.
- mSCOA Asset Sub-Types: Sub-types offer a more granular view, breaking down the asset types into specific categories. This granularity aids in tracking, managing, and analysing municipal assets and expenditures effectively.

By using the asset types and sub-types within mSCOA, this approach provides a nuanced perspective on how projects are distributed and categorised within the Project Class. By scrutinising the portfolio from this angle, insights are gained into which specific asset types and sub-types are prominent within the project class.

This analysis not only highlights the distribution of projects across various asset types but also underscores their alignment with the municipality's financial classification system. This process facilitates more informed decision-making, resource allocation, and strategic planning, as it ensures that projects align with financial priorities and objectives. Through this lens, the municipality can effectively optimise project selection, maximise resource utilisation, and ensure that infrastructure expenditure planning harmonises with the municipal objectives.

Figure 2-7: Total Demand per Asset Type and Sub-Type

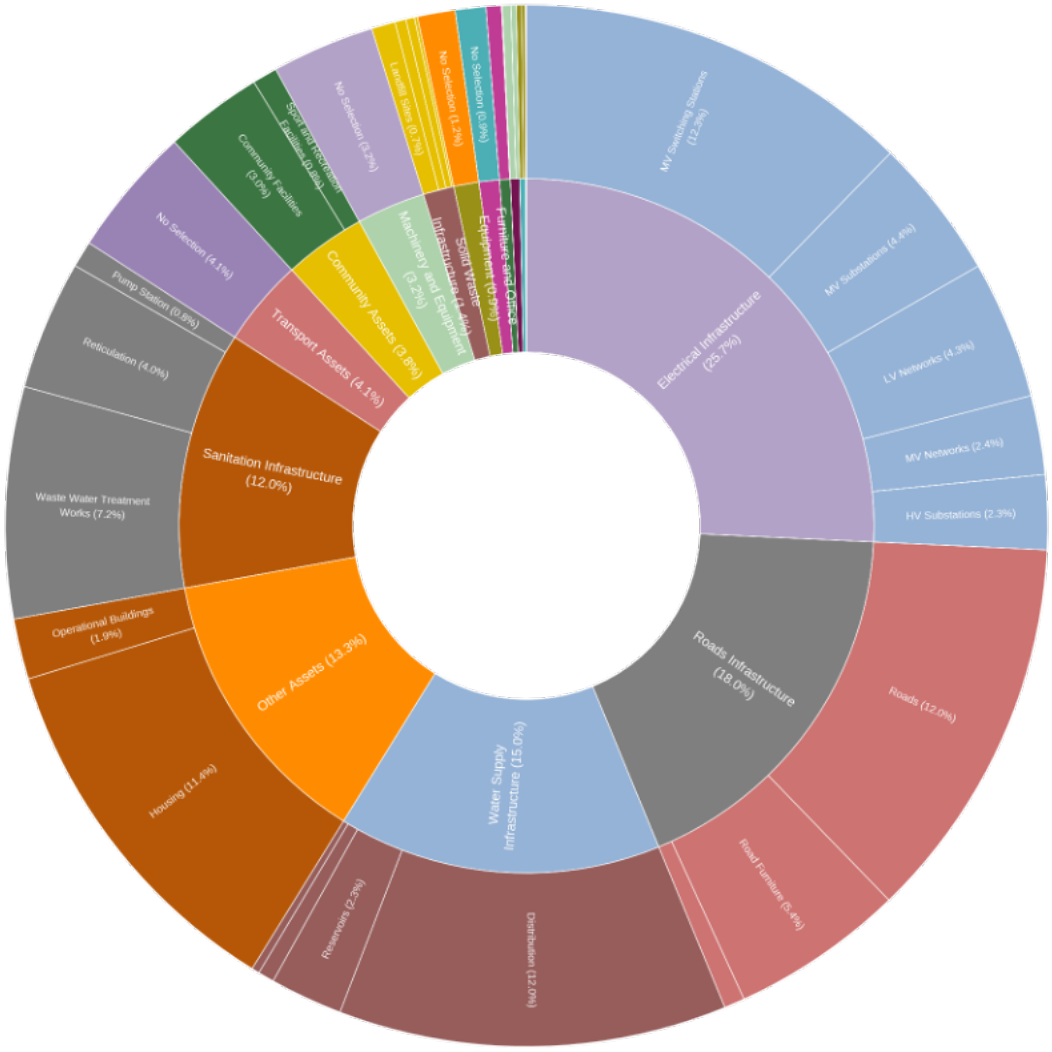

Table 2-6: Total Demand per Action Asset Type and Sub-Type

Asset Type	Asset Sub-Type	Total Planned Capital Expenditure	Percentage
Electrical Infrastructure		R 1 539 064 835	25.74%
	MV Switching Stations	R 735 554 911	12.30%
	MV Substations	R 262 352 504	4.39%
	LV Networks	R 256 502 564.02	4.29%

Asset Type	Asset Sub-Type	Total Planned Capital Expenditure	Percentage
	MV Networks	R 146 303 060	2.45%
	HV Substations	R 138 351 796	2.31%

	Water Treatment Works	R 14 500 000	0.24%
Other Assets		R 795 790 869	13.31%
	Housing	R 683 360 869.17	11.43%
	Operational Buildings	R 112 430 000	1.88%
Sanitation Infrastructure		R 718 187 850	12.01%
	Waste Water Treatment Works	R 429 322 850	7.18%
	Reticulation	R 240 115 000	4.02%
	Pump Station	R 48 750 000	0.82%
Transport Assets		R 242 235 000	4.05%
Community Assets		R 228 195 684	3.82%
	Community Facilities	R 181 995 684	3.04%
	Sport and Recreation Facilities	R 46 200 000	0.77%
Machinery and Equipment		R 190 846 293	3.19%
Solid Waste Infrastructure		R 86 141 917	1.44%
	Landfill Sites	R 44 000 000	0.74%
	Electricity Generation Facilities	R 20 500 000	0.34%
	Waste Drop-off Points	R 15 841 917	0.26%
	Waste Processing Facilities	R 5 800 000	0.10%
Computer Equipment		R 69 850 000	1.17%
Furniture and Office Equipment		R 56 735 592	0.95%
Intangible Assets		R 29 754 435	0.50%
	Licences and Rights	R 28 354 435	0.47%
	Computer Software and Applications	R 1 400 000	0.02%
Information and Communication Infrastructure		R 26 000 000	0.43%
	Core Layers	R 16 000 000	0.27%
	Distribution Layers	R 10 000 000	0.17%
Storm water Infrastructure		R 16 300 000	0.27%
	Storm water Conveyance	R 9 800 000	0.16%
	Drainage Collection	R 6 500 000	0.11%
Heritage Assets		R 2 150 000	0.04%
	Historic Buildings	R 2 150 000	0.04%
Total		R 5 979 830 789	100%

Notable findings from Figure 2-7 and Table 2-6 are outlined as follows:

The distribution of planned capital expenditure across asset types and sub-types reveals the municipality's strategic infrastructure priorities and service delivery focus. This analysis examines demand patterns for key assets, exploring implications for long-term planning and operational sustainability. Key observations are noted below:

- Electrical Infrastructure represents the largest component of the capital portfolio, accounting for 25.74% of total demand (R1.54 billion). Investment is concentrated primarily in MV Switching Stations (12.30%), MV Substations (4.39%), and LV Networks (4.29%), reflecting continued strengthening of the municipal electricity distribution network. These investments aim to enhance network reliability, accommodate demand growth, and support energy security across the municipality.
- Roads Infrastructure accounts for 18.05% of total demand (R1.08 billion), with the majority directed toward road surfaces (12.02%) and road furniture (5.38%). This distribution indicates continued investment in maintaining and upgrading the municipal road network to support mobility, economic activity, and tourism accessibility across both urban and rural areas.
- Other Assets represent 13.31% of total demand (R795.8 million), largely driven by housing development (11.43%), indicating substantial capital demand associated with housing delivery and spatial transformation initiatives. Operational buildings account for 1.88%, reflecting moderate investment in municipal facilities relative to housing programmes.
- Water Supply Infrastructure constitutes 15.04% of total demand (R899.4 million), primarily concentrated in distribution networks (12.04%) and reservoir infrastructure (2.26%), with smaller allocations to bulk mains (0.50%) and water treatment works (0.24%). This pattern suggests a focus on strengthening distribution capacity and storage infrastructure to accommodate population growth and maintain service reliability.
- Sanitation Infrastructure accounts for 12.01% of total demand (R718.2 million), with investment concentrated in wastewater treatment works (7.18%) and reticulation networks (4.02%). These investments reflect the need to expand treatment capacity and upgrade sewer networks to support urban growth and environmental compliance requirements.
- Community Assets represent 3.82% of total demand (R228.2 million), primarily allocated to community facilities (3.04%) and sport and recreation facilities (0.77%). These investments support social infrastructure provision and contribute to improved quality of life across settlements.
- Transport Assets (4.05%), Machinery and Equipment (3.19%), and Solid Waste Infrastructure (1.44%) collectively represent additional investments required to support municipal service delivery operations. Solid waste infrastructure demand focuses primarily on landfill sites (0.74%) and electricity generation facilities associated with waste infrastructure (0.34%), reflecting ongoing waste management capacity requirements.
- Several categories demonstrate relatively modest capital demand, including Computer Equipment (1.17%), Furniture and Office Equipment (0.95%), Information and Communication Infrastructure (0.43%), Intangible Assets (0.50%), and Stormwater Infrastructure (0.27%). These allocations suggest that most investment priorities remain focused on traditional engineering infrastructure, with comparatively limited investment in digital infrastructure and stormwater management.
- Heritage Assets account for only 0.04% of the portfolio, reflecting minimal capital demand for historic building preservation within the current project pipeline.

The demand distribution reveals a strong emphasis on traditional bulk infrastructure, particularly electrical, roads, water, sanitation, and housing-related assets, which collectively represent the majority of the municipal capital portfolio. While this reflects the municipality’s core service delivery mandate, the relatively modest investment in areas such as stormwater infrastructure, ICT systems, and digital

infrastructure suggests opportunities to strengthen future planning in support of climate resilience, technological modernisation, and integrated infrastructure management.

2.3.4 Unpacking Project Works Location

Using the project's spatial attributes allows the municipality to better understand spatial realities, ultimately informing locationally based decision-making. This analysis allows us to understand the specific areas targeted for development as per the Spatial Development Framework, as well as other spatial lenses. The location data reveals areas where capital demand is intended to take place, providing a clear understanding of the areas earmarked for expenditure requirements to either service growth or enhancement.

- Administrative HQ: The Administrative HQ serves as the central office for identifying expenditures linked to administrative and daily operational aspects.
- City-wide: City-wide services yield municipality-wide benefits, with specific details lacking for lower-level allocation.
- Not Mapped: "Not mapped" refers to items lacking spatial locations.
- Mapped: refers to all projects that have spatial locations linked to them.

Understanding these details becomes instrumental in assessing the equitable distribution of resources and infrastructure expenditure across the municipality. Additionally, it allows for spatially driven decision-making using location as one of the key prioritisation considerations. By scrutinising projects at this spatial level, the local government gains valuable insights into the geographic concentration of needs.

Figure 2-8: Total Demand per Location across the Municipality

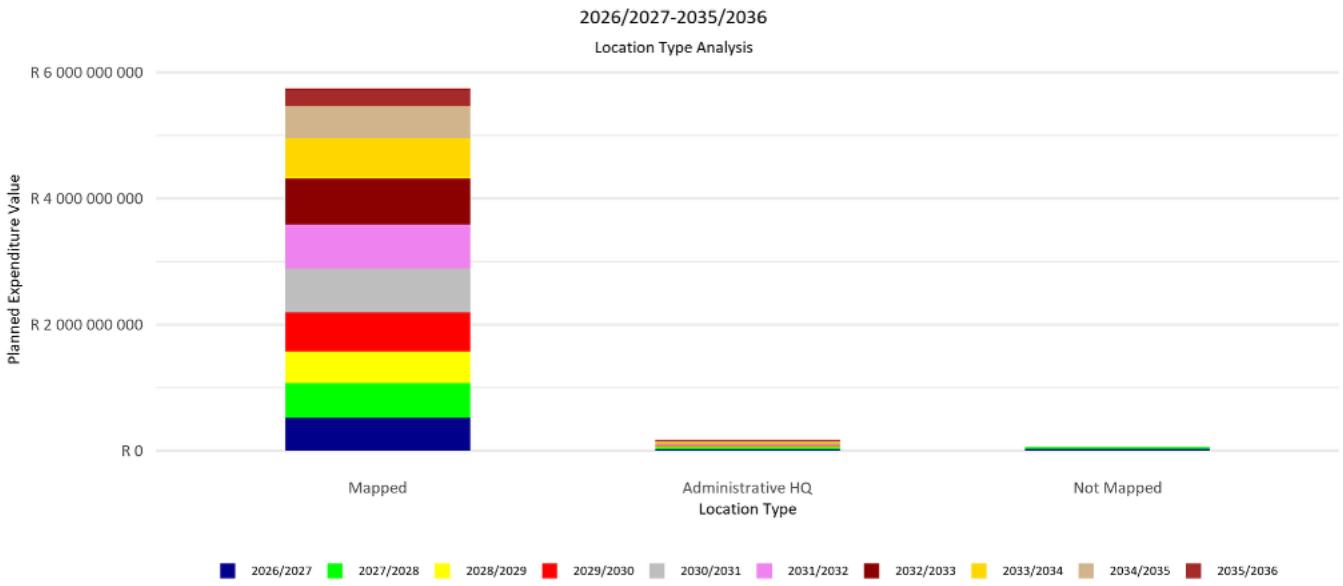

Table 2-7: Total Demand per Location across the Municipality

Financial Year	Mapped	Administrative HQ	Not Mapped	Total	Percentage	Financial Year
2026/2027	R 526 009 351	R 23 292 500	R 27 000 000	R 576 301 851	9.64%	2026/2027

Notable findings from Figure 2-8 and Table 2-7 are outlined as follows:

The categorisation of capital projects through spatial attributes provides critical insights into the municipality's capacity to align infrastructure investments with spatial priorities. This analysis examines how the distribution between Mapped, Administrative HQ, and Not Mapped projects affects strategic planning, spatial targeting, and the municipality's ability to implement MSDF objectives. Key observations are noted below:

- The overwhelming majority of planned capital expenditure, 96.06% of total demand (R5.74 billion), falls within the Mapped category. These projects possess identifiable spatial references that enable direct alignment with the municipality's spatial planning frameworks, including the MSDF and associated settlement strategies. This high proportion of spatially referenced projects reflects strong data quality and planning maturity, enabling targeted infrastructure investment and improved spatial prioritisation during subsequent CEF phases.
- Administrative HQ projects account for 2.90% of total demand (R173.5 million). These projects represent investments linked to municipal administrative facilities, central systems, and institutional infrastructure supporting operational governance and service delivery. The relatively modest proportion is appropriate given that administrative infrastructure primarily supports municipal operations rather than direct service delivery infrastructure.
- The dataset indicates 1.05% of capital demand classified as "Not Mapped" (R62.5 million). These projects represent a small number of initiatives where spatial references have not yet been captured or where project locations remain undefined during early planning stages. While this proportion is relatively minor, improving spatial referencing for these projects would further strengthen the municipality's ability to conduct location-based analysis and ensure alignment with spatial development priorities.
- The consistently high proportion of **Mapped projects across all years of the planning horizon—ranging from R526.0 million in 2026/27 to R273.8 million in 2035/36—**demonstrates sustained spatial alignment of the capital portfolio throughout the 10-year planning period. This consistency supports the municipality's ability to apply spatial prioritisation frameworks and evaluate infrastructure investment impacts across different settlements and development nodes.

The 96.06% mapped proportion reflects a high level of spatial data completeness, providing a strong foundation for spatially informed prioritisation and infrastructure planning. The near-complete spatial referencing of projects enhances the municipality's capacity to align capital investments with the MSDF, target infrastructure interventions within priority development areas, and support evidence-based decision-making in subsequent CEF phases. Continued maintenance of spatial data quality will ensure that infrastructure investment remains a key instrument for achieving the municipality's spatial transformation and service delivery objectives.

2.4 Concluding remarks

The analysis of planned capital expenditure reveals a substantial R5.98 billion portfolio, demonstrating strong planning capacity across the municipality. The portfolio is dominated by Infrastructure Services, accounting for 78.08% of total demand, reflecting the integration of sector master plans addressing electricity distribution, water supply, sanitation, transport, and road infrastructure. The concentration of 28.55% of total demand within the MTREF period (2026/27–2028/29) demonstrates alignment between medium-term budgeting processes and longer-term infrastructure planning. Furthermore, the high 96.06% spatial mapping proportion provides a robust foundation for location-based prioritisation, enabling the municipality to align capital investments with MSDF spatial objectives and settlement development priorities.

The distribution of projects across mSCOA action categories indicates a strong emphasis on upgrading existing infrastructure (57.63%), followed by new infrastructure development (29.30%) and renewal investments (13.06%). While the prominence of upgrade investments reflects a strategic focus on enhancing existing infrastructure capacity, the relatively modest allocation to renewal remains slightly below the 15–25% range typically observed in mature municipal asset portfolios. As the municipality advances toward project prioritisation, validating renewal requirements against asset condition assessments will be important to ensure that long-term infrastructure deterioration risks are adequately addressed.

The temporal distribution of project demand demonstrates that 62.74% of planned expenditure is concentrated within the first six years of the planning horizon, reflecting well-developed medium-term planning supported by existing sector master plans. The gradual decline in demand in the outer years of the portfolio reflects the natural limits of current planning frameworks rather than a lack of need for infrastructure. Strengthening long-term project identification through systematic master plan reviews will help extend planning horizons and maintain a credible project pipeline across the full 10-year CEF period.

The portfolio of projects provides a comprehensive and spatially informed representation of the municipality's infrastructure demand, forming a credible foundation for the subsequent prioritisation process. By combining a substantial infrastructure pipeline with strong spatial data coverage and clear functional allocation, the municipality is well positioned to translate identified infrastructure needs into a fiscally sustainable and strategically targeted capital investment programme that balances growth accommodation, asset enhancement, and infrastructure renewal across Stellenbosch's diverse settlement pattern.

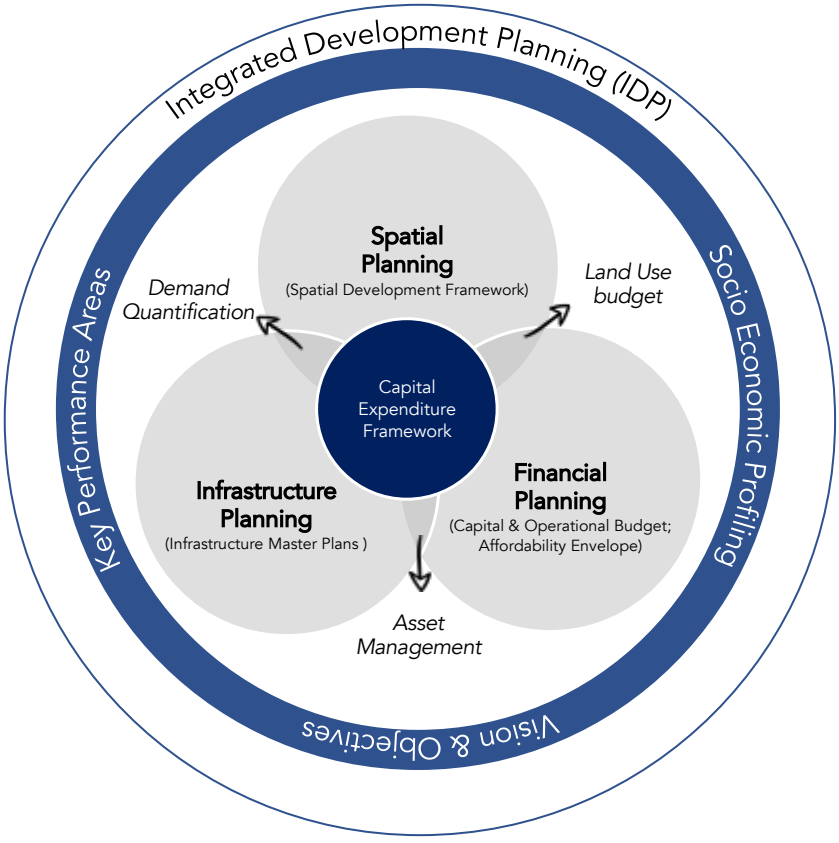
Phase 1

Introduction

1 Part 1: Introduction



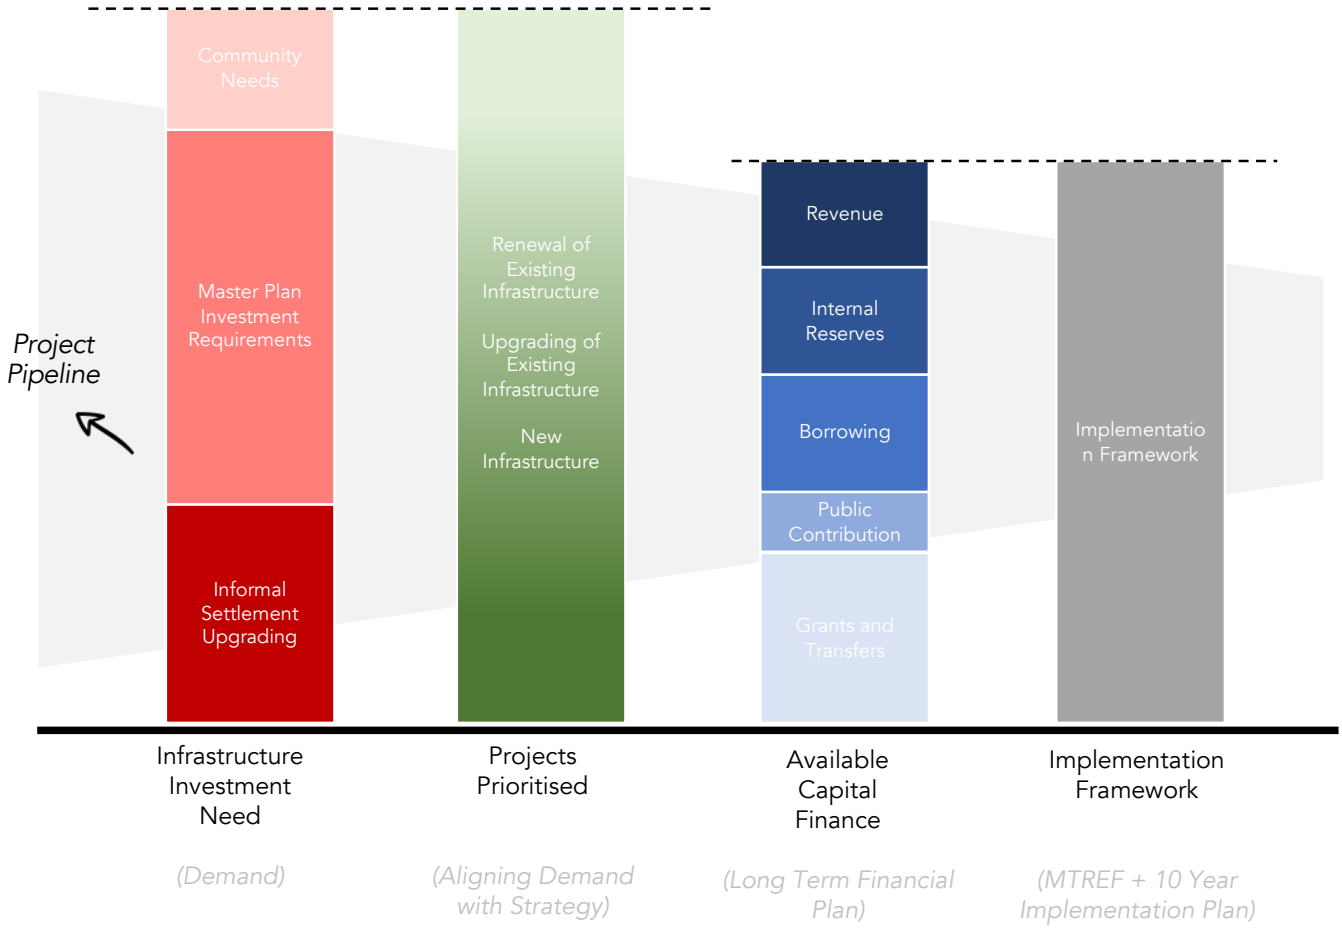
1.1 What is a Capital Expenditure Framework

According to the Department of Cooperative Governance and Traditional Affairs (COGTA) guidelines, a Capital Expenditure Framework (CEF) is a consolidated, high-level view of a municipality's long-term infrastructure investment needs. It ensures that infrastructure priorities are spatially aligned with municipal strategic objectives, budgetary realities, and development plans. The framework is grounded in principles of sustainability, financial feasibility, and strategic alignment, balancing immediate infrastructure needs with long-term development goals, the relationships between these spheres of planning and principles is illustrated in Figure 1–1.

The Spatial Planning and Land Use Management Act, 2013 (SPLUMA) mandates the inclusion of a CEF within a municipality's Spatial Development Framework (SDF). Specifically, Section 21(n) of SPLUMA requires that an SDF "determine a Capital Expenditure Framework for the municipality's development programmes, depicted spatially." This legislative requirement underscores the importance of integrating spatial planning with financial planning, ensuring that the spatial strategies articulated in the SDF are implemented through practical and affordable infrastructure investments.

A Capital Expenditure Framework links spatial development strategies with budgetary constraints and infrastructure demands. It provides a transparent mechanism for prioritising projects, promoting the efficient allocation of resources, and aligning capital expenditure with the municipality's long-term strategic vision.

Figure 1–1: The Capital Expenditure Framework within the built environment context



1.2 Aim of Capital Expenditure Framework

The aim of a Capital Expenditure Framework (CEF) is to create a structured and strategic approach to municipal infrastructure expenditure. The CEF is intended to align the municipality's spatial development strategies with its financial resources and capacity, ensuring that long-term growth and development objectives are achievable, and informs operational activities of a municipality.

A CEF aims to provide a municipality with the means to inform financial planning with infrastructure planning and spatial priorities identified in the Spatial Development Framework (SDF). It aims, furthermore, to establish a clear methodology for municipalities to evaluate, prioritise, and inform implementation processes of infrastructure projects within their affordability envelope, supporting both immediate and long-term development goals.

From Figure 1–2 one can see the illustration that infrastructure investment need, expressed as projects, usually exceeds available capital finance, and therefore it is an imperative for municipalities to partake in a prioritisation process to determine which projects are best aligned with the strategy of the municipality, together with a budget scenario process to determine which projects are affordable and should be implemented when.

Figure 1–2: Relationship between infrastructure investment needs, affordability envelope, prioritisation process, and budget scenario process

1.3 Objectives of Capital Expenditure Framework

The key objectives of a CEF is to:

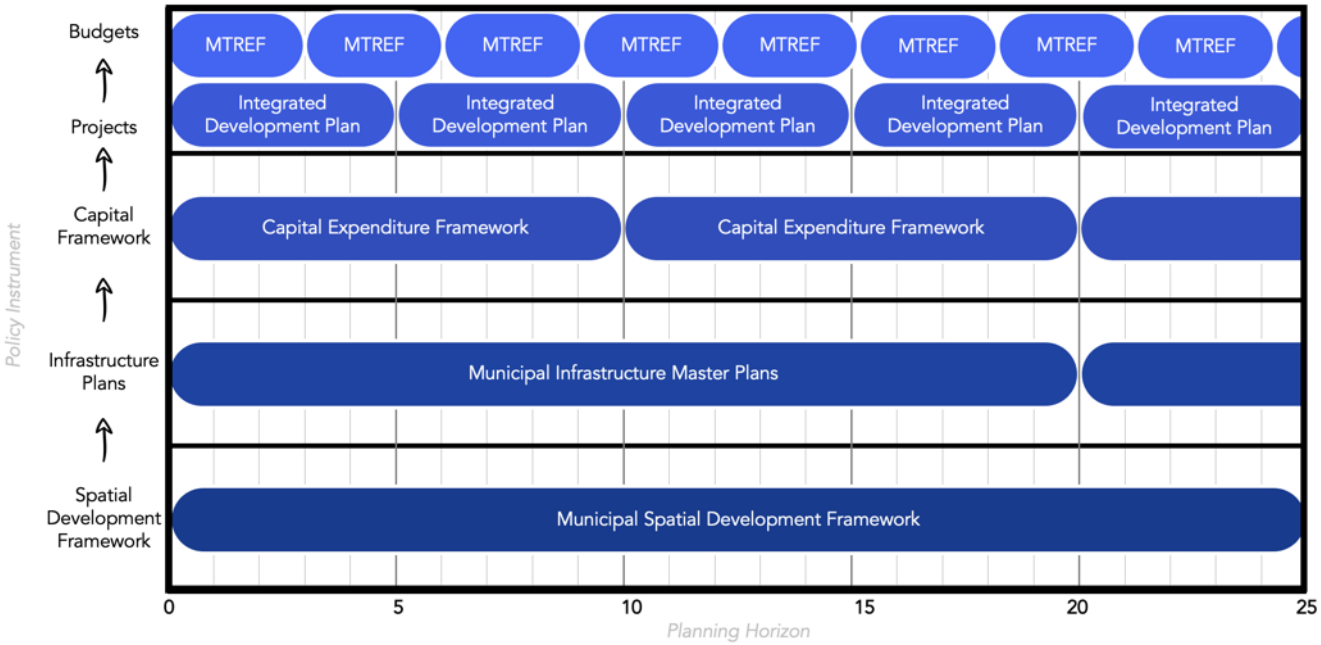
- Socio-economic trends: Understand the socio-economic trends in a municipality over the long term;
- Quantify Infrastructure Needs: Assess and detail the municipality's long-term infrastructure requirements based on an SDF-informed land use budget, infrastructure standards, anticipated socio-economic growth, existing infrastructure, and backlogs;
- Align with the Spatial Development Framework (SDF): Translate the spatial vision and strategic priorities outlined in the SDF into priority development areas which informs prioritisation practices;
- Consolidate Infrastructure Demand: Create a comprehensive list of infrastructure projects across various sectors in line with the municipality's mandate, reflecting the municipality's overall infrastructure demands;
- Contextualise Financial Affordability: Integrate the municipality's affordability envelope, derived from the Long-Term Financial Model (LTFM), to ensure infrastructure expenditure are financially sustainable over the planning horizon;
- Facilitate Prioritisation: Establish a framework to evaluate and rank projects based on strategic alignment, socio-economic impact, and spatial targeting amongst others, ensuring that resources are allocated to the most critical and impactful projects;
- Determine a Budget Scenario: Offer a structured, evidence-based approach to infrastructure planning and budgeting, improving decision-making processes and accountability to stakeholders - amongst others, to indicate project-level responses per asset type per functional area;
- Enable Spatial Transformation: Direct infrastructure investments toward spatial transformation goals, focusing on reducing inequalities, improving access to services, and promoting inclusive economic growth, and;
- Bridge Short-Term and Long-Term Planning: Ensure a coherent link between the short-term MTREF cycles, Medium-term Integrated Development Plan (IDP) cycles and the municipality's long-term development vision, embedding sustainability and foresight into the planning process.

1.4 Role of the Capital Expenditure Framework as a policy instrument

The Capital Expenditure Framework (CEF) is a cornerstone of municipal planning, grounded in South Africa's legislative framework and designed to bridge the gap between long-term spatial development strategies and actionable infrastructure expenditure. The concept of the CEF was formalised under the Spatial Planning and Land Use Management Act (SPLUMA, Act 16 of 2013), specifically in Section 21(n), which mandates municipalities to determine a spatially referenced CEF as part of their Spatial Development Framework (SDF). This legislative requirement reflects the increasing emphasis on aligning planning and budgeting processes to address developmental challenges effectively.

Historically, the Constitution of South Africa laid the foundation for this alignment in Section 153, which directs municipalities to prioritise the basic needs of communities while promoting socio-economic development through structured planning and budgeting. The Integrated Development Plan (IDP) was introduced as a mechanism to achieve this in the Local Government Transition Act (Act 209 of 1993), evolving through subsequent legislation, including the Municipal Systems Act (MSA, Act 32 of 2000). The MSA established the IDP as the principal planning instrument of local government, requiring it to incorporate a comprehensive financial plan and a Spatial Development Framework. This integration ensures that municipal resources are allocated effectively to achieve the long-term developmental vision.

The CEF builds on these legislative imperatives by operationalising the SDF within the IDP framework. As a long-term (10-year) planning tool, the CEF quantifies infrastructure needs, consolidates them into



prioritised project pipelines, and aligns them with the municipality's financial capacity as outlined in the Long-Term Financial Plan (LTFP). It ensures that infrastructure investments are not only spatially targeted but also financially sustainable, bridging the divide between visionary spatial strategies and practical implementation.

The CEF also plays a vital role in South Africa's Local Government Accountability Cycle, a governance framework defined by the Municipal Finance Management Act (MFMA, Act 56 of 2003). This cycle integrates planning, budgeting, and reporting processes to ensure transparency, accountability, and alignment with development priorities. Through informing the IDP, and so the Medium-Term Revenue and Expenditure Framework (MTREF), as well as the Service Delivery and Budget Implementation Plan (SDBIP), the CEF enables municipalities to stabilise their decision-making processes. It provides a consistent rationale for allocating resources, ensuring that both short-term operational needs and long-term developmental objectives are addressed.

Importantly, the CEF institutionalises long-term planning practices within municipalities. It encourages decision-makers to adopt a forward-looking perspective that considers future growth patterns, socio-economic trends, and financial constraints. This approach reduces the reactive nature of municipal budgeting, replacing it with proactive, evidence-based strategies that support equitable service delivery and spatial justice.

The CEF is a transformative policy instrument that integrates spatial, financial, and infrastructure planning within the legislative and operational frameworks of municipal governance. It strengthens the IDP as the single most strategic document of municipalities, ensures alignment with the SDF, and guides resource allocation through the MTREF and SDBIP. Through its structured and integrated approach, the CEF enables municipalities to achieve their developmental mandates while ensuring financial sustainability and fostering spatial transformation.

Figure 1–3: The relationship between policy instruments effecting the spatial form

1.5 Structure of this Capital Expenditure Framework

The structure of this report is outlined below to guide the reader through the key components of the Capital Expenditure Framework (CEF) and its alignment with municipal planning processes as well as the norms and standards of the CEF.

Table 1-1: Structure of this Capital Expenditure Framework

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 1: Inception and Information Gathering	Phase 1	To provide a contextualisation to the Capital Expenditure Framework. This phase comprises the inception process of the CEF as well as the information gathering process in which a comprehensive integrated infrastructure investment framework, or portfolio of projects, is collated.
Part 2: Functional Area and Spatial Category for Investment Planning Profiling and Spatial Demand Quantification	Phase 2a	This part introduces functional areas for priority investment which are defined and mapped to indicate the spatial strategy depicted in the MSDF (linked to the MSDF proposals). The identified functional areas are used to determine the future population, housing, and land demand based on existing socio-economic and related data which is used in the spatial demand quantification component.
Part 3: Infrastructure demand	Phase 2b	This part determines the investment requirements for each functional area, including operational and maintenance costs per asset class. The goal is to compare the optimal infrastructure requirements scenario with the known infrastructure demand based on current planning frameworks.
Part 4: Affordability Envelope	Phase 3	This part is a reflection of the municipality's financial health and long-term financial plan. Primarily it includes the results of the re-application of the long-term financial plan to determine the appropriate affordability envelope.
Part 5: Prioritisation and Budget Scenario	Phase 4	This part has a prioritisation framework that considers spatial, engineering, and financial factors to calculate a composite score indicating each project's relative importance in the pipeline. It also applies this framework to the budget fit process to determine how to allocate capital within the affordability envelope per project for the next 10 years.
Part 6: Capital Expenditure Programme	Phase 5	This part is a breakdown of the 10-year capital expenditure framework. Essentially, it analyses the fitted project pipeline in terms of spatial alignment, asset type alignment, and other attributes to ultimately verify that the 10-year capital expenditure framework is in line with the strategic intent of the prioritisation framework and the MSDF objectives.
Part 7: Institutional Arrangements and Project Closeout	Phase 6	This phase comprises of a concluding chapter to the CEF, this part aims to identify areas of enhancement that will render the CEF not only as a compliance document but to solidify institutional change around the alignment of planning, engineering, and financial practices – with the ultimate aim to improve service delivery. Furthermore this phase contains a final close-out report detailing the project timeline and conclusions drawn.

Phase 1

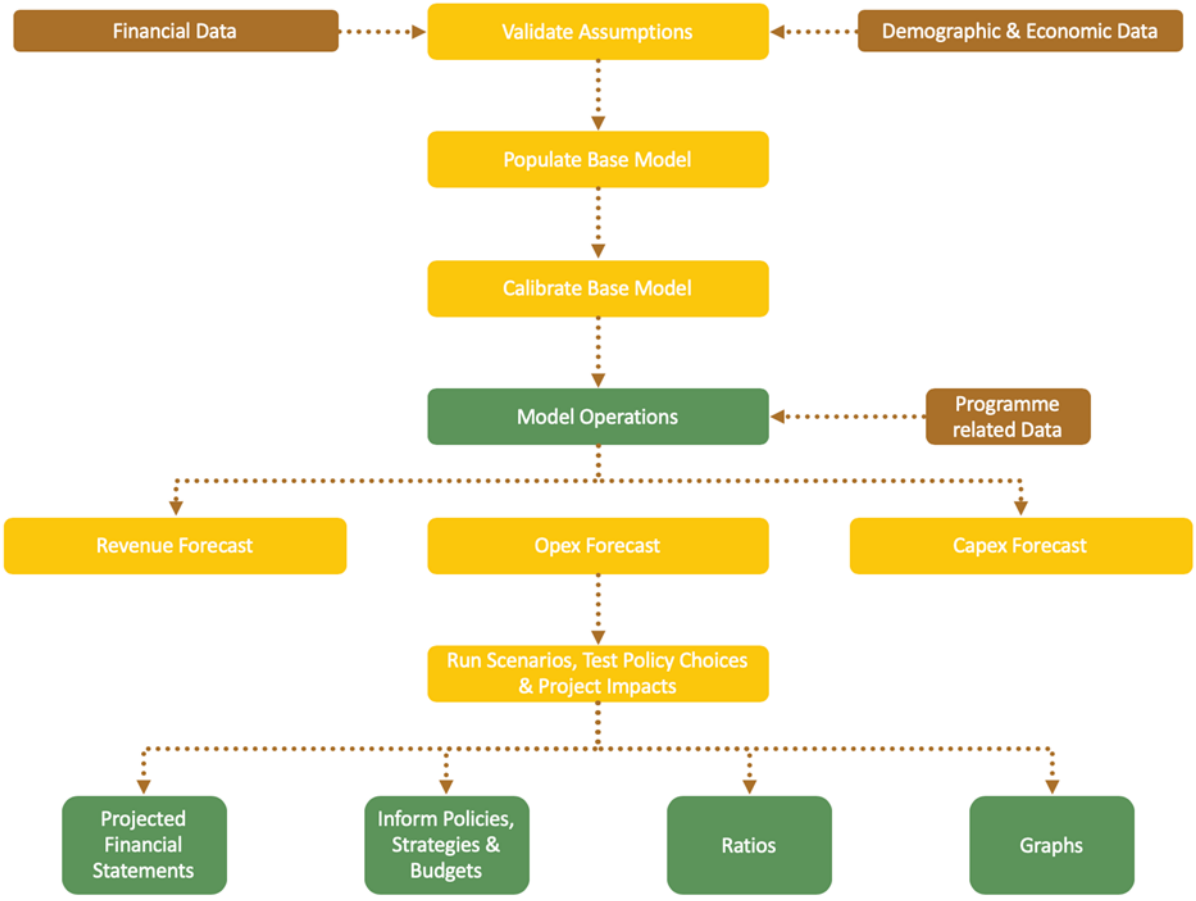
Long Term Financial Model

2 Long Term Financial Model

2.1 Contextualisation

The purpose of this section is to provide the results from the most recent long-term financial plan (LTFP), derived from an independent financial assessment (IFA) and the long-term financial model (LTFM), as it pertains to the CEF.

The objective of a LTFP is to recommend strategies and policies that will maximise the probability of the municipality's financial sustainability into the future. Based on the municipality's historic performance and the environment in which it operates, future cash flows and affordable capital expenditure are forecast utilising a LTFM.



The main outcome of the LTFP, for the purposes of this report, is to determine the affordable future capital expenditure and proposed capital funding mix (affordability envelope) of the municipality over the next 10-years.

The forecast 10-year affordability envelope and proposed capital funding mix is presented in this section.

2.2 Financial model high-level outline

The LTFM used for this section has been populated with the latest information of Stellenbosch Local Municipality and is utilised in presenting a base case financial forecast. Figure 2-1 illustrates the outline of the model.

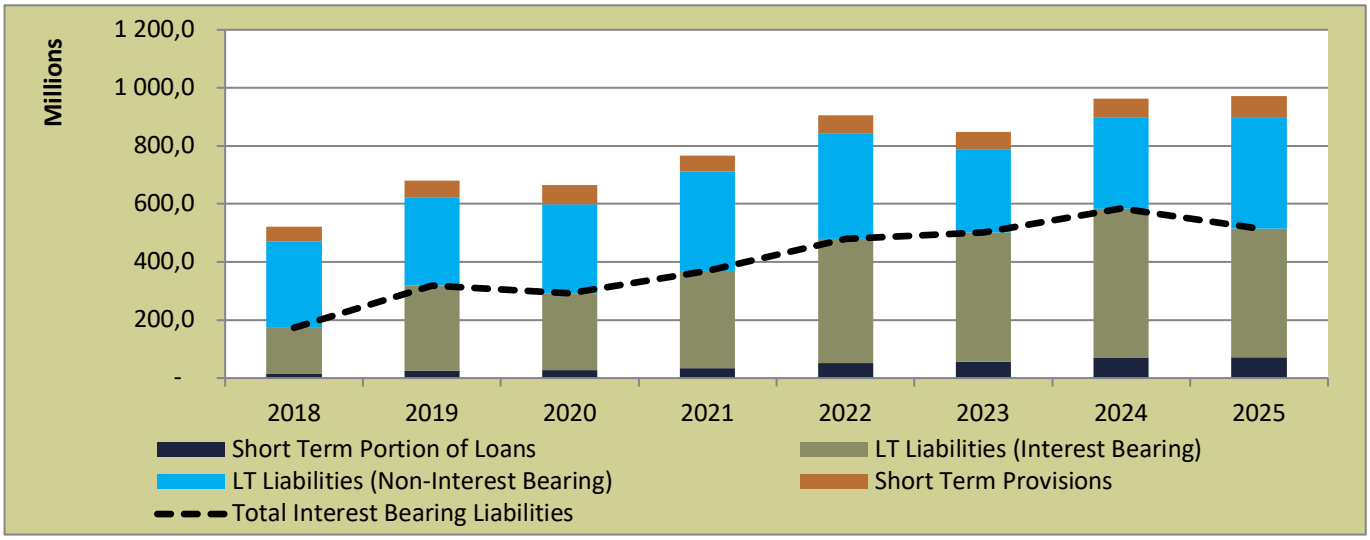
Figure 2-1: Long Term Financial Model

2.2.1 Financial model detailed elements

The LTFM requires input of reliable data and reasonable assumptions. The data and key assumptions utilised in the model are mainly informed by an IFA, which entails:

- A historic financial analysis updated with the information captured in the municipality's pre-audited annual financial statements for the financial year ended 30 June 2025.
- The 2025/26 to 2027/28 Adjusted Budget & 2026/27 to 2028/29 draft capital budget and associated worksheets data, and.
- Information gathered from market research, other strategic documents of the municipality (including the IDP, master plans etc), from experience gained in the sector and other relevant sources.

The outcomes of the IFA and the key assumptions made, are discussed in section 2. This provides an overview of a selection of forecast outcomes from the LTFM which are considered in the LTFP of Stellenbosch Local Municipality. These assumptions and forecasts also underpin the affordability envelope presented in the next section.



2.3 Historical financial perspective

2.3.1 Financial position

Stellenbosch Local Municipality's financial position has improved over the review period. There was an improvement in its net fixed asset position which increased by 4.7% to R6.6 billion in FY2024/25 from R6.3 billion in FY2023/24. The municipality's accumulated surplus increased by 3.3% during FY2024/25, increasing from R5.7 billion in the previous financial year to R5.9 billion. This was driven by sound financial performance observed during the year.

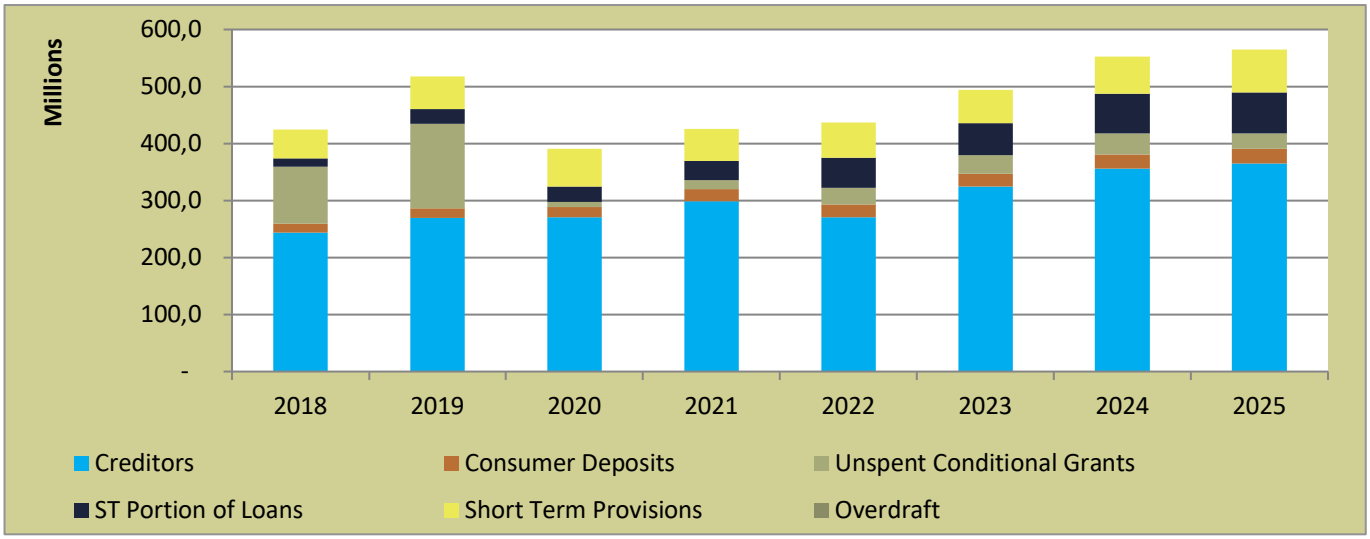
The municipality's interest-bearing long-term liabilities consist of annuity loans from the DBSA, Standard Bank and Nedbank. These loans carry interest rates that vary between 8-12%. The loan tenors range between 10 and 15 years. The debt indicators reflect that the municipality's borrowing levels remained affordable throughout the review period. This is evidenced by the gearing ratio trending below the NT maximum norm of 45% at an average of 21% p.a. over the review period. This ratio totalled 19.6% as at FYE2024/25, down from 24.9% in the prior year as no loans were undertaken in the current year. The debt service to total expense ratio remained below the NT norm of 8% at an average of 4% over the review period and totalled 5.1% as at FYE2024/25. In addition, the municipality maintains long-term provisions for the rehabilitation of landfill sites and employee benefit obligations.

Figure 2-2: Non-interest-bearing versus interest-bearing liabilities

a. Current liabilities

Current liabilities increased by 2.3% during FY2024/25 to a balance of R565.3 million, up from R552.7 million at the prior year end. This increase was mainly influenced by an increase of R8.6 million in creditors from R356.3 million as at FYE2023/24 to R364.9 million as at FYE2024/25. The creditors payment period averaged 59 days p.a. over the review period, exceeding the NT recommendation of 30 days p.a. This average was inflated by the comparably longer credit payment periods exhibited just before and during the Covid-19 pandemic in FY2018 and FY2021 at an average of 63 days p.a. The balance of unspent conditional grants decreased to R27.2 million as at FYE2024/25 from R37.2 million in the prior year. Short-term provisions increased to R76.1 million from R65.2 million in the prior year and contributed to the overall increase in current liabilities.

Figure 2-3: Current liabilities total



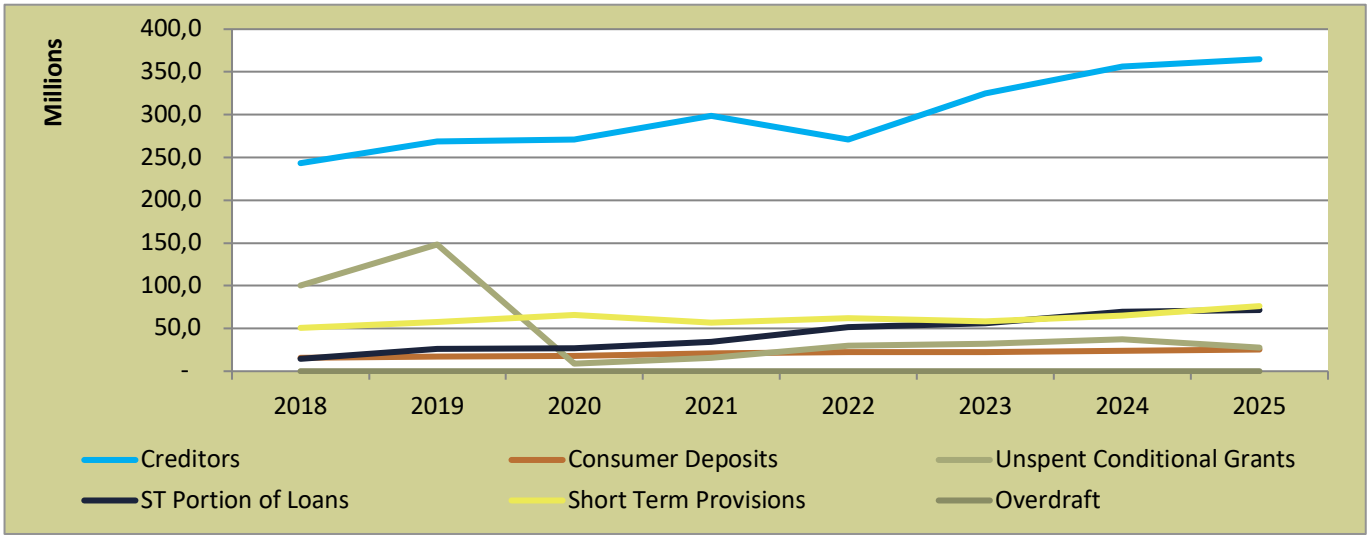


Figure 2-4: Current liabilities by item

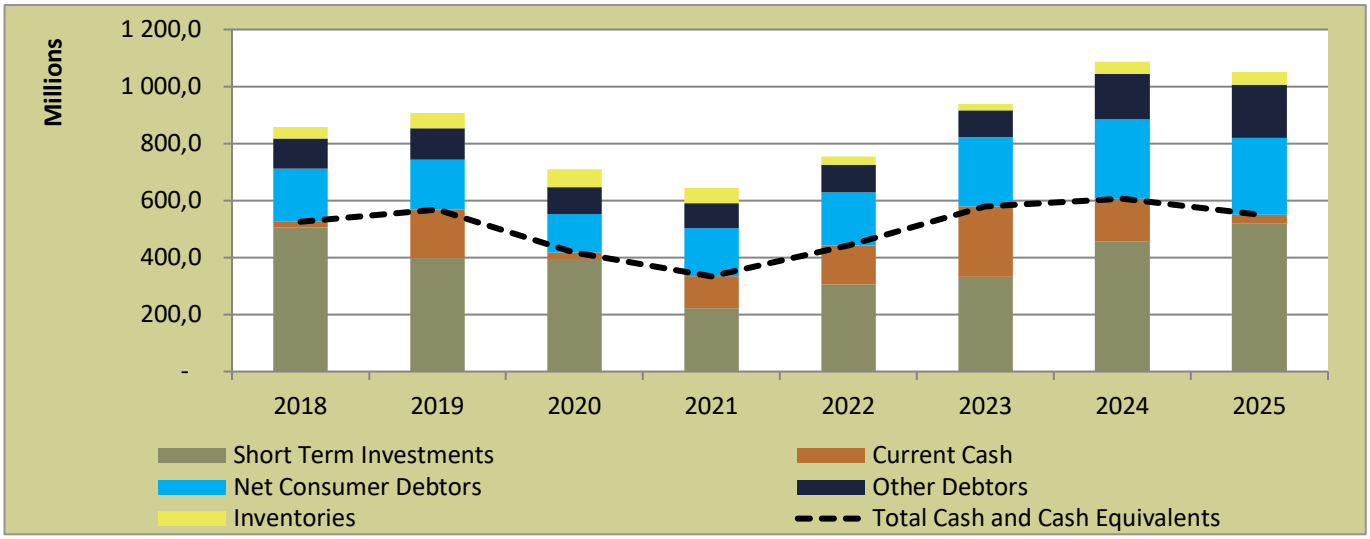
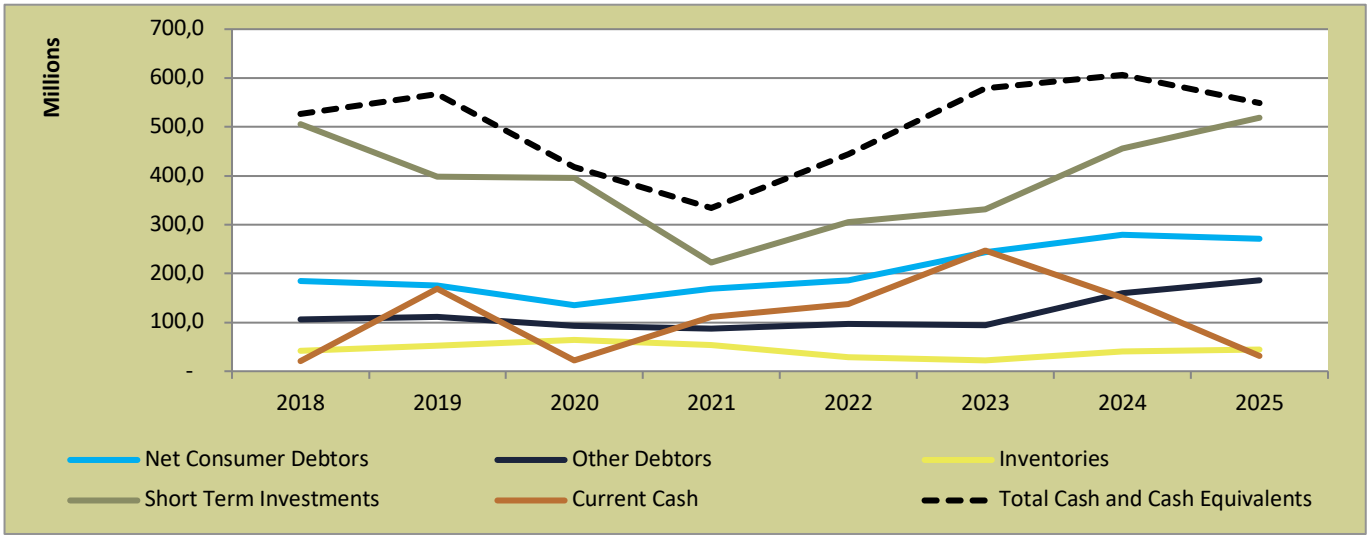
b. Current assets

Current assets decreased by 3% during FY2024/25, to a total of R1.050 billion from R1.086 billion at the prior year end. This reduction was mainly as a result of a reduction in the municipality's cash and cash equivalents, which declined from R606.4 million to R549.5 million. This was predominantly driven by accelerated own cash utilisation to fund capital investment. Net consumer debtors also decreased by 3.2% from R279.3 million at the prior year end to R270.4 million as at FYE2024/25. The collection rate as at FYE2024/25 was calculated at 97.11% and averaged 96.64% over the review period. This is positive to note.

Figure 2-5: Current assets total





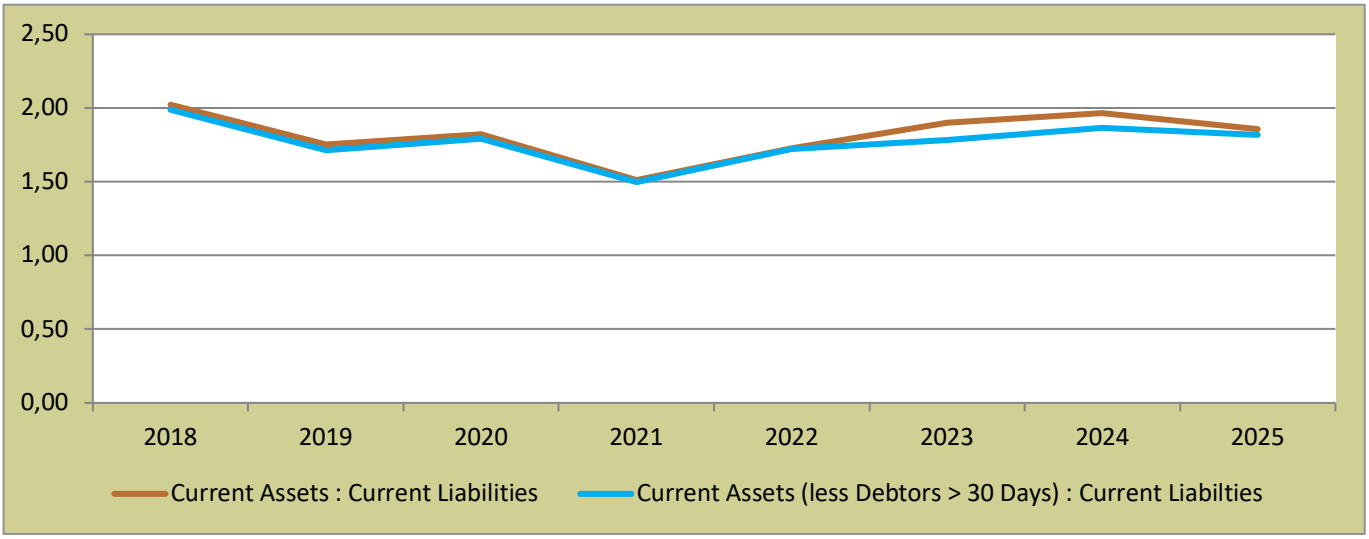


Figure 2-6: Current assets by item

c. Liquidity ratio

Stellenbosch's liquidity ratio fluctuated but remained healthy throughout the review period. The municipality's liquidity ratio declined to 1.86:1 as at FYE2024/25 from 1.97:1 in as at FYE2023/24. The liquidity ratio averaged 1.82:1 p.a. over the review period. In all years under assessment, the municipality managed to meet the minimum liquidity ratio of 1.5:1 as recommended by NT. This is positive to note. Should debtors older than 30 days be excluded from the calculation, the municipality still met the NT recommended minimum liquidity ratio in all years under review. The quality of the municipality's liquidity ratio is limited by a significant portion of the current assets being attributable to debtors. This provides a cash flow risk should a deterioration of the collection rate transpire. The extent of this risk is evident when the cash ratio (cash and cash equivalents to current liabilities) is considered. The cash ratio is calculated at just 0.97:1 at FYE2024/25, highlighting the impact of debtors on the municipality's liquidity position. Given the municipality's history of healthy collection rates, this risk has largely been mitigated. However, should the collection rate deteriorate, this would certainly present a greater risk to the municipality's cash flow prospects.

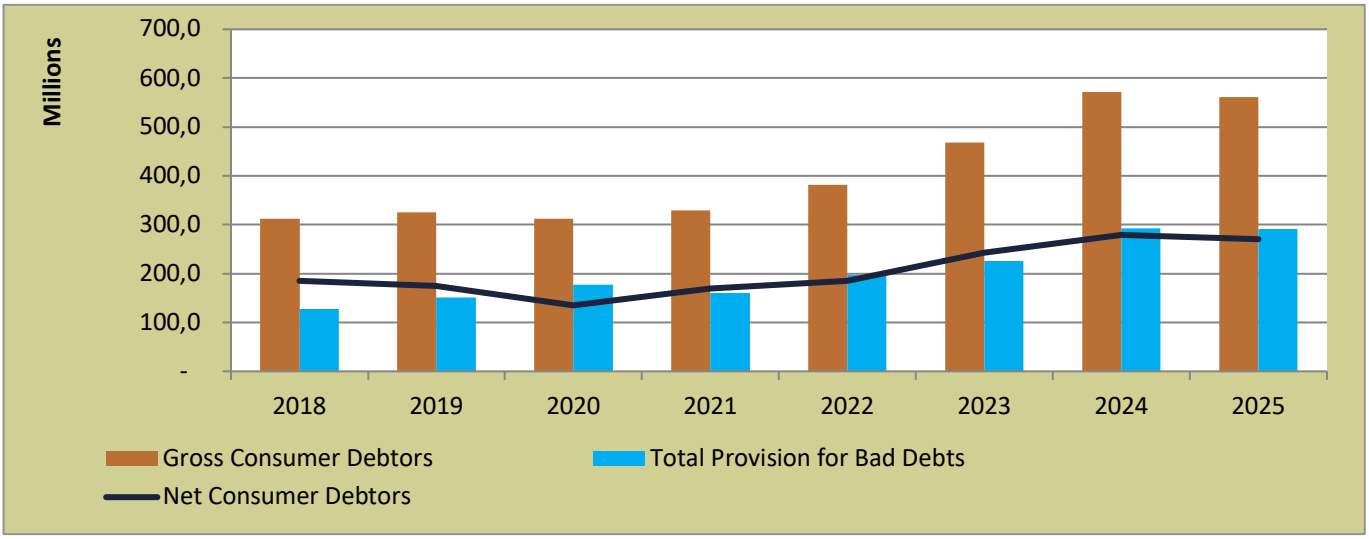

Figure 2-7: Current assets versus current liabilities

d. *Net consumer debtors*

Gross consumer debtors increased by an average of 9% p.a. over the review period, reaching R561.6 million as at FYE2024/25, from R312.3 million as at FYE2018. There was however a decrease in gross consumer debtors during FY2024/25. Net consumer debtors declined to R270.4 million as at FYE2024/25 from R279.3 million at the prior year end.

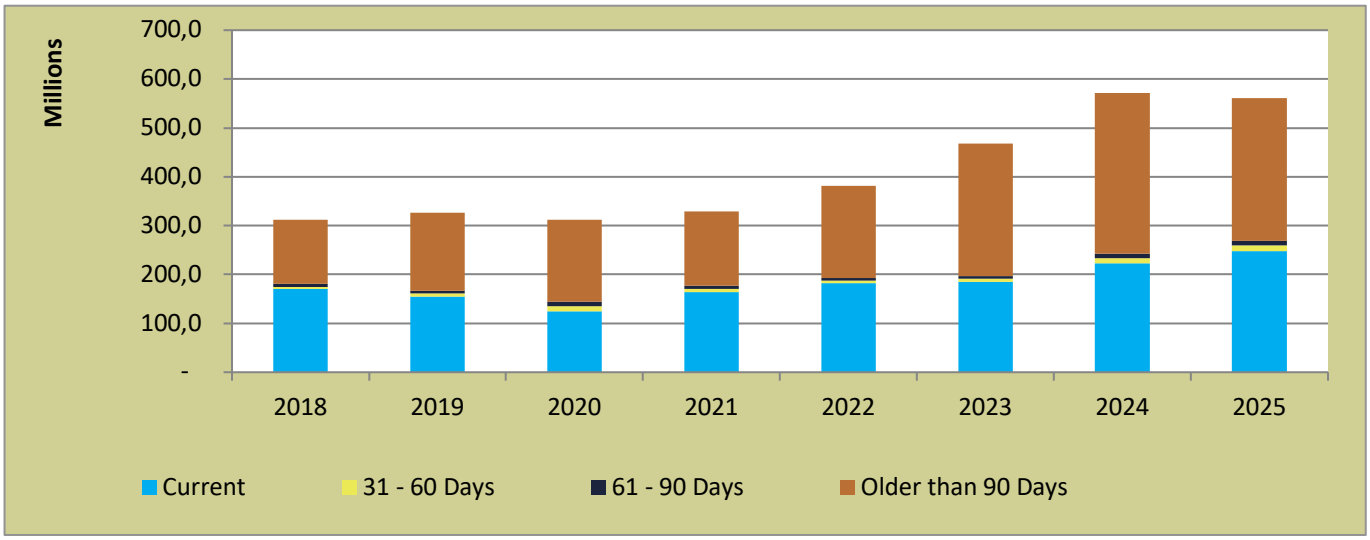

Figure 2-8: Customer debtors

e. Debtors age profile

Approximately 52.1% of debtors are overdue (older than 90 days), while just 44.1% of debtors are less than 30 days old (current). It is positive to note that debtors older than 90 days are fully provided for through the provision for bad debts, which on average covered 104% of this balance over the review period (101% as at FYE2024/25). It is crucial for the credit risk associated with aged debtors to be provided for through the provision for bad debts.

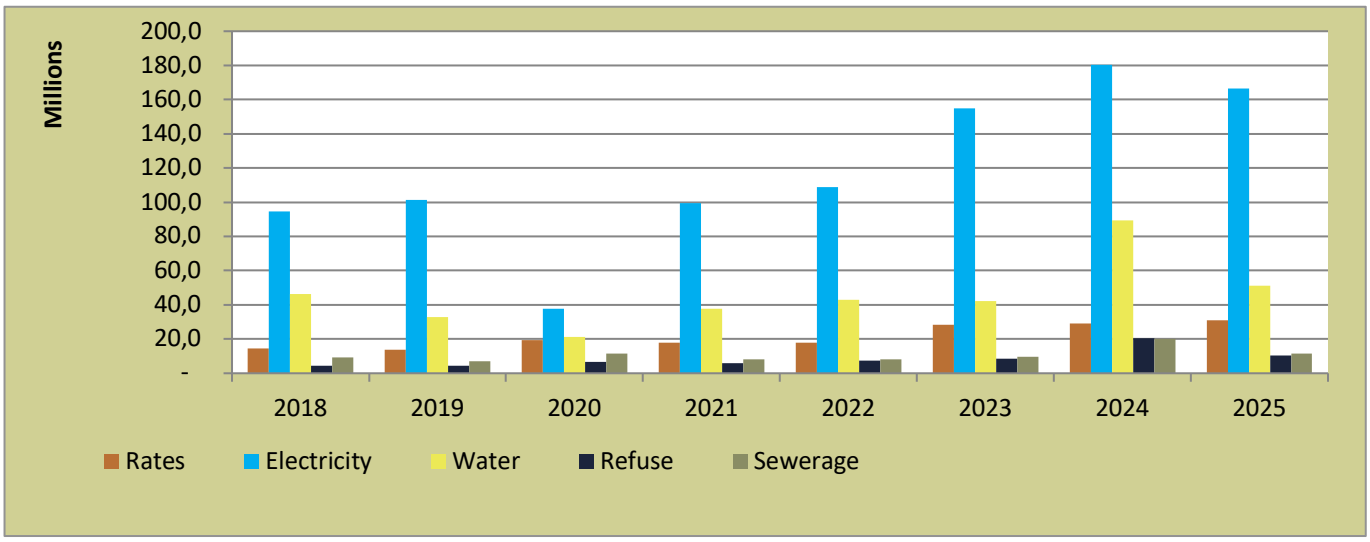

Figure 2-9: Customer debtor age profile

f. Consumer debtors by type

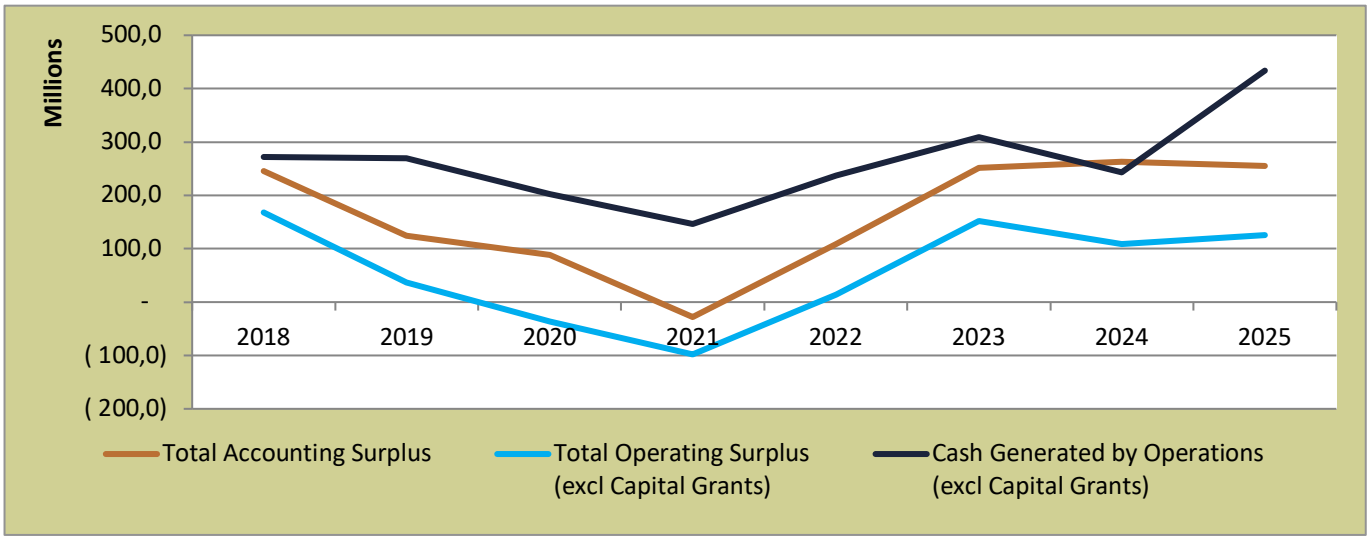
Electricity remained the main contributor to the municipality's debtors and contributed 61.6% as at FYE2024/25. Water followed with a contribution of 18.9%, while rates debtors contributed 11.5% in the current year.

Figure 2-10: Customer debtors by type

2.3.2 Financial performance

Operating income and expenditure increased at average rates of 8.1% and 9.1% p.a. respectively over the review period. Stellenbosch LM posted accounting surpluses 7 out of 8 years under review. Operating surpluses (excluding capital grants) were posted in 6 out of 8 years under review, signalling sustained healthy financial performance. Cash was generated from operations (excluding capital grants) throughout the review period, underpinned by healthy financial performance and the maintenance of high collection rates.

Figure 2-11: Analysis of surpluses and deficits



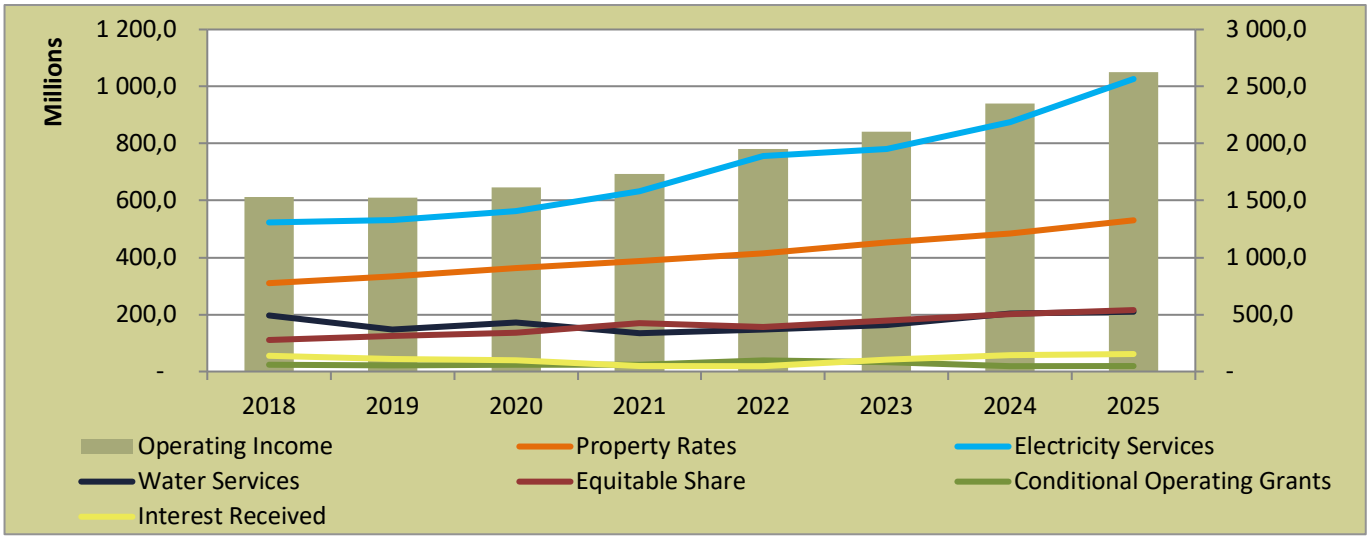


Figure 2-12: Operating income by source

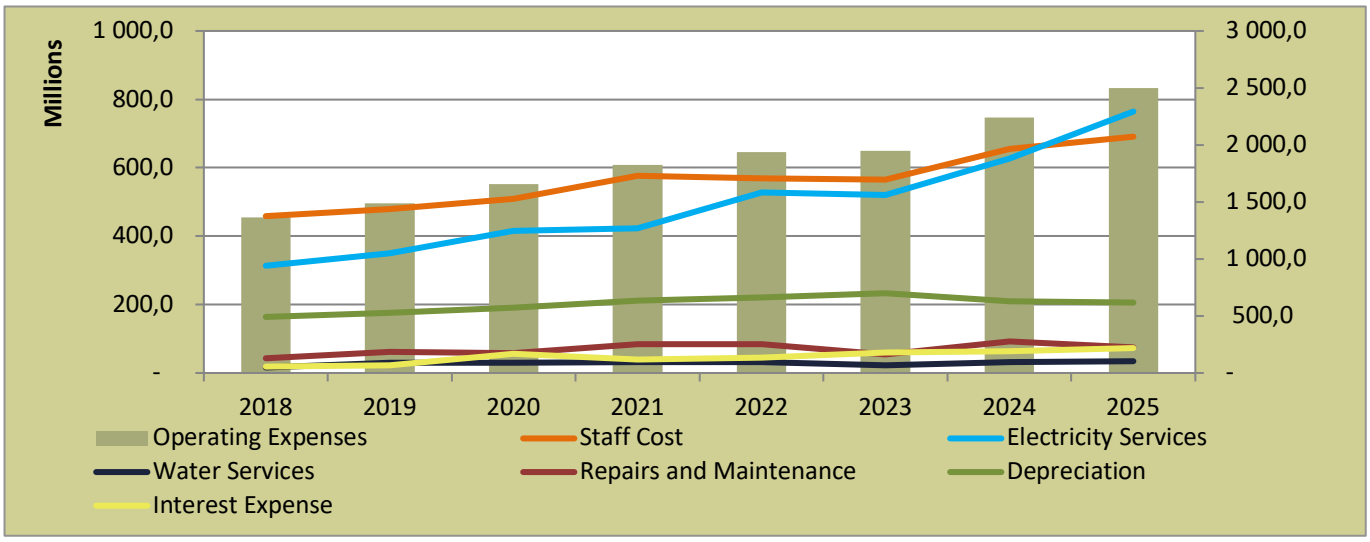

Revenue reflected year on year increases over the review period, rising from R1.60 billion in FY2017/18 to R2.75 billion during FY2024/25. Electricity distribution losses during FY2024/25 were calculated at 5.63% and remained consistent with the prior year. Electricity is the main contributor towards the municipality's revenue and contributed 39.1% towards operating income during FY2024/25, while averaging 37% p.a. over the review period. The high reliance on electricity revenue is evident in the revenue gap between electricity income and other revenue sources. This indicates that Stellenbosch's revenue is vulnerable not only to a reduction in electricity sales pursuant to a lack of energy supply (load

shedding) but also to the choice of consumers to make use of alternative sources of energy, resultantly posing a potential threat to the municipality's future revenue generation prospects.

Property rates contributed approximately 20.2% towards operating income during FYE2024/25. This is the second largest revenue stream for the municipality and had an average annual contribution of 21% p.a. over the review period.

Figure 2-13: Operating expenditure by item

Total operating expenditure increased by an average of 9.1% p.a. between FY2017/18 and FY2024/25. This growth was mostly driven by increases in staff costs and electricity bulk purchases. Electricity bulk purchases overtook staff costs as the main expenditure item, contributing 26% to operating expenditure during FY2024/25. Staff costs accounted for 23% of operating expenditure during the year. This expenditure increased at an annual average of 6% p.a. over the review period, which is above the average CPI over the same period. Contracted services contributed an average of 11% to total operating expenditure over the review period and approximately 11% during FY2024/25. This is well above the NT maximum norm of 5%. Contracted services are, in many respects, seen as an alternative to staff costs. As such, it is worth analysing the combined contribution of staff costs and contracted services to assess the affordability of the municipality's employee related expenditure profile. The combined contribution of staff costs and contracted services totalled 34.5% during FY2024/25. This is below the NT maximum norm of 40% and thus indicative of an affordable employee related expenditure profile. Repairs and maintenance constitute 1.13% as a percentage of PPE in FYE2024/25 this is very low. NT recommends a norm of 8%. The risk provided by the low operating component of repairs and maintenance expenditure is mitigated through a high proportion of capital investment on the renewal and upgrading of assets. It would be prudent, however, to consider increasing operational repairs and maintenance expenditure.

It is positive to note that the municipality earned interest income at levels above interest paid throughout the review period. Interest income averaged R42.4 million p.a. throughout the review period while interest expenses were incurred at an average of R36.2 million p.a. Interest earned on the balance of cash resulted in the surge of interest received since FY2021/22 as reflected in Figure 2-14 below.

Figure 2-14: Interest received versus interest paid

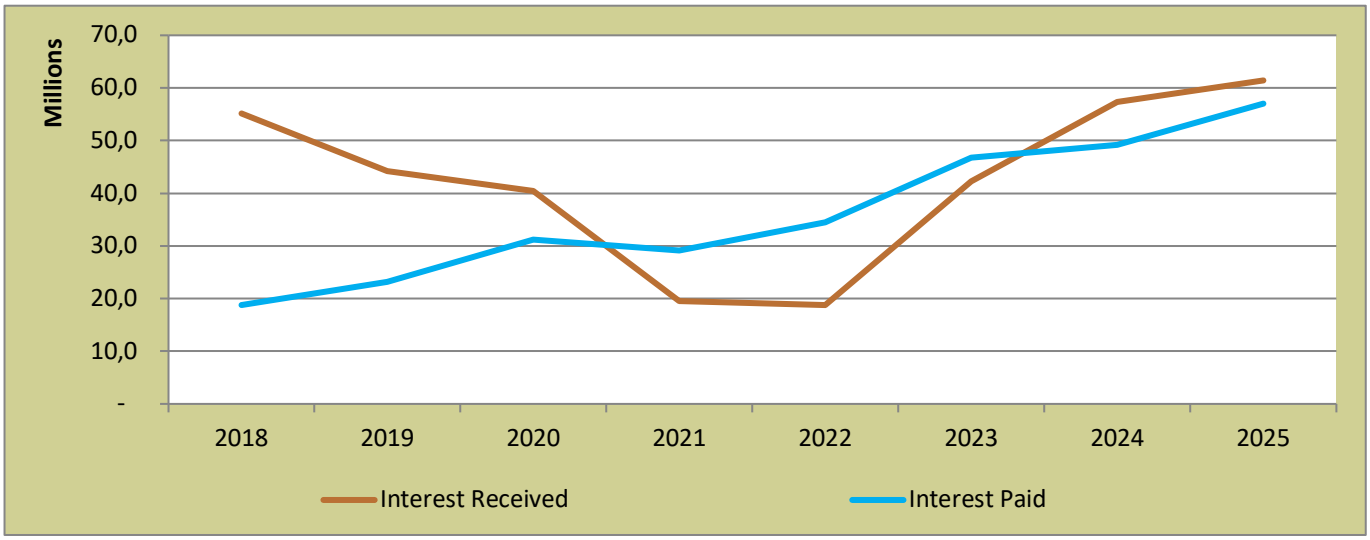

Table 2-1: Operating income by source

	2018	2019	2020	2021	2022	2023	2024	2025

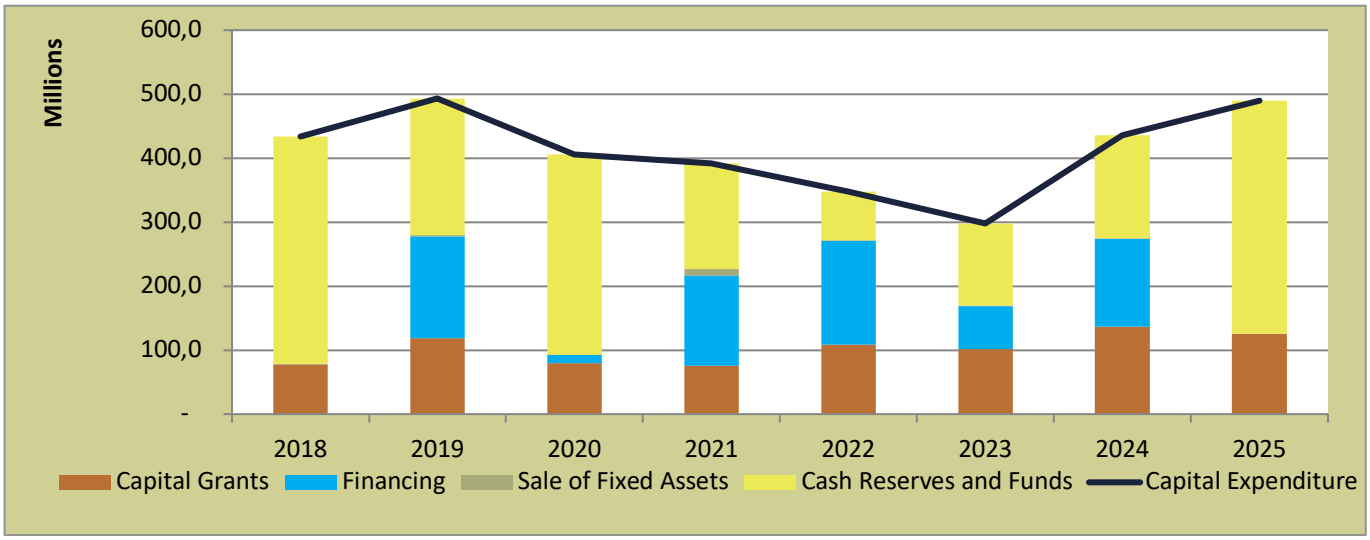
2.3.3 Cash flow



Stellenbosch has successfully generated cash from its operations throughout all years under review. This has been underpinned by the maintenance of a healthy collection rate. Cash from operations represents 15% of the municipality's own-source revenue, an improvement from the prior year.

Figure 2-15: Cash generated from operations/own source revenue

Over the past 8 years, Stellenbosch LM invested a cumulative R3.29 billion in capital infrastructure. This amount was funded by capital grants (25%); own cash reserves (53.8%); and external borrowings (20.7%). Stellenbosch did not undertake any additional borrowing during FY2024/25. The municipality remains heavily reliant on cash reserves and funds to fund infrastructure development. The funding mix observed over the review period can be considered balanced, with adequate borrowings undertaken to supplement own cash utilisation and grant funding. The municipality must however be cognisant of the impact of excessive own cash utilisation which can begin to erode the liquidity position over time, as evidenced by the decline in cash and cash equivalents as at FYE2024/25. It is thus recommended that consistent borrowings are undertaken to maintain historic levels of capital investment without relying too heavily on own cash reserves.

Figure 2-16: Capital funding mix

Stellenbosch is required to maintain sufficient cash reserves to cover Unspent Conditional Grants (R27.2 million), Short-Term Provisions (R76.1 million) and a Working Capital Provision (including 1-month's Opex) (R173.8 million). The municipality's unencumbered cash balance of R549.5 million was insufficient to meet the required minimum liquidity levels of R612.9 million, resulting in a cash shortfall of R63.4 million as at FYE2024/25. The cash coverage ratio (including working capital) decreased from 1.1:1 as at FYE2023/24 to 0.9:1 at FYE2024/25. The municipality has posted cash surpluses in 7 out of the 8 years under review.

Figure 2-17: Cash and investments

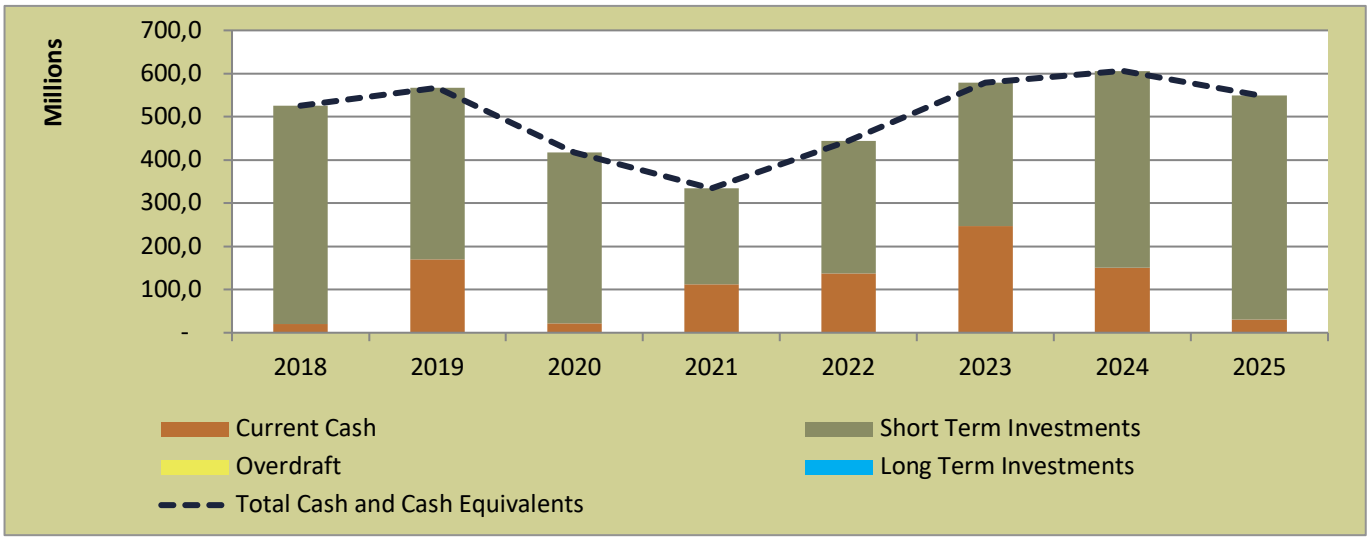


Figure 2-18: Minimum liquidity requirements

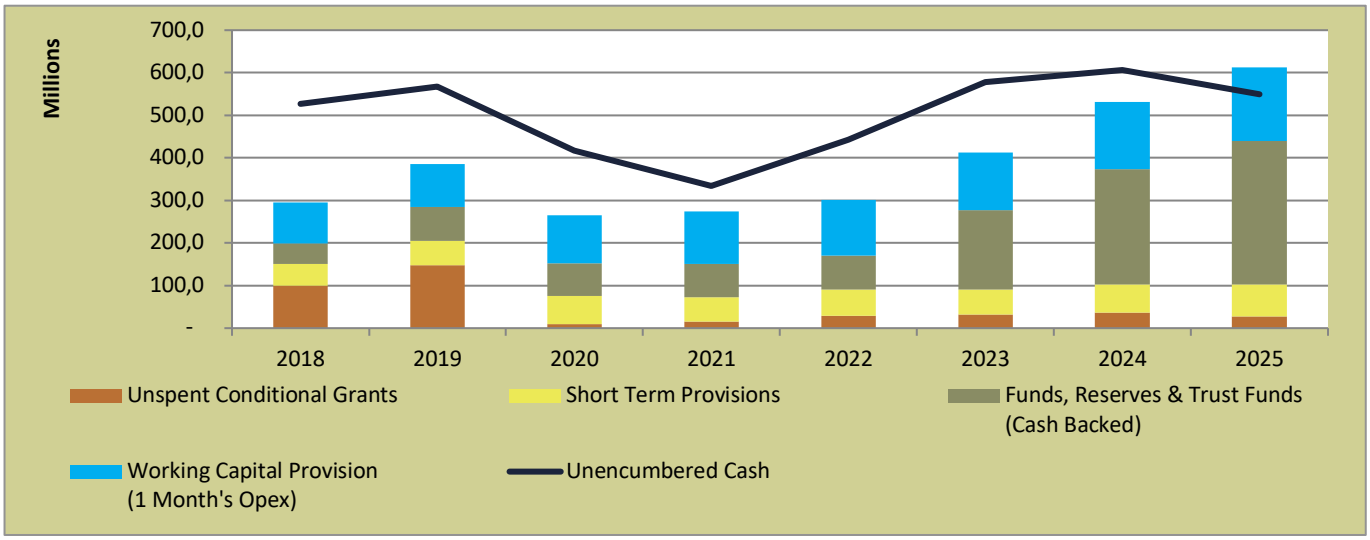

Table 2-3: Minimum liquidity requirements

	2018	2019	2020	2021	2022	2023	2024	2025
Unspent Conditional Grants	100,3	148,2	8,9	15,5	29,7	32,5	37,2	27,2
Short Term Provisions	50,7	57,2	66,1	56,5	61,7	58,3	65,2	76,1

2.3.4 Key findings

The following key findings can be drawn from the historic financial analysis for the period FY2018-FY2025:

- The municipality finds itself in a strong liquidity position, with a liquidity ratio of 1.86:1 as at FYE2024/25.
- Stellenbosch LM was able to retain sufficient cash reserves to meet minimum liquidity requirements 7 out of 8 years under assessment. A cash shortfall of R63.4 million was posted during FYE2024/25.
- The municipality's collection rate fluctuated during the assessment period, with an average of 96.64% over the review period. The collection rate was calculated 97.11% as at FYE2024/25.
- Stellenbosch LM managed to generate cash from operations throughout the review period.

- The capital funding mix mainly consisted of capital grants (25%), borrowings (20.7%) and the municipality's own cash reserves (53.8%). Stellenbosch had a capital budget implementation ratio of 90% in FYE2024/25, below the NT norm range of 95%-100%
- Repairs and maintenance constitute 1.13% as a percentage of PPE in FYE2024/25. NT recommends a norm of 8%.
- The creditors payment period averaged 59 days over the review period. The creditors days as of FYE2024/25 is 53 days down from 58 days in the prior year, exceeding the NT recommended norm of 30 days.

2.3.5 Outcome of the independent financial assessment

a. Strengths

- Healthy collection rate 97.11% as at FYE2024/25 (above NT recommended benchmark of 95%).
- Strong liquidity ratio of 1.86:1 as at FYE2024/25 (within NT recommended benchmark 1.5:1)
- Stellenbosch met the minimum liquidity requirements in 7/8 years under review.
- Strong financial performance, with operating surpluses posted in 6/8 years under review.
- Cash generated by operations (excl. capital grants) throughout the review period.
- Gearing and debt service to total expenditure ratios within the NT recommended benchmarks.

b. Weaknesses

- Low Repairs and Maintenance as % of PPE and Investment Property (1.13% as at FYE2024/25).
- Capital budget implementation ratio of 90% in FYE2024/25, below the NT norm range of 95%-100%

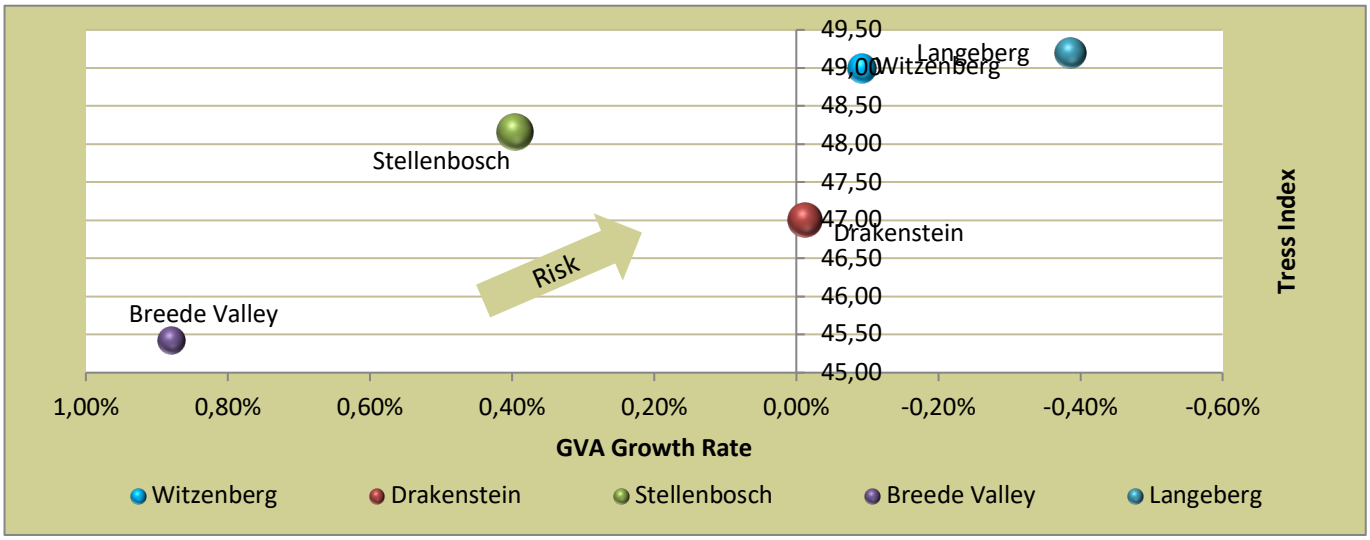
2.3.6 Outcome of the long-term financial model forecast

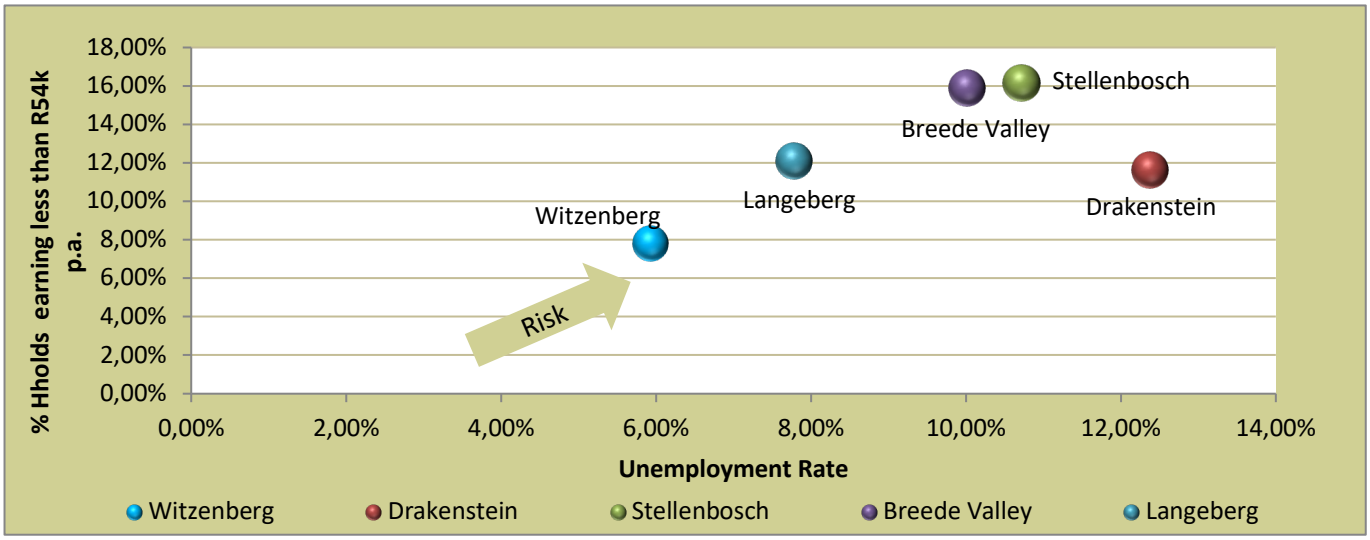
The forecast outcomes from the long-term financial model form the basis of formulating the long-term financial strategy of Stellenbosch Local Municipality. These forecasts also inform, and form part of the affordability envelope presented the next section of this report.

2.3.7 Municipal revenue risk indicators

The latest S&P Global Market Intelligence Update of the Stellenbosch LM economy reveals economic output, i.e., Gross Value Add (GVA) of R24.52 billion (current 2024 prices) which represents approximately 26% of the district economy and 3% of the provincial economy. Annual GVA growth has fluctuated over the last five years, with an average growth rate of 0.4% p.a. Stellenbosch LM had a Tress Index (a measure of economic diversification) of 48.16. This places the municipality as the middle municipality in the district in terms of economic diversification. This is evident in the top 4 contributing sectors contributing 76.08% to GVA in 2024. The higher the degree of diversification, the more resilient the municipality will be to economic shocks. These factors led to a rating of 3.4 which is a "Medium to High" rating on the economic risk component of the MRRI.

Figure 2-19: MRRI: Economic risk





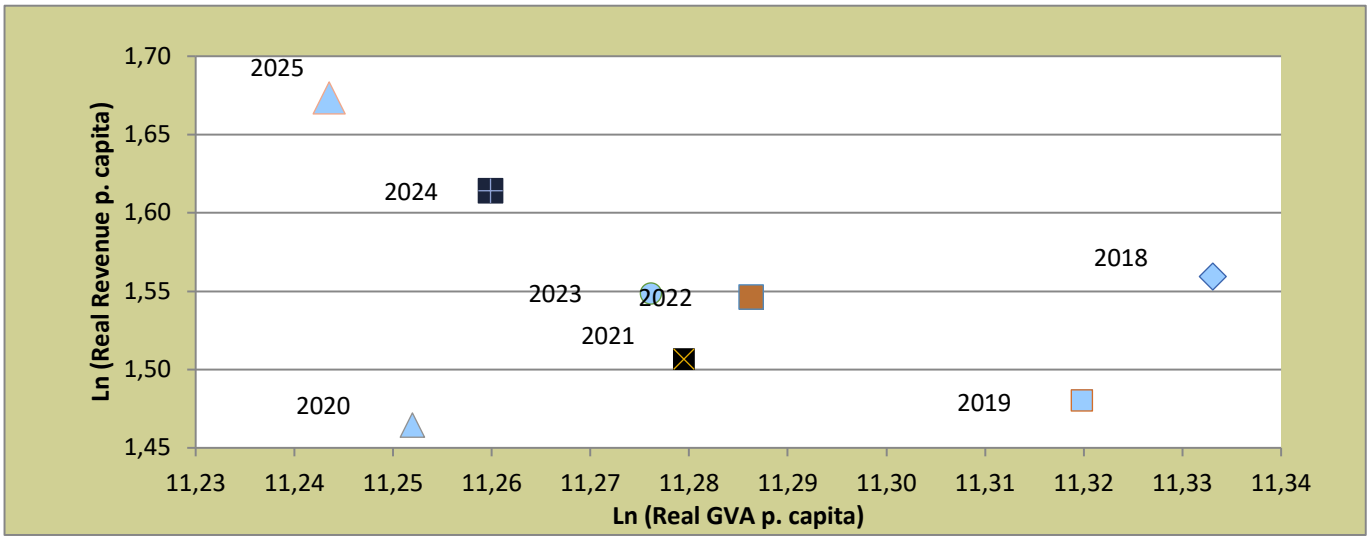


Figure 2-20 indicates the household ability to pay risk by plotting the percentage of households earning less than R54 000 per annum and the unemployment rate. A "**Medium to High**" risk rating on the household affordability component of the MRRI is due to 16.5% of households relying on indigent support, an official unemployment rate of 10.72%, and a Human Development Index of 0.73.

Figure 2-20: MRRI: Household ability to pay risk

The 2 MRRI components (economic risk and household ability to pay risk), resulted in an overall MRRI rating of 3.4 which resulted in **"Medium to High"**. This indicates that there is a medium to high risk that the municipality will not be able to generate the forecast cash revenue expected in future.

Figure 2-21: Historic real GVA per capita versus real revenue per capita

Fluctuations in the real revenue per capita reflect an overall increasing trend between 2018 and 2025. Notable reductions were observed in 2019 & 2020, whereafter year on year increases have been observed. The real GVA per capita decreased in between 2018-2025, with the only years of improvement being 2021 & 2022, representing the recovery from the economic fallout of the pandemic in 2020. This overall trend was influenced by rapid population growth at a 5-year average of 1.5% p.a. and the economic growth rate standing at a lower 5-year average of 0.4% p.a.

2.3.8 Long-Term Financial Model Outcomes

a. Base Case Scenario

- We modelled the municipality's cash needs compared to the operating cash flows it can expect to generate, based on the economy and population of the sub-region and drawing on the audited financial statements for the past 8 years up to FY2023/24 with the pre-audited financial statements used for FY2024/25. The 2025/26 February Adjustment Budget, as well as the Draft Capital Budget for FY2026/27-2028/29 were utilised. This forecast forms the basis to determine the future financial sustainability of the municipality.
- The "Base Case" presented below represents the ideal position the municipality should aim for. The Base Case aims to utilise realistic, achievable assumptions to guide the municipality towards long-term financial sustainability. These assumptions have been discussed and agreed upon with the municipality. Within the Base Case Model, the following variables were amended:
- The collection rate is maintained at 95% throughout the planning period.
- Creditor payment days of 59 days were decreased to 30 days over 10 years.
- Repairs and maintenance expenditure was increased to 2.5% of PPE & IP (from 1.1%) over 10 years.
- Electricity losses were maintained at 6.5% throughout the planning period, while water losses were decreased to 25% from 31.2% over a period of 1 year.
- The MTREF capital expenditure programme was maintained as per the draft capital budget for FY2026/27-2028/29, with assumed annual growth in capital investment beyond FY2028/29 at 4%.
- The MTREF external borrowing was maintained as per the draft capital budget for FY2026/27-2028/29, with assumed annual growth in borrowings beyond FY2028/29 at 6%.

- Borrowings under this scenario include 15-year amortising loans that carry interest at rates of 8% above forecast CPI over the planning period (expected to range between 10-12%).
- Tariff increases were included as put forward in the 2025/26 budget document.

Table 2-4: Base Case Outcomes:

Outcome	10-Year Outcome
Average annual % increase in Revenue	8,4%
Average annual % increase in Expenditure	8,8%
Accounting Surplus accumulated during Planning Period (Rm)	R 1 875
Operating Surplus accumulated during Planning Period (Rm)	R 945
Cash generated by Operations during Planning Period (Rm)	R 3 727
Average annual increase in Gross Consumer Debtors	14,0%
Capital investment programme during Planning Period (Rm) **(FY2027-FY2036)**	R 5 991
External Loan Financing during Planning Period (Rm) **(FY2027-FY2036)**	R 1 707
Cash and Cash Equivalents at the end of the Planning Period (Rm)	R 649
No of Months Cash Cover at the end of the Planning Period (Rm)	1,6
Liquidity Ratio at the end of the Planning Period	2,5 : 1
Gearing at the end of the Planning Period	30,1%
Debt Service to Total Expense Ratio at the end of the Planning Period	4,2%

b. Base Case Outcome

The municipality is forecast to post accounting surpluses in all years of the 10-year planning period. Additionally, operating surpluses (excluding capital grants) are forecast from FY2026/27 onwards. Cash is expected to be generated from operations throughout the planning period. The municipality's cash balance is forecast above the minimum liquidity requirement of one-months operating expenditure throughout the planning period.

The Base Case forecasts healthy operational cash generation over the planning period, with a total of R3.72 billion expected over the planning period. This is driven by the maintenance of a high collection rate of 95%. The reduction of creditors days, water losses as well as the healthy forecast financial performance also contribute to this positive forecast.

Stellenbosch LM's financial position is forecast to improve significantly over the planning period, with the liquidity ratio improving to 2.5:1 by the end of the planning period (1.86:1 at FYE2024/25). This improvement is influenced by the forecast increase in current assets, predominantly driven by the improving cash balance (from R549.5 million at FYE2024/25 to R649.0 million by the end of the 10-year planning period). While limited growth in cash and cash equivalents is expected over the short-term, owing to notable cash outlays to fund capital expenditure, the municipality is expected to maintain one-month's cash coverage throughout the planning period. This is a key indicator of financial sustainability. It must, however, be noted that should adverse economic conditions prevail and key assumptions such as the 95% collection rate not be met, it would be prudent to consider a downward revision of the affordable envelope presented in this report.

The Base Case presents an accelerated total capital investment programme over the planning period of R5 991 million (FY2027-FY2036). Cash reserves and funds remain a reliable and consistent source of funding and is expected to remain the main contributor over the planning period, followed by external financing and capital grants. The budgeted borrowing programme underpins the healthy liquidity position through reducing reliance on own cash reserves to achieve accelerated capital expenditure.

The assumptions in the Base Case can be considered as recommendations that aim to guide the municipality towards a financially sustainable position over the medium to long-term. The Base Case outcomes are characterized by a healthy liquidity ratio that underpins a capital investment programme that does not compromise liquidity and ensures that the minimum liquidity needed to cover at least 1-month's operating expenditure is available throughout the planning period.

Figure 2-22: Base Case Scenario Analysis of Surplus

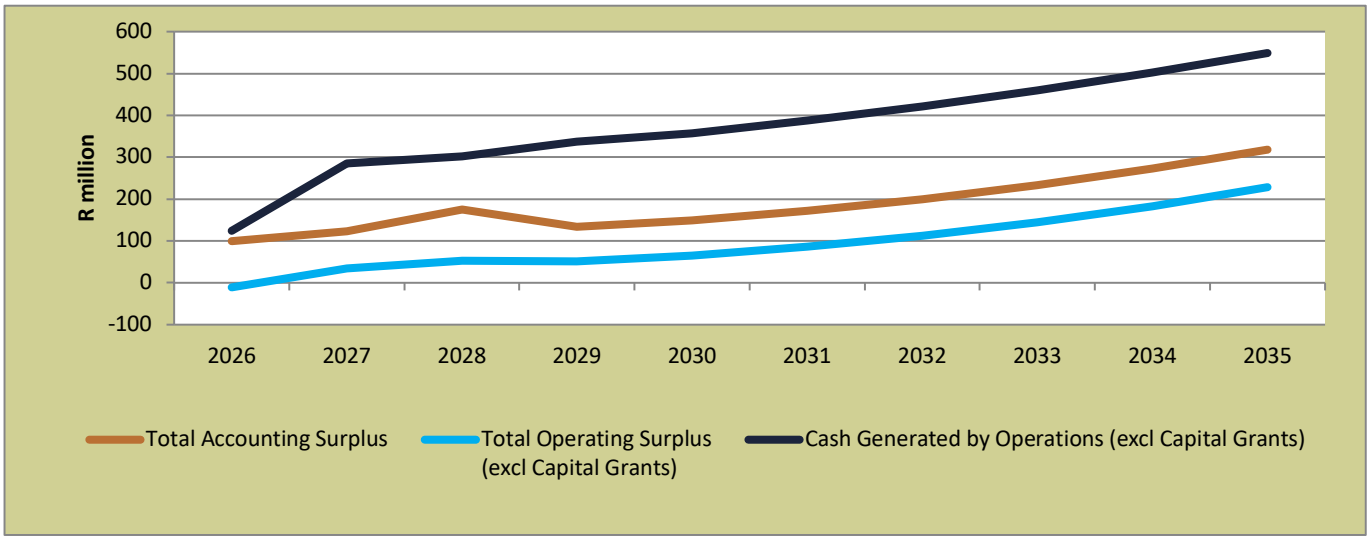

Figure 2-23: Base Case Scenario Bank Balance vs Minimum Liquidity

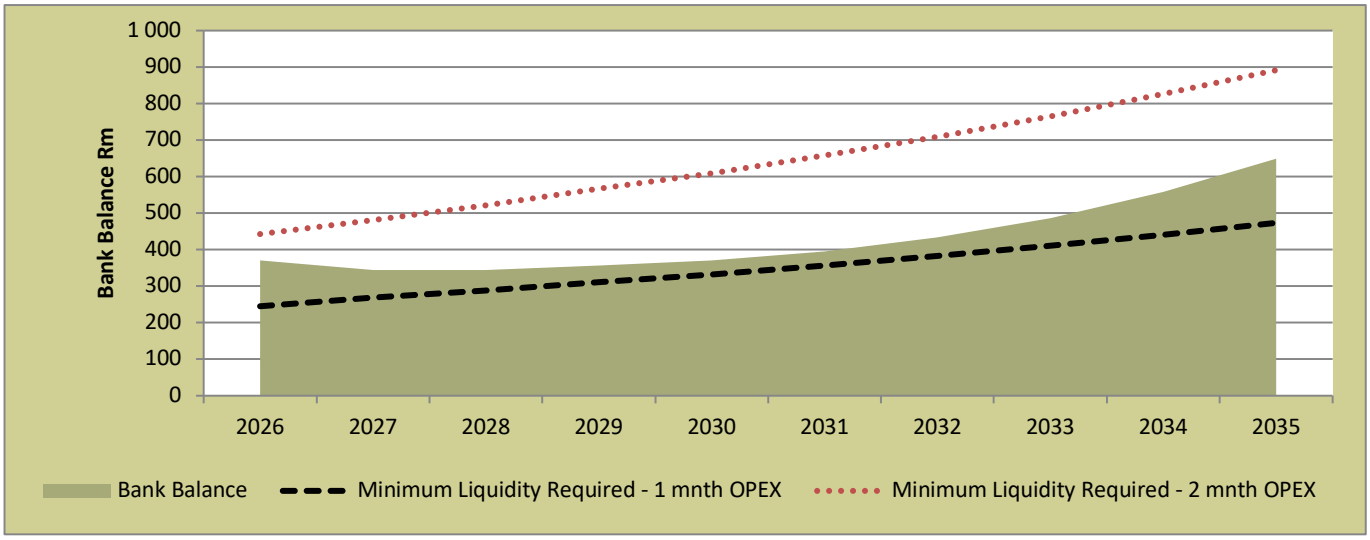

Figure 2-24: Base Case Scenario Capital Funding Mix (FY2027-FY2036)

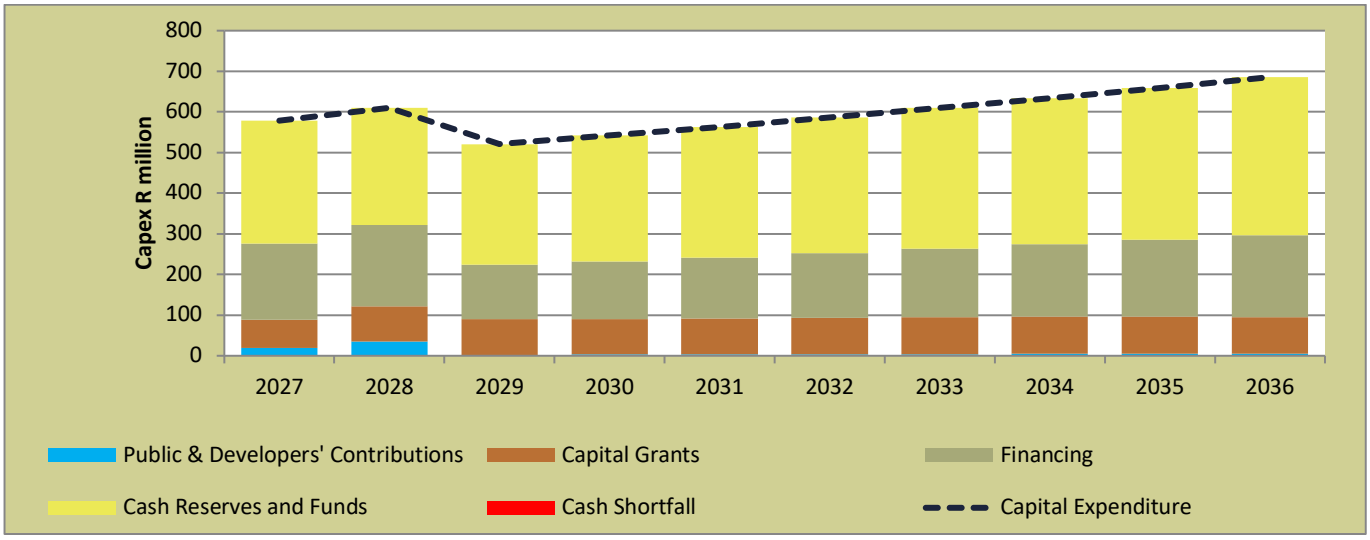

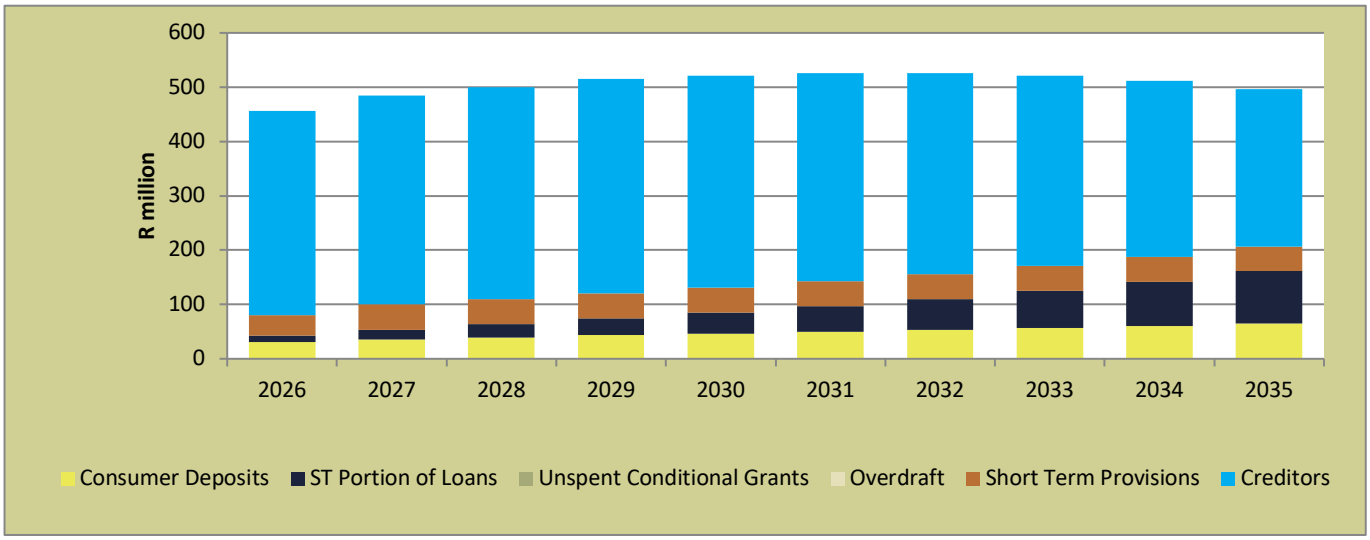

Figure 2-25: Base Case Scenario Current Liabilities

2.4 Summarised outcome of the long-term financial model forecast:

2.4.1 The socio-economic base and future revenue

The unemployment rate of 10.72% and the percentage of indigent households reliant on support (16.5%), create a Medium to high risk of households being unable to pay their municipal bills in future.

Investment in productive assets that create an enabling environment for economic growth, strengthening and expanding the economic base in the process, is critical for the municipality to pursue and sustain policies aimed at providing for the ever-increasing indigent population.

Tariff increases must be broadly aligned with CPI, and cognisance given to the implementation of a cost-reflective tariff structure.

2.4.2 Capital investment

This subsection provides a summary of the most significant forecast outcomes from the long-term financial model in terms of the municipality's ability to invest in capital over the long term. The next section includes the detail forecast outcomes as part of the municipality's 10-year affordability envelope.

As the population increases, the municipality needs to cater for new migrants and improve access to and the quality-of-service delivery within the municipal area.

Heavy reliance is placed on the utilisation of own cash reserves. It must be noted that the extensive use of own cash reserves poses a high risk to the municipality's future liquidity. These further underscores the importance of implementing measures aimed at consolidating the healthy liquidity position. This is essential for the municipality's long-term sustainability.

The Base Case capital programme and funding mix was formulated with the aim of accelerating capital investment in order to meet the municipality's infrastructure and development needs, whilst ensuring that the long-term liquidity position is not compromised. The affordable capital envelope was calculated at R5 991 million for the 10-year planning period (FY2026/27-FY2035/36).

Affordability Envelope

3 Affordability Envelope

3.1 Affordable Future Capital Investment

3.1.1 Capex affordability and funding

We have calculated an affordable capital expenditure envelope for the 10-year planning period (FY2026/27-FY2035/36) which amounts to R5 911 million. This is underpinned by an optimised funding mix which balances sustainable own cash utilisation with affordable levels of borrowings to supplement forecast capital grant funding.

3.1.2 MTREF capital funding mix

The table below reflects the funding mix for the proposed Base Case MTREF capital investment programme (FY2026/27-FY2028/29).

Table 3-1: Base Case MTREF Funding Mix

Year	Total	2027	2028	2029
Public & Developers' Contributions	**58**	20	36	3
Capital Grants	**237**	69	87	81
Financing	**520**	187	199	133
Cash Reserves and Funds	**895**	303	288	304
Capital Expenditure	**1 710**	**579**	**610**	**521**

Over the past 8 years, Stellenbosch LM has invested a cumulative R3.29 billion in capital infrastructure. Historically, Stellenbosch LM was heavily reliant on cash reserves and funds to fund capital expenditure, with 53.8% of capital funding emanating from cash reserves. The remainder was comprised from borrowings (20.7%) and capital grants (25.0%). This funding mix indicates a conservative capital financing approach, characterised by limited reliance on debt and the leveraging of a strong liquidity position. As at FYE2024/25, the gearing ratio stood at 19.6%, underscoring a relatively low level of leverage. IPM recommends a maximum gearing ratio of 35% while NT's maximum level is 45%. In addition, the debt service to total expenditure ratio of 5.1% reflects a manageable debt repayment burden and adequate capacity to meet debt obligations without placing undue pressure on operating budgets.

The strong reliance on cash reserves has kept debt levels relatively low, but this may begin to reduce liquidity over time. Excessive cash-funded capital spending could weaken future cash buffers, particularly as costs and service demands increase. Stellenbosch LM therefore has scope to make greater use of long-term borrowing or grant funding to support a more balanced and sustainable capital funding approach, while still maintaining prudent debt levels.

3.1.3 10-Year capital funding mix

The Base Case capital funding mix for the 10-year planning period is forecast to be as follows:

Table 3-2: Base Case 10-Year Funding Mix (Rm) (FY2027-FY2036)

Capital Funding Mix (Rm)	Total	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036
Public & Developers' Contributions	**87**	20	36	3	3	3	4	4	4	5	5
Capital Grants	**821**	69	87	81	81	82	83	84	85	85	83
Financing	**1 707**	187	199	133	141	150	159	169	179	189	201
Cash Reserves and Funds	**3 322**	303	288	304	316	328	340	353	366	380	396
Cash Shortfall	**0**	0	0	0	0	0	0	0	0	0	0
Capital Expenditure	**5 911**	579	610	521	542	564	586	610	634	659	686

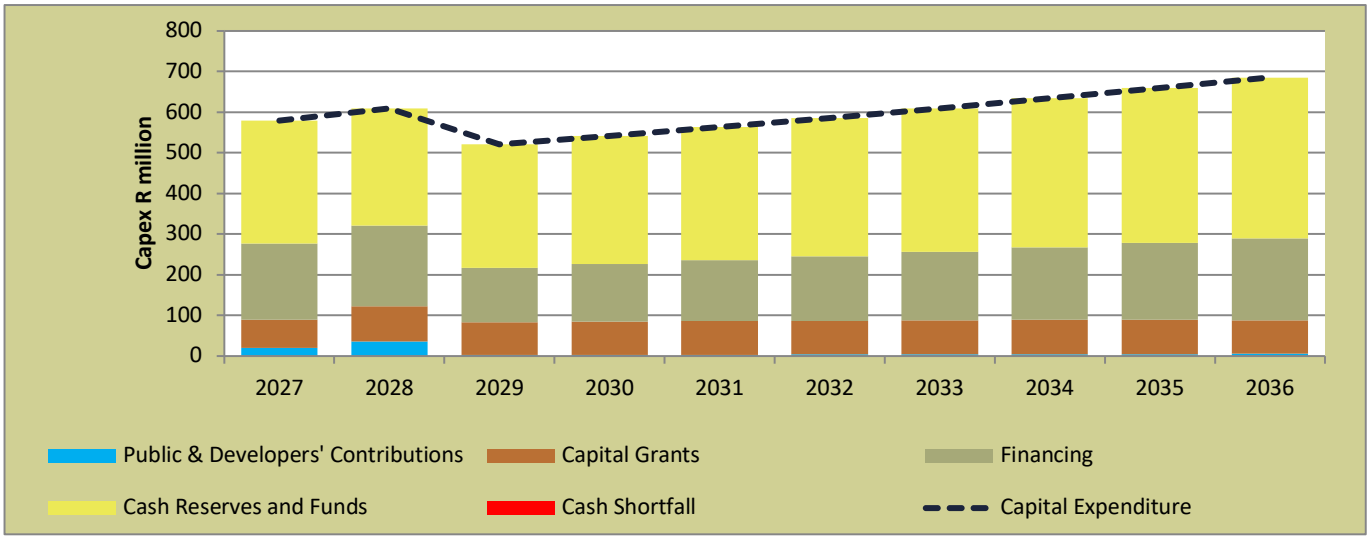
The table below indicates the forecast capital grant funding over the 10-year planning period. The Draft Capital Budget for FY2026/27-2028/29 reflected a notable reduction in capital grants compared to the February Adjustment Budget for FY2025/26-2027/28. This has necessitated a reduction in the affordable capital envelope from the previous iteration of this report. Public & developers' contributions have now been included.

Table 3-3: Forecast Capital Grant Funding (FY2027-FY2036)

Capital Grants (Rm)	Total	2027	208	2029	2030	2031	2032	2033	2034	2035	2036
Capital Grants	**821**	69	87	81	81	82	83	84	85	85	83

The municipality must thus strive to achieve the assumptions included in the Base Case to allow for an affordable implementation of the capital expenditure programme, while ensuring an improvement in the liquidity ratio through affordable utilization of own cash reserves. The Base Case indicates that the major source of funding will be from cash reserves, followed by borrowing and capital grants over the planning period. The municipality must thus focus on balancing sources for capital expenditure so that cash is not strained in future. It is recommended that, at the very least, the Base Case capital funding recommendations are implemented to ensure that the long-term sustainability of the municipality is prioritised. The proposed funding mix is illustrated below:

Figure 3-1: Base Case Capital Funding Mix (FY2027-FY2036)



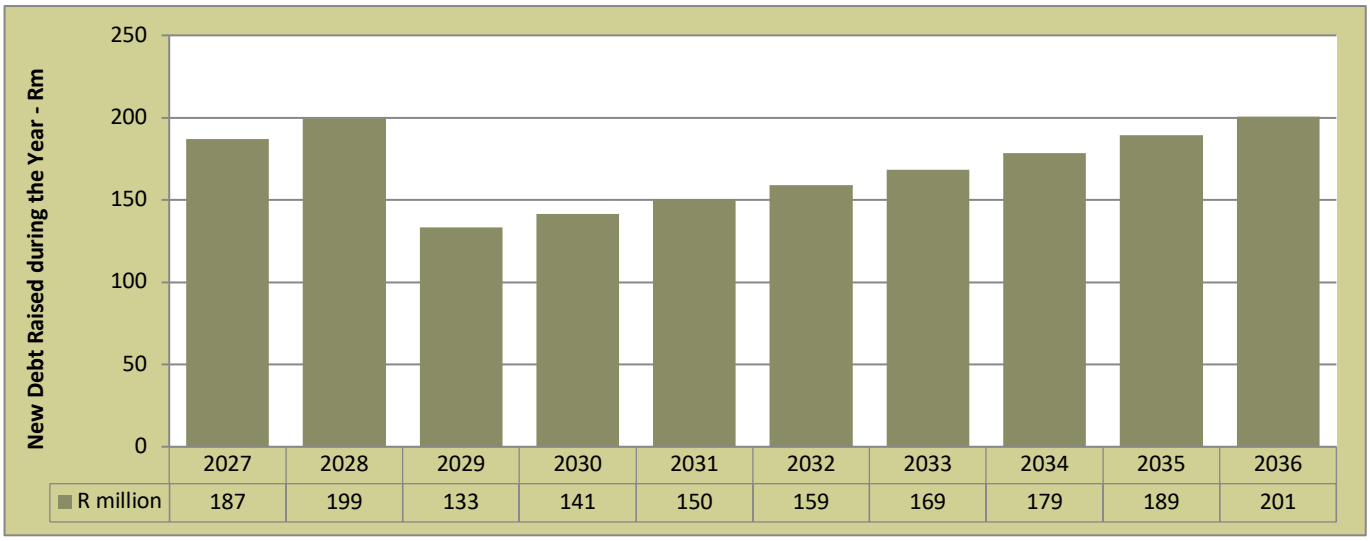


Figure 3-2: Base Case New Debt Raised (FY2027-FY2036)

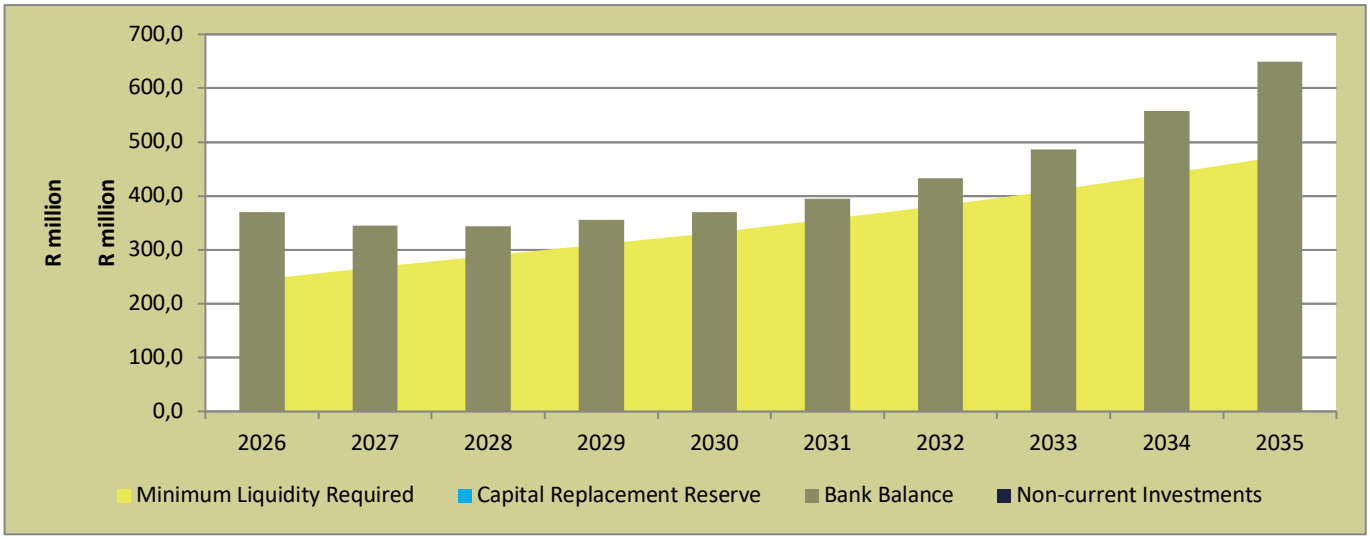

3.1.4 Liquidity and Capital Replacement Reserve

The minimum required liquidity levels cater for unspent conditional grants, short-term provisions, reserves, and a working capital provision of 1-month's operating expenditure. Historically, Stellenbosch achieved the minimum liquidity requirement and posted cash surpluses in 7 out of 8 years under the review period. It is important that the municipality undertakes a prudent approach to capital investment while ensuring that the capital investment decisions do not come at the cost of liquidity and financial sustainability. Stellenbosch is forecast to meet the minimum liquidity requirement of one-months operating expenditure throughout the planning period.

The capital replacement reserve serves to assist the municipality in ensuring that adequate reserves are kept for funding the future replacement, renewal and upgrading of assets to prevent a decline in operational efficiency or unnecessary obsolescence of assets. The annual depreciation charge is considered an indicator as to the extent of adequate annual provisions into the CRR.

Figure 3-3: Base Case Cash vs Minimum Liquidity Levels

a. Gearing

Stellenbosch undertook approximately R681.8 million in new loans over the review period. This resulted in the municipality reaching a gearing ratio of 19.6% at FYE2024/25. This remains below the NT maximum norm of 45% as well as IPM's maximum recommended limit of 35%. From a debt service perspective, the current levels remain within the recommended limits of 7% and 8% by IPM & NT respectively. The Base Case includes an accelerated borrowing programme aimed to underpin the funding from own cash sources and expected capital grant funding. IPM's maximum recommended limits serve as a guide towards the formulation of the borrowing programme. As depicted in the graphs below, from both a gearing and debt service perspective, the municipality is forecast to maintain an affordable debt profile. This underpins the contributions from own cash reserves and capital grants and enables an affordable acceleration of the capital investment programme. The loan tenor is assumed at 15-years for all new debt included in the Base Case. This underpins financial sustainability through supporting cash flow and liquidity management as a result of reducing annual debt service charges. This is particularly prevalent given the extent of the borrowing programme included in the Base Case.

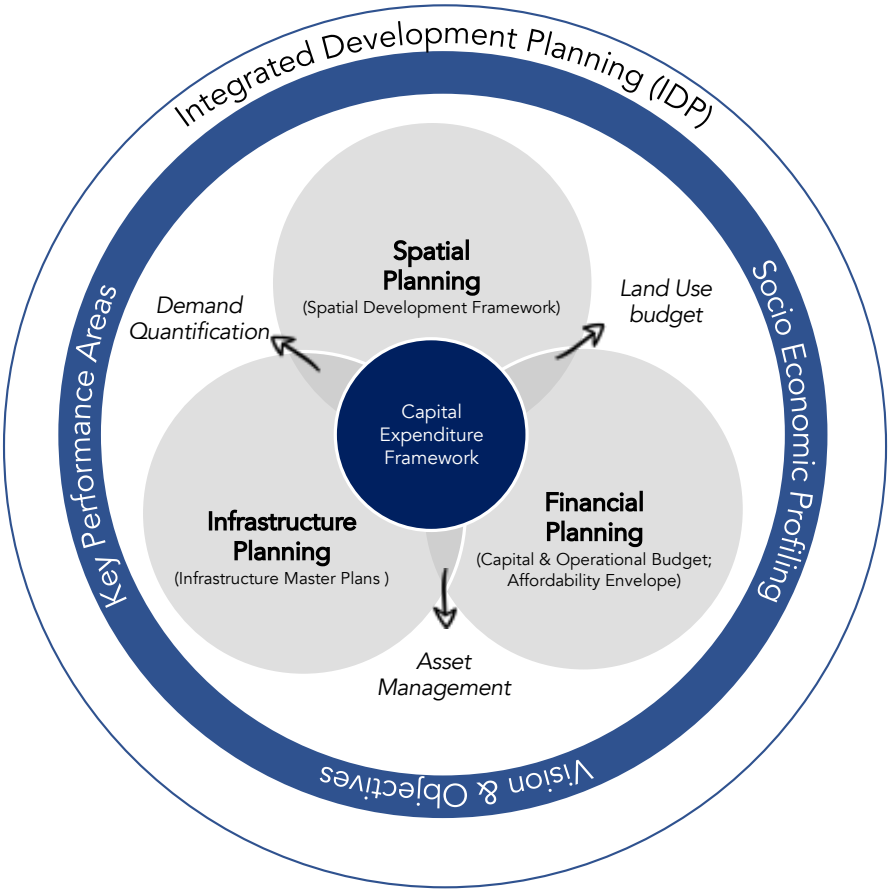
Phase 1

Introduction

1 Part 1: Introduction



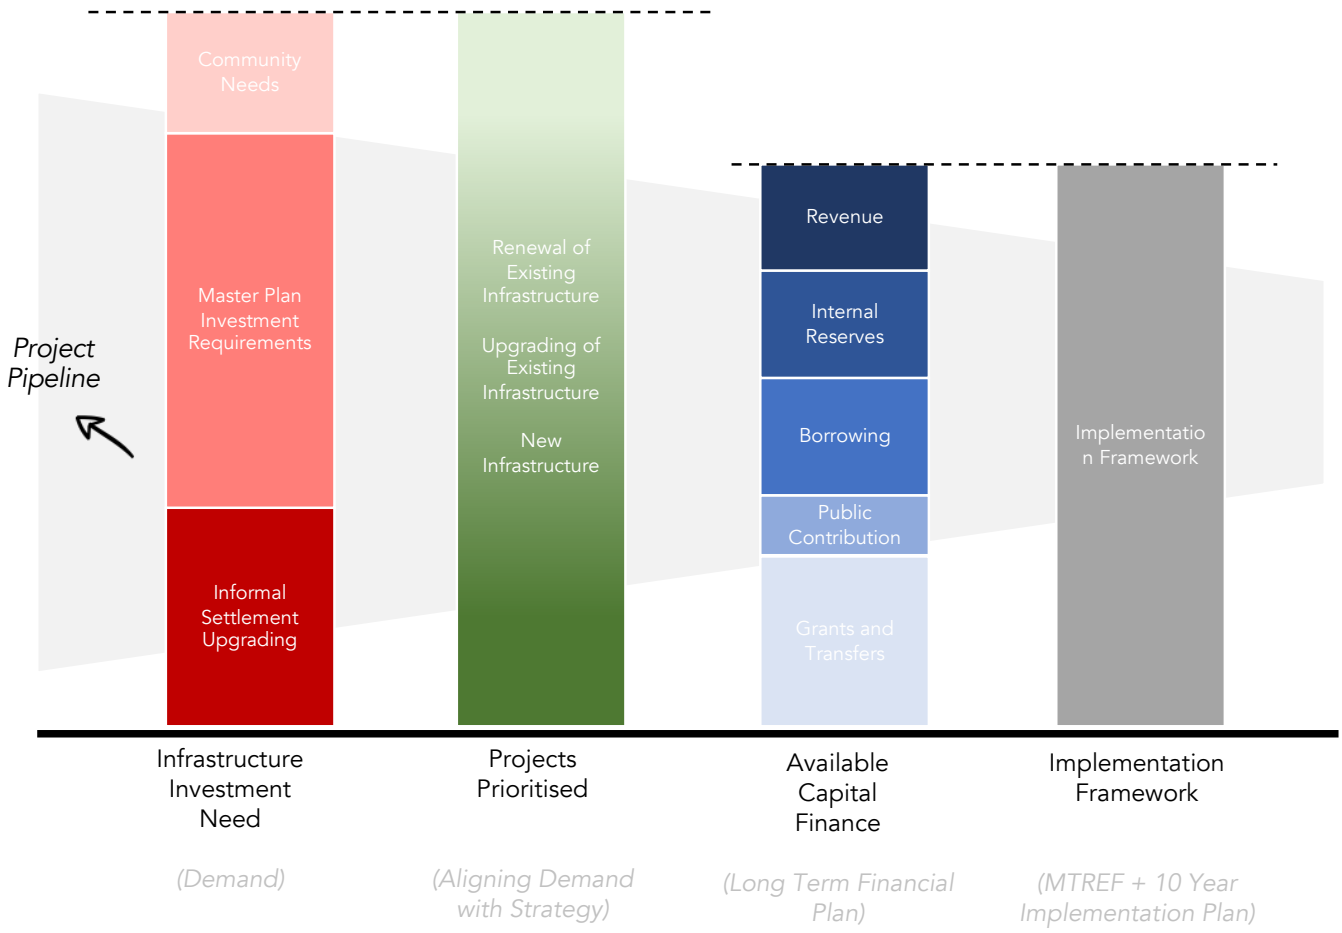
1.1 What is a Capital Expenditure Framework

According to the Department of Cooperative Governance and Traditional Affairs (COGTA) guidelines, a Capital Expenditure Framework (CEF) is a consolidated, high-level view of a municipality's long-term infrastructure investment needs. It ensures that infrastructure priorities are spatially aligned with municipal strategic objectives, budgetary realities, and development plans. The framework is grounded in principles of sustainability, financial feasibility, and strategic alignment, balancing immediate infrastructure needs with long-term development goals, the relationships between these spheres of planning and principles is illustrated in Figure 1–1.

The Spatial Planning and Land Use Management Act, 2013 (SPLUMA) mandates the inclusion of a CEF within a municipality's Spatial Development Framework (SDF). Specifically, Section 21(n) of SPLUMA requires that an SDF "determine a Capital Expenditure Framework for the municipality's development programmes, depicted spatially." This legislative requirement underscores the importance of integrating spatial planning with financial planning, ensuring that the spatial strategies articulated in the SDF are implemented through practical and affordable infrastructure investments.

A Capital Expenditure Framework links spatial development strategies with budgetary constraints and infrastructure demands. It provides a transparent mechanism for prioritising projects, promoting the efficient allocation of resources, and aligning capital expenditure with the municipality's long-term strategic vision.

Figure 1–1: The Capital Expenditure Framework within the built environment context



1.2 Aim of Capital Expenditure Framework

The aim of a Capital Expenditure Framework (CEF) is to create a structured and strategic approach to municipal infrastructure expenditure. The CEF is intended to align the municipality's spatial development strategies with its financial resources and capacity, ensuring that long-term growth and development objectives are achievable, and inform operational activities of a municipality.

A CEF aims to provide a municipality with the means to inform financial planning with infrastructure planning and spatial priorities identified in the Spatial Development Framework (SDF). It aims, furthermore, to establish a clear methodology for municipalities to evaluate, prioritise, and inform implementation processes of infrastructure projects within their affordability envelope, supporting both immediate and long-term development goals.

From Figure 1–2 one can see the illustration that infrastructure investment need, expressed as projects, usually exceeds available capital finance, and therefore it is an imperative for municipalities to partake in a prioritisation process to determine which projects are best aligned with the strategy of the municipality, together with a budget scenario process to determine which projects are affordable and should be implemented when.

Figure 1–2: Relationship between infrastructure investment needs, affordability envelope, prioritisation process, and budget scenario process

1.3 Objectives of Capital Expenditure Framework

The key objectives of a CEF is to:

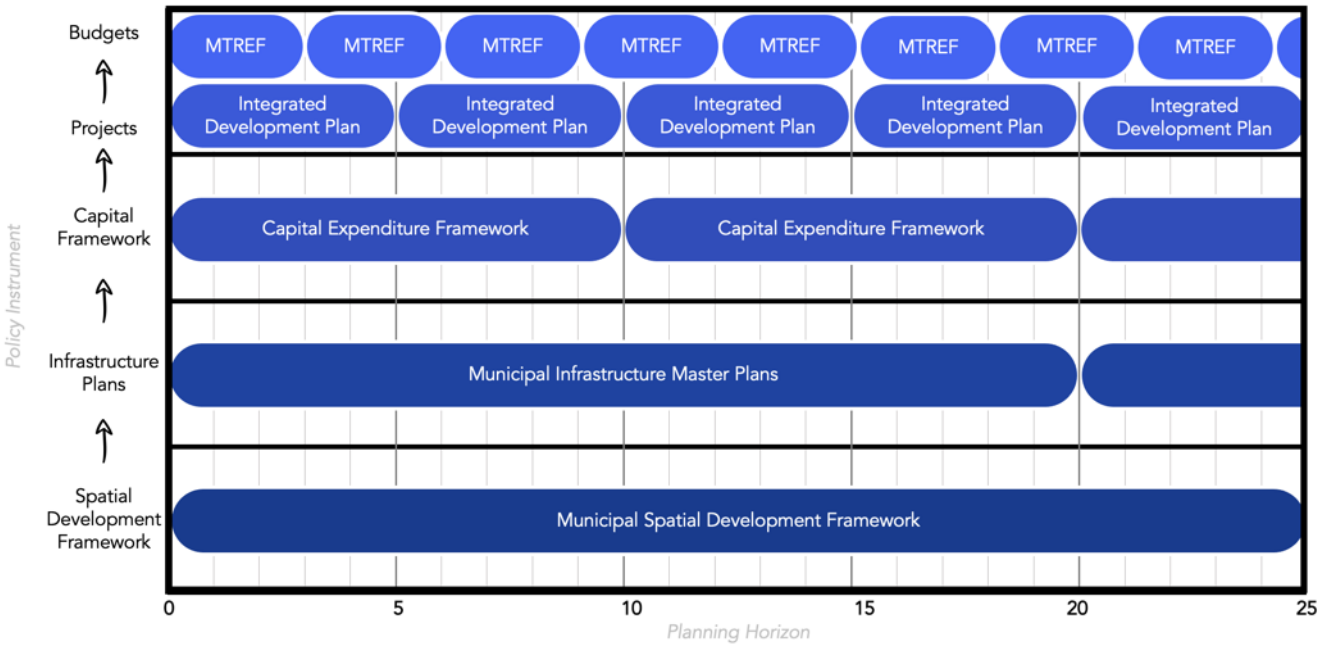
- Socio-economic trends: Understand the socio-economic trends in a municipality over the long term;
- Quantify Infrastructure Needs: Assess and detail the municipality's long-term infrastructure requirements based on an SDF-informed land use budget, infrastructure standards, anticipated socio-economic growth, existing infrastructure, and backlogs;
- Align with the Spatial Development Framework (SDF): Translate the spatial vision and strategic priorities outlined in the SDF into priority development areas which informs prioritisation practices;
- Consolidate Infrastructure Demand: Create a comprehensive list of infrastructure projects across various sectors in line with the municipality's mandate, reflecting the municipality's overall infrastructure demands;
- Contextualise Financial Affordability: Integrate the municipality's affordability envelope, derived from the Long-Term Financial Model (LTFM), to ensure infrastructure expenditure are financially sustainable over the planning horizon;
- Facilitate Prioritisation: Establish a framework to evaluate and rank projects based on strategic alignment, socio-economic impact, and spatial targeting amongst others, ensuring that resources are allocated to the most critical and impactful projects;
- Determine a Budget Scenario: Offer a structured, evidence-based approach to infrastructure planning and budgeting, improving decision-making processes and accountability to stakeholders - amongst others, to indicate project-level responses per asset type per functional area;
- Enable Spatial Transformation: Direct infrastructure investments toward spatial transformation goals, focusing on reducing inequalities, improving access to services, and promoting inclusive economic growth, and;
- Bridge Short-Term and Long-Term Planning: Ensure a coherent link between the short-term MTREF cycles, Medium-term Integrated Development Plan (IDP) cycles and the municipality's long-term development vision, embedding sustainability and foresight into the planning process.

1.4 Role of the Capital Expenditure Framework as a policy instrument

The Capital Expenditure Framework (CEF) is a cornerstone of municipal planning, grounded in South Africa's legislative framework and designed to bridge the gap between long-term spatial development strategies and actionable infrastructure expenditure. The concept of the CEF was formalised under the Spatial Planning and Land Use Management Act (SPLUMA, Act 16 of 2013), specifically in Section 21(n), which mandates municipalities to determine a spatially referenced CEF as part of their Spatial Development Framework (SDF). This legislative requirement reflects the increasing emphasis on aligning planning and budgeting processes to address developmental challenges effectively.

Historically, the Constitution of South Africa laid the foundation for this alignment in Section 153, which directs municipalities to prioritise the basic needs of communities while promoting socio-economic development through structured planning and budgeting. The Integrated Development Plan (IDP) was

introduced as a mechanism to achieve this in the Local Government Transition Act (Act 209 of 1993), evolving through subsequent legislation, including the Municipal Systems Act (MSA, Act 32 of 2000). The MSA established the IDP as the principal planning instrument of local government, requiring it to incorporate a comprehensive financial plan and a Spatial Development Framework. This integration ensures that municipal resources are allocated effectively to achieve the long-term developmental vision.



The CEF builds on these legislative imperatives by operationalising the SDF within the IDP framework. As a long-term (10-year) planning tool, the CEF quantifies infrastructure needs, consolidates them into prioritised project pipelines, and aligns them with the municipality's financial capacity as outlined in the Long-Term Financial Plan (LTFP). It ensures that infrastructure investments are not only spatially targeted but also financially sustainable, bridging the divide between visionary spatial strategies and practical implementation.

The CEF also plays a vital role in South Africa's Local Government Accountability Cycle, a governance framework defined by the Municipal Finance Management Act (MFMA, Act 56 of 2003). This cycle integrates planning, budgeting, and reporting processes to ensure transparency, accountability, and alignment with development priorities. Through informing the IDP, and so the Medium-Term Revenue and Expenditure Framework (MTREF), as well as the Service Delivery and Budget Implementation Plan (SDBIP), the CEF enables municipalities to stabilise their decision-making processes. It provides a consistent rationale for allocating resources, ensuring that both short-term operational needs and long-term developmental objectives are addressed.

Importantly, the CEF institutionalises long-term planning practices within municipalities. It encourages decision-makers to adopt a forward-looking perspective that considers future growth patterns, socio-economic trends, and financial constraints. This approach reduces the reactive nature of municipal budgeting, replacing it with proactive, evidence-based strategies that support equitable service delivery and spatial justice.

The CEF is a transformative policy instrument that integrates spatial, financial, and infrastructure planning within the legislative and operational frameworks of municipal governance. It strengthens the IDP as the single most strategic document of municipalities, ensures alignment with the SDF, and guides resource allocation through the MTREF and SDBIP. Through its structured and integrated approach, the CEF enables municipalities to achieve their developmental mandates while ensuring financial sustainability and fostering spatial transformation.

Figure 1–3: The relationship between policy instruments effecting the spatial form

1.5 Structure of this Capital Expenditure Framework

The structure of this report is outlined below to guide the reader through the key components of the Capital Expenditure Framework (CEF) and its alignment with municipal planning processes as well as the norms and standards of the CEF.

Table 1-1: Structure of this Capital Expenditure Framework

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 1: Inception and Information Gathering	Phase 1	To provide a contextualisation to the Capital Expenditure Framework. This phase comprises the inception process of the CEF as well as the information gathering process in which a comprehensive integrated infrastructure investment framework, or portfolio of projects, is collated.
Part 2: Functional Area and Spatial Category for Investment Planning Profiling and Spatial Demand Quantification	Phase 2a	This part introduces functional areas for priority investment which are defined and mapped to indicate the spatial strategy depicted in the MSDF (linked to the MSDF proposals). The identified functional areas are used to determine the future population, housing, and land demand based on existing socio-economic and related data which is used in the spatial demand quantification component.
Part 3: Infrastructure demand	Phase 2b	This part determines the investment requirements for each functional area, including operational and maintenance costs per asset class. The goal is to compare the optimal infrastructure requirements scenario with the known infrastructure demand based on current planning frameworks.
Part 4: Affordability Envelope	Phase 3	This part is a reflection of the municipality's financial health and long-term financial plan. Primarily it includes the results of the re-application of the long-term financial plan to determine the appropriate affordability envelope.
Part 5: Prioritisation and Budget Scenario	Phase 4	This part has a prioritisation framework that considers spatial, engineering, and financial factors to calculate a composite score indicating each project's relative importance in the pipeline. It also applies this framework to the budget fit process to determine how to allocate capital within the affordability envelope per project for the next 10 years.

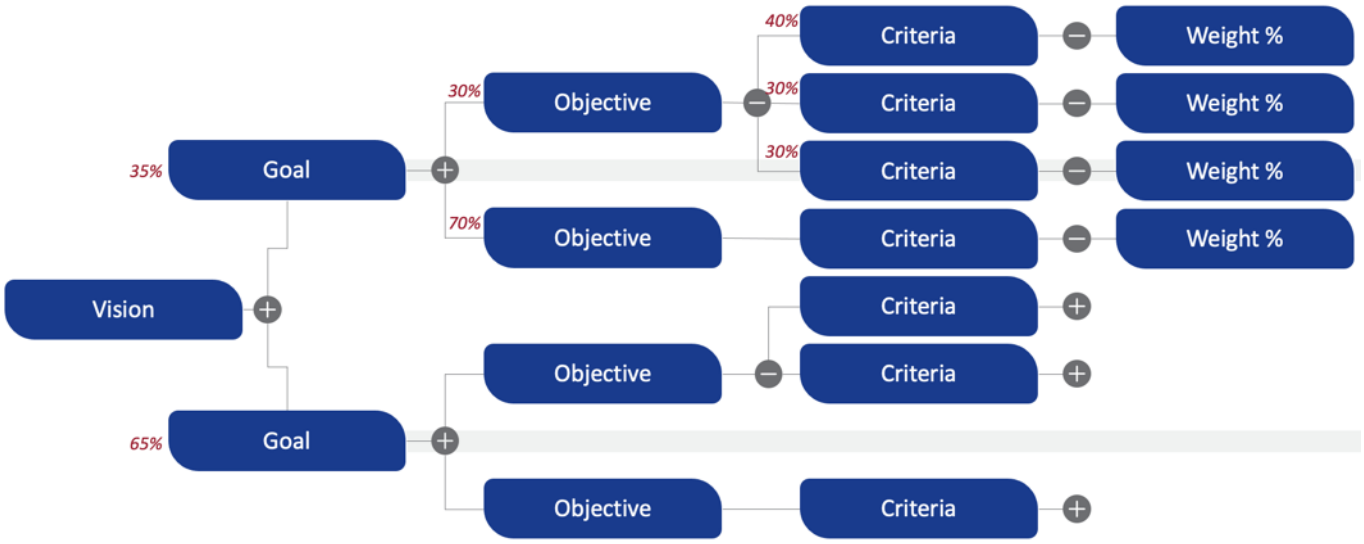
Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 6: Capital Expenditure Programme	Phase 5	This part is a breakdown of the 10-year capital expenditure framework. Essentially, it analyses the fitted project pipeline in terms of spatial alignment, asset type alignment, and other attributes to ultimately verify that the 10-year capital expenditure framework is in line with the strategic intent of the prioritisation framework and the MSDF objectives.
Part 7: Institutional Arrangements and Project Closeout	Phase 6	This phase comprises of a concluding chapter to the CEF, this part aims to identify areas of enhancement that will render the CEF not only as a compliance document but to solidify institutional change around the alignment of planning, engineering, and financial practices – with the ultimate aim to improve service delivery. Furthermore this phase contains a final close-out report detailing the project timeline and conclusions drawn.

Phase 4

Prioritisation Framework

2 Part 5: Prioritisation

2.1 Contextualisation



Prioritisation in a capital expenditure framework refers to the process of ranking and selecting investment projects based on their relative importance, measured in terms of their strategic alignment. This is typically done in order to ultimately allocate limited resources to the most deserving projects and ensure that the organisation's goals and objectives are met in the most efficient and effective manner.

Multi-criteria assessment frameworks are often used in prioritisation, as they provide a systematic and comprehensive approach to evaluating and comparing projects. These frameworks consider multiple dimensions or criteria that are relevant to the organisation, such as financial performance, strategic alignment, risk, and impact.

In a multi-criteria assessment framework, each project is rated against each criterion using a set of predefined weights and scales. The ratings are then combined to generate an overall score or rank for each project, which can be used to determine its priority. The selection of criteria and their relative importance is determined based on the specific goals and objectives of the organisation, as well as any relevant constraints or limitations.

Using a multi-criteria assessment framework can help organisations to make more informed and objective decisions about their capital expenditure priorities, by taking into account a wide range of factors and considering trade-offs between different criteria. This can lead to better alignment with strategic goals, improved allocation of resources, and increased return on investment.

Figure 2–1: Prioritisation Framework

2.2 Prioritisation Rationale

A prioritisation rationale is a written explanation that outlines the reasoning behind prioritising projects, initiatives, or investments. The criteria used in the prioritisation process and how each project was evaluated and ranked are detailed in the rationale. This document provides transparency and

accountability in the decision-making process and allows stakeholders to understand why certain projects were given priority.

The prioritisation rationale is influenced by the strategic goals and objectives of the municipality. It typically includes objectives, criteria, and weights associated to each. Having a clear prioritisation rationale can help build trust and support among stakeholders and serve as a reference for future decision-making. As the CEF is an extension of the municipal Spatial Development Framework (MSDF), it is key that the two documents are aligned. To align the documents key focus is placed on the municipality's SDF strategies. The rationale is an important tool for ensuring that resources are allocated in a way that aligns with the municipality's goals and objectives.

2.2.1 Objectives

The Stellenbosch prioritisation model is a framework used to evaluate and rank capital projects based on multiple criteria. The objectives of this model are as follows:

- **Strategic Focus Area Alignment:** This objective assesses how well a project aligns with the strategic focus areas identified by the municipality. This helps ensure that resources are being allocated to initiatives that support the municipality's overall goals and objectives.
- **Master Plan Alignment:** This objective evaluates how well a project aligns with the municipality's master plan, which outlines its long-term vision for growth and development. Projects that are in line with the master plan are given priority, as they support the municipality's overall direction.
- **Urban Edge Alignment:** This objective assesses how well a project aligns with the municipality's vision for the urban edge, which refers to the physical and functional boundaries of the city. Projects that are consistent with the vision for the urban edge are given priority as they help shape the city's future.
- **Adam Tas Corridor Alignment:** This objective evaluates how well a project aligns with the Adam Tas Corridor, which is a key transportation and development corridor in the city. Projects that support the Adam Tas Corridor are given priority, as they help to improve connectivity and support economic growth.
- **Beneficial Area Alignment:** This objective assesses the potential benefits a project will bring to the community, including economic, social, and environmental benefits. Projects that are expected to have a positive impact on the community are given priority, as they support the overall well-being of the city.

Figure 2–2: Prioritisation Objectives

2.2.2 Strategic Alignment

Prioritisation Objective	Primary Strategy Alignment	Secondary Strategy Alignment
Strategic Focus Area Alignment	Strategy 7: Enable private/community sector alignment Strategy 8: Focus on catalytic development areas	Strategy 3: Direct growth to specific areas
Master Plan Alignment	Strategy 3: Direct significant growth to designated areas Strategy 4: Clarify settlement roles and maintain identity	Strategy 6: Develop balanced, inclusive communities Strategy 8: Catalytic development areas
Urban Edge Alignment	Strategy 1: Maintain natural environment assets Strategy 3: Direct growth appropriately	Strategy 4: Maintain settlement identity Strategy 6: Positive relationship with nature and agricultural land
Adam Tas Corridor Alignment	Strategy 5: Balanced transport approach (regional mobility + local accessibility)	Strategy 8: Catalytic development areas along corridor
Beneficial Area Alignment	Strategy 6: Balanced, inclusive, serviced communities Strategy 1: Natural environment Strategy 2: Cultural heritage	All strategies contribute to community well-being.

2.3 Prioritisation Criteria

2.3.1 Strategic Focus Area Alignment

The Strategic Focus Area Alignment branch assesses the alignment of each capital project with the IDP strategic Focus Areas. The Strategic focus areas of Stellenbosch include:

- **Good Governance and Compliance:** This area focuses on ensuring that the municipality is run in a transparent and accountable manner, with processes and policies in place to ensure compliance with local and national regulations. This could include areas such as financial management, ethics, and corruption, and ensuring that all decision-making is in the best interest of the community.
- **Green and Sustainable Valley:** This area focuses on promoting sustainability and environmental responsibility in the municipality. This could include initiatives to reduce the municipality's carbon footprint, protect natural resources, and promote sustainable development practices.
- **Dignified Living:** This area focuses on improving the quality of life for all residents in the municipality. This could include initiatives to address poverty and inequality, promote affordable housing, and ensure access to basic services such as healthcare, education, and employment.
- **Safe Valley:** This area focuses on improving safety and security for residents in the municipality. This could include initiatives to reduce crime and improve emergency response times, as well as promoting community engagement and public safety awareness programs.
- **Valley of Possibility:** This area focuses on promoting economic growth and development in the municipality. This could include initiatives to attract investment, create jobs, and support small businesses and entrepreneurs.

2.3.2 Master Plan Alignment

The Master Plan Alignment branch evaluates the degree to which each capital project aligns with the various sector master plans. The sector master plan groupings include:

- Water Supply and Bulk Water
- Wastewater & Sanitation
- Strategic/IDP
- Stormwater
- Solid Waste and Environmental Management

- Roads and Transport
- Other/Miscellaneous
- Fleet and Equipment
- Council Resolutions and Governance

By prioritising projects emanating from the sector Master Plans, the municipality aims to leverage the expertise encapsulated within each masterplan. This is to take into consideration the comprehensive understanding of the needs, challenges, and opportunities in each sector, such as transportation, water, or housing. This information is utilised to develop a vision and goals for the sector that align with the overall development objectives of the municipality. By prioritising projects within the sector master plans, the municipality can focus its investment in areas that will have the greatest impact in achieving the desired outcomes for that sector.

Prioritising projects within sector master plans provides a clear and transparent process for decision-making, providing technical support and evidence-based information during the decision-making process. The process of prioritisation within the sector master plans involves considering the needs and constraints of the sector, as well as the available resources, which determine which projects should receive priority based on a set of criteria. This process helps to ensure that investments are made in a strategic and evidence-based manner and that they are aligned with the overall goals and objectives of the municipality.

2.3.3 Urban Edge Alignment

The Urban Edge alignment branch evaluates the degree to which each capital project aligns with the spatial boundary of the Urban Edge. Focusing investment within the urban edge is an important strategy for cities seeking to promote sustainable and equitable development. By taking advantage of opportunities in these areas, cities can help to create vibrant, liveable communities that meet the needs of all residents. It is further regarded as an important prioritisation criteria as it:

- Firstly, helps to mitigate urban sprawl and promote compact, sustainable development patterns. By investing in and revitalising areas along the urban edge, cities can encourage more efficient use of land, reduce the need for long commutes, and minimize the negative impacts of urbanisation on the environment.
- Secondly, the result of investing within the urban edge can help create new job opportunities and support local economic development. By developing and improving commercial, retail, and industrial centres within the urban edge, cities can attract new businesses and workers, which further drives economic growth and improves overall quality of life.
- Thirdly, by guiding investment spatially, it helps to address social and environmental challenges, such as poverty, crime, and environmental degradation. Improving housing, transportation, and other infrastructure in urban centres can enhance the safety and liveability of communities, thereby promoting the health and well-being of residents.

2.3.4 Adam Tas Corridor Alignment

The Adam Tas Corridor alignment branch evaluates the degree to which each capital project aligns to the spatial delineation of the Adam Tas Corridor. Projects within this area are given higher priority than

those outside of it. This is important for Stellenbosch, especially in terms of spatial planning, financial management, and infrastructure delivery:

- Spatial Planning: The alignment of the Adam Tas Corridor contributes to the development of a cohesive and integrated spatial development plan for the area. Prioritising projects within the corridor ensures that development takes place in an orderly and planned manner. This helps in avoiding haphazard and piecemeal development that can result in land-use conflicts, degradation of the environment, and reduced effectiveness of infrastructure investments.
- Financial Management: Prioritising projects within the Adam Tas Corridor alignment can also lead to cost savings and more efficient use of resources. By focusing on the corridor, it becomes possible to optimize the use of existing infrastructure and services, and to leverage economies of scale in the development of new infrastructure. This leads to a more cost-effective and efficient use of public funds.
- Infrastructure Delivery: Focusing investment within the Adam Tas Corridor ensures that adequate infrastructure is in place to support development. This includes both hard infrastructure, such as roads and water supply systems, as well as soft infrastructure, such as health and education services. By prioritising the development of infrastructure in the corridor, it becomes possible to provide the necessary support for sustainable and equitable growth and development in the area. This helps to create an enabling environment for economic growth and to improve the quality of life for residents and businesses in the area.

2.3.5 Beneficial Area Alignment

The Beneficial Areas Alignment evaluates the degree to which each capital project aligns with the various wards of the municipality. Capital investment is aligned based on the following three arguments, using wards:

- Community Impact: Wards align capital projects to impactful areas by allowing a localised approach to identifying the community's areas of greatest benefit. This enables decision-makers to prioritise projects that are expected to bring significant benefits to the people living in a particular ward, improving their quality of life and supporting the overall well-being of the city.
- Equity and Fairness: By aligning capital projects with wards, the prioritisation process ensures that investment is distributed equitably across the city. Projects that bring significant benefits to underserved or marginalised communities are given priority, reducing disparities, and promoting a more equitable and just society.
- Data-Driven Decision-Making: Using ward-level data benefits the prioritisation process by allowing for an informed and data-driven decision-making approach. Considering the specific locational attributes of capital projects, and their alignment to each ward, decision-makers can make more informed and strategic investment decisions, leading to better outcomes for the community and the municipality.

2.4 Prioritisation Tool

2.4.1 A Multi-Criteria Assessment Framework Approach

A multi-criteria assessment framework is a decision-making tool that helps in evaluating different options based on multiple criteria. It involves a step-by-step process that assigns scores to each alternative based on its performance against the criteria. The scores are then converted into points for each criterion and

project. The weightage of each criterion is pre-determined using a points system, where a higher number indicates a greater level of importance.

By applying this framework, decision-makers can assess multiple options objectively, based on their performance against various criteria. It helps in identifying the most suitable option that meets the needs of the organisation or project. This approach also ensures transparency in the decision-making process, as the criteria and weightage assigned to each criterion are clearly defined beforehand.

The outcome of a multi-criteria assessment framework is a set of scores or rankings for each alternative being evaluated, based on their performance against multiple criteria. The scores are typically presented as a set of numbers, where each number represents the performance of a specific alternative on a particular criterion.

2.4.2 Determining Prioritisation Results

Determining prioritisation results is a critical step in decision-making, ensuring that projects or initiatives are assessed fairly and systematically. A structured approach helps stakeholders align their decisions with strategic goals, ensuring transparency and objectivity. The process involves defining preferences, establishing criteria, collecting relevant data, and ultimately ranking projects based on their importance. The following table outlines the key steps involved in determining prioritisation results using a multi-criteria assessment framework.

Table 2-1: Prioritisation Methodology

Step	Description
Step 1: Define The Relative Preferences for Each Goal That Was Set Out	Weights for relative preferences should be determined through stakeholder consultations to prioritise goals. In some cases, all goals may be given equal weight to reflect their equal importance.
Step 2: Define Relative Preferences for Each Objective That Was Set Out	Objectives contribute differently to achieving a goal, with some being more significant than others. This step ensures that prioritisation is based on principles rather than the merits of individual projects, allowing for a fair comparison of all projects.
Step 3: Set-Up Each Criterion to Evaluate Relative Importance	Evaluation criteria are established based on performance indicators, spatial, qualitative, or quantitative measures. The goal is to ensure fairness by avoiding discrimination and allowing all projects an equal opportunity for assessment.
Step 4: Data Collection & Standardisation	The availability of relevant data is crucial for assessment. If specific data is unavailable, proxy criteria can be used. Essential data include project name, implementing department, scope, spatial details, cost, and duration.
Step 5: Calculate Score	Once criteria, weights, and evaluation measures are set, projects are assessed within the multi-criteria assessment framework. This process ranks them from most important to least important based on their attributes.
Step 6: Assess Outcome	This final step allows decision-makers to calibrate the model to ensure reliability and validity. Adjustments may be made to enhance the accuracy and fairness of the prioritisation results.

2.5 Prioritisation Results

The Capital Prioritisation Model (CPM) is a critical tool used by municipalities to identify and rank capital projects based on their potential impact and benefit to the community. Prioritising capital projects is a critical process that involves identifying and ranking impactful projects for government investment. This helps allocate resources and focus efforts on the municipality's strategic overview. This section will discuss the relative ranking resulting from the CPM.

2.5.1 Project Distribution

The visualisation and analysis of prioritised projects through score distribution is a valuable technique. By examining score distributions, we can detect data trends and patterns, while also pinpointing potential gaps or biases requiring attention. One metric used to gauge distribution is skewness, which measures the degree of asymmetry in the data. A perfectly symmetrical distribution yields a skewness of zero. Conversely, positive skewness signifies a rightward skew, indicating a longer tail on the positive side of the axis.

Within the context of project scores, a positive skewness suggests a preponderance of projects with lower scores and fewer with higher scores. This is typical of the start-up effect (running the model for the first time) and might indicate the necessity for standardising data collection procedures and ensuring uniform evaluation criteria for all projects. Additionally, it could point toward the need for an extra criterion to bolster the prioritisation process. However, it's crucial to emphasise that achieving a normal distribution of scores is of paramount importance. Achieving a normal distribution of scores is crucial for several reasons. Normal distributions, well-understood in statistics, offer predictability for estimating probabilities and making inferences about project outcomes. They enable fair project comparisons, aid balanced decision-making, and support efficient resource allocation. Additionally, striving for a normal distribution encourages an ongoing evaluation process refinement, identifying and rectifying biases or inconsistencies, ultimately leading to improved decision quality.

Ultimately, comprehending the skewness of the score distribution empowers municipalities to enhance project planning practices and optimise resource allocation. Figure 2-3 illustrates the project score distribution for the Municipality.

Figure 2-3: Project Score Distribution

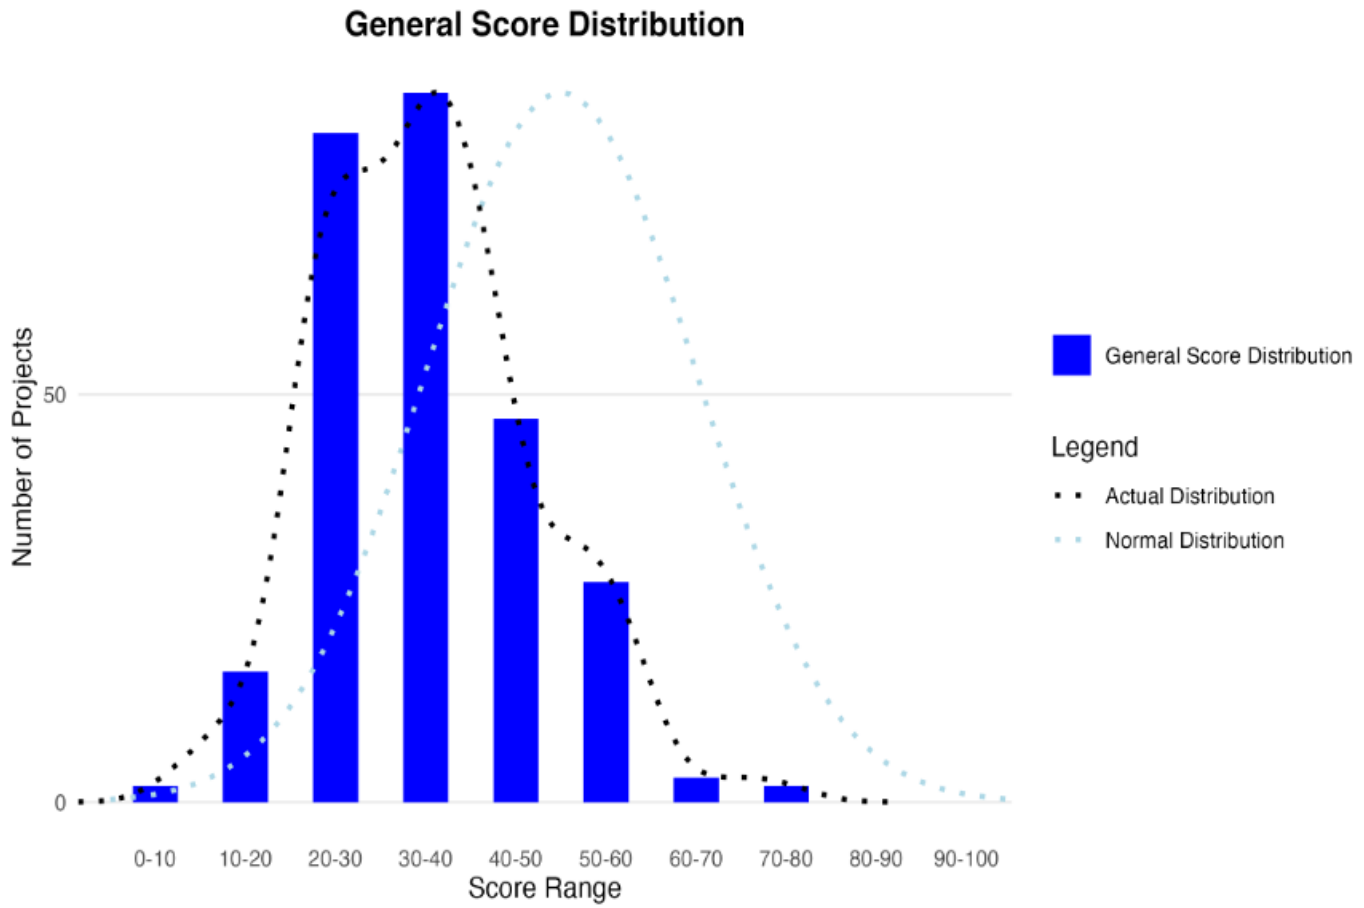


Table 2-2: Project Score Distribution

Score Range	Total Projects
0-10	2
10-20	16
20-30	82
30-40	87
40-50	47
50-60	27
60-70	3
70-80	2
80-90	0
90-100	0

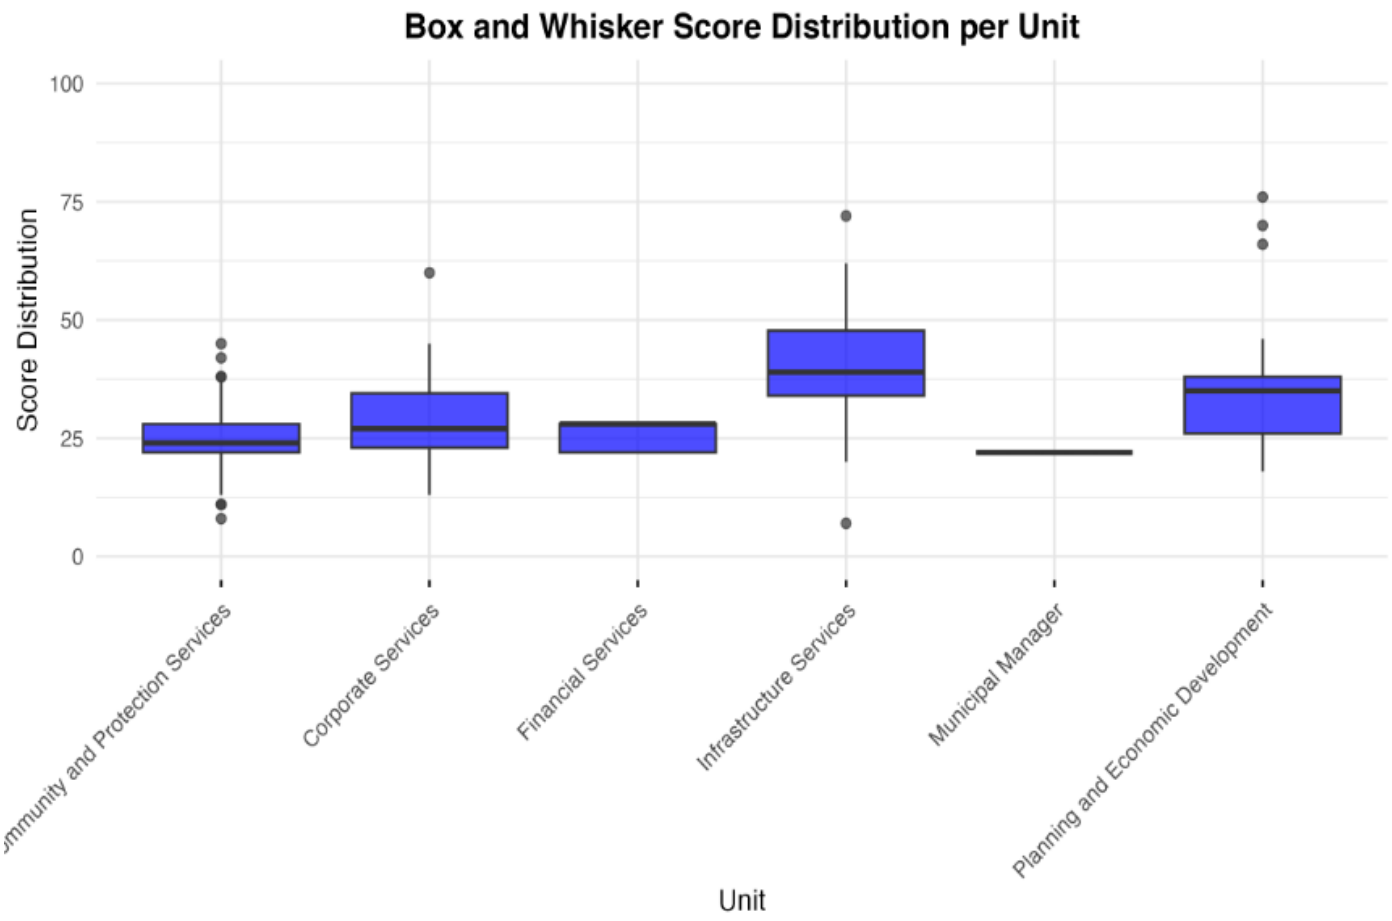
The following observations can be made from Figure 2-3 and Table 2-2:

The distribution of prioritisation scores across the project portfolio reveals important patterns regarding strategic alignment, framework calibration, and the municipality's ability to advance infrastructure investments that support its spatial and development objectives. The analysis assesses how projects performed against the multi-criteria prioritisation framework, highlighting concentrations of higher-scoring projects, the characteristics of lower-scoring initiatives, and the implications for capital investment decision-making. Key observations are outlined below:

- The scoring distribution demonstrates a clear concentration of projects within the middle ranges of the prioritisation spectrum, with the largest share of projects falling between 20 and 40 points. Specifically, 82 projects fall within the 20–30 range and 87 projects within the 30–40 range, representing the dominant portion of the portfolio. This pattern suggests that a significant share of

projects demonstrate partial alignment with the strategic criteria, performing well in certain dimensions while showing weaker linkages in others.

- A further grouping of projects is observed within the 40–60 range, comprising 47 projects scoring between 40–50 and 27 projects between 50–60. These projects represent initiatives with stronger strategic alignment and clearer connections to municipal spatial priorities, service delivery requirements, or development objectives. While smaller in number compared to the mid-range cohort, these projects demonstrate a higher degree of alignment with the prioritisation framework.
- Only a limited number of projects achieve scores above 60 points, with three projects in the 60–70 range and two projects in the 70–80 range. The absence of projects above 80 points indicates that very few initiatives demonstrate consistently strong performance across all prioritisation criteria. This outcome reflects the rigorous application of the multi-criteria framework, where high scores require strong alignment across spatial targeting, service delivery impact, financial considerations, and broader municipal policy objectives.
- At the lower end of the distribution, 18 projects fall below the 20-point threshold, including two projects in the 0–10 range and 16 projects in the 10–20 range. These projects likely reflect initiatives with limited alignment to the prioritisation criteria or projects addressing operational or administrative requirements without strong spatial or strategic justification. The relatively small proportion of projects in this range indicates that most initiatives demonstrate at least a baseline level of strategic relevance within the portfolio.
- The overall distribution exhibits a moderate positive skew, with the majority of projects concentrated in the 20–40 range and progressively fewer projects achieving higher scores. This pattern is typical when a prioritisation model is applied across a broad portfolio of projects for the first time, as scoring depends heavily on the completeness and consistency of project information. Over time, as project definitions are refined and data inputs become more standardised, the distribution is likely to evolve toward a more balanced profile.
- From a capital planning perspective, the distribution provides important guidance for investment decision-making. Projects in the higher scoring ranges represent the strongest candidates for advancement within the capital programme, while projects in the mid-range require further consideration regarding sequencing, timing, and alignment with available funding. Lower-scoring projects should be reviewed to determine whether they require additional strategic justification, improved project definition, or repositioning within the municipality's planning frameworks.



The prioritisation results demonstrate that while a limited number of projects exhibit very high strategic alignment, the majority of the project portfolio occupies the middle ranges of the scoring framework. This outcome highlights the role of the prioritisation process in differentiating between competing infrastructure investments and provides a structured and transparent basis for determining which projects should be advanced within the municipality's capital expenditure programme.

2.5.2 Project Score Distribution Across Units

Comparing project scores within the Municipality serves to discern projects that closely align with the strategic goals and rationale of the Municipality. The visual representation in Figure 2-4 employs a box and whisker diagram to portray the composite project scores spanning the entire Municipality. This diagram is a powerful visual aid that effectively condenses a range of data points into a coherent summary. This graphical representation provides insight into several key aspects of the data. It highlights the median score of a given unit, along with the spectrum between the minimum and maximum scores. Furthermore, it visually conveys the distribution of scores encompassed between the 25th and 75th

percentiles. The "x" symbol corresponds to the unit's average score. Meanwhile, the endpoints of the whiskers extend to indicate the maximum and minimum scores. In this diagram, projects that fall within the range of scores spanning from the minimum value to the 25th percentile are positioned along the lower whisker. Conversely, projects with scores ranging from the maximum value to the 75th percentile find their place along the upper whisker and within the box section of the diagram.

Figure 2-4: Score Distribution per Unit

The following observations can be made from Figure 2-4:

The box and whisker plot illustrates the distribution of prioritisation scores across municipal units, providing insight into the relative strategic alignment of projects and the variability of performance across organisational functions. The analysis highlights how project scores cluster within each unit, identifies the degree of variability in project performance, and reveals structural differences between service delivery units and administrative functions. Key observations are noted below:

- The score distribution indicates clear variation between municipal units in terms of strategic alignment. Infrastructure Services demonstrates the highest median score, approximately in the upper-30 to low-40 range, with the interquartile range concentrated roughly between the mid-30s and mid-40s. This pattern indicates that the majority of infrastructure-related projects demonstrate stronger alignment with the prioritisation framework relative to other units. Planning and Economic Development follows with a median score in the low-to-mid-30 range, with several higher-scoring outliers extending well above 60 points, reflecting the presence of projects with strong spatial and strategic alignment.
- Corporate Services and Financial Services display median scores clustered within the mid-20 range, indicating moderate alignment with the prioritisation criteria. Corporate Services exhibits a slightly

broader distribution, including a notable higher-scoring outlier approaching approximately 60 points, suggesting that while most initiatives are operational in nature, certain projects demonstrate stronger strategic alignment. Financial Services, by contrast, shows a relatively narrow range of scores centred around the mid-20 range, reflecting a portfolio largely composed of operational or support-oriented projects.

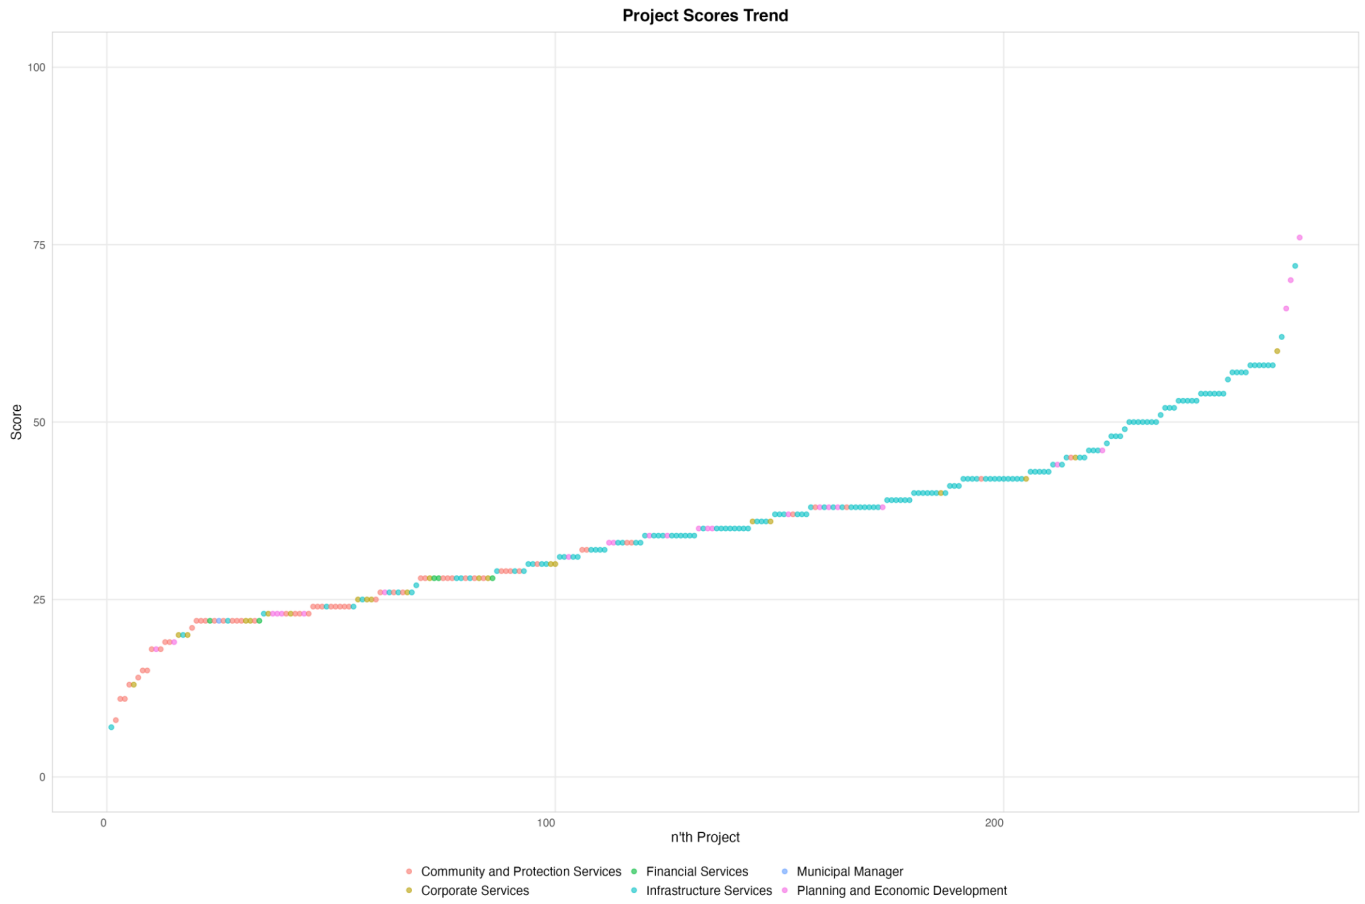
- Community and Protection Services demonstrates a similar distribution pattern, with a median score in the mid-20 range and moderate variability across projects. The presence of several higher-scoring observations above the interquartile range indicates that some projects within this unit demonstrate stronger alignment with strategic criteria, although the majority fall within the moderate scoring band of the prioritisation framework.
- The Municipal Manager portfolio displays the lowest and most concentrated score distribution, with a median score around the low-20 range and very limited variability. This reflects the small number of projects within this portfolio and the administrative nature of these initiatives, which typically lack strong spatial targeting or direct infrastructure delivery components.
- Distinct functional groupings emerge when considering the distribution of scores across units. Service delivery-oriented units, particularly Infrastructure Services and Planning and Economic Development, demonstrate relatively higher median scores and greater variability, reflecting projects linked to infrastructure investment, spatial development priorities, and sector master planning. Operational and administrative units, including Financial Services, Corporate Services, and the Municipal Manager portfolio, cluster within lower score ranges due to the nature of their projects, which primarily support internal municipal operations rather than direct service delivery infrastructure.
- The observed distribution pattern highlights the effectiveness of the prioritisation framework in differentiating between projects with strong strategic and spatial alignment and those that serve primarily administrative or operational functions. Infrastructure and spatial planning portfolios tend to achieve higher prioritisation scores due to their direct contribution to service delivery, spatial targeting, and development objectives, while internal support projects naturally score lower within a framework designed to prioritise infrastructure investment and spatial transformation.

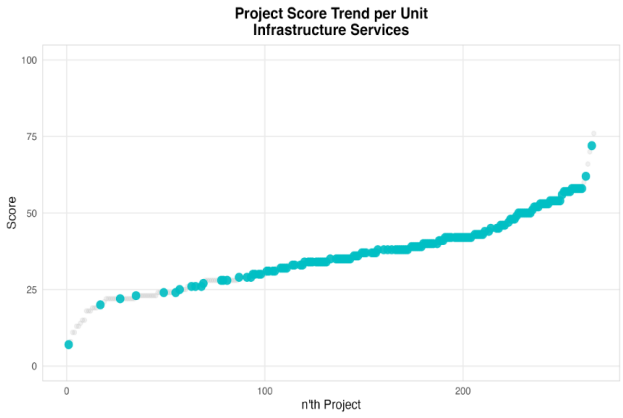
The box and whisker analysis demonstrates that the distribution of scores across municipal units reflects the differing functional mandates within the municipality. Units responsible for infrastructure delivery and spatial planning exhibit stronger alignment with the prioritisation framework, while administrative units cluster within lower score ranges due to the operational nature of their project portfolios. This distribution confirms that the prioritisation framework effectively differentiates between project types and provides a credible basis for evidence-based capital investment decision-making.

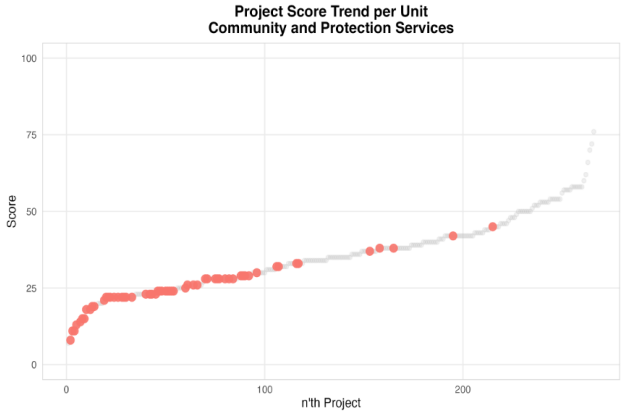
2.5.3 Project Score Analysis: Score per Unit

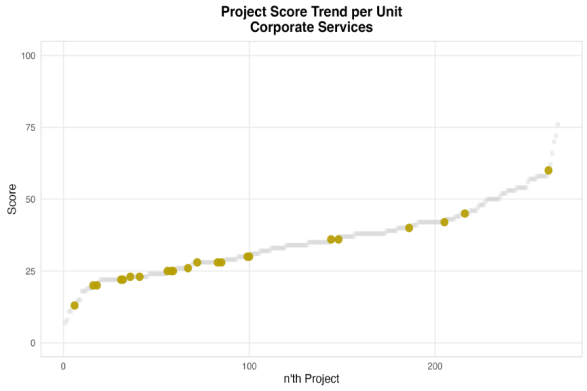
The prioritisation model is used to rank projects in order of importance. To validate the model, the distribution of scores of projects must be considered. A fair score distribution should show a gradual increase in the number of projects as the score increases. A clustered distribution of scores could indicate bias within the model or an underrepresentation of data attributes. For example, if most projects do not have a location or a budget, then most projects will score low, resulting in a clustered distribution – even if the model is well calibrated. Figure 2-5 illustrates the score per project for all Units.

Figure 2-5: Score per Project for All Units









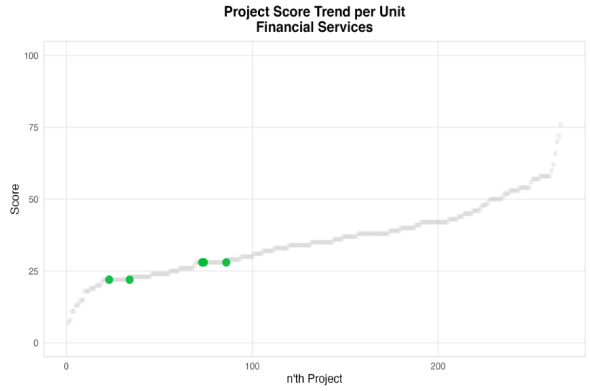


Figure 2-6: Score per Project for All Units - split per Unit

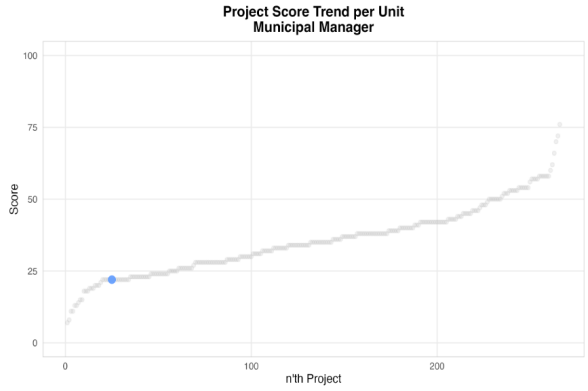
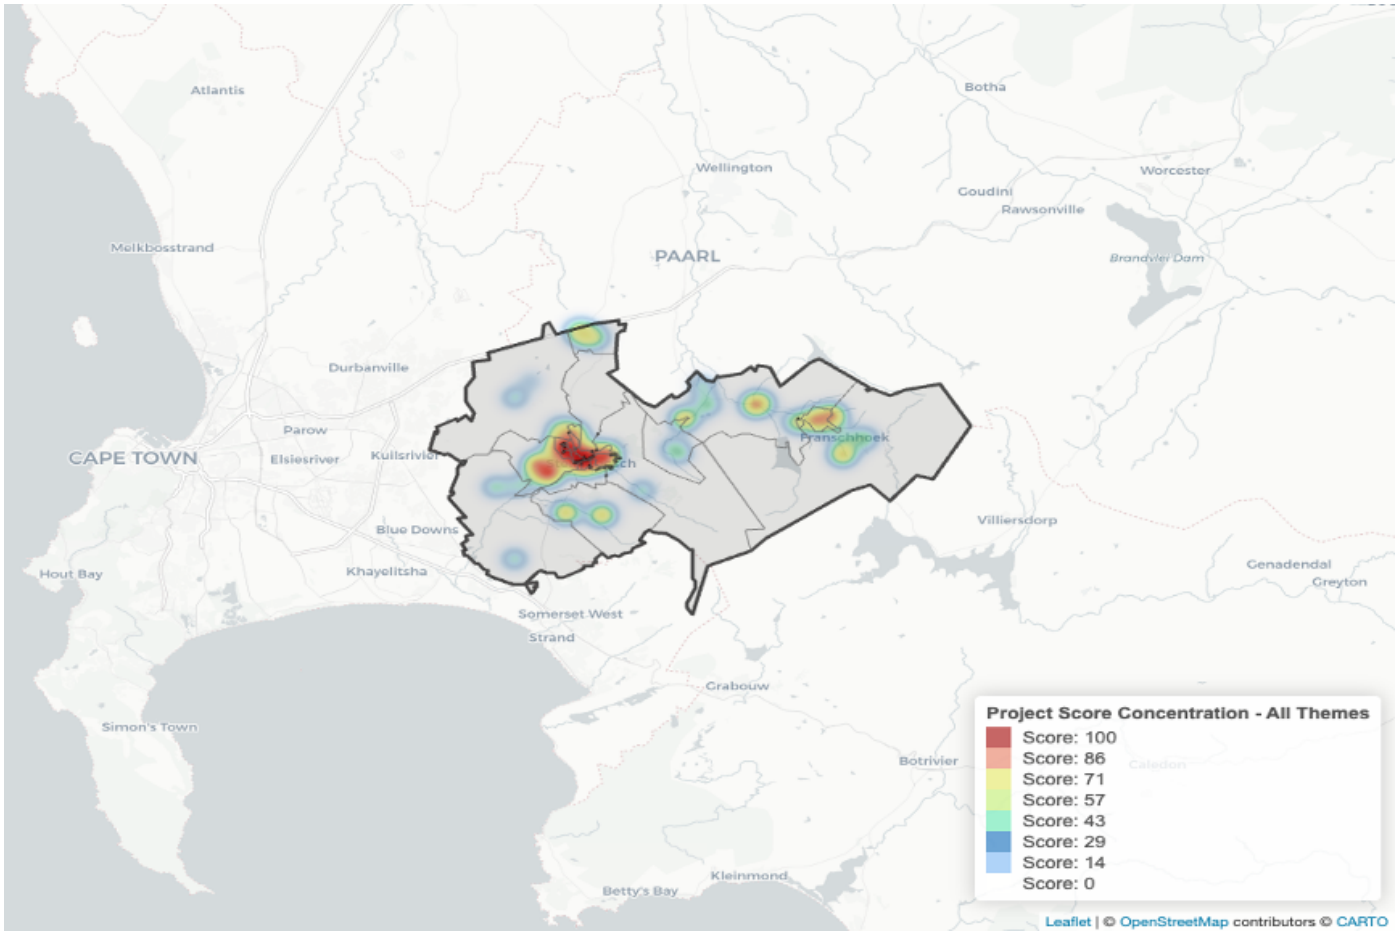


The following observations can be made from Figure 2-5 and Figure 2-6:

The progression of project scores across municipal units provides an additional validation of the prioritisation model by illustrating how projects are ranked according to their strategic alignment. Examining the score progression allows the municipality to assess whether the model differentiates projects gradually and fairly, or whether clustering patterns suggest potential gaps in project data or evaluation criteria. The analysis presented in Figure 2-7 evaluates the score progression both across the overall portfolio and within individual municipal units. Key observations are outlined below:

- The overall project score trend demonstrates a smooth upward progression from approximately 7 to 75 points, forming a gradual S-curve pattern across the full project portfolio. This progression indicates that the prioritisation model differentiates projects incrementally rather than clustering scores within narrow bands. The absence of abrupt jumps or dense clustering confirms that the multi-criteria framework is effectively capturing varying levels of strategic alignment across the project portfolio.
- Units managing larger project portfolios exhibit broader score distributions, reflecting the diversity of projects evaluated within those functions. Infrastructure Services demonstrates the widest range of scores, extending from low-scoring operational initiatives in the lower ranges to high-scoring strategic infrastructure projects approaching the upper-70 range. Community and Protection Services and Planning and Economic Development display similar gradual progressions, confirming that projects within these service-delivery functions vary substantially in their alignment with spatial, technical, and service delivery priorities.
- Units with smaller capital portfolios demonstrate narrower score distributions, reflecting the functional nature of their project portfolios rather than limitations in the prioritisation framework. Financial Services and the Municipal Manager portfolio each contain only a limited number of projects, resulting in a more constrained score progression. These projects generally fall within the lower to mid-range of the scoring spectrum, which is consistent with their administrative and institutional focus rather than direct infrastructure delivery.
- Corporate Services presents a moderate spread of scores with a gradual upward progression. While many of its projects are operational in nature, the presence of higher-scoring projects indicates that certain initiatives—particularly those related to institutional capacity, ICT systems, and municipal facilities—demonstrate stronger alignment with the prioritisation criteria.
- Importantly, no units display significant score clustering within a single band, which would typically indicate incomplete data inputs or poorly calibrated evaluation criteria. Instead, the score progression across all units demonstrates consistent incremental increases, suggesting that project data inputs are sufficiently complete to enable meaningful differentiation between initiatives.



- The gradual score progression across the portfolio confirms that the prioritisation model is functioning as intended. Projects with stronger spatial targeting, infrastructure impact, and service delivery outcomes achieve higher scores, while projects with more limited strategic alignment occupy the lower ranges of the distribution. This pattern reinforces the ability of the model to distinguish between projects based on their contribution to municipal development objectives.

The project score progression analysis therefore validates the effectiveness of the prioritisation model in assessing strategic alignment across the municipal project portfolio. The smooth progression of scores across units confirms that the framework differentiates projects based on genuine strategic merit rather than artificial clustering. This provides confidence that the prioritisation results form a reliable basis for evidence-based capital investment decision-making and the subsequent alignment of projects with the municipality's long-term financial planning framework.

2.5.4 Spatial Alignment

The prioritisation tool provides a significant advantage in that it allows for both alphanumeric and spatial data analytics. This means that spatial inputs can be used to prioritise projects, allowing for a more targeted approach. As per Section 152 (1) (b), (c), and (d) of the Constitution, a municipality is obligated to ensure sustainable provision of services to communities, foster social and economic development, and create safe and healthy environments. Section 152 (2) further emphasises that a municipality must endeavour, within its financial and administrative capacities, to realise the goals outlined in Section 152 (1). Given the prevailing developmental pressures in South Africa, notably the scarcity of resources to meet municipalities' infrastructure demands, this scenario is coupled with the constitutional framework and other planning documents. Consequently, the principle of spatial targeting has been adopted. Spatial targeting involves a deliberate concentration of efforts within a specific spatial area to attain a particular desired outcome or objective. Ultimately, the use of spatial data analytics in the prioritisation process helps to ensure that resources are allocated efficiently and effectively, resulting in more equitable and sustainable development. Figure 2-7 represents the concentration of scores of projects spatially.

Figure 2-7: Generalised Spatial Representation of Project Scores

The following observations can be made from Figure 2-7:

The integration of spatial data analytics within the prioritisation framework enables the municipality to assess how capital projects align with spatial development objectives and service delivery priorities. The spatial distribution of project scores provides insight into the geographic concentration of higher-scoring initiatives and the extent to which the prioritisation framework supports the strategic direction of the Municipal Spatial Development Framework (MSDF). Key observations are noted below:

- The combined thematic heatmap indicates a clear concentration of higher-scoring projects within the Stellenbosch urban core and its surrounding urbanised areas. The most intense clustering occurs within the central Stellenbosch area and the Adam Tas development corridor, with an additional notable concentration in Franschhoek. These locations correspond with established urban settlements and key economic nodes identified in the MSDF, suggesting that projects located within these areas tend to demonstrate stronger alignment with spatial development priorities, infrastructure capacity, and service demand.
- Secondary clusters of project activity are visible across other parts of the municipal area, particularly around Franschhoek and portions of the greater Stellenbosch urban region, as well as smaller isolated nodes distributed throughout the municipal area. These clusters indicate that capital investment proposals are generally aligned with existing settlement structures where population density, infrastructure networks, and economic activity are concentrated.
- Lower-intensity project concentrations are visible across peripheral and rural portions of the municipality, where projects appear more dispersed spatially. These areas display fewer high-scoring initiatives, which reflects the nature of spatial prioritisation criteria that favour settlement consolidation, infrastructure efficiency, and proximity to established service networks. Projects in

these areas may therefore score lower in spatial alignment despite addressing important local service delivery needs.

- The spatial distribution observed in the heatmap reflects a pattern of investment broadly aligned with the municipality's spatial development approach of reinforcing existing urban settlements and strategic development corridors. The concentration within the Stellenbosch urban core and along the Adam Tas corridor is particularly significant, as this corridor represents a key spatial restructuring and economic development focus area within the municipality's long-term planning framework.
- Importantly, the spatial distribution does not suggest the exclusion of rural or peripheral areas. Rather, it illustrates the natural outcome of a prioritisation framework that rewards projects demonstrating stronger spatial integration, population service potential, and alignment with identified development nodes. Projects located in lower-density areas remain present in the portfolio but typically achieve lower composite scores due to the structure of the spatial criteria.

The spatial heatmap analysis indicates that higher-scoring projects tend to cluster within established settlements and strategic development corridors across the Stellenbosch municipal area. This pattern suggests that the prioritisation framework successfully integrates spatial considerations into the capital investment assessment process, supporting infrastructure investment decisions that reinforce the municipality's spatial development objectives while maintaining a balanced distribution of projects across the broader municipal area.

2.6 Concluding Remarks

The multi-criteria assessment framework demonstrates strong effectiveness as a capital expenditure prioritisation tool, supporting the differentiation of projects based on strategic alignment while maintaining fairness across the municipal project portfolio. The overall score distribution, together with the smooth progression of project scores across the scoring range, confirms that the model functions without systematic bias. The concentration of projects within the moderate score ranges indicates that a substantial portion of the municipal capital portfolio demonstrates meaningful alignment with Integrated Development Plan (IDP) priorities and Municipal Spatial Development Framework (MSDF) spatial objectives.

Differences in scoring patterns between municipal units reflect expected functional characteristics rather than inconsistencies in the assessment framework. Infrastructure Services demonstrates the strongest overall performance, reflecting the spatially targeted nature of infrastructure investments and the alignment of many projects with sector master plans and service delivery priorities. Planning and Economic Development similarly demonstrates relatively strong performance due to the strategic significance of spatial planning, housing, and economic development initiatives within the municipal development agenda. By contrast, portfolios such as Financial Services and the Municipal Manager reflect lower average scores, which is consistent with the administrative and institutional nature of projects within these units that typically have limited spatial targeting or direct infrastructure delivery impact.

Spatial analysis further supports the validity of the prioritisation outcomes. The heatmap of project scores illustrates a clear concentration of higher-scoring projects within the Stellenbosch urban core and surrounding settlement areas, with notable clustering along the Adam Tas development corridor and within the Franschhoek node. These areas correspond with key development nodes and corridors identified in the MSDF, indicating that projects located within established settlements and priority growth

areas tend to achieve stronger alignment with spatial development objectives and infrastructure investment criteria. The spatial distribution, therefore, demonstrates how the prioritisation framework supports the translation of spatial policy into investment decision-making.

The analysis also highlights several opportunities to strengthen future prioritisation cycles. Improved completeness of project data, particularly spatial coordinates, implementation timeframes, and indicative cost estimates, would enhance the precision of the scoring process. Periodic review of assessment criteria would ensure continued alignment with evolving municipal priorities, including climate resilience, renewable energy transitions, and digital infrastructure development. Greater integration of lifecycle cost considerations would further strengthen the framework by balancing capital investment requirements with long-term operational affordability. Institutionalising the multi-criteria prioritisation approach within the municipality's annual capital budgeting process would reinforce consistent, transparent and evidence-based decision-making, support the efficient allocation of limited financial resources while advance the municipality's long-term development objectives.

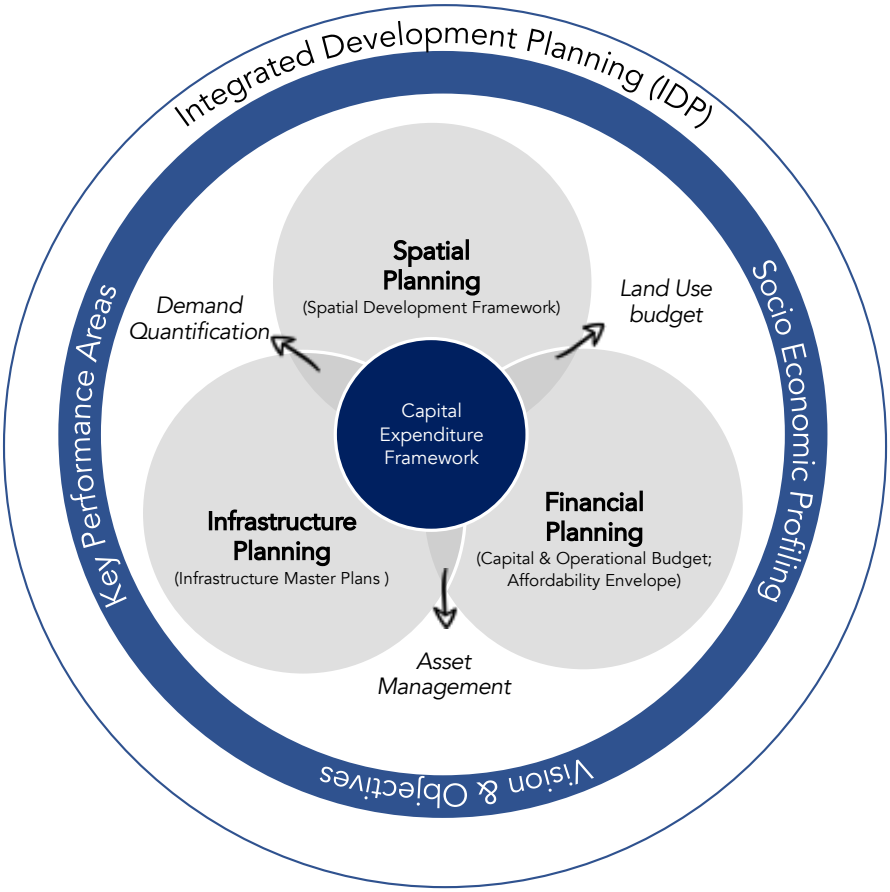
Phase 1

Introduction

1 Part 1: Introduction



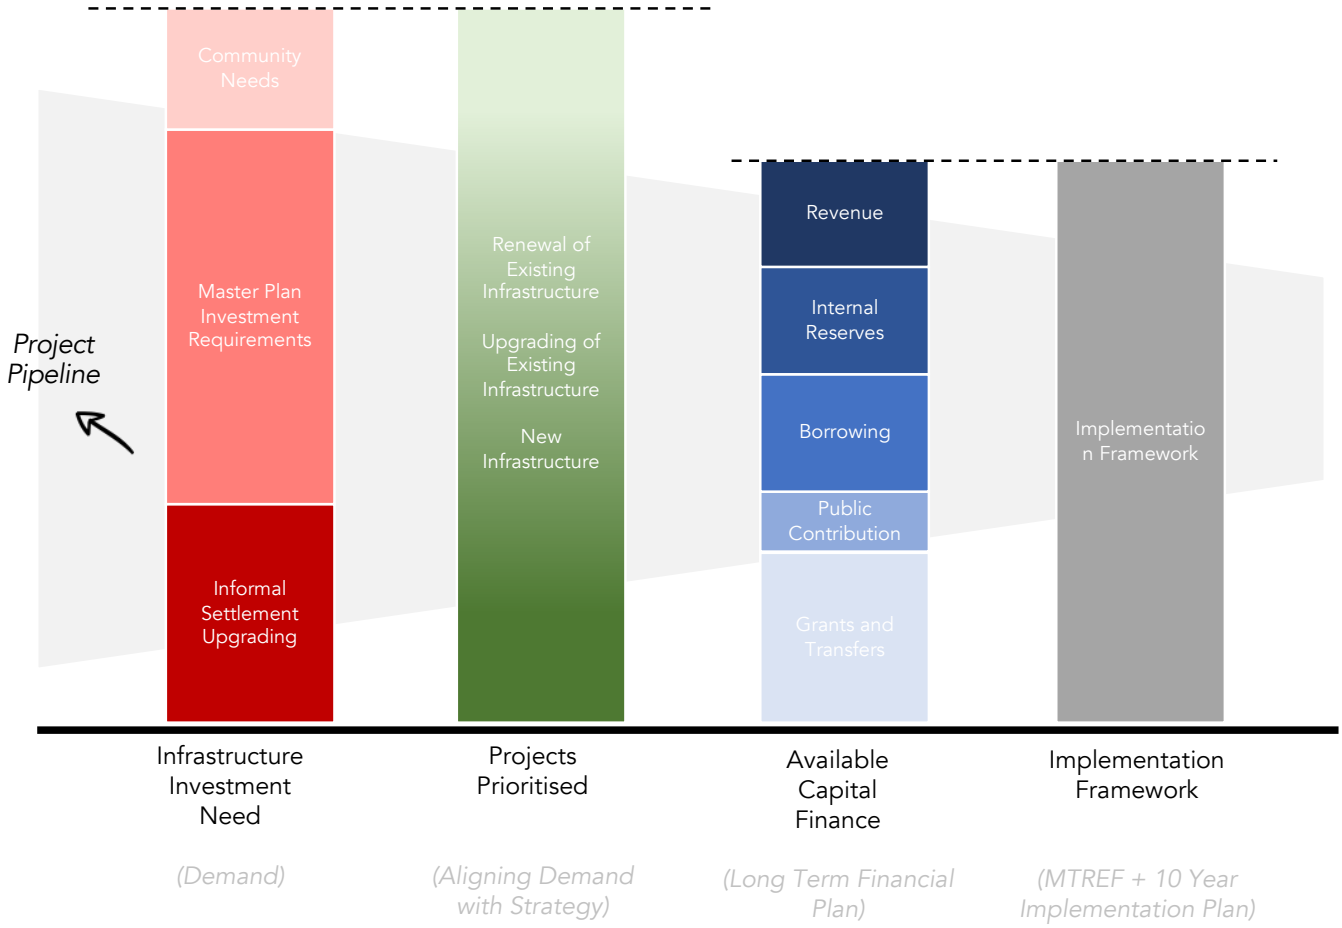
1.1 What is a Capital Expenditure Framework

According to the Department of Cooperative Governance and Traditional Affairs (COGTA) guidelines, a Capital Expenditure Framework (CEF) is a consolidated, high-level view of a municipality's long-term infrastructure investment needs. It ensures that infrastructure priorities are spatially aligned with municipal strategic objectives, budgetary realities, and development plans. The framework is grounded in principles of sustainability, financial feasibility, and strategic alignment, balancing immediate infrastructure needs with long-term development goals, the relationships between these spheres of planning and principles is illustrated in Figure 1–1.

The Spatial Planning and Land Use Management Act, 2013 (SPLUMA) mandates the inclusion of a CEF within a municipality's Spatial Development Framework (SDF). Specifically, Section 21(n) of SPLUMA requires that an SDF "determine a Capital Expenditure Framework for the municipality's development programmes, depicted spatially." This legislative requirement underscores the importance of integrating spatial planning with financial planning, ensuring that the spatial strategies articulated in the SDF are implemented through practical and affordable infrastructure investments.

A Capital Expenditure Framework links spatial development strategies with budgetary constraints and infrastructure demands. It provides a transparent mechanism for prioritising projects, promoting the efficient allocation of resources, and aligning capital expenditure with the municipality's long-term strategic vision.

Figure 1–1: The Capital Expenditure Framework within the built environment context



1.2 Aim of Capital Expenditure Framework

The aim of a Capital Expenditure Framework (CEF) is to create a structured and strategic approach to municipal infrastructure expenditure. The CEF is intended to align the municipality's spatial development strategies with its financial resources and capacity, ensuring that long-term growth and development objectives are achievable, and informs operational activities of a municipality.

A CEF aims to provide a municipality with the means to inform financial planning with infrastructure planning and spatial priorities identified in the Spatial Development Framework (SDF). It aims, furthermore, to establish a clear methodology for municipalities to evaluate, prioritise, and inform implementation processes of infrastructure projects within their affordability envelope, supporting both immediate and long-term development goals.

From Figure 1–2one can see the illustration that infrastructure investment need, expressed as projects, usually exceeds available capital finance, and therefore it is an imperative for municipalities to partake in a prioritisation process to determine which projects are best aligned with the strategy of the municipality, together with a budget scenario process to determine which projects are affordable and should be implemented when.

Figure 1–2: Relationship between infrastructure investment needs, affordability envelope, prioritisation process, and budget scenario process

1.3 Objectives of Capital Expenditure Framework

The key objectives of a CEF is to:

- Socio-economic trends: Understand the socio-economic trends in a municipality over the long term;
- Quantify Infrastructure Needs: Assess and detail the municipality's long-term infrastructure requirements based on an SDF-informed land use budget, infrastructure standards, anticipated socio-economic growth, existing infrastructure, and backlogs;
- Align with the Spatial Development Framework (SDF): Translate the spatial vision and strategic priorities outlined in the SDF into priority development areas which informs prioritisation practices;
- Consolidate Infrastructure Demand: Create a comprehensive list of infrastructure projects across various sectors in line with the municipality's mandate, reflecting the municipality's overall infrastructure demands;

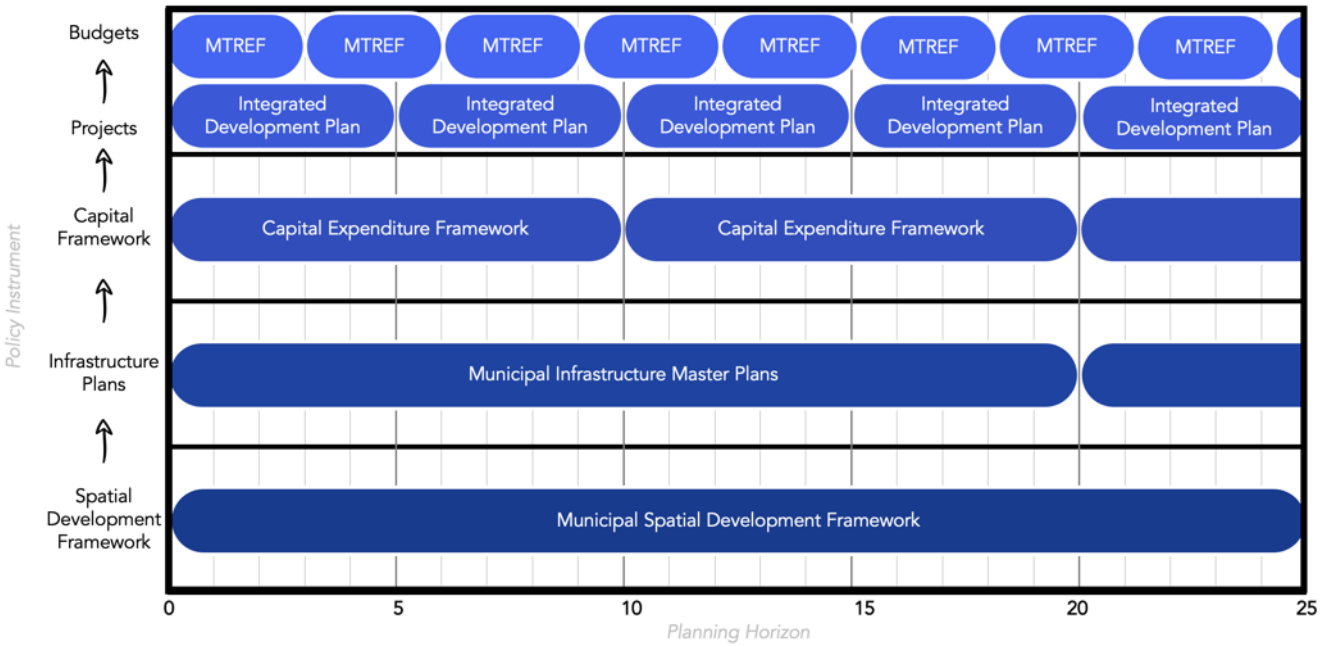
- Contextualise Financial Affordability: Integrate the municipality's affordability envelope, derived from the Long-Term Financial Model (LTFM), to ensure infrastructure expenditure are financially sustainable over the planning horizon;
- Facilitate Prioritisation: Establish a framework to evaluate and rank projects based on strategic alignment, socio-economic impact, and spatial targeting amongst others, ensuring that resources are allocated to the most critical and impactful projects;
- Determine a Budget Scenario: Offer a structured, evidence-based approach to infrastructure planning and budgeting, improving decision-making processes and accountability to stakeholders - amongst others, to indicate project-level responses per asset type per functional area;
- Enable Spatial Transformation: Direct infrastructure investments toward spatial transformation goals, focusing on reducing inequalities, improving access to services, and promoting inclusive economic growth, and;
- Bridge Short-Term and Long-Term Planning: Ensure a coherent link between the short-term MTREF cycles, Medium-term Integrated Development Plan (IDP) cycles and the municipality's long-term development vision, embedding sustainability and foresight into the planning process.

1.4 Role of the Capital Expenditure Framework as a policy instrument

The Capital Expenditure Framework (CEF) is a cornerstone of municipal planning, grounded in South Africa's legislative framework and designed to bridge the gap between long-term spatial development strategies and actionable infrastructure expenditure. The concept of the CEF was formalised under the Spatial Planning and Land Use Management Act (SPLUMA, Act 16 of 2013), specifically in Section 21(n), which mandates municipalities to determine a spatially referenced CEF as part of their Spatial Development Framework (SDF). This legislative requirement reflects the increasing emphasis on aligning planning and budgeting processes to address developmental challenges effectively.

Historically, the Constitution of South Africa laid the foundation for this alignment in Section 153, which directs municipalities to prioritise the basic needs of communities while promoting socio-economic development through structured planning and budgeting. The Integrated Development Plan (IDP) was introduced as a mechanism to achieve this in the Local Government Transition Act (Act 209 of 1993), evolving through subsequent legislation, including the Municipal Systems Act (MSA, Act 32 of 2000). The MSA established the IDP as the principal planning instrument of local government, requiring it to incorporate a comprehensive financial plan and a Spatial Development Framework. This integration ensures that municipal resources are allocated effectively to achieve the long-term developmental vision.

The CEF builds on these legislative imperatives by operationalising the SDF within the IDP framework. As a long-term (10-year) planning tool, the CEF quantifies infrastructure needs, consolidates them into prioritised project pipelines, and aligns them with the municipality's financial capacity as outlined in the Long-Term Financial Plan (LTFP). It ensures that infrastructure investments are not only spatially targeted but also financially sustainable, bridging the divide between visionary spatial strategies and practical implementation.



The CEF also plays a vital role in South Africa's Local Government Accountability Cycle, a governance framework defined by the Municipal Finance Management Act (MFMA, Act 56 of 2003). This cycle integrates planning, budgeting, and reporting processes to ensure transparency, accountability, and alignment with development priorities. Through informing the IDP, and so the Medium-Term Revenue

and Expenditure Framework (MTREF), as well as the Service Delivery and Budget Implementation Plan (SDBIP), the CEF enables municipalities to stabilise their decision-making processes. It provides a consistent rationale for allocating resources, ensuring that both short-term operational needs and long-term developmental objectives are addressed.

Importantly, the CEF institutionalises long-term planning practices within municipalities. It encourages decision-makers to adopt a forward-looking perspective that considers future growth patterns, socio-economic trends, and financial constraints. This approach reduces the reactive nature of municipal budgeting, replacing it with proactive, evidence-based strategies that support equitable service delivery and spatial justice.

The CEF is a transformative policy instrument that integrates spatial, financial, and infrastructure planning within the legislative and operational frameworks of municipal governance. It strengthens the IDP as the single most strategic document of municipalities, ensures alignment with the SDF, and guides resource allocation through the MTREF and SDBIP. Through its structured and integrated approach, the CEF enables municipalities to achieve their developmental mandates while ensuring financial sustainability and fostering spatial transformation.

Figure 1–3: The relationship between policy instruments effecting the spatial form

1.5 Structure of this Capital Expenditure Framework

The structure of this report is outlined below to guide the reader through the key components of the Capital Expenditure Framework (CEF) and its alignment with municipal planning processes as well as the norms and standards of the CEF.

Table 1-1: Structure of this Capital Expenditure Framework

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 1: Inception and Information Gathering	Phase 1	To provide a contextualisation to the Capital Expenditure Framework. This phase comprises the inception process of the CEF as well as the information gathering process in which a comprehensive integrated infrastructure investment framework, or portfolio of projects, is collated.

Document Reference	Adapted CEF Structure Reference	Adapted CEF Structure Aim
Part 2: Functional Area and Spatial Category for Investment Planning Profiling and Spatial Demand Quantification	Phase 2a	This part introduces functional areas for priority investment which are defined and mapped to indicate the spatial strategy depicted in the MSDF (linked to the MSDF proposals). The identified functional areas are used to determine the future population, housing, and land demand based on existing socio-economic and related data which is used in the spatial demand quantification component.
Part 3: Infrastructure demand	Phase 2b	This part determines the investment requirements for each functional area, including operational and maintenance costs per asset class. The goal is to compare the optimal infrastructure requirements scenario with the known infrastructure demand based on current planning frameworks.
Part 4: Affordability Envelope	Phase 3	This part is a reflection of the municipality's financial health and long-term financial plan. Primarily it includes the results of the re-application of the long-term financial plan to determine the appropriate affordability envelope.
Part 5: Prioritisation and Budget Scenario	Phase 4	This part has a prioritisation framework that considers spatial, engineering, and financial factors to calculate a composite score indicating each project's relative importance in the pipeline. It also applies this framework to the budget fit process to determine how to allocate capital within the affordability envelope per project for the next 10 years.
Part 6: Capital Expenditure Programme	Phase 5	This part is a breakdown of the 10-year capital expenditure framework. Essentially, it analyses the fitted project pipeline in terms of spatial alignment, asset type alignment, and other attributes to ultimately verify that the 10-year capital expenditure framework is in line with the strategic intent of the prioritisation framework and the MSDF objectives.
Part 7: Institutional Arrangements and Project Closeout	Phase 6	This phase comprises of a concluding chapter to the CEF, this part aims to identify areas of enhancement that will render the CEF not only as a compliance document but to solidify institutional change around the alignment of planning, engineering, and financial practices – with the ultimate aim to improve service delivery. Furthermore this phase contains a final close-out report detailing the project timeline and conclusions drawn.

Phase 4

Budget Scenario

2 Budget Scenario

2.1 Contextualisation

The process of developing a budget scenario is a crucial step in the annual capital planning process, designed to guide the allocation of resources efficiently and effectively. This systematic approach leverages the wealth of information gathered during the planning process and employs a defined set of rules and scenario parameters to determine which projects should be incorporated into the 10-year capital expenditure framework, in conjunction with the annual draft budget. In this section, the primary objectives are to establish a clear understanding of the budget determination process and delve into the budget components concerning modelled demand, planned capital expenditure, and affordability. These objectives form the foundation upon which prudent financial decisions are made.

The Local Municipality relies on the budget scenario methodology to construct the draft MTREF capital budget on an annual basis. The methodology utilised in this CEF integrates the outcomes of various planning processes to create a well-informed budget scenario:

- Portfolio of Projects: The portfolio of projects identified during the demand identification phase is evaluated and integrated into the annual capital planning process, ensuring that there is a transparent and succinct way to incorporate new demand into the annual capital planning process.
- Committed Budget: The recently approved capital budget is used as an input to the budget scenario, to ensure that current commitments by the municipality are taken into account for particular commitments with a multi-year implication.
- Long-Term Financial Model Alignment: The results of the Long-Term Financial Model (LTFM) are synchronised with the budget scenario parameters. This alignment helps establish sustainable affordability envelopes for a 10-year planning horizon, ensuring fiscal responsibility.
- Project Prioritisation: Projects identified within the portfolio of projects are ranked in terms of their relative importance. The Capital Prioritisation Model (CPM) outcomes are seamlessly incorporated into the budget scenario preparation process, aiding in strategic project selection.

Through this comprehensive approach, the municipality not only crafts a budget scenario that aligns with its long-term objectives and capital demand but also prioritises projects that align with the strategy while adhering to financial sustainability principles.

2.2 The Difference between Prioritisation and a Budget Scenario

Prioritisation and budget scenarios are related but distinct concepts in the local government space. Prioritisation involves identifying and ranking the most important projects that a municipality should undertake based on their level of strategic importance and impact on the community. Prioritisation is typically done during the planning process, before the budget is developed, and involves determining which initiatives should receive the most attention and resources.

Budget scenario, on the other hand, involves allocating resources to the initiatives that have been prioritised. It involves creating a financial plan that outlines how much money will be allocated to each

initiative and how it will be spent. Budget scenarios are developed based on various factors, such as a municipality's financial resources, priorities, and objectives.

It is important to understand that just because an initiative is prioritised and deemed strategically important, it does not necessarily mean that it will be allocated funds in the current budget cycle. Budgets are developed based on available resources, and some priorities may have to be deferred or delayed until a municipality has sufficient funds to allocate to them.

The use of software/tools to facilitate the prioritisation and budget scenario process in local government can bring several benefits that can help streamline and optimise the decision-making process.

2.3 Preparing for a Budget Scenario

To initiate the process of applying a budget scenario, a number of input variables should be prepared. These variables provide the content of the budget scenario and how the budget scenario parameters are applied, in order to achieve a draft capital budget. These include the baseline management, project status and relative project score.

2.3.1 Project Status

Project status is considered a first priority during the application of the budget scenario. The allocation of a project's status considers projects which are earmarked as Assets Under Construction (AUC's); committed projects from previous original or adjusted capital budgets, and projects which are ready for implementation. A status is allocated to selected projects during the baseline management process and can include one of the following:

- Committed - Includes projects identified as AUC's, which are contractually committed, and previously formed part of either the approved capital budget or adjusted capital budget. Termination of a committed project will result in either legal or financial liability for the municipality. Given commitments made on these projects, the budget scenario methodology regards these projects as non-negotiable, irrespective of the CPM project score. Furthermore, projects with a committed status will be fitted to the budget scenario template based on the financial year in which the budget is requested.
- Provisioned-In - Includes projects which previously formed part of either the approved capital budget or adjusted capital budget, but not identified as contractually committed AUC's. Projects classified as provisioned-in include projects that are ready for implementation, but without contractual commitments in place. Termination of a provisioned-in project will not result in either legal or financial liability for the municipality. The budget scenario methodology regards these projects as having a higher priority than projects without a status. Projects which form part of this category will be fitted to the budget scenario template based on the financial year in which the budget is required, but only if there is sufficient capital budget available.

2.3.2 Relative Project Score

The Municipality's CPM is a systematic and objective methodology that provides a way to rank or sort a diverse set of projects into an order of importance based on each project's alignment with the spatial and

technical objectives of the municipality. The CPM identifies each project's relative importance by deriving a numerical value representative of the project's priority in terms of the municipality's strategic direction.

As part of the budget scenario preparation process, the Municipality's CPM is applied to the input baseline to obtain an order of importance for projects and capital demand captured during the planning process. The relative importance of projects determines which projects will be allocated budget within the parameters of the budget scenario. For more information on how relative project scores are applied to the budget scenario refer to below.

2.4 Budget scenario setup

To prepare a budget scenario template, budget scenario parameters are applied to establish a rule set in which planned capital expenditure is applied.

The budget scenario template defines the available capital budget for the MTREF and is distributed according to the grant allocations as documented within the DoRA. Although the DoRA indicates a total available capital budget for the MTREF, the outcomes of the LTFM determine a 10-year affordability envelope.

In addition to defining the overall total available budget and the distribution thereof per funding source, optional ring-fencing of capital budget can also be applied per outcomes-based portfolios, departmental level or stage gates.

2.4.1 Funding Source Balancing and Grant Allocations

The DoRA is published on an annual basis with the distinct purpose to document the equitable share and grant allocations to municipalities. Although the publication dates may differ annually, the DoRA publication will set out all the external available capital funding for a municipality emanating from national and provincial budgets.

It is important to note that not all projects are eligible to utilise all of the funding sources as documented within the DoRA publication. An example of this includes the PTIS grant which is only applicable to public transport orientated infrastructure and the INEP grant which is only applicable to electrification programmes.

Although the budget scenario template outlines the total capital budget and source of funding as documented within the DORA publication, together with internal capital funding sources, funding source alignment should be undertaken prior to publishing a final capital budget. The process of funding source balancing ensures the correct alignment of capital budget as outlined within the grant conditions.

2.4.2 Long-Term Financial Model and Resultant Affordability Envelopes

As part of National Treasury's Budget Reporting Regulations and Templates, the Local Municipality submits all internally generated capital funding as determined through the use of a Long-Term Financial Model (LTFM). Internal capital budget funding typically comprises of the following funding sources:

- Own Municipal Funding: Funding generated from municipality revenue (i.e. rates and taxes);
- Public Contributions and Donations: Donations and bulk services contributions for capital expenditure to provide additional bulk capacity to service new developmental demand;
- Capital Replacement Reserves (CRR): Savings by the municipality for deferred capital expenditure to maintain the existing municipal asset base, and;
- Borrowings: External loans from the financial markets or bonds issued by the municipality to the financial markets.

Based on the outcome of the LTFM, a Funding Envelope is established which evaluates amongst others the municipality's financial position. This includes a view on the optimal funding mix per annum which aids the municipality in maintaining a desirable financial position.

2.5 Budget Scenario: Input & Output

2.5.1 Input

a. Planned Capital Expenditure Review

The annual planned capital expenditure can be expressed as follows:

Table 2-1: Planned Capital Expenditure Summary

Year	Planned Capital Expenditure	Percentage
2026/2027	R 576 301 851	9.64%
2027/2028	R 610 030 198	10.20%
2028/2029	R 520 771 404	8.71%
2029/2030	R 627 581 768	10.49%
2030/2031	R 708 512 005	11.85%
2031/2032	R 708 326 015	11.85%
2032/2033	R 740 801 328	12.39%
2033/2034	R 661 807 825	11.07%
2034/2035	R 531 603 395	8.89%
2035/2036	R 294 095 000	4.92%
Total	R5 979 830 789	100.00%

b. Funding Envelope

The available funds as per the LTFM can be expressed as follows:

Table 2-2: Funding Envelope Summary

Year	Funding Envelope	Percentage
2026/2027	R 579 296 000	9.67%
2027/2028	R 610 026 000	10.18%
2028/2029	R 521 021 000	8.70%
2029/2030	R 541 896 000	9.05%
2030/2031	R 563 591 000	9.41%
2031/2032	R 586 148 000	9.78%
2032/2033	R 609 600 000	10.18%
2033/2034	R 633 983 000	10.58%
2034/2035	R 659 332 000	11.01%
2035/2036	R 685 685 000	11.45%
Total	R5 990 578 000	100.00%

Table 2-1 and Table 2-2 provide an overview of the input data relevant to the budget scenario. Table 2-1 is a summary of the current demand of the municipality, identified in the portfolio of projects. Table 2-2 is a summary of the available funds and supply, as per the LTFM.

2.5.2 Output

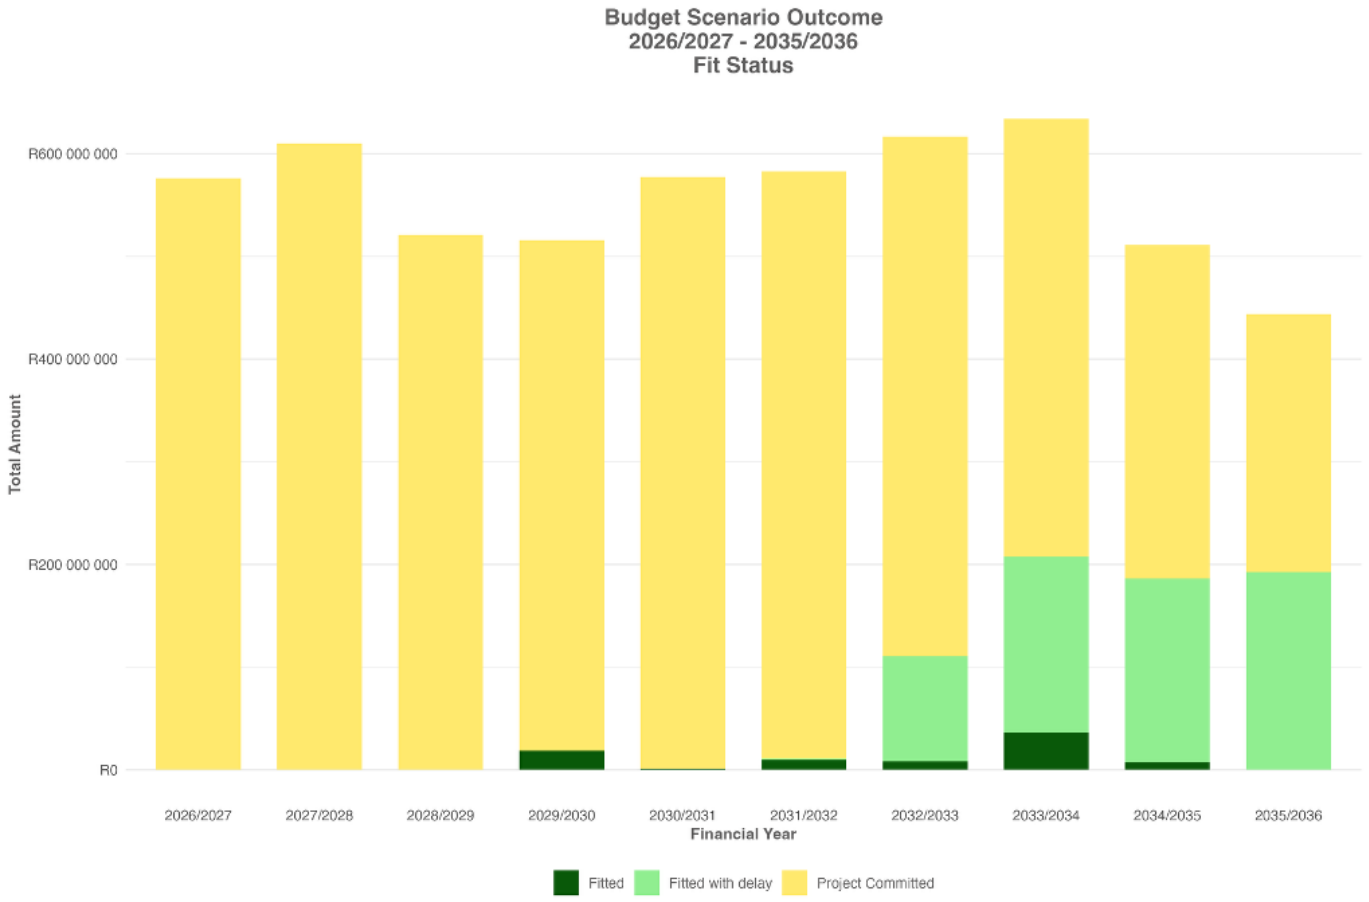
a. Fit Status Summary

After the budget scenario has been applied, the following summary can be observed:

Table 2-3: Budget Scenario Results

Fit Status	Total for Analysis Period	Percentage
Fitted	R 81 849 966	1.46%
Fitted with delay	R 646 619 529	11.57%
Project Committed	R4 859 646 465	86.96%
Total	R5 588 115 960	100.00%

Figure 2-1: Budget Scenario Results



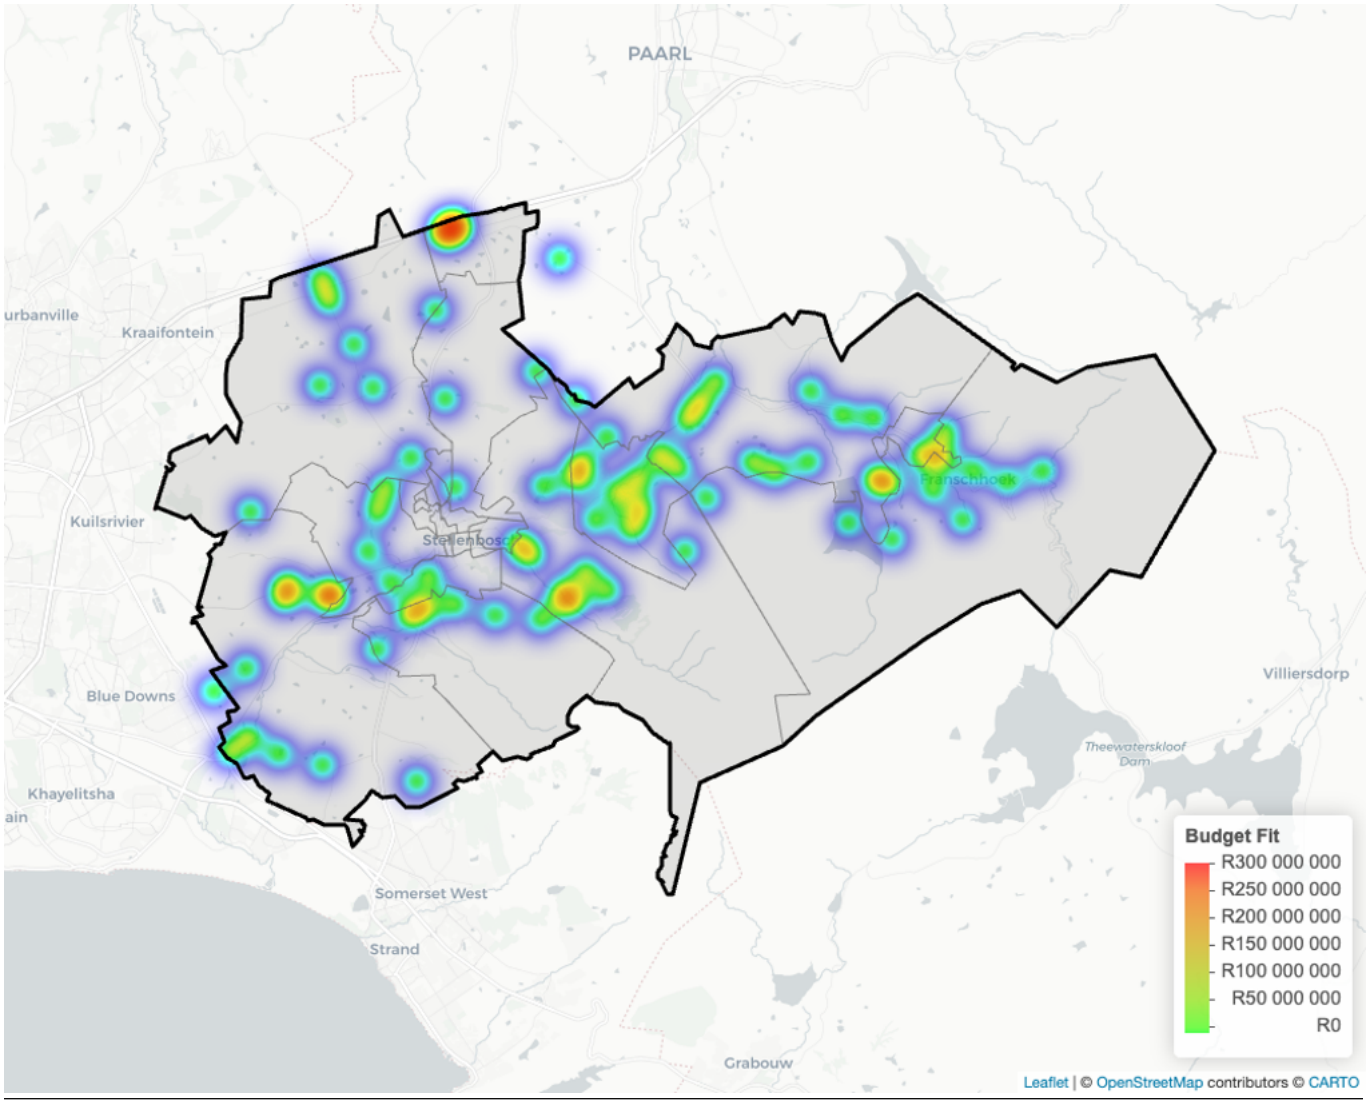


Figure 2-2: Spatial Representation of Budget Scenario Results

- The following observations can be made from Table 2-3, Figure 2-1 and Figure 2-2:

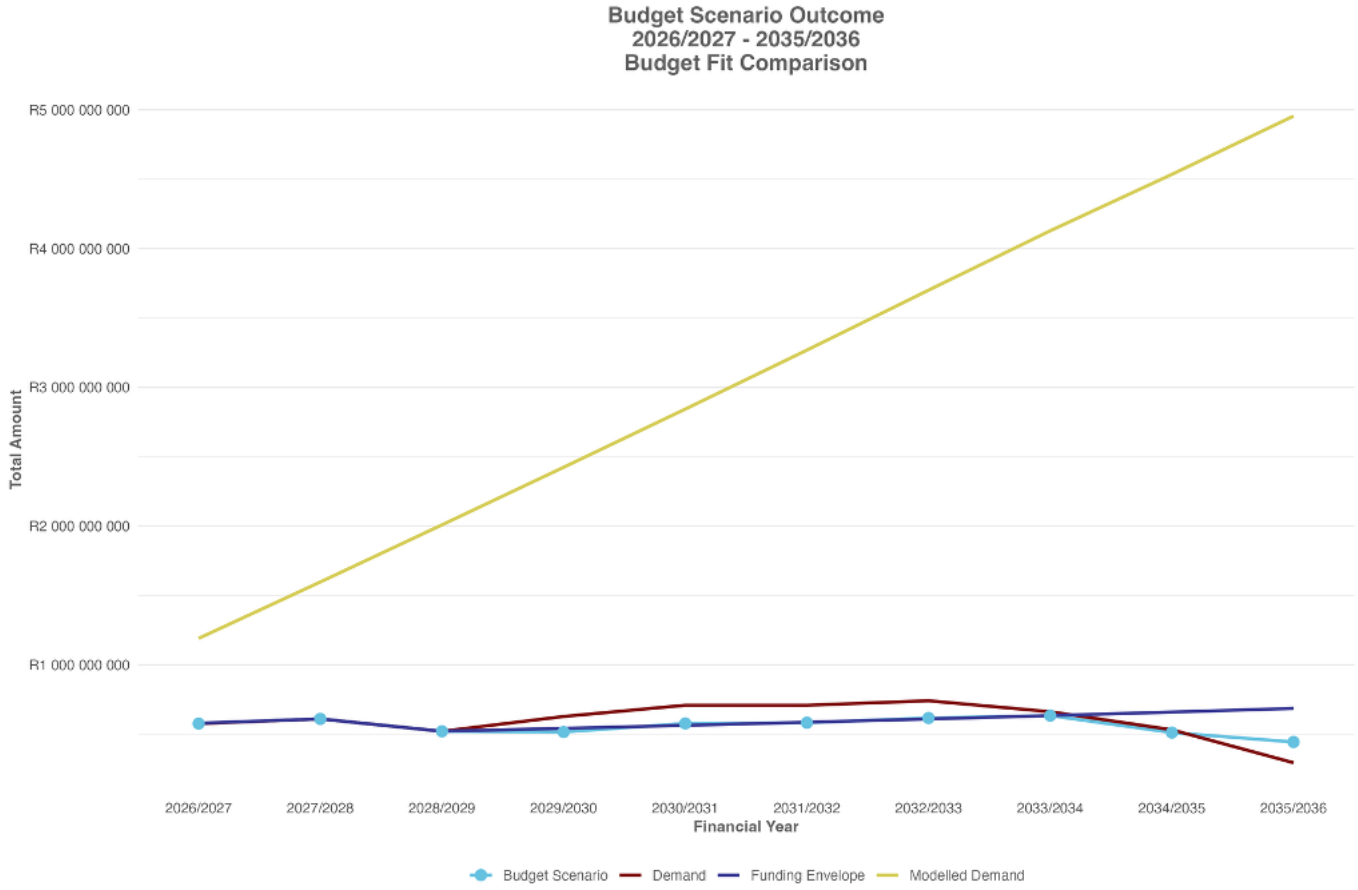
The application of the budget scenario methodology results in a capital expenditure programme valued at R5.65 billion over the 10-year planning horizon. This allocation reflects the outcome of applying the affordability envelope derived from the Long-Term Financial Model (LTFM) to the prioritised portfolio of projects and existing multi-year commitments. The resulting fit status distribution illustrates the dominant role of previously committed projects, together with the limited fiscal space available for accommodating newly prioritised projects within the affordability envelope. Key observations are outlined below:

- Projects classified as Project Committed account for R4 859 billion (86.96%) of the total programme. These projects typically represent Assets Under Construction (AUCs), multi-year contractual obligations, or projects that formed part of previously approved budgets. As these projects cannot be deferred without legal or financial implications, they are automatically accommodated within the

budget scenario irrespective of prioritisation outcomes. The large share of committed expenditure demonstrates how historical capital investment decisions significantly shape the available fiscal space for new projects within the planning horizon.

- Projects classified as Fitted amount to R81 million (1.46%) of the programme. These projects were able to be accommodated within the requested financial year while remaining within the affordability constraints defined by the LTFM. The modest share of projects fitted without delay indicates that limited funding capacity remains available after accounting for committed projects, highlighting the restrictive influence of historical commitments on the municipality's ability to introduce new capital initiatives.
- Projects categorised as Fitted with delay amount to R646.6 million (11.57%) of the capital programme. These projects are accommodated within the 10-year planning horizon but require scheduling in later financial years due to insufficient budget availability in the originally requested implementation periods. This pattern indicates that while the municipality's long-term financial capacity can support these projects, short-term affordability constraints require phased implementation and careful sequencing across the planning horizon.
- Together, Committed and Fitted with delay projects represent approximately 98% of the total capital programme, demonstrating that the majority of the available funding envelope is already predetermined by existing commitments or by projects that require phased implementation. This distribution highlights the importance of disciplined capital planning and careful management of multi-year commitments, as early budget decisions have long-term implications for the municipality's investment flexibility.
- Prioritisation outcomes determine the relative importance of projects, while the budget scenario allocates projects within the limits of the affordability envelope. The relatively small share of newly fitted projects suggests that although the municipality maintains a strong pipeline of prioritised projects, the ability to introduce these projects into the capital programme remains constrained by the existing financial commitments embedded within the portfolio.
- The spatial distribution of fitted and delayed projects shows clear concentrations within the Stellenbosch urban core, the Adam Tas development corridor, and the Franschhoek node, with additional investment clusters emerging along key transport and settlement corridors. This spatial pattern aligns with the municipality's spatial development objectives, directing infrastructure investment toward established settlements and priority development areas where infrastructure spending can support economic activity, residential growth, and improved service delivery.

The fit status analysis demonstrates that the budget scenario successfully translates the prioritised project portfolio into a financially viable capital programme while maintaining alignment with the municipality's long-term affordability constraints. At the same time, the dominant share of committed expenditure highlights the importance of maintaining flexibility within future capital budgets to ensure that emerging infrastructure needs and strategic priorities can be accommodated within the municipality's long-term investment framework.



b. Budget Scenario Comparison

Table 2-4: Budget Scenario Comparison

Year	Demand	Modelled Demand	Funding Envelope	Budget Scenario
2026/2027	R 576 301 851	R 1 190 374 000	R 579 296 000	R 576 301 851
2027/2028	R 610 030 198	R 1 596 850 000	R 610 026 000	R 610 030 198

Year	Demand	Modelled Demand	Funding Envelope	Budget Scenario
2028/2029	R 520 771 404	R 2 008 347 000	R 521 021 000	R 520 771 404
2029/2030	R 627 581 768	R 2 423 361 000	R 541 896 000	R 515 645 110
2030/2031	R 708 512 005	R 2 842 596 000	R 563 591 000	R 577 216 006
2031/2032	R 708 326 015	R 3 267 858 000	R 586 148 000	R 582 656 082
2032/2033	R 740 801 328	R 3 699 792 000	R 609 600 000	R 616 467 666
2033/2034	R 661 807 825	R 4 127 754 000	R 633 983 000	R 633 964 197
2034/2035	R 531 603 395	R 4 534 302 464	R 659 332 000	R 511 401 507
2035/2036	R 294 095 000	R 4 954 232 679	R 685 685 000	R 443 661 939
Total	R5 979 830 789	R30 645 467 143	R5 990 578 000	R5 588 115 960

Figure 2-3: Budget Fit Scenario

- The following observations can be noted from Table 2-4 and Figure 2-3:

The comparison between municipal demand, modelled demand, the funding envelope, and the resulting budget scenario provides insight into how the prioritised project portfolio aligns with the municipality's long-term financial capacity. This analysis demonstrates how the budget scenario reconciles identified infrastructure demand with the affordability limits established through the Long-Term Financial Model (LTFM) while sequencing projects across the 10-year planning horizon. Key observations are outlined below:

- In the first three financial years, municipal demand closely matches the available funding envelope. For example, demand in 2026/27 amounts to R576.3 million against an envelope of R579.3 million, while 2027/28 demand of R610.0 million closely aligns with the R610.0 million envelope. This alignment suggests that the municipality's current capital planning processes are reasonably calibrated to the medium-term financial capacity reflected in the MTREF period.

- The funding envelope grows steadily from approximately R579.3 million in 2026/27 to R685.7 million by 2035/36, reflecting the municipality's projected growth in revenue capacity and borrowing potential as modelled in the LTFM. This gradual expansion of fiscal capacity creates additional room for infrastructure investment in the later years of the framework, although the effective utilisation of this capacity depends on the maturity and readiness of the project pipeline.
- Annual demand generally ranges between R520 million and R740 million during the period 2026/27 to 2033/34, indicating a relatively stable medium-term infrastructure pipeline supported by existing sector plans and project identification processes. Demand declines in the final two years of the horizon, dropping to R531.6 million in 2034/35 and R294.1 million in 2035/36, reflecting the natural tapering of identified projects beyond current sector planning horizons rather than a reduction in infrastructure need.
- The resulting budget scenario totals R5.58 billion, compared with a funding envelope of R5.99 billion over the analysis period. In most years, the budget scenario utilises a substantial portion of the available funding capacity, demonstrating that the budget scenario methodology effectively translates the affordability envelope into a feasible capital investment programme. Minor variations between the envelope and the budget scenario reflect the practical constraints of scheduling individual projects within discrete financial years.
- For example, in 2030/31 the budget scenario reaches R577.2 million against an envelope of R563.6 million, reflecting the requirement to accommodate previously committed projects within the capital programme. These instances illustrate how multi-year project commitments can temporarily place pressure on annual affordability limits, highlighting the long-term financial implications associated with capital investment decisions.
- From 2033/34 onwards, the funding envelope continues to increase while municipal demand begins to decline. For example, in 2035/36 the envelope reaches R685.7 million while demand is only R294.1 million. This divergence indicates that additional fiscal capacity may be available in the outer years of the framework to accommodate deferred projects or newly identified infrastructure priorities as future master plan reviews expand the municipality's long-term project pipeline.
- Total municipal demand amounts to R5.98 billion, while the budget scenario accommodates R5.58 billion within the affordability envelope of R5.99 billion. Although the majority of demand is accommodated, there are some projects that are forced out of the 10-year scope due to high single year demands. These projects include the STB Switch Gear (11kv) SF6, Jamestown: Housing (Phase 4), and Erf 64, Kylemore projects. These projects have initial lower cost years but throughout the project cycle represent a large enough demand that it becomes difficult to accommodate within the demanded year. These projects are in the outer years of the budget scenario and should be reviewed in subsequent long term planning engagement.

The budget scenario comparison illustrates how the municipality balances infrastructure demand with fiscal constraints over the 10-year planning horizon. While early-year demand pressures require careful prioritisation and sequencing of projects, the increasing funding envelope in later years provides opportunities to accommodate additional infrastructure investments as planning pipelines mature. Continuous refinement of the project pipeline, combined with disciplined financial management, will remain essential to ensure that capital investment supports both service delivery objectives and long-term financial sustainability.

2.6 Concluding remarks

The budget scenario analysis demonstrates that the municipality successfully accommodated R5.88 billion (approximately 98%) of the R5.98 billion planned capital expenditure portfolio within the 10-year affordability envelope. The distribution of fit statuses indicates that the capital programme is strongly influenced by existing commitments, with R4.85 billion (86.96%) classified as Project Committed. A further R646.6 million (11.57%) of projects are accommodated through temporal adjustment, indicating that while these projects remain viable within the planning horizon, their implementation requires phased scheduling to align with annual fiscal constraints. Only R81.8 million (1.46%) of projects are fitted directly within the originally requested implementation period, reflecting the limited fiscal flexibility available once historical commitments are accommodated.

Despite the strong alignment between the budget scenario and the funding envelope, several structural constraints remain evident. The difference between total municipal demand and the resulting budget scenario amounts to approximately R400 million, representing projects that could not be fully accommodated within the affordability parameters or required adjustment through delayed implementation. The presence of substantial committed expenditure also constrains fiscal flexibility, as nearly 86% of the capital programme is allocated to projects that must proceed irrespective of prioritisation outcomes. This significantly reduces the portion of the funding envelope available for introducing newly prioritised projects and highlights the long-term fiscal implications associated with multi-year capital commitments.

Temporal patterns within the capital programme further illustrate the importance of disciplined project sequencing. Municipal demand remains relatively stable during the first eight years of the planning horizon, generally ranging between R520 million and R740 million annually, while the funding envelope gradually increases from approximately R579 million in 2026/27 to R686 million by 2035/36. In the later years of the framework, demand declines while the funding envelope continues to expand, suggesting that additional fiscal capacity may become available toward the end of the planning horizon. This divergence indicates that additional project preparation and long-term planning will be required to ensure that available fiscal capacity in the outer years of the framework is effectively utilised.

Strengthening long-term infrastructure planning will therefore be essential to ensure that future capital investment opportunities are fully realised. Continued refinement of sector master plans and infrastructure pipelines can help populate the outer years of the framework with credible projects aligned with municipal development objectives. At the same time, exploring complementary financing mechanisms such as development contributions, expanded grant utilisation, and other external funding sources may help bridge remaining funding gaps and accelerate delivery of high-priority infrastructure.

The budget scenario demonstrates that the municipality is able to translate the prioritised project portfolio into a financially viable capital expenditure programme while remaining broadly aligned with the affordability envelope established through the Long-Term Financial Model. Maintaining this balance between infrastructure demand, fiscal sustainability, and strategic investment priorities will remain critical

to ensuring that capital expenditure continues to support spatial transformation, service delivery equity, and long-term municipal development objectives.

Phase 5

Capital Expenditure Programme

3 Capital Expenditure Programme

3.1 Contextualisation

A Capital Expenditure Programme (CEP) refers to a detailed programme that outlines the municipality's list of projects that are required to be implemented over a multi-year period. This programme is the municipality's list of projects that are prioritised according to the strategic prioritisation process, in which projects were given a ranking. Using the budget scenario tool, these projects were allocated resources efficiently, in line with their respective demand estimates, whilst ensuring that their collective cost aligns with the affordability envelope of the municipality.

There are multiple benefits of having this overview, some of which are listed below:

- Improved service delivery: A Capital Expenditure Programme identifies the most essential projects required to improve service delivery in the municipality. It allows for more effective planning and allocation of resources to meet the needs of the population.
- Strategic planning: A Capital Expenditure Programme enables the municipality with a strategic plan, based on an understanding of the projects that are necessary to meet the needs of the municipality. It allows for a long-term vision to be developed that is aligned with the goals of the municipality.
- Increased efficiency: By understanding the essential projects, the municipality can ensure that resources are used efficiently. Projects are already prioritised based on their importance, and resources have been allocated accordingly.
- Attraction of investment: A comprehensive overview of necessary projects can help attract investment to the municipality. It provides potential investors with a clear understanding of the opportunities that exist in the area and the projects that are necessary to support growth and development.
- Attraction and retention of residents: By addressing the needs of the population through these essential projects, the municipality can attract new residents whilst retaining the current population. This can lead to increased economic activity and a higher quality of life for those living in the region.
- In essence, the CEP furnishes the municipality with a comprehensive perspective on the essential capital undertakings it must carry out to fulfil its current and future service delivery responsibilities, while concurrently enticing investment, commerce, and inhabitants from throughout the province.

3.2 Capital Expenditure Programme Results

As municipalities strive to deliver basic infrastructure services and meet the needs of their communities, budgeting is a critical process. Through the Budget Scenario Tool, the municipality was able to consider various budget-related parameters and align resources, strategic priorities and investment demand. In this section of the report, the results of the budget scenario results is presented using different perspectives, detailing the proposed implementation framework over the 10-year horizon. This section aims to provide insight into how the municipality intends to allocate its resources to meet its strategic objectives. Understanding the budget scenario results over the next 10 years in a municipality is crucial for effective long-term planning. A clear understanding of budget scenario results enables municipalities to prioritise the right capital projects, allocate resources accordingly, and ensure that funds are available to complete critical projects. It also helps to identify areas of improvement required in the planning process over the long term, acting as an early warnings system in the planning and project preparation

process. This understanding can also support infrastructure maintenance and improvement, economic growth, and development and promote transparency and accountability in government. This section explores the budget scenario results for 10 years in the municipality.

3.3 Budget Scenario Spatial Distribution

In the following section, an exploration of the budget scenario will be undertaken, with a focus on its spatial aspects. This will involve an examination of Priority Development Areas (PDAs) and Electoral Wards. The spatial investment approach, established through the prioritisation and budget scenario methodology, forms the core of this analysis. This section will present the spatial distribution of the Capital Expenditure Programme, providing clear illustrations of how the budget scenario results are strategically distributed across various geographic areas within the municipality. Navigating through this section, the goal is to better understand the degree of spatial targeting.

3.3.1 Budget Scenario Outcome Analysis per Urban Edge

The budget scenario results are presented with a particular focus on urban edges spanning over a 10-year horizon. The main objective is to assess the municipality's attempts to spatially target and limit its resource allocation within marked edges. This analysis seeks to offer insights into the manifestation of strategic decisions through budgetary action as outlined in the 10-year plan within the municipality's urban edges. Consequently, it provides a comprehensive understanding of the spatial agglomeration and concentration, as well as the potential impacts of the budget scenario across urbanised areas. Figure 3-2 illustrates the distribution of the budget scenario outcomes across the different urban edges, while

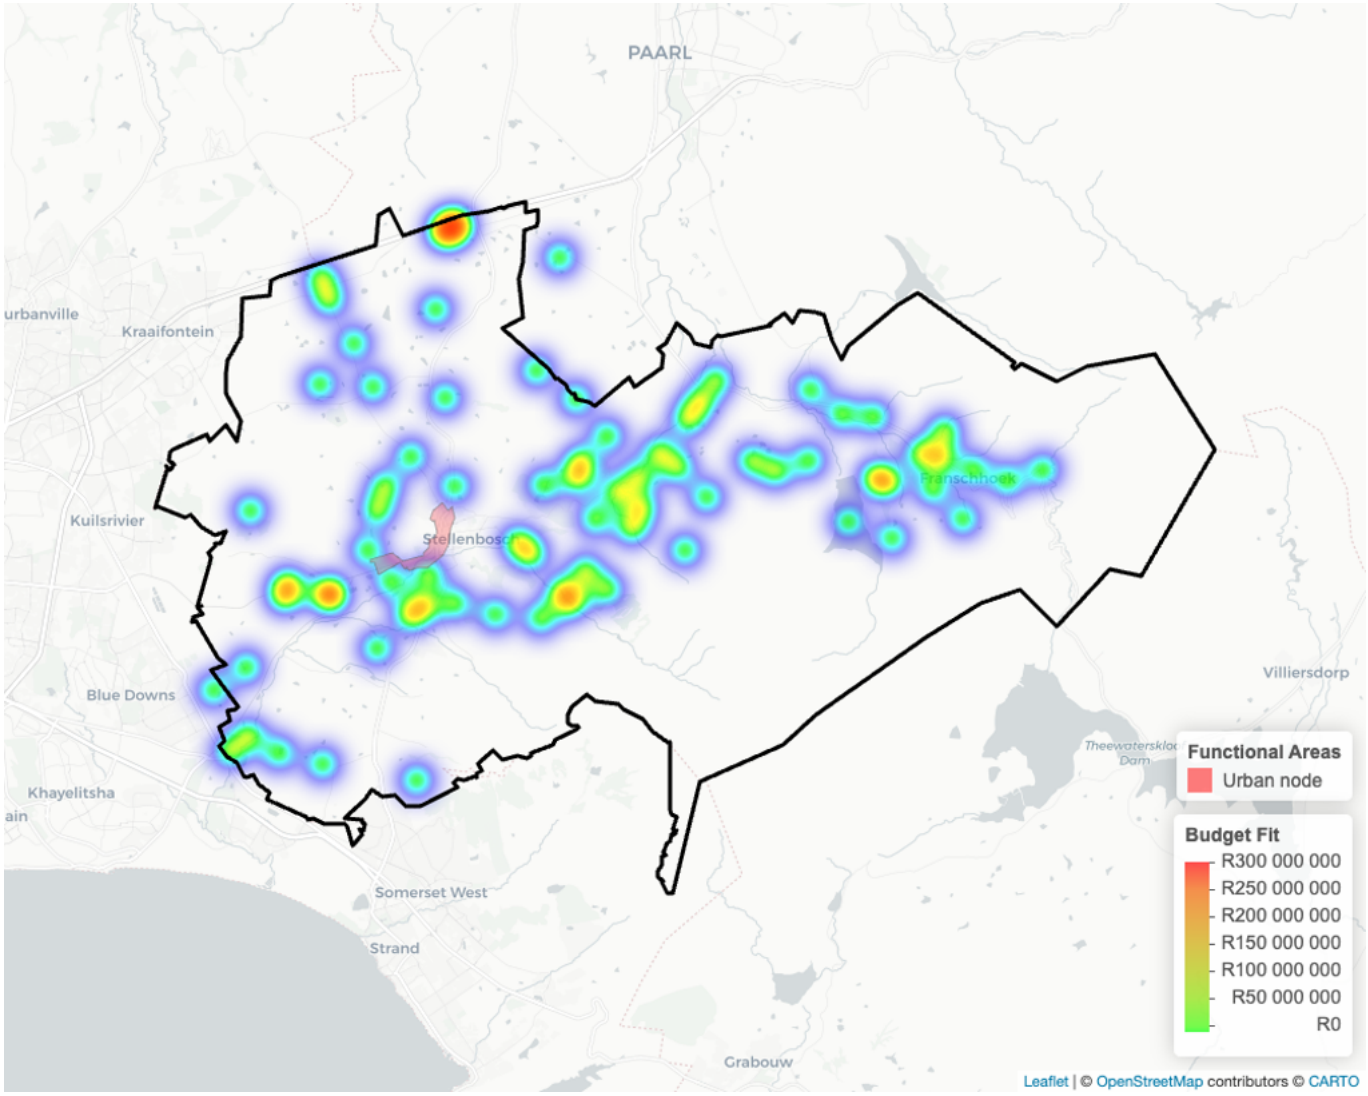


Table 3-1 provides a detailed breakdown of the budget scenario results.

Figure 3-1: Budget Scenario Results per Urban Edge

Percentage	69.83%	21.54%	3.11%	1.52%	1.12%	0.95%	0.90%	0.84%

The following observations can be noted from Figure 3-1, Figure 3-2 and Table 3-1:

The budget scenario demonstrates a strong spatial concentration of capital investment within the municipality's primary urban core and established settlement areas. The resulting capital expenditure programme of R5.59 billion reflects a deliberate investment pattern aligned with the Spatial Development

Framework (SDF), prioritising infrastructure investment within existing settlements and key development nodes while limiting extensive infrastructure expansion into dispersed rural areas. Key observations are noted below:

- This functional area receives R3.90 billion (69.83%) of the total capital programme over the 10-year planning horizon. The magnitude of this allocation reflects the concentration of infrastructure demand within the municipality's primary economic and population centre, where investments in bulk services, electricity networks, transport infrastructure, and urban development initiatives support densification, economic activity, and continued growth within the Stellenbosch urban core and surrounding development corridors.
- Projects classified as "No Intersect" account for R1.20 billion (21.54%) of the programme. These projects typically represent infrastructure investments that serve the broader municipal system rather than a specific settlement, such as network upgrades, bulk infrastructure improvements, or projects where spatial location is not yet precisely defined. While these investments remain essential for maintaining municipal infrastructure capacity, their classification highlights the continued importance of strengthening spatial data precision in future iterations of the Capital Expenditure Framework.
- Projects associated with Administrative Headquarters amount to R173.5 million (3.11%) of the capital programme. These projects relate primarily to municipal operational facilities, institutional infrastructure, and administrative support systems required to sustain service delivery operations. The relatively small share confirms that the majority of capital investment remains directed toward service delivery infrastructure rather than internal municipal facilities.
- Settlements such as Klapmuts (R53.3 million; 0.95%), Pniel/Johannesdal (R50.5 million; 0.90%), and Franschhoek (R46.7 million; 0.84%) receive moderate allocations aimed at supporting localised service delivery improvements, tourism-related infrastructure, and community facilities. These investments contribute to improving infrastructure quality within these settlements while maintaining proportional alignment with their population size, infrastructure needs, and economic activity relative to the Stellenbosch urban core.
- Areas such as Wemmershoek (R85 million; 1.52%) and La Motte (R10.6 million; 0.19%) receive smaller capital allocations focused on specific projects within these localities. Similarly, Vlottenburg receives a minimal allocation of R50 000, reflecting limited infrastructure requirements within dispersed rural areas. These smaller allocations demonstrate a selective investment approach that prioritises targeted infrastructure improvements rather than large-scale network expansion in low-density areas.
- Projects categorised as "Not Mapped" account for R62.5 million (1.12%) of the capital programme. These projects likely represent initiatives where spatial attribution remains incomplete or where project location may be determined during later design phases. While this proportion remains relatively small, improving spatial data completeness will strengthen future spatial analysis and enhance the municipality's ability to align infrastructure investment with settlement development priorities.
-
- The spatial distribution confirms the municipality's strategic focus on consolidating infrastructure investment within its primary urban growth area while supporting targeted service delivery improvements in secondary settlements. The concentration of approximately 70% of capital investment within the Stellenbosch urban core reflects the municipality's role as the principal economic, administrative, and service delivery hub within the municipal area. At the same time, the presence of municipality-wide infrastructure investments and targeted allocations to smaller settlements demonstrates a balanced approach that supports both infrastructure efficiency and equitable service delivery across the broader municipal region.

- The spatial allocation of the capital expenditure programme therefore demonstrates clear alignment between infrastructure investment and the municipality's long-term spatial development objectives. By concentrating the majority of capital investment within established urban areas and strategic development nodes while limiting dispersed infrastructure expansion, the municipality strengthens the efficiency, sustainability, and long-term resilience of its infrastructure network.

The spatial allocation of the capital expenditure programme therefore demonstrates clear alignment between infrastructure investment and the municipality's long-term spatial development objectives. By concentrating the majority of capital investment within established urban areas and strategic development nodes while limiting dispersed infrastructure expansion, the municipality strengthens the efficiency, sustainability, and long-term resilience of its infrastructure network.

3.3.2 Budget Scenario Outcome Analysis per Electoral Wards

In the analysis of the budget scenario results per Electoral Wards, the focus shifts towards understanding the allocation and utilisation of financial resources within specific electoral divisions. This examination seeks to illuminate how the budget scenario results are distributed across different wards, providing insights into the municipality's strategic investment priorities at a localised level. By scrutinising the budget scenario through the lens of Electoral Wards, this analysis unveils the geographic nuances that influence financial decisions, reflecting the municipality's commitment to addressing the unique needs and development requirements of each electoral area. Figure 3-3 and Table 3-2 serve as valuable tools in comprehending the localised impact of budgetary decisions as per the budget scenario on the development landscape within each Electoral Ward.

Figure 3-3: Budget Scenario Results per Electoral Ward

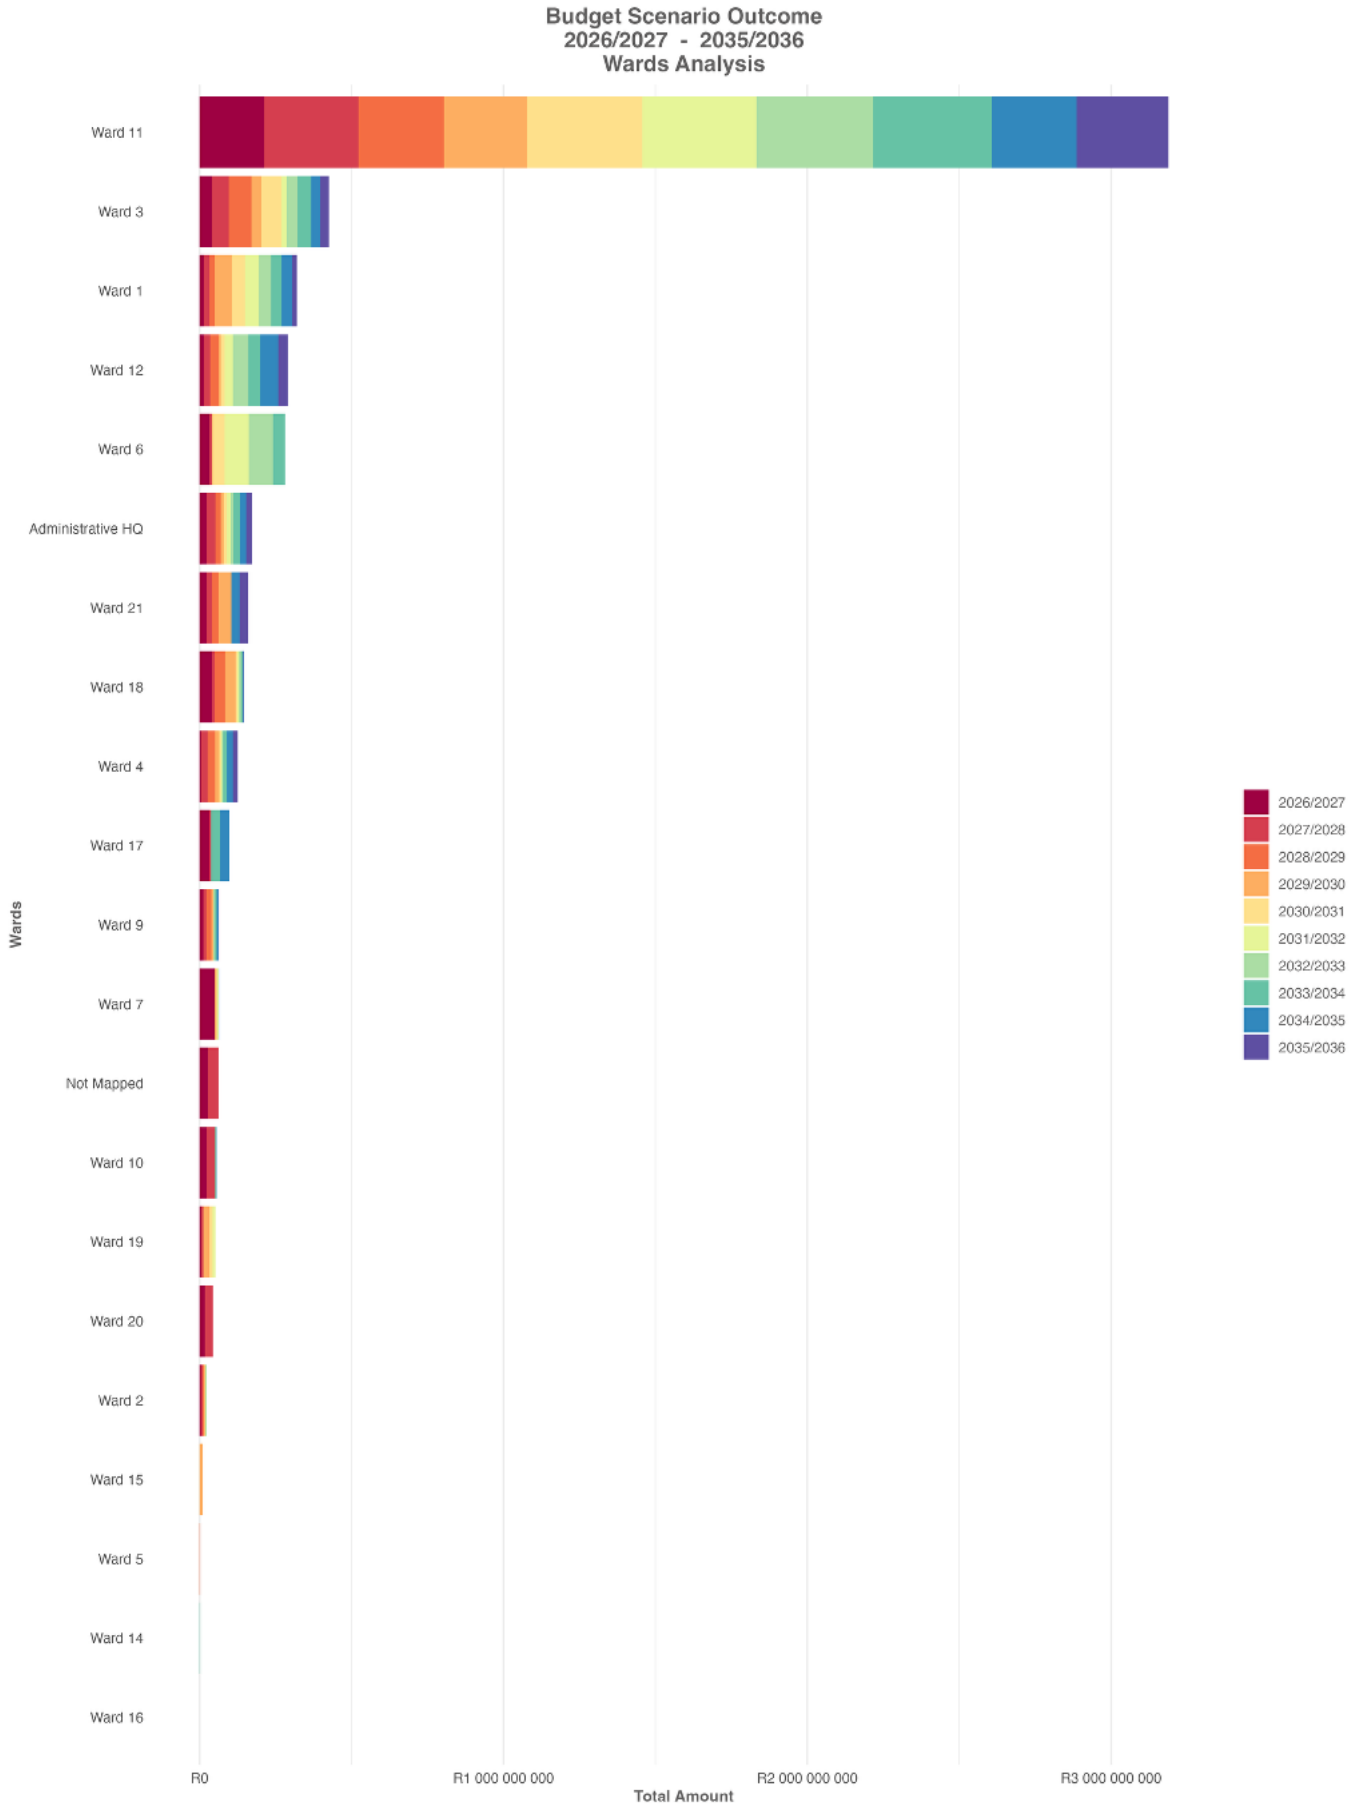

Table 3-2: Budget Scenario Results per Electoral Ward

2028/2029	2029/2030	2030/2031	2031/2032	2032/2033	2033/2034	2034/2035	2035/2036	Total	Percentage

Ward 15	R 0	R 0
Ward 5	R 300 000	R 200 000
Ward 14	R 500 000	R 0

The following observations can be noted from Figure 3-3 and Table 3-2:

The electoral ward distribution of the capital expenditure programme demonstrates a strong spatial concentration of infrastructure investment within a limited number of wards that correspond with the municipality's primary urban settlement areas and development corridors. The R5.59 billion ward-specific capital programme reflects a highly uneven distribution of investment, where a small number of wards receive the majority of capital allocations while several peripheral wards receive comparatively modest funding. Key observations are outlined below:

- This ward receives R3.19 billion (57.06%) of the total capital expenditure programme over the 10-year planning horizon. The scale of this allocation reflects the concentration of major infrastructure projects within the Stellenbosch urban core and surrounding development corridors. Investments within this ward are associated with large-scale bulk infrastructure upgrades, electricity network expansion, transport improvements, and urban development initiatives that support both the ward itself and the broader municipal economy.
- Ward 3 (R426.5 million; 7.63%), Ward 1 (R320.3 million; 5.73%), Ward 12 (R289.9 million; 5.19%), and Ward 6 (R281.9 million; 5.04%) collectively account for a significant share of the remaining capital programme. These wards represent established residential and development areas where infrastructure upgrades, service expansion, and urban development projects are required to support population growth and economic activity.
- Ward 21 (R159.3 million; 2.85%), Ward 18 (R146.1 million; 2.61%), and Ward 4 (R125.7 million; 2.25%) represent a third tier of investment within the capital programme. Projects within these wards are typically associated with localised infrastructure upgrades, network extensions, and targeted service delivery improvements that address community infrastructure needs.
- Projects associated with Administrative Headquarters total R173.5 million (3.11%) across the planning horizon. These investments support municipal operational capacity through upgrades to administrative facilities, institutional infrastructure, and supporting systems required for effective governance and service delivery.
- Wards such as Ward 17 (1.76%), Ward 9 (1.13%), Ward 7 (1.13%), Ward 10 (1.01%), Ward 19 (0.94%), and Ward 20 (0.77%) receive smaller shares of the overall capital programme. These allocations typically correspond to smaller-scale infrastructure upgrades, local service improvements, and targeted community projects rather than major bulk infrastructure investments.

- Projects classified as Not Mapped account for R62.5 million (1.12%), while wards such as Ward 2 (0.43%), Ward 15 (0.18%), Ward 5 (0.03%), and Ward 14 (0.02%) receive minimal allocations. These lower allocations may reflect lower population densities, fewer large-scale infrastructure projects within these wards, or investments that serve broader municipal systems rather than being geographically confined to a specific ward.
- Annual allocations within this ward remain consistently high across the planning horizon, suggesting the implementation of multi-year capital projects that require sustained funding. Such patterns are typically associated with bulk infrastructure upgrades, electricity network expansion, and transport-related investments that support broader municipal service delivery.

The ward-level distribution of the capital expenditure programme therefore illustrates a highly concentrated investment pattern driven by major infrastructure projects within the municipality's primary urban areas. While this concentration reflects strategic spatial targeting and the location of large-scale capital investments, continued monitoring of ward allocations will be necessary to ensure that infrastructure spending remains responsive to service delivery needs, population growth, and spatial development priorities across the municipality.

3.3.3 Budget Scenario Outcome Analysis per Priority Development Area (PDAs)

The analysis of the budget scenario results by Priority Development Areas (PDAs) provides an analysis of how financial resources are allocated and utilised within the zones defined by the Spatial Development Framework. This analysis aims to assess the effectiveness of spatial targeting by the municipality, determining whether resources are being directed toward areas of strategic importance as intended. This spatial perspective is crucial for understanding the alignment between the municipality's budgetary decisions and its development objectives. It allows for an assessment of whether the investments are reinforcing the intended spatial structure, fostering growth in priority areas, and addressing regional inequalities. Figure 3-4 and Table 3-3 serve as valuable tools in understanding this analysis.

Figure 3-4: Budget Scenario Results per Priority Development Area

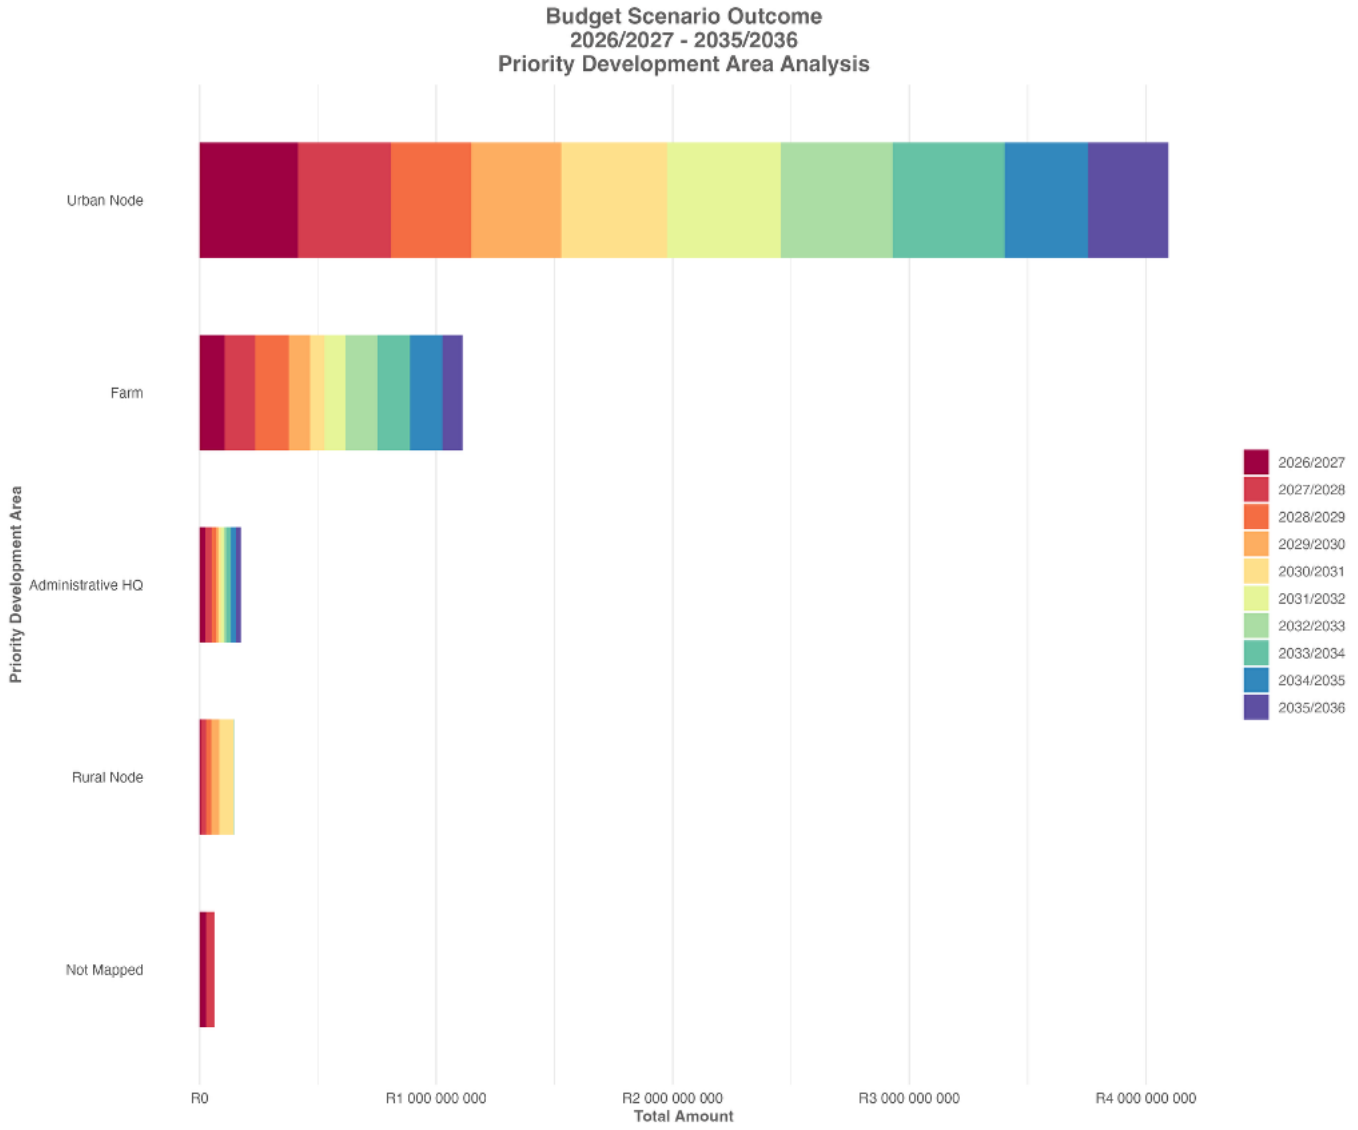

Table 3-3: Budget Scenario Results per Priority Development Area

	2035/2036	Total	Percentage
	R 338 816 939	R 4 094 983 313	73.28%
	R 84 040 000	R 1 110 937 647	19.88%
	R 20 305 000	R 173 545 000	3.11%

Total	R 576 301 851	R 610 030 198	R 520 771 404	R 515 645 110	R 577 216 006	R 582 656 082	R 616 467 666	R 633 964 197	R 511 401 507
Percentage	10.31%	10.92%	9.32%	9.23%	10.33%	10.43%	11.03%	11.34%	9.15%

The following observations can be noted from Figure 3-4 and Table 3-4:

The Priority Development Area (PDA) distribution of the capital expenditure programme demonstrates a strong spatial alignment with the municipality's settlement hierarchy and spatial development objectives. The R5.59 billion capital programme shows a clear concentration of infrastructure investment within established urban nodes, supported by targeted investments within farm areas and minimal allocations to rural settlements. This distribution reflects the municipality's spatial development approach of consolidating infrastructure investment within existing settlements while supporting key economic activities across the broader municipal landscape. Key observations are noted below:

- Urban Nodes represent the dominant focus of capital investment within the municipality. Projects located within Urban Nodes receive R4.09 billion (73.28%) of the total capital expenditure programme over the 10-year planning horizon. This substantial allocation reflects the concentration of infrastructure demand within Stellenbosch's principal settlement areas, including the Stellenbosch urban core and surrounding development nodes. Investments within these areas typically include bulk infrastructure upgrades, electricity network improvements, transport investments, and urban development initiatives that support densification, economic activity, and improved service delivery within the municipality's primary population centres.
- Farm areas represent the second-largest category of capital investment. Projects associated with farm areas account for R1.11 billion (19.88%) of the programme. These investments often relate to infrastructure supporting the municipality's agricultural economy, including infrastructure servicing wine estates, tourism-related developments, and rural infrastructure networks that support economic activity within the Cape Winelands landscape. The scale of this allocation reflects the continued importance of agriculture, wine production, and tourism within the Stellenbosch local economy.
- Administrative infrastructure represents a modest but necessary component of the capital programme. Projects associated with Administrative Headquarters total R173.5 million (3.11%) across the planning horizon. These investments support municipal operational capacity through upgrades to administrative facilities, institutional infrastructure, and systems required for effective governance and service delivery.
- Rural Nodes receive a comparatively small share of the capital programme. Projects located within Rural Nodes total R146.2 million (2.62%) across the planning horizon. This limited allocation reflects the municipality's spatial development approach of avoiding extensive infrastructure expansion in dispersed rural settlements where service delivery costs are significantly higher. Infrastructure investment is therefore prioritised within established settlement nodes where economies of scale can be achieved and service delivery efficiency can be maintained.
- A very small proportion of the programme remains spatially unassigned. Projects classified as Not Mapped account for R62.5 million (1.12%) of the capital programme. These projects typically represent initiatives where spatial coordinates have not yet been fully specified or where infrastructure benefits extend across multiple areas rather than being linked to a single spatial category.
- The temporal distribution of investment demonstrates sustained emphasis on Urban Nodes throughout the planning horizon. Annual allocations to Urban Node areas remain consistently high across the framework, ranging from approximately R338.8 million in 2035/36 to over R482 million in 2031/32, reflecting multi-year infrastructure programmes and ongoing urban development investment. This pattern indicates that major infrastructure projects are implemented across several financial years rather than through short-term expenditure spikes.
- Farm area investments show moderate variation over time, reflecting the phased implementation of infrastructure projects associated with agricultural activity and tourism development. These

allocations are particularly evident across the middle years of the planning horizon as infrastructure projects supporting rural economic activity are implemented in stages.

- The relatively limited allocation to Rural Nodes reinforces the municipality's spatial development strategy. By limiting large-scale infrastructure investment in dispersed rural settlements, the capital programme supports more efficient infrastructure provision within established urban areas while protecting the surrounding agricultural and heritage landscapes that form an important component of the municipality's identity.

The Priority Development Area budget distribution therefore demonstrates strong alignment between the capital expenditure programme and the municipality's spatial development objectives. The concentration of nearly three-quarters of capital investment within Urban Nodes confirms that infrastructure investment is primarily directed toward the municipality's principal settlement areas, while targeted investments within farm areas support the agricultural economy and limited allocations to Rural Nodes reflect a deliberate strategy to manage infrastructure expansion in dispersed areas. This spatial pattern reinforces the municipality's commitment to sustainable settlement development and efficient infrastructure.

3.3.4 Budget Scenario Outcome Analysis per Pro-Poor Areas

The budget scenario will analyse how financial allocations are dedicated to pro-poor areas, assessing the impact of these investments on both regional upliftment and overall municipal stability. Whilst allocating budget resources to poor areas is crucial for addressing challenges like inadequate infrastructure, limited services, and low income levels. By focusing investments in these pro-poor regions, the municipality can improve living conditions, boost public services, and stimulate local economies, which can help break the cycle of poverty. However, it is equally important to maintain funding for non-poor areas to ensure infrastructure upkeep and support broader economic growth. Figure 3-5 and Table 3-4 serve as valuable tools in understanding this analysis.

Figure 3-5: Budget Scenario Results by poor vs. non-poor expenditure analysis

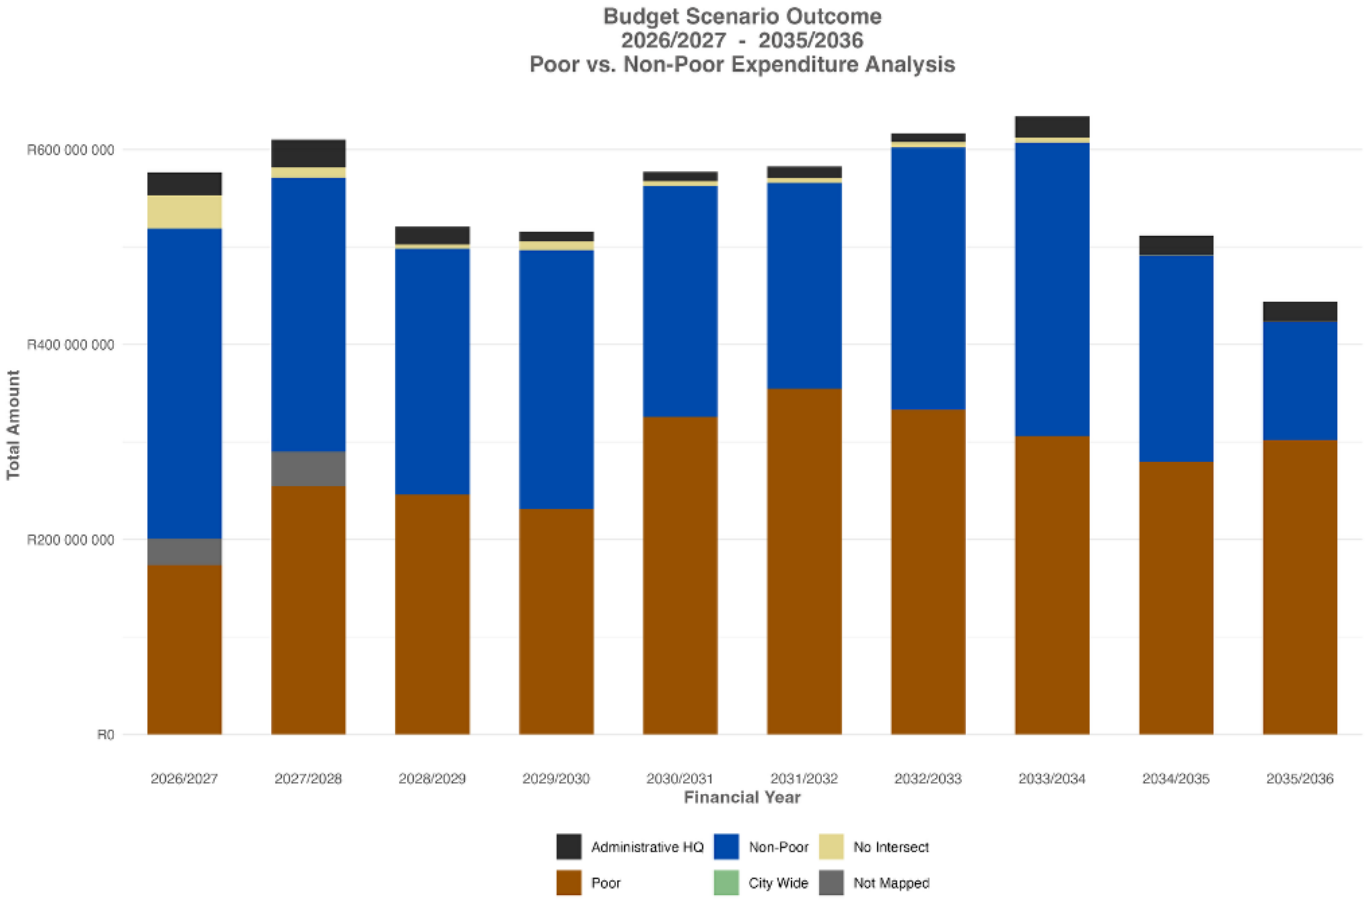

Table 3-4: Budget Scenario Results by poor vs. non-poor expenditure analysis

Poor	Non-Poor	Total	Poor : Non-Poor

2035/2036	R 0	R 300 000	R 0	R 20 305 000
Total	R 62 500 000	R 78 613 044	R 0	R 173 545 000

The following observations can be noted from Figure 3-5 and Table 3-4:

The beneficial area distribution of the capital expenditure programme provides insight into how municipal infrastructure investment supports equitable service delivery across socio-economic groups. The analysis distinguishes between projects benefiting areas classified as Poor and Non-Poor, together with investments associated with administrative infrastructure and projects without clearly defined spatial benefit areas. The results indicate a substantial allocation of infrastructure investment toward poorer communities over the 10-year planning horizon. Key observations are noted below:

- Poor areas receive the majority of capital investment within the analysed programme. Projects benefiting areas classified as Poor amount to R2.81 billion, representing approximately 51.8% of the analysed capital expenditure. This allocation marginally exceeds that directed toward Non-Poor areas and reflects the municipality's focus on addressing infrastructure backlogs and improving service delivery conditions within disadvantaged communities.
- Non-Poor areas account for a significant but smaller share of the capital programme. Projects benefiting Non-Poor areas total R2.47 billion, representing approximately 45.6% of the analysed capital expenditure. These investments typically include infrastructure upgrades within established urban areas, bulk service expansions, and infrastructure supporting economic activity and urban development within higher-income areas.
- Administrative and non-spatially defined projects represent a relatively small portion of the programme. Projects associated with Administrative Headquarters total R173.5 million, while projects classified as No Intersect amount to R78.6 million and Not Mapped projects total R62.5 million over the planning horizon. Together, these categories represent a minor share of the overall capital programme and generally relate to institutional infrastructure or projects that benefit the municipality broadly rather than a specific socio-economic area.
- The temporal distribution of investment reveals a gradual shift toward poorer areas during the middle and later years of the programme. In the early years of the framework, capital investment is relatively balanced between Poor and Non-Poor areas. However, from approximately 2030/31 onwards, allocations to Poor areas increase significantly, reaching annual levels of over R300 million in several years of the planning horizon. This pattern suggests a sequencing of infrastructure investments aimed at progressively addressing service delivery gaps within disadvantaged communities.
- The ratio of investment between Poor and Non-Poor areas varies over time but increasingly favours poorer communities. Early years of the programme demonstrate a stronger share of investment in Non-Poor areas due to previously committed projects or bulk infrastructure investments located in established urban centres. Over time, however, the balance shifts toward Poor areas, with the Poor:Non-Poor ratio increasing from approximately 1:0.5 in 2026/27 to around 1:2.5 by 2035/36, indicating the progressive rollout of projects targeting lower-income communities.
- The distribution indicates that the capital programme incorporates both equity and economic considerations. Investments in Poor areas contribute toward addressing infrastructure backlogs and improving service delivery conditions, while continued investment in Non-Poor areas supports economic activity, urban development, and infrastructure capacity within key growth areas of the municipality.

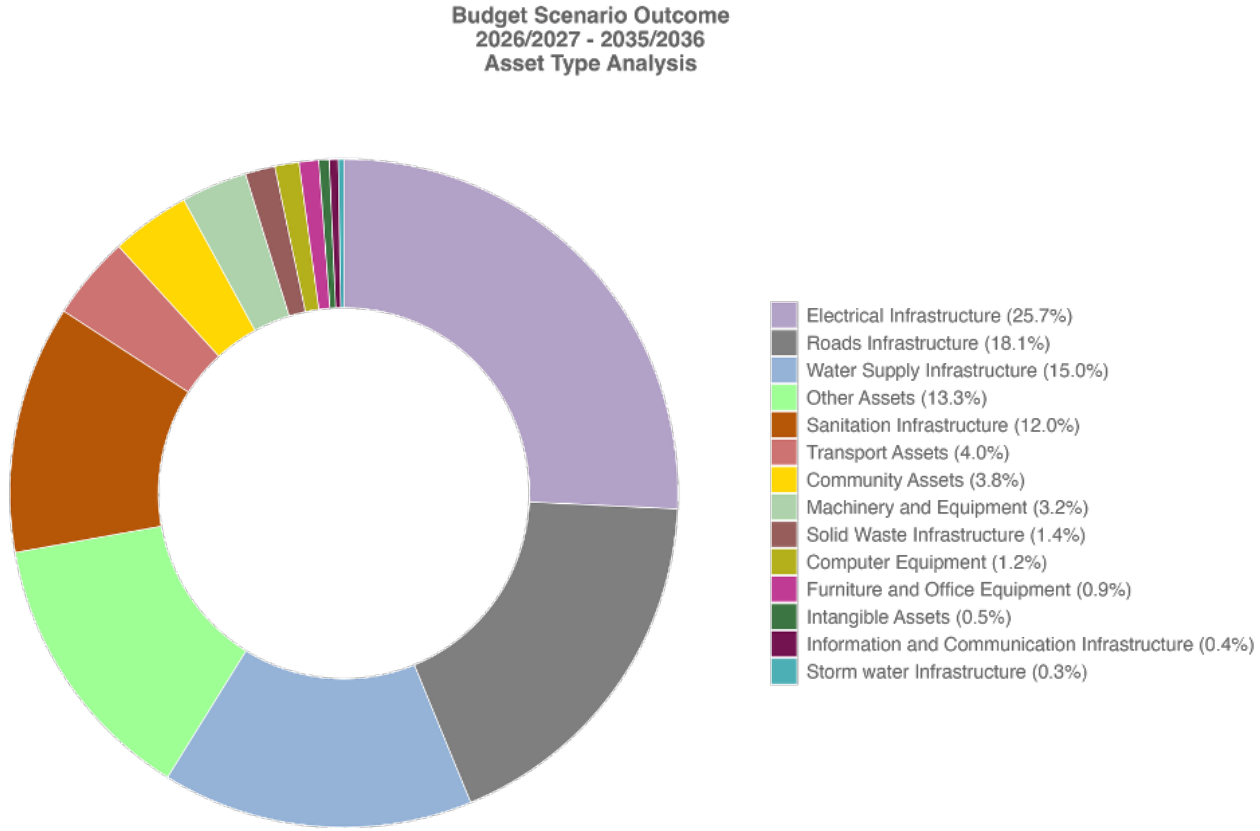
The beneficial area distribution therefore demonstrates a broadly balanced capital investment pattern that combines pro-poor infrastructure investment with continued support for infrastructure development within established urban areas. The fact that a slightly larger share of the capital programme benefits poorer communities indicates that the municipality's capital expenditure framework supports broader

service delivery equity objectives while maintaining the infrastructure investments required to sustain economic growth and urban development across the municipal area.

3.4 Budget Scenario as per the mSCOA Perspectives

In the subsequent sections, the budget scenario outcomes will be explored through the lens of the Municipal Standard Chart of Accounts (mSCOA). The National Treasury has introduced Integrated Financial Management and Internal Control System processes for local government, a significant component of which is the implementation of the Regulation of a Standard Chart of Accounts—commonly known as mSCOA. This standardised financial transaction classification framework, in accordance with mSCOA, gazetted on April 22, 2014 (Gazette No 37577), plays a pivotal role in ensuring consistency and uniformity in financial reporting for municipalities.

3.4.1 Budget Scenario Outcome Analysis per mSCOA Asset Type



In this section, a detailed analysis is conducted of the budget scenario results based on the mSCOA Asset Type. This perspective involves the intricate details of how the budget scenario results are allocated and managed across various asset types within the municipal environment. The visual representations in Table 3-5, and Figure 3-6 illustrate the budget scenario results per Asset Type and Sub-Type. This analysis not only sheds light on the fiscal dynamics of the municipality but also facilitates a nuanced understanding of the prioritisation and strategic planning associated with distinct asset types.

Table 3-5: Budget Scenario Results per Asset Type and Sub-Asset Analysis

Asset Type	Asset Total	Asset Percentage	Sub-Type	Sub-Type Total	Sub-Type Percentage
Electrical Infrastructure	R1 233 350 006	22.07%	MV Switching Stations	R 429 840 082	7.69%
			MV Substations	R 262 352 504	4.69%
			LV Networks	R 256 502 564	4.59%
			MV Networks	R 146 303 060	2.62%
			HV Substations	R 138 351 796	2.48%
Roads Infrastructure	R1 079 191 054	19.31%	Roads	R 718 998 047	12.87%
			Road Furniture	R 321 993 007	5.76%
			Road Structures	R 38 200 000	0.68%
Water Supply Infrastructure	R 899 387 260	16.09%	Distribution	R 720 011 130	12.88%
			Reservoirs	R 134 876 130	2.41%
			Bulk Mains	R 30 000 000	0.54%
			Water Treatment Works	R 14 500 000	0.26%
Sanitation Infrastructure	R 718 187 850	12.85%	Waste Water Treatment Works	R 429 322 850	7.68%
			Reticulation	R 240 115 000	4.30%
			Pump Station	R 48 750 000	0.87%
Other Assets	R 709 790 869	12.70%	Housing	R 597 360 869	10.69%
			Operational Buildings	R 112 430 000	2.01%
Transport Assets	R 242 235 000	4.33%	No Selection	R 242 235 000	4.33%
Community Assets	R 228 195 684	4.08%	Community Facilities	R 181 995 684	3.26%
			Sport and Recreation Facilities	R 46 200 000	0.83%
Machinery and Equipment	R 190 846 293	3.42%	No Selection	R 190 846 293	3.42%
Solid Waste Infrastructure	R 86 141 917	1.54%	Landfill Sites	R 44 000 000	0.79%
			Electricity Generation Facilities	R 20 500 000	0.37%
			Waste Drop-off Points	R 15 841 917	0.28%
			Waste Processing Facilities	R 5 800 000	0.10%

Asset Type	Asset Total	Asset Percentage	Sub-Type	Sub-Type Total	Sub-Type Percentage
Computer Equipment	R 69 850 000	1.25%	No Selection	R 69 850 000	1.25%
Furniture and Office Equipment	R 56 735 592	1.02%	No Selection	R 56 735 592	1.02%
Intangible Assets	R 29 754 435	0.53%	Licences and Rights	R 28 354 435	0.51%
			Computer Software and Applications	R 1 400 000	0.03%

			Drainage Collection	R 6 500 000	0.12%
Heritage Assets	R 2 150 000	0.04%	Historic Buildings	R 2 150 000	0.04%
Total	R5 588 115 960	NA%		R5 588 115 960	NA%

Figure 3-6: Budget Scenario Results per Asset Type Analysis

The following observations can be noted from Table 3-5, as well as Figure 3-6:

The mSCOA asset type distribution reveals the municipality's capital investment priorities across major infrastructure systems and supporting assets. The R5.59 billion capital expenditure programme shows a strong concentration within core service delivery infrastructure, particularly electricity, roads, water supply, and sanitation systems. These categories represent the foundational infrastructure required to support urban growth, service delivery reliability, and economic activity across the municipality. Key observations are noted below:

- Electrical infrastructure represents the largest share of the capital programme. Investments in this category total R1.23 billion (22.07%), reflecting the municipality's focus on strengthening electricity distribution capacity and network reliability. The largest components within this category include MV Switching Stations (7.69%), MV Substations (4.69%), and LV Networks (4.59%), indicating substantial investment in both bulk electrical infrastructure and distribution systems required to support residential growth and economic development.
- Roads infrastructure forms the second-largest investment category. Projects within this asset type total R1.08 billion (19.31%), primarily directed toward road construction and upgrades (12.87%) and road furniture (5.76%), with a smaller allocation for road structures (0.68%). These investments support urban mobility, access to economic opportunities, and the continued expansion and maintenance of the municipal transport network.
- Water supply infrastructure represents a significant component of the capital programme. Investments amount to R899.4 million (16.09%), with the majority allocated to water distribution networks (12.88%), followed by reservoir infrastructure (2.41%) and smaller allocations to bulk mains (0.54%) and water treatment works (0.26%). This distribution reflects the importance of maintaining reliable water distribution systems to meet increasing demand associated with population growth and economic activity.
- Other assets, primarily housing infrastructure, account for a substantial share of the programme. This category totals R709.8 million (12.70%), with the majority allocated to housing projects (10.69%) and a smaller portion directed toward operational buildings (2.01%). The scale of this investment indicates continued focus on residential development and the provision of supporting municipal facilities.
- Sanitation infrastructure represents another critical investment category. Projects in this category total R718.2 million (12.85%), with significant allocations to wastewater treatment works (7.68%), reticulation networks (4.30%), and pump stations (0.87%). These investments are essential to maintain environmental compliance, expand sanitation capacity, and accommodate population growth within the municipality.
- Secondary infrastructure categories support municipal operations and service delivery systems. These include transport assets (4.33%), community assets (4.08%), and machinery and equipment (3.42%), which collectively contribute toward maintaining operational capacity, improving municipal service delivery systems, and supporting the provision of community facilities and recreational infrastructure.
- Environmental and waste-related infrastructure receives comparatively smaller allocations. Solid waste infrastructure totals R86.1 million (1.54%), including investments in landfill sites, electricity generation facilities associated with waste infrastructure, waste drop-off points, and processing facilities. These investments support waste management services and environmental sustainability objectives.
- Administrative and technological infrastructure represents a small but necessary portion of the programme. Investments in computer equipment (1.25%), furniture and office equipment (1.02%), intangible assets (0.53%), and information and communication infrastructure (0.47%) contribute toward strengthening the municipality's institutional capacity and supporting digital systems required for effective governance and service delivery.
- Stormwater and heritage infrastructure receive minimal allocations. Stormwater infrastructure totals R16.3 million (0.29%), while heritage assets account for R2.15 million (0.04%). Although these allocations are relatively small compared with core infrastructure systems, they contribute toward maintaining drainage networks and preserving historic buildings within the municipality.

The mSCOA asset type distribution demonstrates a strong concentration of capital investment within core municipal infrastructure systems. Electricity, roads, water supply, sanitation, and housing-related infrastructure collectively represent the majority of the capital programme, reflecting the municipality's

priority to maintain essential service delivery infrastructure while supporting urban development and population growth. Smaller allocations to operational, technological, and environmental assets complement these core investments by strengthening institutional capacity and supporting long-term infrastructure sustainability.

3.4.2 Budget Scenario Outcome Analysis per mSCOA Action

In this section, the focus shifts to the budget scenario results analysis per mSCOA Action, particularly concentrating on new or upgrading assets. This examination closely inspects the budget scenario results landscape to reveal how resources are planned and managed concerning the implementation or enhancement of assets within the framework of the mSCOA actions. Figure 3-7 and Table 3-6 provide a visual representation of these budget scenario results allocations, and their implications for different asset-related actions. By zeroing in on actions related to the introduction or improvement of assets, the aim is to uncover the strategic decisions and priorities guiding the municipality's developmental initiatives. This analysis offers a nuanced understanding of the fiscal implications associated with creating new assets or enhancing existing ones, providing valuable insights into the dynamic interplay between budget allocations, mSCOA classifications, and the municipality's overarching goals for asset development and improvement.

Figure 3-7: Budget Scenario Results per Action

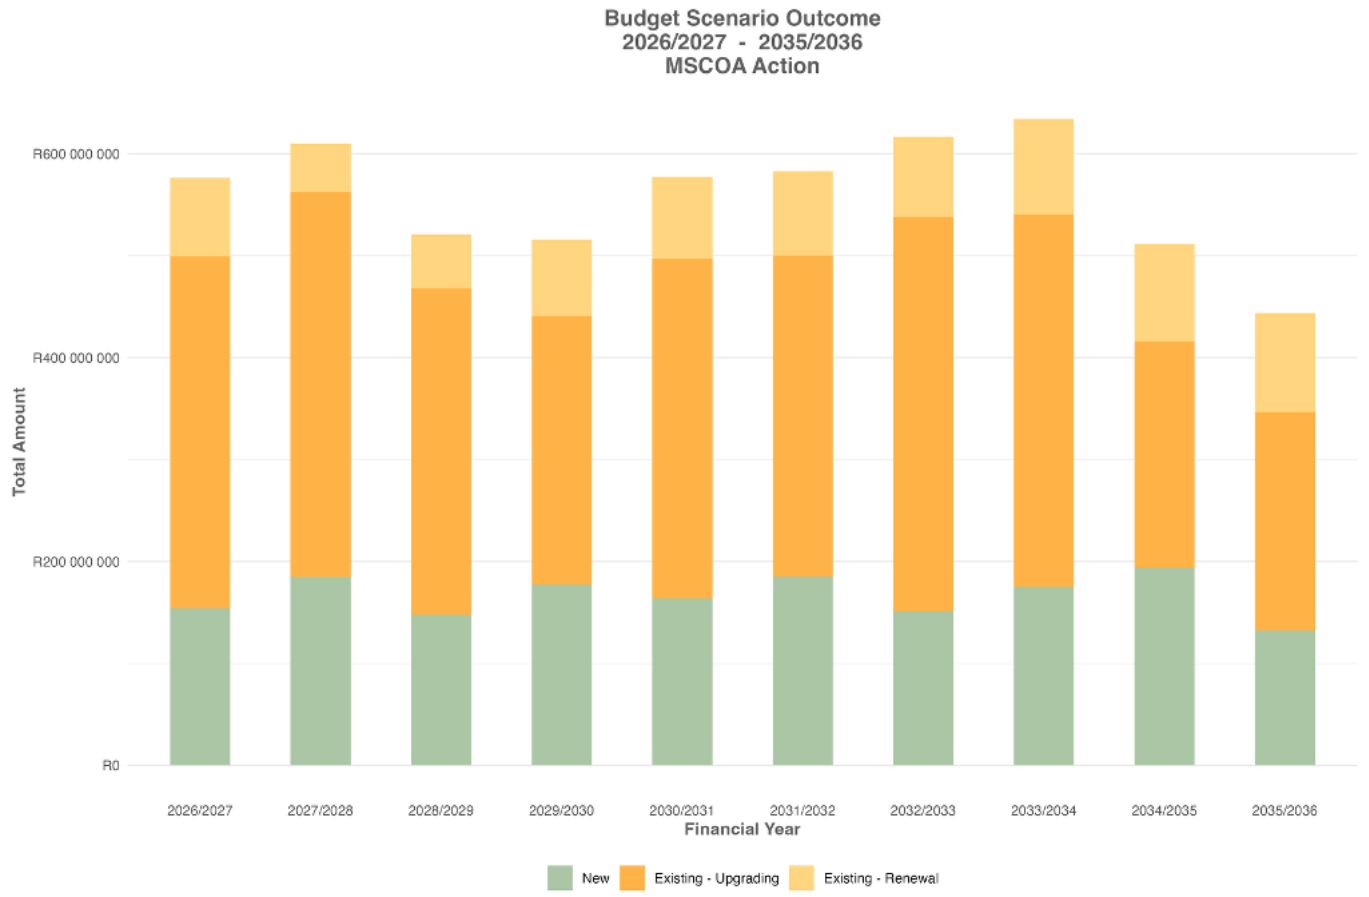

Table 3-6: Budget Scenario Results per Action

Financial Year	Renewal	Renewal Percentage	Upgrading	Upgrading Percentage	New	New Percentage	Total	Ratio (Existing:New)
2026/2027	R 76 986 500	9.86%	R 344 994 907	10.99%	R 154 320 444	9.26%	R 576 301 851	1:0.37
2027/2028	R 47 791 051	6.12%	R 377 660 582	12.03%	R 184 578 565	11.08%	R 610 030 198	1:0.43
2028/2029	R 53 110 034	6.80%	R 319 711 304	10.18%	R 147 950 066	8.88%	R 520 771 404	1:0.40
2029/2030	R 75 057 436	9.61%	R 263 015 717	8.37%	R 177 571 957	10.66%	R 515 645 110	1:0.53
2030/2031	R 80 368 079	10.29%	R 332 969 970	10.60%	R 163 877 957	9.83%	R 577 216 006	1:0.40
2031/2032	R 82 693 079	10.59%	R 315 165 046	10.04%	R 184 797 957	11.09%	R 582 656 082	1:0.46
2032/2033	R 78 606 814	10.06%	R 386 331 258	12.30%	R 151 529 594	9.09%	R 616 467 666	1:0.33
2033/2034	R 93 441 979	11.96%	R 365 327 021	11.63%	R 175 195 197	10.51%	R 633 964 197	1:0.38
2034/2035	R 95 776 623	12.26%	R 221 307 131	7.05%	R 194 317 753	11.66%	R 511 401 507	1:0.61
2035/2036	R 97 305 000	12.46%	R 214 116 939	6.82%	R 132 240 000	7.94%	R 443 661 939	1:0.42
Total	R 781 136 595	100.00%	R 3 140 599 875	100.00%	R 1 666 379 490	100.00%	R 5 588 115 960	1:0.42

The following observations can be made from Figure 3-7 and Table 3-6:

The mSCOA action distribution illustrates the balance between investment in new infrastructure and expenditure on maintaining and improving the municipality's existing asset base. The R5.59 billion capital

expenditure programme demonstrates a clear emphasis on strengthening and upgrading existing infrastructure systems, while still accommodating new infrastructure required to support urban growth and service delivery expansion. Key observations are noted below:

- Existing infrastructure enhancement represents the dominant focus of the capital programme. Combined investment in upgrading and renewal of existing assets totals approximately R3.92 billion (70.2%), compared with R1.67 billion (29.8%) allocated to new infrastructure. This distribution reflects a strategic emphasis on improving the performance, reliability, and capacity of the municipality's existing infrastructure networks rather than relying primarily on the creation of entirely new assets.
- Upgrading of existing infrastructure constitutes the largest component of the programme. Investments in upgrading amount to R3.14 billion (56.2%) over the planning horizon. These projects typically involve expanding the capacity of existing infrastructure systems, modernising infrastructure networks, or improving service levels within established urban areas. The strong emphasis on upgrading reflects the need to accommodate population growth and increased service demand within the municipality's existing urban footprint.
- Renewal of ageing infrastructure forms an important but smaller component of the capital programme. Renewal projects total R781.1 million (14.0%), focusing on the replacement or refurbishment of existing assets that have reached the end of their useful life. Although this proportion is smaller than upgrading investments, it remains an essential component of sustainable asset management by ensuring that critical infrastructure continues to function effectively over the long term.
- New infrastructure development represents just under one-third of the capital programme. Investments in new assets total R1.67 billion (29.8%), reflecting projects aimed at expanding infrastructure networks to accommodate growth areas, new residential developments, and emerging economic activities. While this proportion exceeds the commonly referenced 10–20% benchmark for mature municipalities, it remains moderate within the context of ongoing urban development and infrastructure expansion within the municipality.
- The overall ratio between existing infrastructure investment and new infrastructure development remains relatively consistent across the planning horizon. Annual ratios vary between approximately 1:0.33 and 1:0.61, with an overall average ratio of approximately 1:0.42 across the 10-year framework. This indicates that while the municipality continues to invest in new infrastructure, the majority of capital expenditure remains directed toward strengthening and maintaining the existing asset base.
- Temporal patterns demonstrate relatively stable upgrading investment throughout the planning horizon. Upgrading allocations remain above R260 million annually in most years, peaking at over R386 million in 2032/33, before declining toward the end of the planning horizon as the overall capital programme tapers. In contrast, renewal investments gradually increase over time, rising from approximately R77 million in 2026/27 to over R97 million by 2035/36, reflecting the growing importance of asset replacement as infrastructure networks age.
- The distribution highlights the need to maintain a careful balance between expansion and maintenance. While new infrastructure investments support economic development and population growth, continued emphasis on upgrading and renewal is necessary to avoid deterioration of existing infrastructure and the accumulation of maintenance backlogs.

The mSCOA action distribution demonstrates that the municipality's capital expenditure programme prioritises the improvement and sustainability of its existing infrastructure systems while still accommodating strategic investments in new infrastructure. The strong emphasis on upgrading and

renewal supports sound asset management practices and contributes to maintaining reliable service delivery while enabling the municipality to respond to future growth and development pressures.

3.4.3 Budget Scenario Outcome Analysis per Infrastructure and Non-Infrastructure Factors

This examination is pivotal in understanding how the budget scenario results are distributed and managed within these distinct realms of municipal development. By differentiating between infrastructure and non-infrastructure elements, it offers an overview of the budgetary allocations and priorities associated with both sectors. Figure 3-8 and Table 3-7 provide a visual representation of these capital expenditure allocations and their implications for both categories.

This analysis serves as a strategic lens, providing insights into the municipality's approach to balancing investments in physical structures, utilities, and other tangible assets against non-physical aspects such as policies, programs, and services. The ensuing exploration sheds light on the nuanced decision-making process that underlies the budget scenario, contributing to a holistic understanding of the municipality's development strategy and its impact on both physical and non-physical dimensions of community growth. Non-physical dimensions encompass intangible elements such as policies, programs, and services that contribute to community well-being. Municipalities allocate funds to develop and implement regulations, social services, and cultural initiatives, representing a strategic approach to balancing investments in tangible infrastructure with non-physical aspects. This includes directing resources toward educational programs, healthcare services, community engagement efforts, and technology infrastructure. This sheds light on the municipality's nuanced decision-making process, offering insights into how budgetary allocations impact both the physical structures and the intangible dimensions crucial for holistic community growth. Non-physical dimensions play a pivotal role in fostering a comprehensive understanding of the municipality's development strategy, emphasising its commitment to addressing both tangible and intangible facets of community well-being.

Figure 3-8: Budget Scenario Results per Infrastructure/ Non-Infrastructure Factors

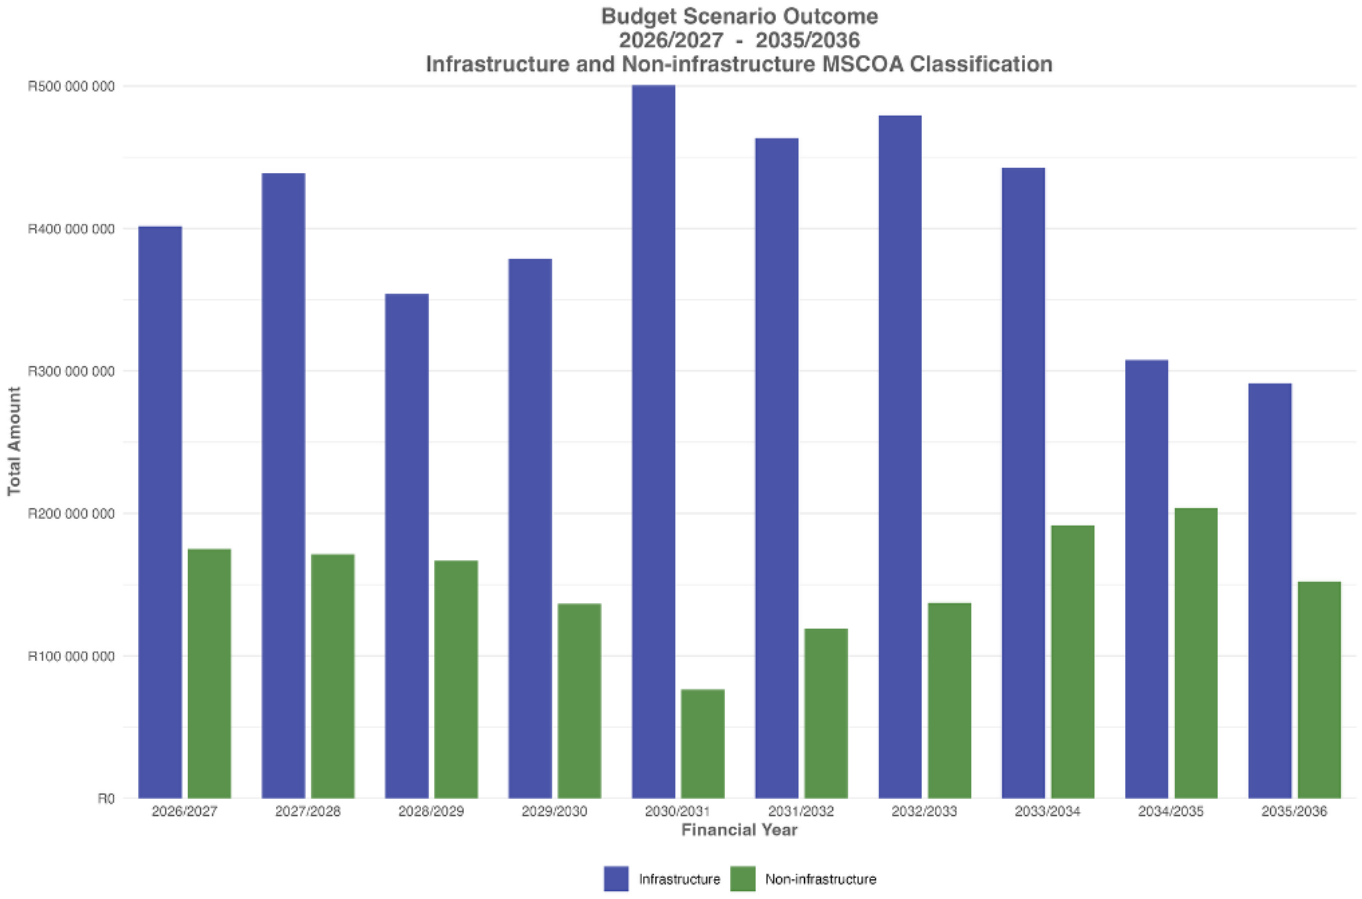

Table 3-7: Budget Scenario Results per Infrastructure/ Non-Infrastructure Factors

Non-infrastructure	Non-infrastructure Percentage	Total	Ratio (Infrastructure:Non-Infrastructure)
R 174 928 578	11.44%	R 576 301 851	1:0.44
R 171 213 722	11.19%	R 610 030 198	1:0.39
R 166 762 403	10.90%	R 520 771 404	1:0.47
R 136 689 271	8.94%	R 515 645 110	1:0.36
R 76 524 930	5.00%	R 577 216 006	1:0.15
R 118 965 006	7.78%	R 582 656 082	1:0.26
R 137 142 050	8.97%	R 616 467 666	1:0.29
R 191 539 083	12.52%	R 633 964 197	1:0.43
R 203 697 830	13.32%	R 511 401 507	1:0.66
R 152 095 000	9.94%	R 443 661 939	1:0.52
R 1 529 557 873	100.00%	R 5 588 115 960	1:0.38
27.37%	0.00%		100.00%

Financial Year	Infrastructure	Infrastructure Percentage
2026/2027	R 401 373 273	9.89%
2027/2028	R 438 816 476	10.81%
2028/2029	R 354 009 001	8.72%
2029/2030	R 378 955 839	9.34%
2030/2031	R 500 691 076	12.34%
2031/2032	R 463 691 076	11.43%
2032/2033	R 479 325 616	11.81%
2033/2034	R 442 425 114	10.90%
2034/2035	R 307 703 677	7.58%
2035/2036	R 291 566 939	7.18%
Total	R 4 058 558 087	100.00%
Percentage	72.63%	0.00%

The following observations can be noted from Figure 3-8 and Table 3-7:

The distribution between infrastructure and non-infrastructure expenditure provides insight into the extent to which the capital programme prioritises physical service delivery assets relative to institutional, operational, and supporting investments. The R5.59 billion capital expenditure programme demonstrates a strong concentration of resources within physical infrastructure systems, reflecting the municipality's focus on maintaining and expanding core service delivery networks. Key observations are noted below:

- Infrastructure investment represents the dominant component of the capital programme. Infrastructure assets account for R4.06 billion (72.63%) of total capital expenditure over the planning horizon. These investments include core service delivery systems such as electricity networks, water supply infrastructure, sanitation infrastructure, and road infrastructure. The magnitude of this allocation reflects the municipality's priority to maintain reliable infrastructure services while accommodating urban growth and increasing service demand.
- Non-infrastructure expenditure represents a smaller but important portion of the capital programme. Projects classified as non-infrastructure total R1.53 billion (27.37%) over the planning horizon. These investments typically include institutional assets, operational facilities, housing projects, machinery and equipment, information technology infrastructure, and other municipal assets that support service delivery capacity rather than forming part of the core engineering infrastructure networks.
- The overall ratio between infrastructure and non-infrastructure expenditure reflects a strong infrastructure focus. The capital programme demonstrates an overall ratio of approximately 1:0.38, indicating that for every rand invested in infrastructure, roughly 38 cents are allocated to supporting non-infrastructure assets. This pattern is consistent with municipalities prioritising physical service delivery infrastructure as the primary driver of capital investment.
- Annual ratios demonstrate variation across the planning horizon. The ratio of infrastructure to non-infrastructure expenditure ranges between approximately 1:0.15 and 1:0.66 over the 10-year period. Years such as 2030/31 show particularly strong infrastructure dominance due to the scheduling of major infrastructure projects, while later years such as 2034/35 show a relatively higher proportion of non-infrastructure expenditure as the overall capital programme tapers.
- Infrastructure investment remains relatively strong during the early and middle years of the programme. Annual infrastructure allocations remain above R354 million between 2026/27 and 2033/34, peaking at approximately R500.7 million in 2030/31. This pattern indicates sustained multi-

year investment in core service delivery infrastructure required to maintain network reliability and support municipal growth.

- Non-infrastructure investment shows greater variability over time. Allocations fluctuate between approximately R76.5 million and R203.7 million annually, reflecting the episodic nature of investments in operational facilities, institutional assets, and supporting equipment rather than the long-term construction cycles associated with engineering infrastructure.
- The strong infrastructure emphasis aligns with the municipality's service delivery responsibilities. Investments in electricity, roads, water supply, and sanitation infrastructure represent the essential backbone of municipal service provision and therefore constitute the majority of capital expenditure.

The infrastructure versus non-infrastructure distribution therefore demonstrates a capital programme that prioritises investment in core service delivery infrastructure while maintaining a smaller but necessary allocation for institutional and operational assets. The strong emphasis on infrastructure reflects the municipality's commitment to maintaining reliable service delivery systems while supporting long-term urban development and economic growth across the municipal area.

3.5 Concluding remarks

The Capital Expenditure Programme demonstrates strategic alignment between fiscal constraints and infrastructure priorities, fitting R5.59 billion (approximately 93%) of the R5.98 billion planned portfolio within the 10-year affordability envelope. The spatial distribution validates strong targeting, with 69.83% of capital expenditure concentrated in the Stellenbosch/Jamestown/De Zalze urban area and 73.28% allocated within Urban Nodes, reflecting alignment with the municipality's settlement hierarchy and Urban Edge strategy. The mSCOA asset type distribution appropriately emphasises core infrastructure investment, with Electrical Infrastructure (22.07%), Roads Infrastructure (19.31%), Water Supply Infrastructure (16.09%), Other Assets – primarily housing (12.70%), and Sanitation Infrastructure (12.85%) representing the dominant categories within the capital programme. However, comparatively small allocations to Stormwater Infrastructure (0.29%), Information and Communication Infrastructure (0.47%), and Heritage Assets (0.04%) suggest areas that may require strengthening in future capital planning cycles.

Several strategic considerations require continued monitoring. The beneficial area distribution demonstrates a pro-poor investment bias, with R2.81 billion (approximately 51.8%) of the programme benefiting areas classified as Poor compared with R2.47 billion (approximately 45.6%) in Non-Poor areas. However, ward-level disparities remain pronounced, with Ward 11 receiving R3.19 billion (57.06%) of total capital expenditure while several peripheral wards receive allocations below 1%, warranting periodic review to ensure alignment with population distribution and service delivery needs. Investment in new assets totals R1.67 billion (29.8%), exceeding the commonly referenced 10–20% industry benchmark, although the capital programme remains dominated by investment in existing assets through upgrading (56.2%) and renewal (14.0%). The infrastructure-to-non-infrastructure ratio of 72.63:27.37 reflects a strong emphasis on core service delivery infrastructure relative to institutional and operational assets.

The CEP's adaptive framework enables continuous refinement in response to evolving fiscal conditions and infrastructure priorities. The remaining difference between municipal demand and the resulting budget scenario highlights the importance of disciplined project prioritisation and sequencing.

Opportunities exist to strengthen the capital programme through alternative financing mechanisms, including development contributions, grant optimisation, and strategic partnerships that can accelerate the delivery of priority infrastructure. Strengthening demand management through rigorous project preparation, whole-of-life cost modelling, and disciplined commitment management will help protect fiscal space for high-priority investments. Regular review of both the Capital Expenditure Framework (CEF) and the Long-Term Financial Plan will ensure continued alignment between capital investment, spatial transformation objectives, service delivery equity, and long-term financial sustainability.

Phase 5

MTREF Report

4 MTREF Budget Scenario Results

4.1 Contextualisation

The Medium-Term Revenue and Expenditure Framework (MTREF) serves as a three-year rolling budgetary tool that guides municipal expenditure decisions within an affordability framework. As part of the Capital Expenditure Framework (CEF), the MTREF Budget Scenario Results provide a structured assessment of how capital projects align with municipal strategic objectives, financial capacity, and spatial planning imperatives.

This section presents the results of the budget scenario developed for the municipality's Capital Expenditure Programme (CEP) (refer to the previous report of the CEF), outlining the projected capital expenditure across financial years, municipal departments, asset types, and functional areas. The scenario reflects a data-driven approach to prioritising infrastructure projects, ensuring that capital allocation supports both immediate service delivery needs and long-term strategic goals.

It is important to recognise that the budget scenario is not static but rather a working model that evolves over time. Each year, as new financial data, planning priorities, and infrastructure needs emerge, adjustments will be made to optimise capital expenditure decisions. The CEF and MTREF are iterative processes, requiring continuous refinement to reflect changes in municipal priorities, funding availability, and regulatory frameworks.

4.2 MTREF Budget Scenario Results Analysis

4.2.1 MTREF Budget Scenario Results by Financial Year

This section presents the results of the MTREF budget scenario, analysing projected capital expenditure trends over the three-year planning horizon. Evaluating these results at a financial-year level provides insight into the anticipated trajectory of municipal expenditure, indicating whether expenditure is expected to increase, stabilise, or decline over time. It also assesses the financial sustainability of the scenario, ensuring alignment with the municipality's affordability envelope as outlined in the Long-Term Financial Model (LTFM). Additionally, given the evolving nature of municipal planning, the outer-year projections remain subject to adjustments as new priorities emerge, master planning processes are refined, and funding availability changes. Understanding these year-by-year trends establishes a foundation for the more detailed analyses that follow, including budget scenario results by department, asset type, and spatial distribution.

Figure 4-1: MTREF Budget Scenario Results by Financial Year

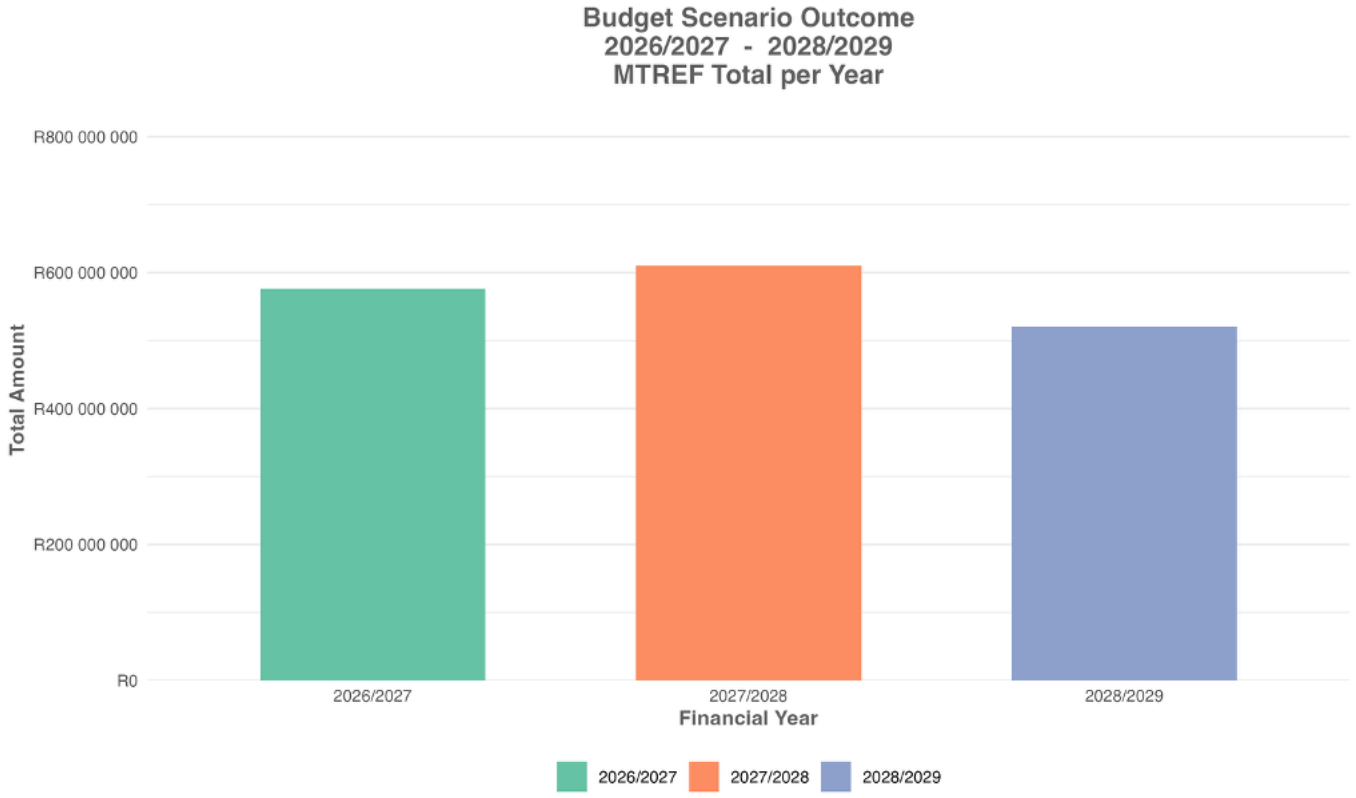

Table 4-1: MTREF Budget Scenario Results by Financial Year

Financial Year	Total	Percentage
2026/2027	R 576 301 851	33.76%
2027/2028	R 610 030 198.17	35.73%
2028/2029	R 520 771 403.62	30.51%
Total	R 1 707 103 452.79	100.00%

The following observations can be noted from Figure 4-1 and Table 4-1:

The MTREF budget scenario demonstrates a relatively balanced expenditure pattern across the three-year planning horizon, with R1.69 billion allocated to capital infrastructure. The distribution reveals R571.30 million (33.82%) in 2026/27, increasing to R605.03 million (35.82%) in 2027/28, before declining to R512.77 million (30.36%) in 2028/29. This pattern reflects the interaction between committed projects, affordability envelope constraints, and the strategic sequencing of infrastructure investments within the municipality's medium-term financial framework. Key observations are noted below:

- The MTREF demonstrates moderate mid-term concentration, with 2027/28 commanding the highest allocation at R605.03 million (35.82%). The initial allocation of R571.30 million (33.82%) in 2026/27 reflects the accommodation of committed projects and early-stage implementation of prioritised infrastructure investments. The subsequent increase in 2027/28 suggests the continuation and peak implementation of several multi-year capital projects before expenditure declines in 2028/29 to R512.77 million (30.36%), reflecting the tapering of certain projects toward completion.
- The distribution over time reflects alignment with LTFM-defined affordability constraints, balancing the need for immediate infrastructure investment with the preservation of medium-term fiscal sustainability. The relatively strong allocation in the first two years allows the municipality to advance

committed projects and implement high-priority infrastructure interventions, while the adjustment in the third year demonstrates prudent fiscal planning that maintains capital investment within projected revenue and expenditure limits.

- The slightly higher allocation in 2027/28 (35.82%) reflects the sequencing of infrastructure investments and the natural progression of multi-year capital projects. Many infrastructure programmes typically reach peak expenditure during the second year of implementation as procurement processes are completed and construction activities accelerate. The subsequent decline in 2028/29 (30.36%) reflects the anticipated completion of several projects and the phasing of new initiatives within the outer year of the MTREF.
- 2028/29 remains the most susceptible to adjustment as municipal priorities evolve and revenue projections are refined through the annual budget process. The current allocation of R512.77 million represents the planning estimate based on the Long-Term Financial Model and the prioritised project pipeline. External factors such as economic performance, national fiscal transfers, and municipal revenue trends may influence final allocations during future MTREF reviews.

The MTREF budget scenario therefore demonstrates a generally balanced expenditure pattern, with R571.30 million (33.82%) in 2026/27, increasing slightly to R605.03 million (35.82%) in 2027/28, before declining to R512.77 million (30.36%) in 2028/29. This distribution reflects the sequencing of multi-year capital projects, the accommodation of committed investments, and alignment with affordability constraints established through the LTFM. The pattern supports sustained infrastructure delivery while recognising that outer-year allocations remain subject to refinement as municipal priorities and fiscal conditions evolve.

4.2.2 MTREF Budget Scenario Results by Unit and Department

This section analyses the MTREF budget scenario results at the Unit and Department level, providing a breakdown of planned capital expenditure across the municipality's divisions. By examining the projected expenditure per unit, this analysis highlights how different departments are expected to spend capex over the MTREF period. The results reflect the municipality's strategic priorities and focus, offering insight into how expenditure is distributed across various functions.

As the municipality's understanding of capital expenditure needs evolves, these projections may be adjusted to accommodate emerging priorities, financial constraints, and policy shifts. Future updates to the Capital Expenditure Framework (CEF) may refine expenditure allocations based on updated assessments and planning directives.

Figure 4-2: MTREF Budget Scenario Results by Unit and Department

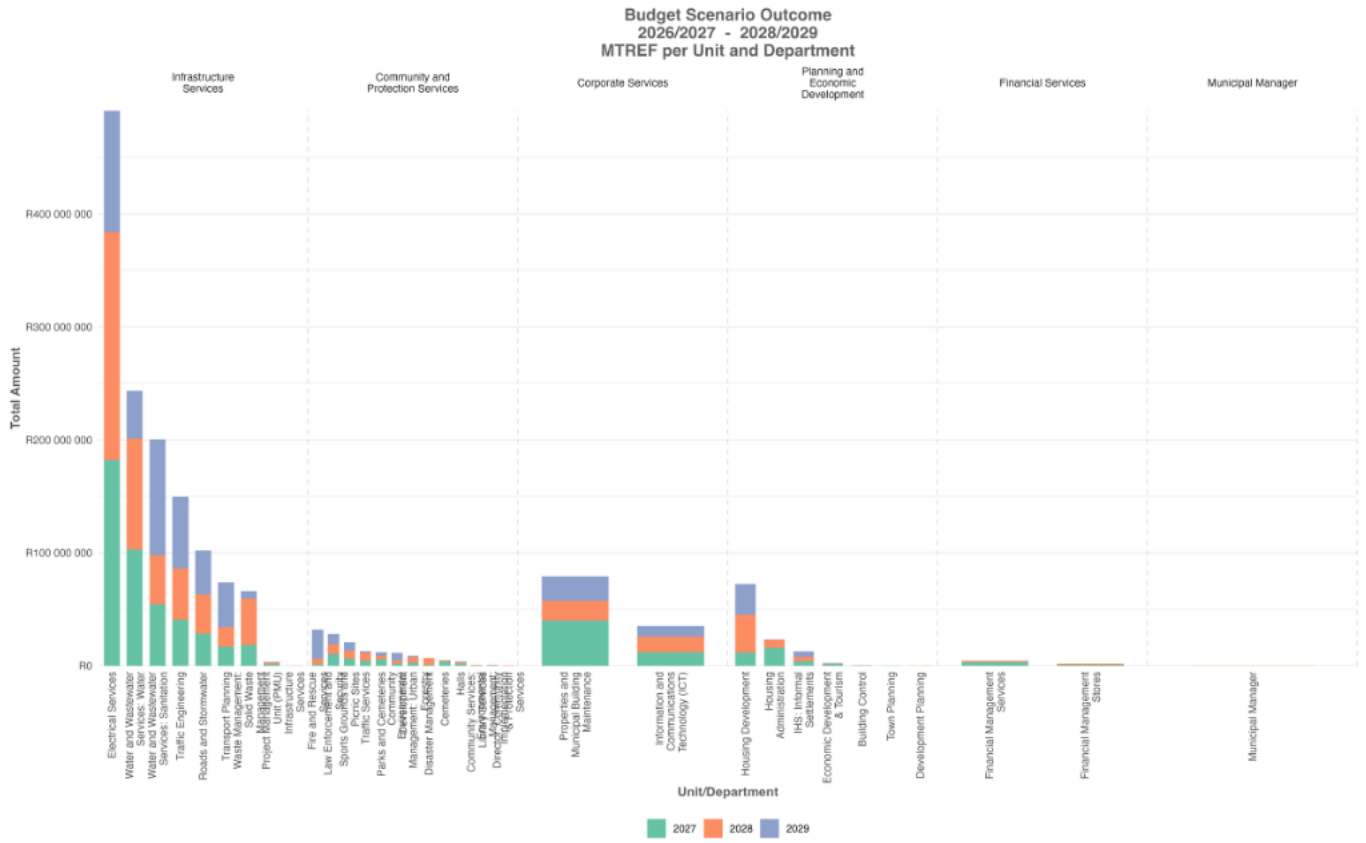

Table 4-2: MTREF Budget Scenario Results by Unit and Department

Unit and Department	2027	2028	2029	Total	Percentage	Total Number of Projects
Infrastructure Services	R 445 794 308	R 483 504 003	R 401 190 989.62	R 1 330 489 300.62	77.94%	154
- Electrical Services	R 181 890 364	R 201 930 909	R 107 472 511.62	R 491 293 784.62	28.78%	46
- Water and Wastewater Services: Water	R 103 076 130	R 98 200 000	R 42 000 000	R 243 276 130	14.25%	18
- Water and Wastewater Services: Sanitation	R 54 522 850	R 43 315 000	R 102 750 000	R 200 587 850	11.75%	18

Total	R 576 301 851	R 610 030 198.17	R 520 771 403.62	R 1 707 103 452.79	100%	266
Percentage	33.76%	35.73%	30.51%	100%		

The following observations can be noted from Figure 4-2 and Table 4-2:

The unit and department budget distribution demonstrates pronounced infrastructure dominance, with R1.31 billion (77.70%) allocated to Infrastructure Services across 153 projects within the MTREF period. The leading service delivery departments-Electrical Services (29.09%), Water and Wastewater Services: Water (14.40%), Water and Wastewater Services: Sanitation (11.88%), and Traffic Engineering (8.86%)-collectively command 64.23% of the MTREF, validating the municipality's strategic prioritisation of core service delivery infrastructure during the three-year planning horizon. Key observations are noted below:

- Infrastructure Services commands the largest share of the MTREF, receiving R1.31 billion (77.70%, 153 projects). Electrical Services leads with R491.29 million (29.09%, 46 projects), reflecting continued investment in electricity network stability, grid expansion, and distribution upgrades required to support residential growth and economic activity. Water infrastructure receives R243.28 million (14.40%, 18 projects), supporting distribution networks, reservoir capacity, and supply reliability. Sanitation infrastructure follows with R200.59 million (11.88%, 18 projects), addressing wastewater treatment capacity and reticulation upgrades. The strong concentration within these core services confirms the municipality's focus on maintaining essential infrastructure systems.
- Transport and mobility infrastructure remains a significant component of the MTREF. Traffic Engineering receives R149.64 million (8.86%, 19 projects) while Roads and Stormwater infrastructure receives R83.90 million (4.97%, 21 projects). Together these transport-related functions represent 13.83% of the MTREF, reinforcing the municipality's focus on improving urban mobility, maintaining road infrastructure, and supporting accessibility within key growth areas.
- Substantial departmental variation highlights broader municipal investment priorities beyond engineering infrastructure. Community and Protection Services receives R143.97 million (8.52%, 59 projects) reflecting investments in waste management, fire and rescue services, law enforcement, and community facilities. These projects contribute toward community safety, environmental management, and the provision of social infrastructure supporting quality of life across the municipality.
- Corporate Services and Planning and Economic Development receive moderate allocations supporting institutional and spatial development functions. Corporate Services receives R114.43 million (6.77%, 22 projects), primarily directed toward municipal property maintenance, operational buildings, and information technology systems. Planning and Economic Development receives R111.63 million (6.61%, 25 projects), with significant allocations to Housing Development (4.29%) and Transport Planning (4.37%), reflecting investments in spatial planning capacity and housing-related infrastructure supporting urban development.
- Several departments receive smaller allocations reflecting more specialised infrastructure programmes. Waste Management receives R66.19 million (3.92%), ICT receives R35.35 million (2.09%), Fire and Rescue Services receives R32.08 million (1.90%), and Law Enforcement receives

R28.27 million (1.67%). These investments contribute toward strengthening municipal operational capacity and service delivery systems.

- Administrative departments receive minimal capital allocations. Financial Services receives R6.40 million (0.38%, 5 projects) while the Municipal Manager portfolio receives R180 000 (0.01%), reflecting the largely operational nature of these functions where capital investment requirements remain limited.
- The strong concentration within Infrastructure Services reflects the municipality's core service delivery mandate. While Infrastructure Services accounts for 77.70% of the MTREF, supporting departments such as Community and Protection Services (8.52%), Corporate Services (6.77%), and Planning and Economic Development (6.61%) collectively represent 21.90% of the programme, demonstrating complementary investment in social infrastructure, institutional systems, and planning capacity.

The unit and department distribution therefore demonstrates a clear emphasis on engineering and service delivery infrastructure, with Electrical, Water, Sanitation, and Transport-related departments representing the majority of capital investment within the MTREF. While this concentration supports reliable service delivery and infrastructure capacity expansion, the presence of supporting investments in housing, community infrastructure, and institutional systems indicates a broader approach that balances core engineering programmes with complementary investments supporting spatial development and municipal operations.

4.2.3 MTREF Budget Scenario Results by Asset Type per Action

This section presents the MTREF budget scenario results categorised by asset type, using the Municipal Standard Chart of Accounts (mSCOA) asset type classification. This classification provides a standardised framework for categorising municipal infrastructure expenditure, ensuring consistency in financial reporting and alignment with regulatory requirements. Asset types include categories such as roads, water and sanitation, electricity, public facilities, and other infrastructure components that support service delivery.

Analysing planned capital expenditure by mSCOA asset type offers insight into how resources are allocated across different infrastructure sectors. It also helps in understanding whether expenditure is focused on new infrastructure development, asset renewal, or maintenance, reflecting the municipality’s strategic priorities. The results provide a comparative view of planned spending patterns, highlighting shifts in expenditure focus over the MTREF period.

As municipal priorities evolve and master planning processes are refined, these projections may be adjusted in future iterations of the Capital Expenditure Framework (CEF).

Figure 4-3: MTREF Budget Scenario Results by Asset Type per Action

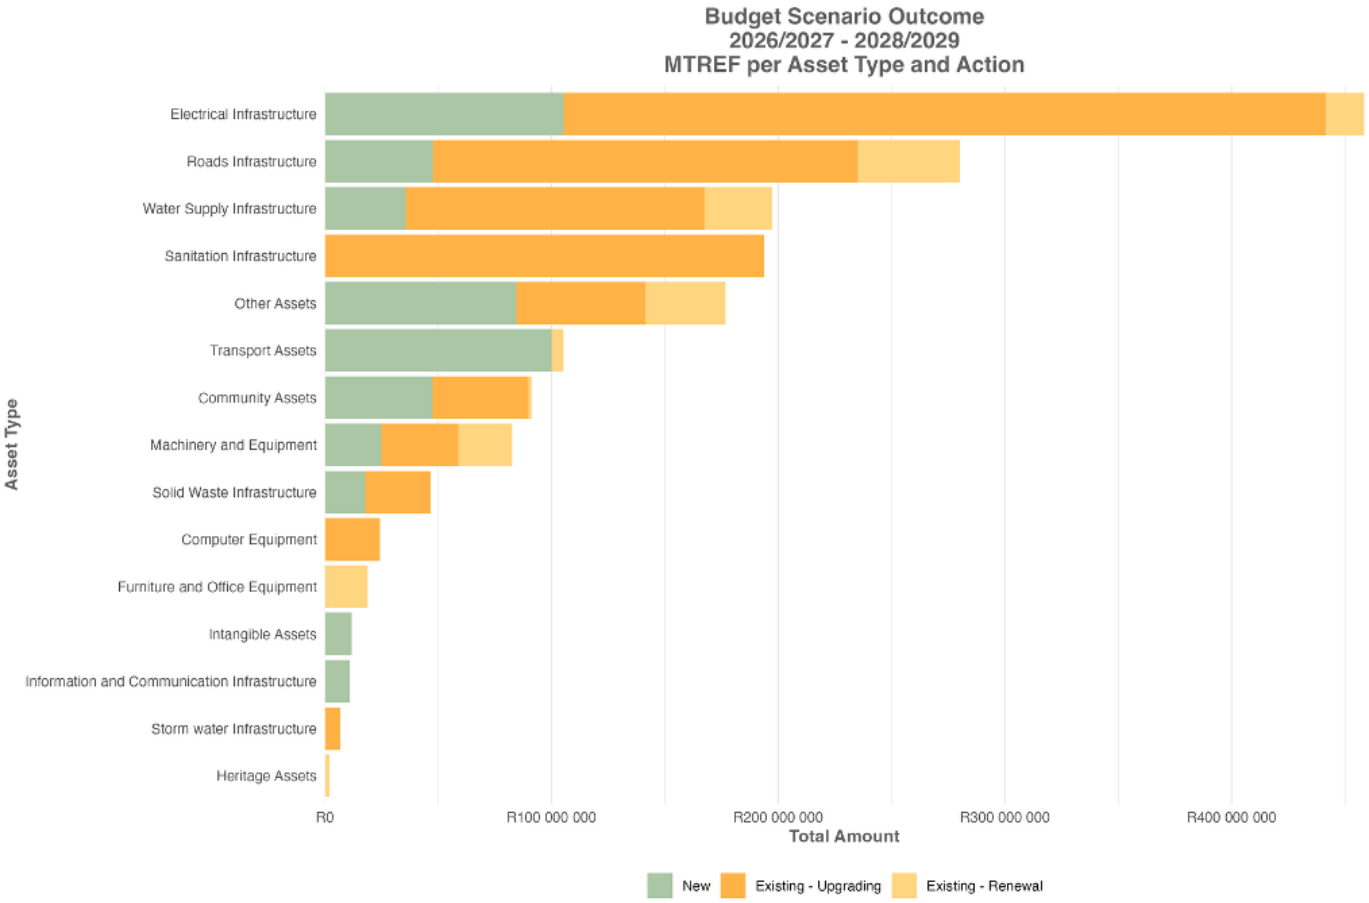

Table 4-3: MTREF Budget Scenario Results by Asset Type per Action

Asset Type	New	Existing - Upgrading	Existing - Renewal	Other	Total MTREF	Percentage
Electrical Infrastructure	R 105 308 418	R 336 188 951.02	R 17 015 300	R 0	R 458 512 669.02	26.86%
Roads Infrastructure	R 47 698 047	R 187 443 007	R 45 000 000	R 0	R 280 141 054	16.41%
Water Supply Infrastructure	R 35 724 628	R 131 640 632	R 30 000 000	R 0	R 197 365 260	11.56%
Sanitation Infrastructure	R 0	R 193 737 850	R 0	R 0	R 193 737 850	11.35%
Other Assets	R 84 576 956.17	R 56 943 913	R 35 200 000	R 0	R 176 720 869.17	10.35%
Transport Assets	R 100 150 000	R 0	R 5 000 000	R 0	R 105 150 000	6.16%
Community Assets	R 47 494 109	R 42 232 609	R 1 500 000	R 0	R 91 226 718	5.34%
Machinery and Equipment	R 24 769 565	R 34 229 831.09	R 23 554 667.50	R 0	R 82 554 063.59	4.84%
Solid Waste Infrastructure	R 17 841 917	R 28 800 000	R 0	R 0	R 46 641 917	2.73%
Computer Equipment	R 0	R 24 350 000	R 0	R 0	R 24 350 000	1.43%
Furniture and Office Equipment	R 431 000	R 0	R 18 467 617.01	R 0	R 18 898 617.01	1.11%
Intangible Assets	R 11 854 435	R 0	R 0	R 0	R 11 854 435	0.69%
Information and Communication Infrastructure	R 11 000 000	R 0	R 0	R 0	R 11 000 000	0.64%
Storm water Infrastructure	R 0	R 6 800 000	R 0	R 0	R 6 800 000	0.40%
Heritage Assets	R 0	R 0	R 2 150 000	R 0	R 2 150 000	0.13%
Total	R 486 849 075.17	R 1 042 366 793.11	R 177 887 584.51	R 0	R 1 707 103 452.79	100%
Percentage	28.52%	61.06%	10.42%	0%	100%	

The following observations can be noted from Figure 4-3 and Table 4-3:

The asset type and action distribution indicates that R486.85 million (28.82%) is allocated to new assets, R1.04 billion (61.71%) to upgrading, and R159.89 million (9.47%) to renewal across the R1.69 billion MTREF capital programme. This distribution demonstrates a continued emphasis on enhancing existing infrastructure systems while still accommodating targeted investment in new infrastructure required to support service delivery expansion and urban development. Sector-specific variations reveal distinct infrastructure investment priorities across electrical networks, roads, water supply, sanitation, and supporting municipal assets. Key observations are noted below:

- The MTREF capital programme demonstrates a strong emphasis on upgrading existing infrastructure. Upgrading accounts for 61.71% of total expenditure, reflecting the municipality's focus on strengthening infrastructure capacity, improving service reliability, and extending the operational lifespan of existing assets. New infrastructure represents 28.82% of the programme, while renewal accounts for 9.47%, indicating a continued but comparatively smaller emphasis on replacing ageing infrastructure components.
- Electrical Infrastructure commands the largest allocation within the MTREF, receiving R458.51 million (27.15%) of the capital programme. The majority of this investment is directed toward upgrading existing electrical networks (R336.19 million), with additional allocations for new infrastructure (R105.31 million) and renewal (R17.02 million). This distribution reflects significant investment in strengthening the electrical distribution network to support energy demand, improve network stability, and enhance system resilience.
- Roads Infrastructure represents the second-largest asset category, receiving R262.14 million (15.52%) across the planning horizon. This allocation is distributed across upgrading (R187.44 million), new construction (R47.70 million), and renewal (R27.00 million). The balanced distribution reflects continued investment in maintaining road infrastructure while accommodating targeted network expansion and rehabilitation.
- Water Supply Infrastructure receives R197.37 million (11.68%), comprising R131.64 million for upgrading, R35.72 million for new infrastructure, and R30.00 million for renewal. This distribution demonstrates a combination of distribution network upgrades, system expansion, and replacement of ageing water infrastructure components to maintain reliable water supply.
- Sanitation Infrastructure receives R193.74 million (11.47%), with the entire allocation directed toward upgrading existing wastewater infrastructure systems. The absence of new sanitation infrastructure or renewal allocations indicates a focus on expanding and improving the capacity of existing wastewater treatment and reticulation networks.
- Other Assets account for R176.72 million (10.46%), including housing development and operational municipal buildings. This category reflects investments supporting social infrastructure programmes and municipal operational facilities required to support service delivery.
- Transport Assets receive R105.15 million (6.23%), primarily directed toward new transport infrastructure development (R100.15 million) with a smaller allocation for renewal. Community Assets receive R91.23 million (5.40%), supporting recreational facilities and community infrastructure that contribute toward broader social development objectives.
- Supporting municipal assets represent smaller portions of the capital programme. Machinery and Equipment accounts for R82.55 million (4.89%), Solid Waste Infrastructure R46.64 million (2.76%), Computer Equipment R24.35 million (1.44%), and Furniture and Office Equipment R18.90 million (1.12%). These allocations support municipal operational capacity rather than forming part of core engineering infrastructure systems.

- Several infrastructure categories receive relatively small allocations, including Information and Communication Infrastructure (0.65%), Stormwater Infrastructure (0.40%), and Heritage Assets (0.13%). While these investments remain important for digital infrastructure development, environmental resilience, and heritage preservation, their limited scale suggests potential areas for strengthened investment in future capital planning cycles.
- The action distribution highlights a continued preference for enhancing existing infrastructure systems. With 61.71% of MTREF expenditure directed toward upgrading, the capital programme prioritises improving the performance and capacity of existing networks. Although renewal represents 9.47% of the programme, this proportion remains below commonly referenced industry benchmarks for mature infrastructure systems, indicating the need for continued monitoring of asset condition assessments and long-term replacement planning.

The MTREF asset distribution therefore demonstrates R486.85 million (28.82%) allocated to new infrastructure, R1.04 billion (61.71%) to upgrading existing assets, and R159.89 million (9.47%) to renewal. Electrical, roads, water supply, and sanitation infrastructure dominate investment priorities, reflecting the municipality's focus on strengthening core service delivery systems. While the strong emphasis on upgrading supports infrastructure reliability and operational efficiency, the relatively modest renewal allocation suggests the importance of continued monitoring of infrastructure lifecycle planning to ensure sustainable long-term asset management.

4.2.4 MTREF Budget Scenario Results by Asset Type per Functional Area

This section provides a detailed analysis of the MTREF budget scenario results by mSCOA asset type within each Functional Area (FA) of the municipality. Functional Areas represent geographically or operationally distinct zones within the municipality that guide infrastructure planning and service delivery. By integrating the mSCOA asset type classification with Functional Areas, this analysis offers a spatially contextualised view of planned capital expenditure, highlighting how financial resources are distributed across different regions and infrastructure categories.

This approach allows the municipality to assess how different asset types contribute to development within specific Functional Areas, ensuring that expenditure aligns with service delivery priorities and spatial transformation objectives. It provides a structured method to evaluate whether infrastructure spending is balanced across key urban, peri-urban, and rural zones, reinforcing a targeted approach to capital planning.

As infrastructure demands evolve and municipal strategies are refined, these expenditure projections may be adjusted to reflect changing priorities, master planning updates, and financial considerations.

Stellenbosch Local Municipality
Capital Expenditure Implementation Framework
MTREF Budget Scenario Outcome

NOVUS 3

The following observations can be noted from Figure 4-4 and

Table 4-4:

The asset type and spatial distribution reveals that R1.04 billion (61.55%) of the MTREF capital programme is concentrated within the Stellenbosch/Jamestown/De Zalze urban area, demonstrating continued prioritisation of the municipality's primary settlement node and economic centre. However, a substantial portion of the programme-R439.40 million (26.01%)-is classified as "No Intersect", indicating that a significant share of projects remains spatially unassigned or represents network-level infrastructure serving the broader municipal area. Key observations are noted below:

- Stellenbosch/Jamestown/De Zalze represents the dominant spatial focus of MTREF capital investment, receiving R1.04 billion (61.55%) of the programme. The asset composition reflects a diverse infrastructure portfolio including Electrical Infrastructure (R205.61 million), Roads Infrastructure (R192.44 million), Water Supply Infrastructure (R160.64 million), Other Assets (R132.74 million), and Transport Assets (R97.15 million). This distribution reflects comprehensive infrastructure investment supporting the municipality's principal urban node, aligning with spatial development strategies that prioritise infrastructure consolidation within established settlement areas.
- The "No Intersect" category accounts for R439.40 million (26.01%) of the MTREF programme, representing projects that either operate across multiple geographic areas or lack precise spatial intersection within available spatial datasets. Major asset categories within this group include Electrical Infrastructure (R190.40 million), Sanitation Infrastructure (R71.77 million), Roads Infrastructure (R65.70 million), Community Assets (R29.52 million), and Water Supply Infrastructure (R34.99 million). The scale of this category suggests that many projects represent municipality-wide infrastructure upgrades or network-level interventions.
- Administrative Headquarters accounts for R70.17 million (4.15%) of the MTREF programme, primarily associated with institutional and operational infrastructure such as Computer Equipment (R24.35 million), Furniture and Office Equipment (R16.17 million), Information and Communication Infrastructure (R11.00 million), and Machinery and Equipment (R8.00 million). These investments support municipal administrative capacity and operational efficiency rather than direct service delivery infrastructure.
- A smaller portion of the programme remains spatially undefined, with R62.50 million (3.70%) classified as "Not Mapped." This allocation consists entirely of Electrical Infrastructure projects where spatial coordinates or final project locations have not yet been captured within the spatial dataset.
- Secondary settlements receive comparatively modest allocations during the MTREF period. Pniel Johannesdal receives R40.50 million (2.40%), primarily associated with sanitation infrastructure improvements. Klapmuts receives R21.24 million (1.26%), largely directed toward Solid Waste Infrastructure (R9.14 million) and Community Assets (R11.10 million). La Motte receives R8.30 million (0.49%), primarily within solid waste infrastructure, while Franschhoek receives R6.24 million (0.37%). Wemmershoek and Vlottenburg receive minimal allocations of R1.00 million (0.06%) and R50 000 respectively, reflecting small-scale infrastructure interventions.
- The distribution across asset categories reinforces the municipality's focus on core infrastructure systems. Electrical Infrastructure remains the largest category at 27.15%, followed by Roads Infrastructure (15.52%), Water Supply Infrastructure (11.68%), Sanitation Infrastructure (11.47%), and Other Assets (10.46%). These categories collectively represent the majority of MTREF expenditure and highlight the municipality's focus on strengthening core engineering infrastructure networks.

The MTREF spatial distribution therefore demonstrates strong prioritisation of the Stellenbosch/Jamestown/De Zalze urban core, where 61.55% of capital investment is concentrated,

reinforcing the municipality's settlement hierarchy and infrastructure consolidation strategy. At the same time, the substantial 26.01% "No Intersect" allocation highlights the importance of strengthening spatial data capture and project geolocation in future capital planning cycles. Improved spatial referencing would enhance the municipality's ability to fully align infrastructure investment with spatial planning objectives and support more precise monitoring of geographic investment patterns.

4.2.5 MTREF Budget Scenario Outcome by Asset Type and Priority Development Area

This section presents the MTREF budget scenario results categorised by mSCOA asset type within Priority Development Areas (PDAs). Priority Development Areas are identified in the municipality's Spatial Development Framework (SDF) as key locations for targeted infrastructure expenditure to drive spatial transformation, improve service delivery, and support sustainable urban growth. By analysing the planned capital expenditure within these designated areas, the municipality ensures that infrastructure expenditure aligns with long-term spatial planning objectives and contributes to equitable development.

The results provide a structured view of how different asset types are prioritised within PDAs, offering insights into whether planned expenditure supports strategic infrastructure interventions, addresses service backlogs, and enhances connectivity and accessibility in key development zones. This analysis also enables the municipality to evaluate whether planned expenditure patterns align with the SDF's spatial vision, ensuring that infrastructure spending is directed toward areas with the highest impact on urban integration and economic development.

Given the evolving nature of spatial planning, expenditure projections within PDAs may be refined over time to accommodate changing priorities, updated master planning inputs, and financial considerations.

Figure 4-6: MTREF Budget Scenario Outcome by Asset Type and Priority Development Area

Information and Communication Infrastructure	R 0	R 0	R 0
Storm water Infrastructure	R 0	R 0	R 6 800 000
Heritage Assets	R 0	R 0	R 0
Total	R 376 624 312	R 49 850 000	R 1 147 959 141
Percentage	22.06%	2.92%	67.25%

The following observations can be noted from Figure 4-6 and Table 4-5:

The asset type and Priority Development Area (PDA) distribution demonstrate that R1.13 billion (66.90%) of the MTREF capital programme is allocated to Urban Nodes, while R376.62 million (22.30%) is directed toward Farm areas. Together these two spatial categories account for 89.20% of the total MTREF allocation, confirming strong spatial concentration of infrastructure investment within the municipality's primary development areas and economic landscape. Key observations are noted below:

- Urban Nodes command the dominant share of MTREF investment, receiving R1.13 billion (66.90%) of the programme. The asset composition within Urban Nodes reflects substantial investment across core engineering infrastructure systems including Electrical Infrastructure (R205.61 million), Roads Infrastructure (R193.44 million), Water Supply Infrastructure (R162.38 million), and Sanitation Infrastructure (R143.19 million). Additional allocations include Transport Assets (R97.15 million), Machinery and Equipment (R74.55 million), and Community Assets (R59.41 million). This broad asset distribution confirms that the majority of infrastructure investment supports the municipality's primary urban settlements and aligns with spatial strategies promoting compact urban development and infrastructure consolidation.
- Farm areas represent the second-largest spatial investment category, receiving R376.62 million (22.30%) over the MTREF period. The asset distribution within this category includes Electrical

Infrastructure (R190.40 million), Roads Infrastructure (R65.70 million), Other Assets (R41.98 million), Community Assets (R29.52 million), and Water Supply Infrastructure (R34.99 million). These investments support infrastructure servicing agricultural activities, wine estate developments, and tourism-related infrastructure across the municipality's rural economic landscape.

- Rural Nodes receive a comparatively small allocation of R49.85 million (2.95%), primarily associated with Sanitation Infrastructure (R41.55 million) and Solid Waste Infrastructure (R6.00 million). The relatively modest allocation reflects limited infrastructure expansion within smaller rural settlements, consistent with spatial planning strategies that seek to limit costly infrastructure extension into dispersed areas while focusing investment within established settlement nodes.
- Administrative Headquarters accounts for R70.17 million (4.15%) of the MTREF capital programme, supporting institutional and operational infrastructure. Major asset categories within this allocation include Computer Equipment (R24.35 million), Furniture and Office Equipment (R16.17 million), Information and Communication Infrastructure (R11.00 million), and Machinery and Equipment (R8.00 million). These investments strengthen municipal operational capacity and administrative systems.
- A portion of the programme remains spatially undefined, with R62.50 million (3.70%) classified as "Not Mapped." This category consists entirely of Electrical Infrastructure projects, indicating that some network-level or preliminary projects have not yet been assigned precise spatial coordinates within the planning dataset.
- The distribution across asset types continues to emphasise core infrastructure investment. Electrical Infrastructure dominates at R458.51 million (27.15%), followed by Roads Infrastructure (15.52%), Water Supply Infrastructure (11.68%), Sanitation Infrastructure (11.47%), and Other Assets (10.46%). These five categories collectively represent the majority of MTREF capital expenditure, reflecting the municipality's focus on strengthening core service delivery infrastructure systems.
- Several infrastructure categories receive comparatively modest allocations, including Solid Waste Infrastructure (2.76%), Computer Equipment (1.44%), Furniture and Office Equipment (1.12%), Information and Communication Infrastructure (0.65%), Stormwater Infrastructure (0.40%), and Heritage Assets (0.13%). These limited allocations suggest potential areas for strengthened investment in future planning cycles, particularly with regard to environmental resilience, digital infrastructure, and heritage asset management.

The MTREF PDA distribution therefore demonstrates strong spatial alignment with the municipality's settlement hierarchy, with Urban Nodes receiving 66.90% of investment, followed by Farm areas at 22.30%, and Rural Nodes at 2.95%. This distribution confirms a clear emphasis on strengthening infrastructure within established urban areas while supporting the municipality's agricultural economy. The relatively limited allocation to dispersed rural settlements reinforces the municipality's spatial transformation objectives aimed at promoting compact development, infrastructure efficiency, and sustainable service delivery.

4.2.6 MTREF Budget Scenario Outcome compared to historic MTREF Trend

To assess how the current MTREF budget scenario results align with past expenditure patterns, this section compares the scenario outcomes with historic MTREF trends based on previous Original Budget (ORGB) submissions to National Treasury. By analysing past capital expenditure trends, the municipality can identify patterns, shifts in priorities, and potential deviations from previous planning assumptions.

Comparing the current scenario results with historic trends provides insights into whether planned expenditure aligns with long-term municipal objectives, remains within expected affordability constraints,

and reflects consistent strategic priorities. This analysis also helps to evaluate the municipality's ability to sustain infrastructure planned expenditure levels over time, ensuring that financial planning remains realistic, adaptable, and responsive to evolving development needs.

Furthermore, this comparison may highlight whether certain infrastructure categories or spatial priorities have seen increasing or decreasing emphasis over successive budget cycles. Such insights can inform future iterations of the Capital Expenditure Framework (CEF), ensuring that expenditure remains strategically focused and aligned with both municipal goals and regulatory requirements.

Total	R 1 399 226 987	R 1 270 137 327	R 1 172 008 826	R 1 276 546 044	R 1 596 951 304	R 1 747 866 972	R 1 808 410 091		R 1 689 103 453

The following observations can be noted from Figure 4-7 and Table 4-6:

The historical MTREF trend demonstrates capital expenditure growth from R1.27 billion (2019/20) to R1.81 billion (2024/25), representing an increase of approximately 42.4% over six budget cycles. The new MTREF scenario totals R1.69 billion, reflecting a moderate reduction of approximately 6.6% compared with the most recent MTREF total, and indicating closer alignment with the affordability parameters established through the Long-Term Financial Model (LTFM). The revised scenario also reflects a relatively balanced distribution across the three-year planning horizon rather than pronounced front-loading. Key observations are noted below:

- Historical MTREF totals demonstrate overall growth over time, increasing from R1.27 billion in the 2019/20 MTREF cycle to R1.81 billion in the 2024/25 MTREF cycle. This expansion occurred despite noticeable fluctuations between planning cycles. For example, the MTREF total declined from R1.27 billion to R1.17 billion between the 2019/20 and 2020/21 cycles, before recovering to R1.60 billion in the 2022/23 MTREF and continuing to increase to R1.75 billion (2023/24) and R1.81 billion (2024/25). These variations reflect changing economic conditions, adjustments to grant funding allocations, and periodic reprioritisation of municipal infrastructure programmes.
- The new MTREF scenario totals R1.69 billion, representing a moderate decrease relative to the most recent MTREF cycle. This reduction reflects the application of the affordability envelope derived from the LTFM and indicates a shift toward more controlled and financially sustainable capital programming. While the scenario remains broadly comparable to recent historical investment levels, it demonstrates a deliberate effort to ensure that capital expenditure remains aligned with long-term fiscal capacity.
- Annual allocations within the new MTREF scenario demonstrate a balanced expenditure profile. Capital allocations amount to R571.30 million in 2026/27, R605.03 million in 2027/28, and R512.77 million in 2028/29, producing a relatively even distribution across the three-year planning horizon. This balanced allocation contrasts with earlier MTREF patterns where Year-1 allocations frequently dominated the three-year envelope. The more even distribution supports improved project scheduling and reduces implementation pressure on the first year of the capital programme.
- The gradual expansion of MTREF totals over successive cycles reflects the municipality's continued investment in infrastructure development. Increasing capital allocations over time have supported infrastructure expansion, improved service delivery capacity, and maintenance of existing infrastructure networks. The moderation observed in the new scenario suggests a transition toward more disciplined capital planning while maintaining the municipality's infrastructure investment trajectory.
- Maintaining sustainable capital investment levels requires careful consideration of operational affordability. Each capital investment introduces ongoing operational and maintenance obligations that must be accommodated within the municipal operating budget. The R1.69 billion MTREF scenario remains broadly consistent with recent historical capital investment levels, suggesting that the municipality can sustain infrastructure investment without imposing excessive long-term fiscal pressure.

- The historical variation between MTREF cycles highlights the importance of adaptive planning processes. External factors such as macroeconomic conditions, national fiscal transfers, and evolving infrastructure priorities can significantly influence capital investment levels. Continuous monitoring of capital expenditure performance, together with regular updates to the LTFM and Capital Expenditure Framework (CEF), will therefore remain essential to ensure that infrastructure investment remains aligned with municipal financial sustainability.

The historical MTREF analysis therefore demonstrates steady long-term growth in capital investment, increasing from R1.27 billion in the 2019/20 MTREF cycle to R1.81 billion in the 2024/25 cycle, with the new R1.69 billion MTREF scenario reflecting moderate adjustment aligned with fiscal affordability constraints. The balanced distribution across the three-year planning horizon supports improved implementation stability and reinforces the municipality's commitment to sustainable, long-term infrastructure development.

4.3 Concluding remarks

The MTREF budget scenario demonstrates strategic capital programming totalling R1.93 billion across 2026/27-2028/29, representing moderate 6.6% growth compared to the most recent historical MTREF, validating alignment with the Long-Term Financial Model (LTFM) affordability parameters. The temporal distribution shows a balanced allocation across the three-year period, with R664.98 million (34.50%) in 2026/27, R645.35 million (33.48%) in 2027/28, and R617.25 million (32.02%) in 2028/29, reflecting stable capital programming rather than pronounced front-loading. Infrastructure Services dominance (83.56%, R1.61 billion) with Electrical (31.58%), Sanitation (15.50%), and Water (13.69%) collectively commanding 60.77% validates strong prioritisation of essential service delivery infrastructure.

The mSCOA action distribution demonstrates a strong emphasis on upgrading existing assets (65.16%), whilst new infrastructure accounts for 25.62% and renewal represents 9.22% of the MTREF. This pattern reflects a strategic focus on strengthening existing infrastructure capacity, although the renewal proportion remains below the 15-25% industry benchmark, suggesting the need to monitor long-term asset replacement planning. Spatial analyses demonstrate strong concentration within priority development areas, with Urban Nodes commanding 73.81% of investment, followed by Farm areas (20.52%) and Rural Nodes (3.66%), confirming alignment with the municipality's settlement hierarchy and compact development strategy.

The MTREF asset distribution demonstrates continued prioritisation of core engineering infrastructure, with Electrical Infrastructure (28.48%), Roads Infrastructure (17.41%), Sanitation Infrastructure (15.64%), and Water Supply Infrastructure (11.22%) dominating capital expenditure. However, relatively small allocations remain within Stormwater Infrastructure (0.40%), ICT Infrastructure (0.16%), and Heritage Assets (0.11%), suggesting opportunities to strengthen investment in climate resilience, digital infrastructure, and specialised municipal assets in future planning cycles.

The historical comparison confirms continued growth in capital investment from R1.27 billion in the 2019/20 MTREF to R1.81 billion in the 2024/25 MTREF, with the new R1.93 billion MTREF scenario representing moderate and financially sustainable expansion. The balanced distribution across the three-year planning horizon indicates improved capital programming stability compared with historical fluctuations between MTREF cycles.

The MTREF's adaptive framework enables continuous refinement; however, several strategic considerations remain important for future capital planning:

- Monitoring the 9.22% renewal allocation against asset condition assessments to ensure adequate long-term infrastructure replacement;
- Strengthening investment in stormwater management, digital infrastructure, and climate-resilient systems;
- Maintaining balanced infrastructure investment alongside social and institutional infrastructure programmes; and
- Continuously refining spatial data and project preparation to ensure precise alignment between capital investment and spatial development priorities.

The MTREF, therefore, represents credible three-year capital programming balancing infrastructure delivery priorities with fiscal sustainability. The structured prioritisation framework, LTFM alignment, and strong spatial targeting demonstrate a maturing municipal capital planning system. Continued monitoring and refinement will ensure that capital investment supports Stellenbosch's spatial transformation objectives, infrastructure resilience, and long-term sustainable development outcomes.

Collaborator No:
IDP KPA Ref No: *Good Governance & Compliance*
Meeting Date: 27 May 2026

1. SUBJECT: APPROVAL AND ADOPTION OF THE WATER SERVICES DEVELOPMENT PLAN 2025-2027

2. PURPOSE

For Council to approve the proposed Water Service Development Plan 2025-2027 of the Municipality after the public participation process has concluded.

3. DELEGATED AUTHORITY

Council.

4. EXECUTIVE SUMMARY

The current Municipal Water Services Development Plan (WSDP) must be updated every five years as directed by the Water Services Act (Act 108 of 1997) and regulations relating to the compulsory "National Standard Measures to Conserve Water".

The Water Services Development Plan contains provisions in support of basic human services, replacement and upgrading of old infrastructure, cleaned piped water, sanitation services and procedures relating to service connections to consumers, services specifications, compliance regulations and obligation matters relating to the Municipality's constitutional obligation to effective service delivery, as well as to all relevant legislation.

The WSDP 2025-2027 ends with the current IDP cycle in 2027 and proposes to regulate all activities, infrastructure and entities associated with potable water, wastewater generation, and the disposal of sewerage effluent by all types of consumers. The proposed plan is in congruence with existing policies (eg, Credit Control Policy. etc.).

We confirm that the WSDP 2025-2027 was made available for a period of 21 days to the public for comment, and we confirm that no comments nor objections were received during this period. The plan is thus tabled for adoption by Council.

5. RECOMMENDATIONS

(a) that the content of this report be noted.

(b) that Council notes that the WSDP was public participated for the required period of 21 days and that no comments or objections were received from the Public.

(c) that Council therefore approves and formally adopts the Water Services Development Plan (2025-2027).

6. DISCUSSION / CONTENTS

6.1. Background

The Water Services Act (No. 108 of 1997) -Section 12-15 places a duty on all Water Service Providers and Authorities to prepare a Water Services Development Plan for its area of jurisdiction. This plan must be developed every five years. The Stellenbosch Municipality is an authorised service authority and as such must adhere to the relevant sections of the Water Services Act (No. 108 of 1997).

A period of 21 days for public comment has been completed and no comments were received.

6.2 Discussion

This WSDP (2025-2027) addresses the following:

- The responsible municipal personnel as well as the approach in adopting the Water Services Development Plan.
- The population figures, households formal and informal.
- Summarizing of basic services and housing backlogs.
- The provision of basic services and the impact this has had on the social well-being of the communities, as social well-being is considered as important as economic well-being in improving livelihoods.
- Focuses on the health and employment situations of the Stellenbosch Municipality.
- The document gives an overview of the Existing Infrastructure for instance — Water Sources, Pipelines, Pumpstations and Reservoirs.
- Where water quality is tested on a regular basis, as well as the physical condition of the pumps and pumpstations.
- Dam Safety Reports and the recording of the abstraction of water. It also looks into the physical condition of all treatment facilities.

Legislative procedures:

The current, Water Services Development Plan (WSDP) must be updated every five years as directed by the Water Services Act. (act 108 of 1997) and regulations relating to the compulsory “National Standard Measures to Conserve Water” .

6.3 Financial Implications

The WSDP financial implications are included into the Capital Expenditure Framework and MTREF budget of the Municipality.

6.4 Legal Implications

The recommendations in this report comply with Council’s policies and all applicable legislation.

6.8.2 ***Director: Planning and Economic Development***

Supported, subject to the Chief Financial Officer's approval should any projects arising from this Water Services Development Plan not be included in the approved budget.

6.8.3 ***Director: Community and Protection Services:***

No comment.

6.8.4 ***Acting Director: Corporate Services:***

No comment.

6.8.6 ***Chief Financial Officer:***

Supports the recommendations.

6.8.7 ***Acting Municipal Manager:***

Supported, subject to the Chief Financial Officer's approval should any projects arising from this Water Services Development Plan not be included in the approved budget.

WTW	Water Treatment Works
WULA	Water Use License Application
W_2RAP	Waste Water Risk Abatement Plan
WWTP	Waste Water Treatment Plant
WWTW	Waste Water Treatment Works

KEY TERMS AND INTERPRETATIONS

Climate Change	Changes in climatic conditions due to natural causes or to anthropogenic (man-made) effects such as emissions of greenhouse gases, e.g. carbon dioxide, nitrous oxide, and methane, from industry, transport, farming and deforestation, which are expected to have significant consequences for rainfall and water availability on earth.
Current replacement cost (CRC)	The cost of replacing the service potential of an existing asset, by reference to some measure of capacity, with an appropriate modern equivalent asset. GAMAP defines CRC as the cost the entity would incur to acquire the asset on the reporting date.
Depreciated Replacement Cost (DRC)	The replacement cost of an existing asset after deducting an allowance for wear or consumption to reflect the remaining economic life of the existing asset.
Financial Year	Financial year means in relation to- • a national or provincial department, the year ending 31 March; or • a municipality, the year ending 30 June.
Global Warming	The increase in the average surface temperatures across the globe, usually measured over long periods of time; reported to have increased by 1°C over the past hundred years.
Integrated Development Plan (IDP)	An IDP is a legislative requirement for municipalities, which identifies the municipality's key development priorities; formulates a clear vision, mission and values; formulates appropriate strategies; shows the appropriate organisational structure and systems to realise the vision and the mission and aligns resources with the development priorities.
National Water Resource Strategy 2	Sets out how we will achieve the following core objectives: • Water supports development and the elimination of poverty and inequality. • Water contributes to the economy and job creation, and • Water is protected, used, developed, conserved, managed and controlled sustainably and equitably.
International Water Association (IWA) Water Balance	
System Input Volume	The volume of treated water input to that part of the water supply system to which the water balance calculation relates.
Authorised Consumption	The volume of metered and/or un-metered water taken by registered customers, the water supplier and others who are implicitly or explicitly authorised to do so by the water supplier, for residential, commercial and industrial purposes. It also includes water exported across operational boundaries. Authorised consumption may include items such as fire-fighting and training, flushing of mains and sewers, street cleaning, watering of municipal gardens, public fountains, frost protection, building water, etc. These may be billed or unbilled, metered or unmetered.
Water Losses	The difference between System Input and Authorised Consumption. Water losses can be considered as a total volume for the whole system, or for partial systems such as transmission or distribution schemes, or individual zones. Water Losses consist of Physical Losses and Commercial Losses (also known as Real Losses and Apparent Losses).
Billed Authorised Consumption	Those components of Authorised Consumption which are billed and produce revenue (also known as Revenue Water). Equal to Billed Metered Consumption plus Billed Unmetered Consumption.
Unbilled Authorised Consumption	Those components of Authorised Consumption which are legitimate but not billed and therefore do not produce revenue. Equal to Unbilled Metered Consumption plus Unbilled Unmetered Consumption.
Commercial Losses	Includes all types of inaccuracies associated with customer metering as well as data handling errors (meter reading and billing), plus unauthorised consumption (theft or illegal use). Commercial losses are called "Apparent Losses" by the International Water Association and in some countries the misleading term "Non-Technical Losses" is used.

KEY TERMS AND INTERPRETATIONS

Physical Losses	Physical water losses from the pressurized system and the utility's storage tanks, up to the point of customer use. In metered systems this is the customer meter, in unmetered situations this is the first point of use (stop tap/tap) within the property. Physical losses are called "Real Losses" by the International Water Association and in some countries the misleading term "Technical Losses" is used.
Billed Metered Consumption	All metered consumption which is also billed. This includes all groups of customers such as domestic, commercial, industrial or institutional and also includes water transferred across operational boundaries (water exported) which is metered and billed.
Billed Unmetered Consumption	All billed consumption which is calculated based on estimates or norms but is not metered. This might be a very small component in fully metered systems (for example billing based on estimates for the period a customer meter is out of order) but can be the key consumption component in systems without universal metering. This component might also include water transferred across operational boundaries (water exported) which is unmetered but billed.
Unbilled Metered Consumption	Metered Consumption which is for any reason unbilled. This might for example include metered consumption by the utility itself or water provided to institutions free of charge, including water transferred across operational boundaries (water exported) which is metered but unbilled.
Unbilled Unmetered Consumption	Any kind of Authorised Consumption which is neither billed nor metered. This component typically includes items such as fire-fighting, flushing of mains and sewers, street cleaning, frost protection, etc. In a well-run utility it is a small component which is very often substantially overestimated. Theoretically this might also include water transferred across operational boundaries (water exported) which is unmetered and unbilled – although this is an unlikely case.
Unauthorised Consumption	Any unauthorised use of water. This may include illegal water withdrawal from hydrants (for example for construction purposes), illegal connections, bypasses to consumption meters or meter tampering.
Customer Metering Inaccuracies and Data Handling Errors	Commercial water losses caused by customer meter inaccuracies and data handling errors in the meter reading and billing system.
Leakage on Transmission and /or Distribution Mains	Water lost from leaks and breaks on transmission and distribution pipelines. These might either be small leaks which are still unreported (e.g. leaking joints) or large bursts which were reported and repaired but did obviously leak for a certain period before that.
Leakage and Overflows at Utility's Storage Tanks	Water lost from leaking storage tank structures or overflows of such tanks caused by e.g. operational or technical problems.
Leakage on Service Connections up to point of Customer Metering	Water lost from leaks and breaks of service connections from (and including) the tapping point until the point of customer use. In metered systems this is the customer meter, in unmetered situations this is the first point of use (stop tap/tap) within the property. Leakage on service connections might be reported breaks but will predominately be small leaks which do not surface and which run for long periods (often years).
Revenue Water	Those components of Authorised Consumption which are billed and produce revenue (also known as Billed Authorised Consumption). Equal to Billed Metered Consumption plus Billed Unmetered Consumption.
Non-Revenue Water	Those components of System Input which are not billed and do not produce revenue. Equal to Unbilled Authorised Consumption plus Physical and Commercial Water Losses.
Remaining useful life (RUL)	The time remaining over which an asset is expected to be used.
Re-use	Utilisation of treated or untreated wastewater for a process other than the one that generated it. For instance, the re-use of municipal wastewater for agricultural irrigation. Water re-use can be direct or indirect, intentional or unintentional, planned or unplanned, local, regional or national in terms of location, scale and significance. Water re-use may involve various kinds of treatment (or not) and the reclaimed water may be used for a variety of purposes.
Service Delivery Budget Implementation Plan (SDBIP)	The SDBIP is a management, implementation and monitoring tool that enable the City Manager to monitor the performance of senior managers, the Mayor to monitor the performance of the City Manager, and for the community to monitor the performance of the municipality.
Strategic Framework for Water Services	The Strategic Framework provides a comprehensive summary of policy with respect to the water services sector in South Africa and sets out a strategic framework for its implementation over the next ten years.
Water Conservation	The minimisation of loss or waste, the care and protection of water resources and the efficient and effective use of water.
Water Demand Management	The adaptation and implementation of a strategy by a water institution or consumer to influence the water demand and usage of water in order to meet any of the following objectives: economic efficiency, social development, social equity, environmental protection, sustainability of water supply and services, and political acceptability.

KEY TERMS AND INTERPRETATIONS

Water Services Authority (WSA)	A water services authority means a municipality with the executive authority and the right to administer water services as authorised in terms of the Municipal Structures Act, 1998 (Act No.117 of 1998). There can only be one water services authority in any specific area. Water services authority area boundaries cannot overlap. Water services authorities are metropolitan municipalities, district municipalities and authorised local municipalities.
Water Services Development Plan (WSDP)	A plan to be developed and adopted by the WSA in terms of the Water Services Act, 1997 (Act No.108 of 1997)
WSDP Guide Framework	Modular tool which has been developed by the DWS to support WSAs in complying to the Water Services Act with respect to Water Services Development Planning and which is also used by the DWS to regulate such compliance.
Water Services Provider (WSP)	A WSP means any person or institution that provides water services to consumers or to another water services institution, but does not include a water services intermediary.

WSDP EXECUTIVE SUMMARY

Introduction

Every WSA has a duty to progressively ensure efficient, affordable, economical and sustainable access to water services to all customers or potential customers in its area of jurisdiction, in order to promote sustainable livelihoods and economic development.

Sections 12 and 13 of the Water Services Act (Act No 108 of 1997) place a duty on WSAs to prepare and maintain a WSDP, as part of the process of preparing an IDP. The DWS has developed a new set of WSDP guidelines to assist WSAs with the WSDP process and to provide a framework for the capturing of the data. The topics included in the guidelines and addressed in detail in Stellenbosch Municipality's WSDP are as follows:

- Settlements and Demographics
- Service Levels
- Water Services Infrastructure Management (Infrastructure)
- Water Services Infrastructure Management (O&M)
- Conservation and Demand Management
- Water Resources
- Financial
- Institutional Arrangements and Customer Care

The primary instrument of planning in the water services sector is the WSDP. The following principles apply to the WSDP:

- All WSAs must develop a WSDP.
- A new plan must be developed every five years and the plan should be updated as necessary and appropriate in the interim years.
- The WSDP must be integrated with the IDP of the municipality, as required in terms of the Municipal Systems Act.
- The WSDP must integrate water supply planning with sanitation planning.
- The WSDP must integrate technical planning with social, institutional, financial and environmental planning. The planning of capital expenditures must also be integrated with the associated operation and maintenance requirements and expenditures.
- The WSDP must be informed by the business plans developed by water services providers and with the plans of any regional water services providers, as relevant.
- The plan must take into account the impact of HIV/Aids on future water demand.
- The WSDP must integrate with the catchment management strategy.
- The planning process must take into account the views of all important stakeholders, including communities, through a consultative and participatory process. Every effort must be made to ensure the adequate and meaningful participation of women in consultation forums.
- The draft plan must be made available for public and stakeholder comment and all comments made must be considered when preparing the final plan.
- The contents of the WSDP must be communicated to all important stakeholders, including the DWS.

- A WSA must report annually and in a public way on progress in implementing the plan (Annual WSDP Performance- and Water Services Audit Report).

The purpose of this report is to provide relevant and summarised WSDP inputs for incorporation into Stellenbosch Municipality's IDP process and is structured as follows:

Section A: Status Quo Overview: Provides a summarised overview of the water services status quo in terms of the water services functional business elements as aligned to the WSDP framework.

Section B: State of Water Services Planning: Presents the status of- and references the water services planning within Stellenbosch Municipality.

Section C: Water Services Existing Needs Perspective: Gives an overview of Stellenbosch Municipality's assessment and interpretation of its water services, with specific focus on problem definition statements.

Section D: Water Services Objectives and Strategies: Outlines the 5-year water services objectives and strategies as developed through the WSDP process for incorporation in terms of the IDP and aligned to the water services functional business elements.

Section E: Water Services MTEF Projects: The agreed water services projects for the medium-term expenditure framework and inclusive of funding sources.

Section F: WSDP Projects: Presents the projects identified during the WSDP process in order to meet the water services strategies of Stellenbosch Municipality, as aligned to the outflow from the situation analysis per water services business element.

SECTION A: STATUS QUO OVERVIEW

Stellenbosch Municipality is situated within the Breede-Olifants Water Management Area (WMA) and is located within the Cape Winelands District of the Western Cape Province, in which the following local municipalities are also located:

- Drakenstein Municipality;
- Witzenberg Municipality;
- Breede Valley Municipality and
- Langeberg Municipality.

Stellenbosch Municipality consists of 22 individual wards and is the only WSA within the Stellenbosch Municipality's Management Area. The Municipality is also the Water Services Provider (WSP). Stellenbosch Municipality's responsibility as WSA also extends to the rural areas within its boundary, which prior to July 2003 had fallen under the jurisdiction of the former Boland District Municipality. Stellenbosch Municipality's Management Area includes the following towns and ***Water Distribution Systems***.

- The large town of Stellenbosch (including Kayamandi) – ***Stellenbosch System***

  Stellenbosch mainly relies on its own water supply from the Eerste River in the Jonkershoek Valley which is treated at the Idas Valley WTW. During summer when shortfalls occur, water is drawn from the WCWSS, obtained from the Theewaterskloof Dam and treated at Paradyskloof WTW.

- Franschhoek, Groendal, La Motte, Wemmershoek and Robertsvlei – ***Franschhoek System***

  The eastern part of Franschhoek is currently supplied with water from the Municipality's own source in the adjacent mountains, the so-called Perdekloof source. The raw water from the Perdekloof source is treated at the Franschhoek WTW (Package plant). The western part of Franschhoek, La Motte and Wemmershoek are supplied with potable water purchased from the CCT, which is supplied from the Wemmershoek WTW.

- Pniel, Kylemore, Lanquedoc, Johannesdal and Groot Drakenstein – ***Dwars River System***

  The Dwars River system obtains potable water from the Wemmershoek pipeline, operated by the CCT and which forms part of the WCWSS. The water is treated at the Wemmershoek WTW.

- Klapmuts – ***Klapmuts System***

  The Klapmuts system obtains potable water from the Wemmershoek pipeline, operated by the CCT and which forms part of the WCWSS. The water is treated at the Wemmershoek WTW.

- ***Rural Systems***
  - ***Faure / Raithby / Jamestown System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the urban users in Raithby, rural consumers along the pipeline and can also supply water to the De Zalze Estate and Jamestown in Stellenbosch. The system is supplied with bulk potable water by the CCT from their Faure WTW.

    The town of Raithby is serviced with a formal sewer reticulation system consisting of ±5.0km gravity sewer pipelines. The hydraulic capacity of the Raithby WWTW (Activated Sludge) is 0.150 ML/d.

  - ***Polkadraai System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the rural consumers in the Polkadraai area along the pipeline. Water can also in emergency conditions be supplied from the Faure system to the Polkadraai system. The system is supplied with bulk potable water by the CCT from their Blackheath WTW.

  - ***Koelenhof System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the urban users in the Koelenhof rural area. The system is supplied with bulk potable water by the CCT from their Wemmershoek scheme.

  - ***Muldersvlei System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the urban users in the Muldersvlei rural are. The system is supplied with bulk potable water by the CCT from their Bloekombos reservoir (supplied from the Wemmershoek pipeline).

  - ***Meerlust, Croydon and Helderberg Systems***: These systems supplies potable water to the urban users in these areas. Bulk potable water is supplied by the CCT. The Meerlust area is supplied with bulk water from the Wemmershoek scheme and the Helderberg and Croydon areas with bulk water from the Steenbras dam through the CCT's reticulation network.

Physical Perspective:

Climate change: It is necessary for WSAs to develop climate response strategies and include these in their WSDPs, implement WC/WDM and reduce levels of non NRW. Water-related climate change adaptation and mitigation planning should be incorporated into all WSDPs and IDPs. The implementation of WC/WDM is a critical element of adapting to climate change. This must be implemented by all water sector institutions and water users, and should include the optimisation of dam and groundwater operation, as well as the reduction of physical water losses and the introduction of water-efficient appliances, processes and crops.

In terms of adapting for climate change, water systems will need to be more robust and new / alternative sources of supply may need to be found. Increased skills will be required from water managers and long-term water projections are required. Although an overall decrease in rainfall is generally not forecasted, increased variability in the climate and frequency of extreme events, as well as increased temperature and wind could have an impact on water sources, particularly surface waters.

It is therefore advisable for Stellenbosch Municipality that a conservative approach be followed regarding the management of water sources. It is proposed that the following approach be adopted to mitigate and adapt to the impacts of climate change:

- All resources, especially surface water resources, need to be re-evaluated, especially where demand is close to the safe one in twenty year yields. It is therefore important to establish assurance of supply levels of all water sources;

- increase assurance of supply of the water resources by ensuring that there is at least 10% additional capacity (headroom), when considering the maximum 24 hour demand on the peak month of the year;
- do not undertake new developments unless a proper investigation of the implication on water sources and sustainability in the long term has been undertaken;
- vigorously implement WDM measures, especially in terms of the following:
  - increased water efficiency
  - frequent monitoring of the water supply system, from the sources to the consumers; and
  - regular and adequate system maintenance and repairs.
- Diversify water resources, e.g. surface water, groundwater, wastewater re-use and sea water desalination.

Floods: One of the climate change threats in some parts of the Western Cape is the likelihood of floods with greater intensity and longer-term impacts. There is likely to be increases in the severity and unpredictability of weather patterns. Flooding and storms are predicted which could have devastating effects on agricultural production. It is important for Stellenbosch Municipality to ensure that Stormwater Management Plans are in place for all the towns.

Natural Environment: Significant portions of Stellenbosch Municipality fall within globally recognized biosphere areas and designated public and private conservation areas. Eleven public conservation areas cover some 28 741 ha or 34,6% of the municipal area, with a further 3 000 ha managed as private conservation areas. The municipality's landscape consists of a series of valleys on a base of rolling hills to the west culminating in steep and dramatic mountain backdrops to the east and south-east, highly valued for its scenic beauty and sense of place.

Stellenbosch Municipality falls within the Cape Floral Kingdom, internationally recognised as one of the six floral kingdoms of the world (occupying 0,06% of the earth's surface). The Cape Floral Kingdom is the only floral kingdom contained within a single country and characterised by its exceptional richness in plant species and its endemicity.

Critical and vulnerable habitats are mostly found in the mountainous south-eastern parts of the municipality, where large tracts of land are already formally protected. However, within the municipal area nearly all the remaining vegetation is Critically Endangered or Vulnerable (SDF, June 2023).

TOPIC 1: SETTLEMENTS AND DEMOGRAPHICS

The tables below gives an overview of the settlements, population and households in Stellenbosch Municipality's Management Area for 2023/2024. The number of settlements were done according to the grouping of the different areas in DWS's GeoDatabase.

Table A.1.1: Settlement Summary

Section	Number	Assessment Score
1.1 Total Population (Permanent)	228 426	80%
1.2 Total Number of Households (Permanent)	64 492	80%
1.3 Average Household Size	3.6	80%
1.4 Total Number of Settlements (GeoDatabase)	74	80%

Note: The score of 80% in the above table is Excellent, which is the highest score in DWS's eWSDP website.

Table A.1.2 Summary by Settlement Group (Urban / Rural Split)

Settlement Type	Settlements	Population	Households	Assessment Score
Rural	17	47 125	10 797	80%
Urban	57	181 301	53 695	80%
Total	**74**	**228 426**	**64 492**	**80%**

Note: The score of 80% in the above table is Excellent, which is the highest score in DWS's eWSDP website.

Table A.1.3 Assessment Score by Settlement Type						
Main Type	**Settlement Type**	**Settlements**	**Population**	**Households**	**Average Household Size**	**Assessment Score**
Rural	Farming	1	42 423	9 719	4.4	80%
Rural	Scattered Rural Village	3	489	112	4.4	80%
Rural	Small Village <= 5000	9	8 117	2 239	3.6	80%
Rural	Informal Settlements (Squatter Camp)	3	950	269	3.5	80%
Urban	Formal Town	41	131 399	40 376	3.4	80%
Urban	Informal Settlements (Squatter Camp)	11	43 086	11 183	3.3	80%
Urban	Working Towns and Service Centres - Mines, Prisons etc.	6	1 961	594	3.3	80%
Total		**74**	**228 426**	**64 492**	**3.5**	**80%**

Note: The score of 80% in the above table is Excellent, which is the highest score in DWS's eWSDP website.

Table.A.1.4 Amenities Summary (Health & Educational facilities)		
Amenity Type	**Number of Amenities**	**Assessment Score**
Health Facilities	16	80%
Educational facilities	55	80%

Note: The score of 80% in the above table is Excellent, which is the highest score in DWS's eWSDP website.

The 2025/26 IDP of Stellenbosch Municipality and the 2024 Socio Economic Profile of Stellenbosch Municipality indicate the 2024 population at 209 831 persons and the 2024 permanent households at 57 520, with an estimated population of 231 712 by 2029, at an annual growth rate of 1.7%.

The published 2022 Census population for Stellenbosch Municipality was 175 411 persons (Annual growth rate of 1.1% over the period 2011 to 2022) and the number of permanent households was 59 626. The 2022 Census data is not yet available per town and it was therefore not possible to update Stellenbosch Municipality's projected population and households per town (system) according to the 2022 Census data.

The 2023/2024 population for the various water distribution systems were estimated by applying the annual growth rates as indicated in the table below to the 2011 Census data. The current projected population figures and the annual population growth percentages, as indicated in the table below, are aligned with the figures used in DWS's GeoDatabase. The future estimated annual population growth percentages, as listed in the table below, were agreed with the Engineering Department during January 2014.

Table A.1.5: Estimated Future Annual Population Growth Percentages, Population and Households per Distribution System			
Town	**Estimated future annual population growth %**	**Projected 2023/2024 population**	**Projected 2023/2024 households**
Stellenbosch	3.5%	121 363	36 767
Franschhoek	5.0%	28 044	9 216
Dwars River	3.0%	16 395	3 771
Klapmuts	6.0%	15 500	3 942
Raithby	2.0%	1 152	275
Farms	1.5%	45 973	10 521
Stellenbosch Municipality	**3.3%**	**228 426**	**64 492**

The current 2023/2024 population for Stellenbosch Municipality is therefore estimated at 228 426 persons and the permanent households at 64 493, as indicated in the table above.

WSDP EXECUTIVE SUMMARY 2022-2027

The table below gives an overview of the projected population and permanent number of households and the water and sanitation service levels in Stellenbosch Municipality's Management Area.

Table A.1.6: Water Services Overview (Water)

TOPIC 2: SERVICE LEVELS

The National Norms and Standards for Domestic Water and Sanitation Services, as published in the Government Gazette No.41100 of 8 September 2017, make provision for the following norms and standards for levels of water supply and sanitation services:

Table A.2.1: Norms and Standards for Levels of Water Supply Services		
Full level of service: People access and pay for more than 90 l/c/d at high pressure.	Interim **Full**	**Full provision**: People access a minimum of 50 l/c/d of SANS241 quality water on demand at the boundary of the yard, metered and tariffed.
Middle level of service: People access and pay for 51-90 l/c/d at medium pressure.	Interim **Upper**	**Upper provision**: People access a maximum of 90 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered and tariffed.
	Interim **Intermediate**	Intermediate provision: People access more than 50 l/c/d but less than 90 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered and tariffed.
Minimum level of service: People access 25-50 l/c/d at low to medium pressure, use of more than 25 l/c/d is paid for.	Interim **Basic Plus**	**Basic Plus provision**: People access more than 25 l/c/d but less than 50 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered and tariffed.
	Interim **Basic**	**Basic provision**: People access a minimum of 25 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered and tariffed.
	Interim **Free Basic**	**Free basic provision**: People access a minimum of 25 l/c/d of SANS241 quality water from an improved source at the boundary of the yard, metered.
	Intermittent	**Intermittent provision**: People access a minimum of 1500 l/household/week of acceptable quality water on a weekly basis within 100m, which is metered.
Bulk service: Source of potable water to be provided to people, which is metered in all circumstances.		
No service / provision = backlog: People access water from insecure or unimproved sources, or sources that are too distant, too time consuming or are of poor quality.		

Interim provision: People access a minimum of 25 l/c/d of acceptable quality water within 24 hours of disruption, normal service to be restored within 7 days.

Proper disposal, clean platform, vector and rodent control, resource use and health protection.

Table A.2.2: Norms and Standards for Levels of Sanitation Services		
Hygiene promotion; Prevention of pollution; Re-use / recycle; Operation and Maintenance; Metering and tariffing; Solid Waste Management; Asset Management		
Full level: Full concern for human health, environment and sustainability of interconnected systems.	**Full services**	**In-house facility**: Storm water, wastewater/excreta, greywater, solid waste are collected and managed to achieve maximum benefits from treatment and re-use of water and nutrients.
		In-house facility: Access to a pleasant, safe, reliable and properly maintained facility for 24 hours a day, with control of nutrients in human excreta, wastewater and greywater.
Basic level: Remove excreta from the environment through treatment, pathogen reduction, resource recovery and nutrient reuse.	**Free basic services**	**Toilet with functional hand washing facility in the yard**: Access to a pleasant, safe and reliable facility for 24 hours a day, including privacy, personal safety and shelter through a subsidy for free. Maintenance of the facility is for free and is the responsibility of services provider.
	Basic services	**Toilet with functional hand washing facility in the yard**. Access to a pleasant, safe and reliable facility for 24 hours a day, including privacy, personal safety and shelter through a capital subsidy. Maintenance of the facilities is not for free and is the responsibility of the household / owner.
Interim level: Blocking the spread of faecal-oral diseases through proper excreta containment at a fixed point.	**Excreta containment**	**Household, shared or communal toilets with functional hand washing facilities**: Access to safe, reliable and properly maintained toilet and hand washing facility, free of charge, within 200m of the dwelling, which at a minimum safely contains human excreta. Maintenance is the responsibility of the services provider. To be phased out by 2030.
No service / provision = backlog: People practice open defecation or access an unimproved sanitation facility, such as pit toilets and bucket toilets. To be completely eliminated by 2030.		

Emergency level: People access pleasant, safe, reliable and properly maintained improved toilets and hand washing facility on the premises in close proximity to the temporary dwelling within 24 hours and for duration of event.

All the households on formal erven in the urban areas of Stellenbosch Municipality's Management Area are provided with water and sewer connections inside the erven. Informal areas are supplied with shared services (Communal standpipes and toilets) as an intermediary measure. Stellenbosch Municipality is committed to support the private landowners as far as possible in order to ensure that at least basic water and sanitation services are provided to those households in the rural areas with existing services still below basic standard.

The table and graph below give an overview of the water service delivery access profile of Stellenbosch Municipality.

Table A.2.3: Residential Water Services Delivery Access Profile: Water							
Census Category	**Description**	**Year 0 FY2023/24**		**Year - 1 FY2022/23**		**Year - 2 FY2021/22**	
		Nr	**%**	**Nr**	**%**	**Nr**	**%**
	WATER (ABOVE MIN LEVEL)

Farms	Rural	212	926	212	926
Total		**2 835**	**9 696**	**3 240**	**11 131**

Table A.2.6: Water Supply Level Profile (Households)		
Section: Residential water services infrastructure supply level profile	**Totals**	**Assessment Score**
Total households with a water need (Irrelevant the type of need)	**2 835**	**80%**
Total households below RDP	**212**	**80%**
Piped water inside the dwelling/house	28 450	80%
Piped water inside yard	23 899	60%
Piped water distance <200m	9 308	60%
Piped water distance >200m	2 743	60%
Water other (Include no water)	92	60%
Total	**64 492**	**80%**

Note: The scores of 60% and 80% in the above table is Good and Excellent. 80% is the highest score in DWS's eWSDP website.

Table A.2.7: Water Reliability Profile (Households)		
Section: Water Reliability Profile	**Totals**	**Assessment Score**
Total Number of Households having Reliable Service	**61 657**	**80%**
Total Number of Households NOT having Reliable Service	**2 835**	**60%**

Note: The scores of 60% and 80% in the above table is Good and Excellent. 80% is the highest score in DWS's eWSDP website.

The projected figures in the previous tables for water services for the farms are still based on the 2011 Census data and can only be updated once the 2022 Census data becomes available per town or subplace.

The table and graph below give an overview of the sanitation service delivery access profile in Stellenbosch Municipality's Management Area.

Table A.2.8: Residential Water Services Delivery Access Profile: Sanitation							
Census Category	**Description**	**Year 0 FY2023/24**		**Year - 1 FY2022/23**		**Year - 2 FY2021/22**

None	6 885	60%
Total	**64 492**	**60%**

Note: The scores of 60% and 80% in the above table is Good and Excellent. 80% is the highest score in DWS's eWSDP website.

Table A.2.12: Sanitation Reliability Profile (Households)		
Section: Residential sanitation reliability profile	**Totals**	**Assessment Score**
Total number of households having reliable service	**56 902**	**80%**
Total number of households not having reliable service	**7 590**	**60%**
Infrastructure to be upgraded: None to VIP	565	60%
Infrastructure requirement: Bucket to VIP	278	60%
Infrastructure requirement: None to waterborne	6 320	60%
Infrastructure to be upgraded: Pit to VIP	148	60%
Number of households NOT having reliable service due to: Functionality	279	60%

Note: The scores of 60% and 80% in the above table is Good and Excellent. 80% is the highest score in DWS's eWSDP website.

The projected figures in the previous tables for sanitation services for the farms are still based on the 2011 Census data and can only be updated once the 2022 Census data becomes available per town or subplace.

Table A.2.13: Direct Backlog (Water and Sanitation)		
Direct Backlog (Water & Sanitation)	**Totals**	**Assessment Score**
Direct settlement backlog water households. Total household of settlement with a water need (irrelevant the type of need)	2 835	60%
Direct settlement backlog water population. Total population of settlement with a water need (irrelevant the type of need)	9 696	60%
Direct settlement backlog sanitation households. Total household of settlement with a sanitation need (irrelevant the type of need)	7 590	60%
Direct settlement backlog sanitation population. Total population of settlement with a sanitation need (irrelevant the type of need)	26 610	60%

The current number of informal dwellings in Stellenbosch Municipality's Management Area is 11 452. Stellenbosch Municipality's works towards a ratio of at least one communal standpipe for every five households and one communal toilet to every twenty five households. The table below gives a summary of the communal services levels in the informal areas in Stellenbosch Municipality's Management Area.

Table A.2.14: Communal service levels in informal areas (June 2024)

No.	Informal Settlement	No. of informal dwellings	Sanitation						Water				
			Number of Toilets currently provided		HH / Toilet	Broken Toilets	Backlog *		Number of Taps currently provided	HH / Tap	Backlog **		Broken Taps

Notes: No Services, Ratios above Targets, Ratios meeting Targets

* Backlog Sanitation: Households where the ratio of one toilet seat for every 5 households is exceeded.

** Backlog Water: Households where the ratio of one communal tap for every 25 households is exceeded.

It can be noted from the above table that an additional 1 270 toilets and 109 communal taps are required for the informal areas in order to comply with the ratios of one toilet for every five households and one communal tap for every twenty-five households. 179 Toilets and 190 communal taps also need to be repaired. Some of the challenges experienced by Stellenbosch Municipality with regard to the informal areas and the provision of services to these areas include the following:

- Lack of space for new facilities;
- Lack of access for maintenance and emergency vehicles (narrowed roads);
- Uncooperative community members, don't want to move to create space for services;
- Vandalism of existing infrastructure, budget for new infrastructure must be used to maintain existing infrastructure; and
- Illegal water connections that must be removed.

Consumer units in the two tables below refer to number of billed metered consumers within the Municipality. It may well be that an entire residential development (e.g. a block of flats) consisting of many households, is metered with one bulk meter (One consumer). Consequently, the term "billed metered consumer units" does not necessarily equate to the number of households. The number of user connections in each user sector as calculated from the financial data (Billed Metered Consumers), for the various water distribution systems in Stellenbosch Municipality's Management Area, are as indicated in the table below.

Table A.2.15: Total number of billed metered consumers per category and water distribution system

Distribution System	Year	Residential	Business	Other	Total
Stellenbosch	21/22	12 510	694	221	13 425
	22/23	12 593	699	234	13 526
	23/24	**12 786**	**699**	**244**	**13 729**

Asset Management Plan: An updated Asset Management Policy (2025/2026) is in place, which includes the following objectives:

- Specifying Council's practice regarding accounting for assets;
- Ensure consistency in accounting treatment; and
- To assist officials in understanding their legal and managerial responsibilities with regard to key asset functions such as safeguarding of assets; maintaining assets; establishing and maintaining a management, accounting and information system; that accounts for the assets of the municipality; asset valuation principles in accordance with GRAP; establishing and maintaining systems of internal controls over assets; establishing and maintaining asset registers and clarifying responsibilities and accountabilities for the asset management process.

Each Directorate must develop a maintenance strategy that will ensure that the assets of Stellenbosch Municipality are maintained at an adequate operational level or standard by ensuring that all statutory, technical and operational objectives are achieved. This strategy must ensure that tangible assets under the custody and control of the relevant directors are properly maintained and repaired so that their possible maximum useful lives are realised.

Stellenbosch Municipality updated their current Asset Register after June 2024, in order to include the new assets constructed during the 2023/2024 financial year. The tables that follow give an overview of the current water and sewerage infrastructure included in Stellenbosch Municipality's Asset Register.

Water Infrastructure: The Opening Cost and Book Value of the water infrastructure of Stellenbosch Municipality is summarised in the table below (June 2024).

Table A.3.5: Opening Cost and Book Value of the water infrastructure			
Asset Type	**Opening Cost**	**Book Value**	**Book Value / Opening Cost**
Borehole	R86 227 551	R61 774 220	71.64%
Water Mains	R225 179 114	R178 123 277	79.10%
Dams and Weirs	R16 166 313	R12 038 177	74.46%
Water Reticulation Pipeline	R1 305 772 600	R919 260 997	70.40%
Water Pump Station	R2 905 428	R679 144	23.37%
Reservoirs & Tanks	R214 592 898	R188 575 179	87.88%
WTW	R107 159 498	R88 391 666	82.49%
Total	**R1 958 003 402**	**R1 448 842 660**	**74.00%**

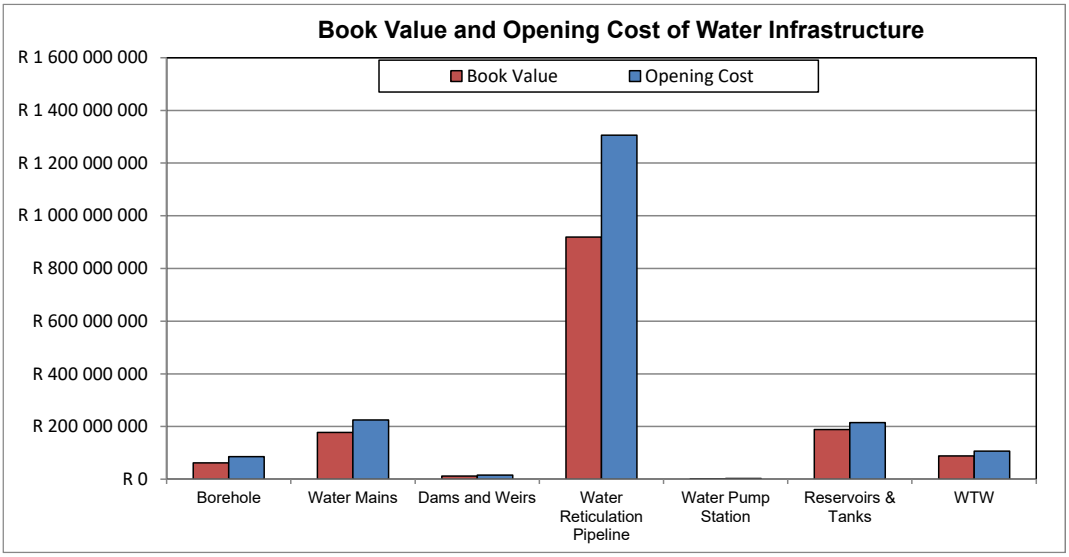

Figure A.3.1: Book Value and Opening Cost of the Water Infrastructure

The information in the previous table indicates that 26.00% of the value of the water infrastructure has been consumed.

The following table gives an overview of the remaining useful life by facility type for the water infrastructure (Opening Cost).

Table A.3.6: Overview of the RUL by facility type for the water infrastructure (Opening Cost):					
Asset Type	**0 – 5 yrs**	**6 – 10 yrs**	**11 – 15 yrs**	**16 – 20 yrs**	**> 20 yrs**
Borehole	R433 575	R477 147	R85 196 336	R120 493	R0
Water Mains	R1 169 274	R22 027 529	R13 168 950	R39 192 240	R149 621 121
Dams and Weirs	R0	R0	R14 687 500	R1 478 813	R0
Water Reticulation Pipeline	R52 767 127	R30 269 629	R24 052 697	R81 907 639	R1 116 775 508
Water Pump Station	R202 905	R2 667 956	R0	R34 567	R0
Reservoirs & Tanks	R37 232 699	R45 221 682	R11 788 266	R10 586 802	R109 763 449

Figure A.3.6: Age Distribution of the Sewerage Infrastructure

Most of the maintenance work currently carried out on the water and sewerage infrastructure are re-active and it is critical for the Municipality to increase their maintenance budget for water and sewerage infrastructure in order to ensure that the required preventative maintenance work is also carried out. The Asset Management Plan needs to indicate the risks associated with the inadequate refurbishment and maintenance of the various water and sewerage infrastructure.

Disaster Management Plan: The purpose of Stellenbosch Municipality Disaster Management is to ensure coordination of multi-disciplinary and multi-sectorial risk reduction through the integrated institutional capacity for disaster risk management, risk assessment, response and recovery, and implementation of measures aimed at:

- Preventing or reducing the risk of disasters;
- Mitigating the severity or consequences of disasters;
- Emergency preparedness;
- Rapid and effective response to disasters; and
- Post-disaster recovery and rehabilitation.

Stellenbosch Municipality's Disaster Management Plan is reviewed annually and:

- anticipates the types of disasters that are likely to occur in its area of jurisdiction and their possible effect;
- places emphasis on measures that reduce the vulnerability of disaster-prone areas, communities, and households at risk;
- promotes disaster management research;
- identifies and addresses weaknesses in capacity to deal with disasters;
- provides for appropriate prevention and mitigation strategies;
- facilitates a rapid and effective response to disaster; and
- Post-disaster recovery and rehabilitation.

Untreated Effluent Management Plan: All effluent discharged in the urban areas in Stellenbosch Municipality are treated at the existing WWTWs and there is no known untreated effluent discharged to the environment. W_2RAPs were prepared for all the WWTWs and sewer drainage networks.

TOPIC 4: WATER SERVICES OPERATION AND MAINTENANCE

Maintenance is usually practiced in two forms, preventative maintenance and corrective maintenance. A third form is called design-out maintenance, which is rather an aspect of the design considerations when the infrastructure is planned.

Pipe bursts and other serious damage to pipes immediately interrupts services to the affected area and is rapidly addressed by Stellenbosch Municipality. O&M is a continuous process for Stellenbosch Municipality involving various activities, with the ultimate purpose of delivering good quality services to all customers at all times and keeping the percentage of water lost through pipe bursts and other serious damage to pipes as low as possible. Stellenbosch Municipality's O&M Plan depends on a range of factors such as the age and condition of the water and sewerage infrastructure, requirements of the Municipality and DWS as the regulating authority, the availability of staff, plant, equipment, spares, money and other resources.

Stellenbosch Municipality also have standby teams available after hours and over weekends, besides the planned and scheduled O&M activities, in order to allow for unscheduled responses to service breakdowns due to mal-functioning equipment, vandalism, emergency situations, etc. This allows Stellenbosch Municipality to be able to quickly assess service breakdowns and re-allocate staff and resources to do unscheduled repairs, and then quickly return to the regular and scheduled O&M activities. The technical personnel ensure that sufficient repair materials, consumables and back-up equipment are also readily available in the stores.

Table A.4.1: Operation and Maintenance

Compliancy	Existing Groundwater Infrastructure	Existing Surface Water Infrastructure	Existing WTW Infrastructure	Existing WWTW Infrastructure	Existing Pump Station Infrastructure	Existing Bulk Pipeline Infrastructure	Existing Tower & Reservoir Infrastructure	Existing Reticulation Infrastructure

Information	Above min. requirement	Above min. requirement	Above min. requirement	Above min. requirement	Above min. requirement	Above min. requirement	Above min. requirement	Above min. requirement
Activity Control & Management	Min. requirement	Min. requirement	Min. requirement	Min. requirement	Min. requirement	Min. requirement	Min. requirement	Min. requirement

TOPIC 5: CONSERVATION AND DEMAND MANAGEMENT

The implementation of the Municipality's WC/WDM measures over the last number of years and the water restrictions during the drought periods has been extremely successful, with an average annual decrease of 0.22% of the raw water volume for all the systems over the last fifteen financial years, from 13 233 Ml in 2008/2009 to 12.807 Ml in 2023/2024. **The overall NRW for all the systems for the 2023/2024 financial year was 3 931.556 Ml (31.3%). The overall water losses for the last financial year were 3 529.523 Ml (28.1%). The Municipality is committed to continue with the implementation of specific WC/WDM measures to further reduce the current NRW and Water Losses.**

The current WC/WDM measures implemented by Stellenbosch Municipality are mostly through their Operation and Maintenance Budgets. The main water demand management interventions implemented by Stellenbosch Municipality over the last number of years, include the following:

- Meter and record all bulk water supply for the various distribution systems and improve the billed metered consumption data (Financial Department) in order to carry out more detail IWA water balances for the various distribution systems.
- Customer Services and Complaints System is implemented by the Municipality for burst pipes, leaks, etc. Standby teams are available after hours and over weekends for immediate repairs of any burst pipes or leaks.
- Strict municipal services standards for the installation of new water reticulation networks for own and private developments.
- Implementation of pressure management, continuous operation and maintenance of various PRV zones.
- Implementation of a seven-block step water tariff structure that promotes the efficient use of water and discourage wastages. Water restrictions are also implemented when required.
- Regular updating of the Water Master Plans for the various water distribution systems.
- Implementation of a Water Pipeline Replacement Programme.

A contractor was also appointed to assist the municipality with various demand management activities during the 2022/2023 financial year. The scope of works comprises of the following key components:

- The inspection and repair of plumbing defects to selected existing residential properties including the repair of leaks associated with pipes, toilets, geysers, taps and other general plumbing components;
- Removal of existing water meters and installation of new programmable domestic (Smart) water meters;
- Replacement of faulty domestic and bulk water meters;
- Installation of new pressure reducing valves and electromagnetic flow meters in the municipal water network;
- Construction of valve and bulk water meter chambers; and
- Connecting pipework to the municipal water network.

The total expenditure over the period 2018/2019 to 2023/2024 for the implementation of these WC/WDM measures over the last six financial years was R20 016 391 (Vat Excluded).

A Water Conservation and Water Demand Management Strategy was drafted for Stellenbosch Municipality in February 2012, but is outdated and requires review and updating.

The table below gives a summary of the treatment losses, NRW, water losses and ILIs for the various distribution systems in Stellenbosch Municipality's Management Area.

Table A.5.1: Treatment Losses, NRW, Water Losses and ILIs for the various water distribution systems

Description	Component	Unit	Record: Prior (Ml/a)					23/24
			18/19	19/20	20/21	21/22	22/23

		Percentage	**26.0%**	**24.2%**	**27.4%**	**29.7%**	**27.3%**	**31.3%**
	Water Losses	**Volume**	**1 838.255**	**1 913.936**	**2 566.882**	**2 945.718**	**2 602.255**	**3 529.523**
		Percentage	**22.8%**	**21.0%**	**24.2%**	**26.5%**	**24.1%**	**28.1%**

Note: Infrastructure Leakage Index (ILI) for Developed Countries = **1 – 2 Excellent (Category A)**, **2 – 4 Good (Category B)**, **4 – 8 Poor (Category C)** and > **8 – Very Bad (Category D)**

Category A = No specific intervention required.

Category B = No urgent action required although should be monitored carefully.

Category C = Requires attention

Category D = Requires immediate water loss reduction interventions

The Infrastructure Leakage Index (ILI) in the previous table is the most recent and preferred performance indicator for comparing leakage from one system to another. It is a non-dimensional index representing the ratio of the current real leakage and the "Unavoidable Annual Real Losses". A high ILI value indicates a poor performance with large potential for improvement while a small ILI value indicates a well-managed system with less scope for improvement. Attaining an ILI = 1 is a theoretical limit, which is the minimum water loss in an operational water reticulation system. A value of less than 1 should not occur since this implies that the actual leakage is less than the theoretical minimum level of leakage.

The table below gives an overview of the System Input Volume, Average Billed Metered Consumption and NRW in litre per connection per day for the various water distribution systems for 2023/2024.

Table A.5.2: System input volume, average billed metered consumption and non-revenue water in litre per connection per day for the various water distribution systems for 2023/2024.

Water Balance Component	Stellenbosch	Franschhoek	Dwars River	Klapmuts
System Input Volume	1 959	1 359	1 148	787
Average Billed Metered Cons.	1 358	966	679	531
Non-Revenue Water	601	393	469	257

Stellenbosch is the town with the highest system input volume per connection per day, the highest average billed metered consumption per connection per day and the highest NRW per connection per day.

The table below gives an overview of the various WC/WDM measures and whether the measures are adequately addressed by Stellenbosch Municipality.

Table A.5.3: Reducing Water Losses		
Reducing Water Losses and water inefficiencies		**Assessment Score**
Night flow metering	Partially	60%
Day flow metering	Yes	80%
Reticulation leaks	Yes	80%
Illegal connections	Yes	80%
Un-metered connections	Yes	80%
Leak and meter repair programmes. Consumer units targeted by:		
Leak repair assistance programme	Partially	60%
Retro-fitting of water inefficient toilets	Partially	60%
Meter repair programme	Yes	80%
Consumer/end-use demand management: Public Information & Education Programmes		
Schools targeted by education programmes	No	20%
Consumers targeted by public information programmes	Yes	80%

DWS's scorecard for assessing the potential for WC/WDM efforts was completed for Stellenbosch Municipality. The aim of the scorecard was to establish areas where the municipality has made good progress in relation to WC/WDM and where there is still room for improvement. It can be seen from the Scorecard that there are 25 questions each of which carries a maximum of 4 points providing a possible maximum score of 100. If the Municipality has the specific item completely under control, it receives the maximum points and if it is neglecting the item completely it receives no points. There are various levels between the maximum and the minimum number of points assigned to the municipality for each item depending on the level of completeness or lack thereof. **The status quo score for Stellenbosch Municipality is 69 out of 100 suggesting that the Municipality is making good progress with regard to the implementation of specific WC/WDM activities.**

TOPIC 6: WATER RESOURCES

The Western Cape experienced a severe drought over the period 2015 to 2017, with some relief during the winter months of the following years. The drought over the period 2015 to 2017 reduced the assurance of supply from the WCWSS to Stellenbosch Municipality and also reduced the yield of the Municipality's own existing surface water resources. The Municipality therefore continued with the implementation of specific WC/WDM measures to lower the current water requirements and the planning for the augmentation of the existing water resources. A Bulk Water Resources: Drought Intervention Projects Study was completed in June 2019 for Stellenbosch Municipality. The Study included various recommended future resource augmentation projects for Stellenbosch Municipality. The table below gives an overview of the current water resources, the current volumes abstracted and authorised and whether the abstractions are registered and recorded.

Table A.6.1: Current water sources and volumes							
Current Water Sources							
Source Type	**Scheme**	**Number of Sources**	**Current 23/24 Abstraction or Returns (Mm³/a)**	**Licensed Abstraction / Returns (Mm³/a)**	**Community Water Supply**		**Assessment Score**
					Rural	**Urban**	
Groundwater	Stellenbosch	Various	0.000000	2.040905	0%	100%	60%

The table below indicates the potential additional future water resources for Stellenbosch Municipality.

Table A.6.2: Additional water resources and volumes				
Source Type	**Schemes**	**Number of Sources**	**Potential Volume (Mm³/a)**	**Licensed Abstraction (Mm³/a)**
Groundwater	Stellenbosch	To be determined	1.598	WULAs will only be submitted when boreholes are developed.
	Dwars River	To be determined	0.365	
	Franschhoek	To be determined	1.054	
	Klapmuts	To be determined	0.473	
	Meerlust	To be determined	0.024	
	Koelenhof	To be determined	0.151	
Surface Water	-	-	-	-
Wastewater Reclamation	Stellenbosch	1	1.825	Detail investigations required first.
	Dwars River	1	0.365	
	Franschhoek	1	0.730	
	Klapmuts	1	0.255	
External Sources (Bulk Purchase)	Stellenbosch (CCT, Blackheath WTW)	1	1.140	Increased allocation from CCT
	Stellenbosch (WCWSS, Second Phase)	1	2.710	Increased allocation from WCWSS
	Other areas (CCT)	1	3.920	Increased allocation from CCT

The table below gives an overview of the various water quality monitoring measures and whether it is in place for Stellenbosch Municipality.

Table A.6.3: Monitoring of abstraction volumes, water levels and water quality		
Monitoring	**Assessment Score**	
% of water abstracted monitored: Surface water	100%	
% of water abstracted monitored: Ground water	Currently not in use	
% of water abstracted monitored: External Sources	100%	
Monitoring	**Interval**	**Assessment Score**
Surface water levels (1: daily, 2: weekly, 3: monthly, 4: annually, 5: never)	Daily and Weekly	80%
Ground water levels (1: daily, 2: weekly, 3: monthly, 4: annually, 5: never)	Not in use	80%
Water quality for formal schemes? (1: daily, 2: weekly, 3: monthly, 4: annually, 5: never)	Hourly, Two Hourly, Six Hourly, Daily, Bi-Weekly	80%
Water quality for rudimentary schemes? (1: daily, 2: weekly, 3: monthly, 4: annually, 5: never)	Cape Winelands District Municipality on request	-
Borehole abstraction? (1: daily, 2: weekly, 3: monthly, 4: annually, 5: never)	Daily when in use	80%

The graph below gives an overview of the average daily raw water supply to all the towns in Stellenbosch Municipality. The impact of the drought experienced over the period 2015 to 2018 can be noted on the graph.

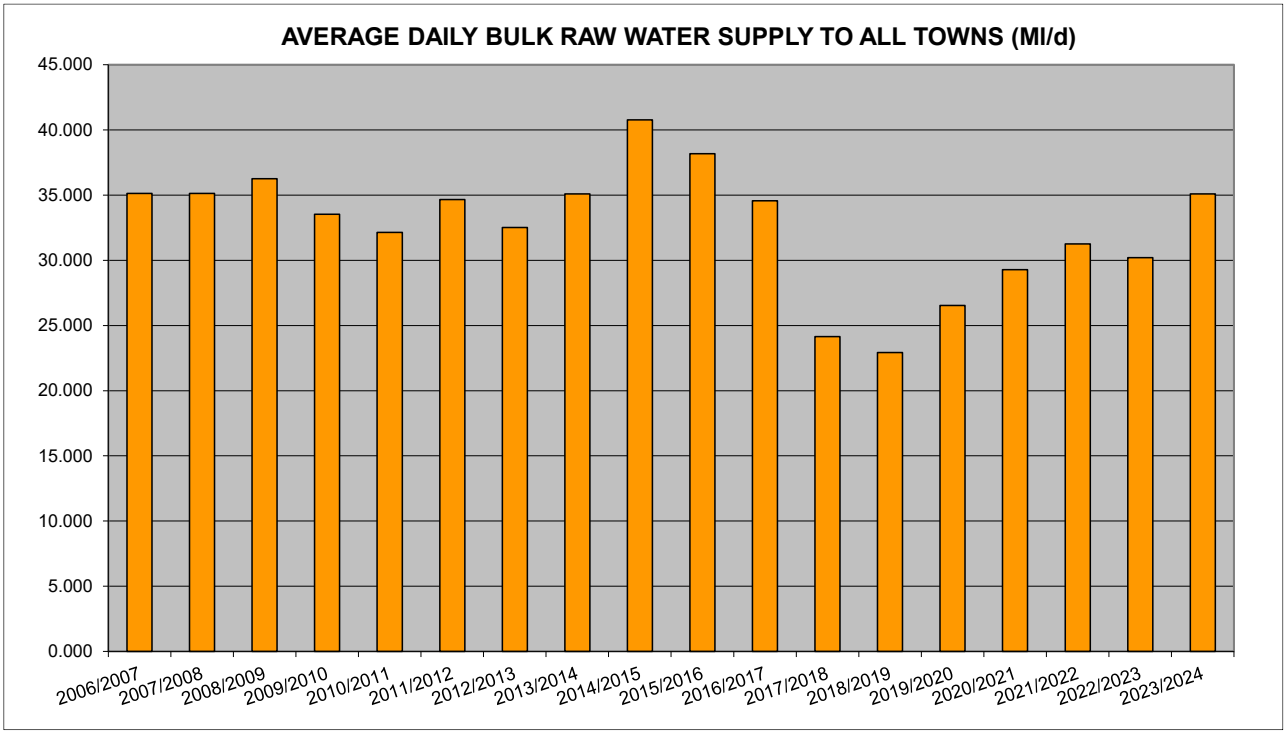

Figure A.6.1: Average daily bulk raw water supply volumes for all the water distribution systems

The graph below gives an overview of the total annual system input volumes and the NRW for the various water distribution systems in Stellenbosch Municipality's Management Area.

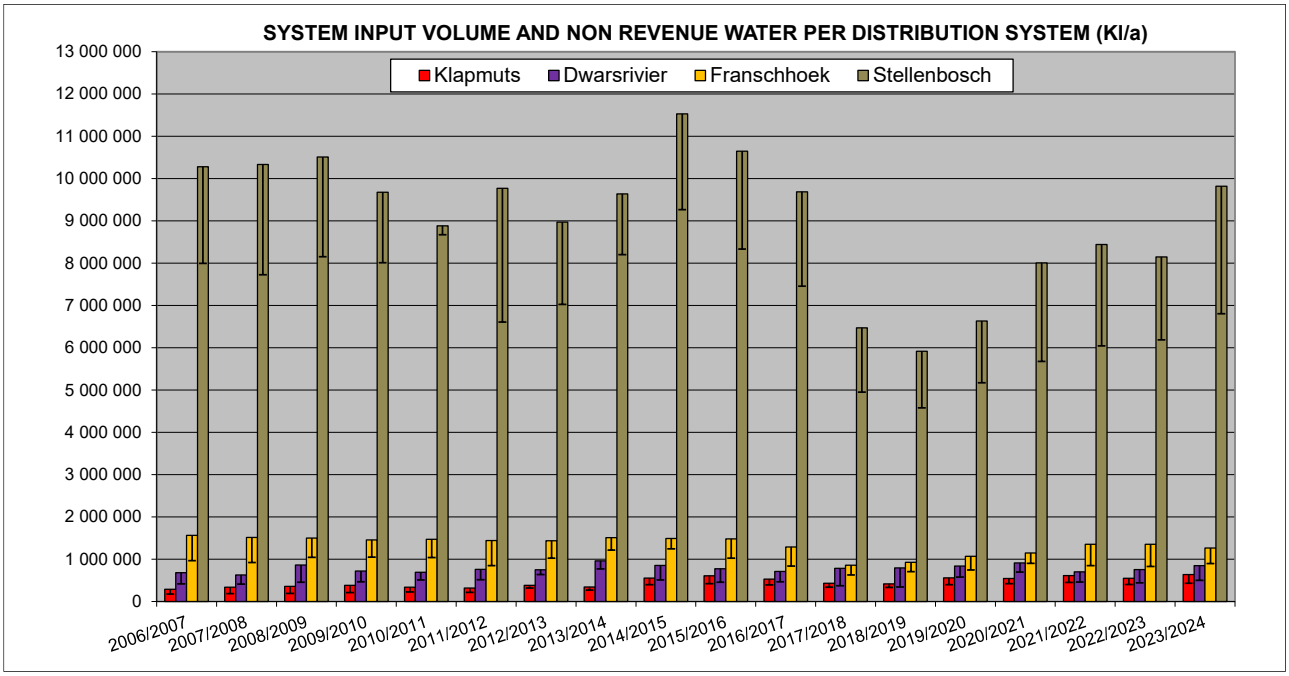

Figure A.6.2: Annual system input volumes and NRW per water distribution system

All water sources are supplied with bulk water meters and accurate records are kept of all bulk water meter readings. The table below gives an overview of the annual volume of bulk potable water supplied (System Input Volume) for each of the water distribution systems within Stellenbosch Municipality's Management Area.

Table A.6.4: Bulk potable water supplied for the various water distribution systems (System Input Volume)

Distribution System	Source	Record: Prior (Ml/a)					
		18/19	19/20	20/21	21/22	22/23	23/24
Stellenbosch	Eerste River, WCWSS, CCT	5 916.404	6 634.438	8 002.551	8 440.869	8 148.090	9 816.785
Franschhoek	Perdekloof and Wemmershoek (CCT)	927.535	1 067.033	1 149.087	1 353.083	1 353.457	1 263.159
Dwars River	Wemmershoek (CCT)	794.708	836.630	911.330	702.596	756.910	846.636
Klapmuts	Wemmershoek (CCT)	417.291	559.826	545.150	611.660	548.730	636.939
Total		**8 055.938**	**9 097.927**	**10 608.118**	**11 108.208**	**10 807.187**	**12 563.519**

Water Quality: Stellenbosch Municipality makes use of an accredited external laboratory to conduct the drinking water compliance sampling and analysis. Samples are taken at various locations in each system and analysed to evaluate the compliance. The water quality results are loaded onto DWS's IRIS via the internet. Once entered the data is automatically compared to SANS241. This real-time system allows for immediate intervention to rectify any problems.

The table below gives an overview of the various water quality monitoring measures and whether it is in place for Stellenbosch Municipality.

Table A.6.5: Water Quality

Water Quality	In place	Status Quo	Assessment Score
Is there a Water Safety Plan in Place?	Yes	40%	40%
Reporting on quality of water taken from source: Urban and Rural	Yes	80%	80%
Quality of water returned to the resource: Urban	Yes	60%	60%
Quality of water returned to the resource: Rural	No	Not Applicable	80%
Is there a pollution contingency measures plan in place?	Yes	60%	60%
Quality of water taken from source: Urban - % monitored by WSA self?	Yes	80%	80%
Quality of water taken from source: Rural - % monitored by WSA self?	No	Not Applicable	80%
Quality of water returned to the source: Urban - % monitored by WSA self?	Yes	60%	60%
Quality of water returned to the source: Rural - % monitored by WSA self?	No	Not Applicable	80%
Are these results available in electronic format?	Yes	80%	80%
% Time within SANS241 standards per year	Yes	80%	80%
Abstraction IS registered with DWS	Yes	80%	80%
The abstraction IS NOT registered with DWS	-	-	-
The abstraction IS recorded	Yes	80%	80%
The abstraction IS NOT recorded	-	-	-

The overall percentage of compliance of the water quality samples taken over the period July to June for the last three financial years is summarised in the table below per distribution system.

Table A.6.6: Percentage compliance of the water quality samples for the last three financial years per performance indicator

Performance Indicator	Performance Indicator categorised as unacceptable Yes / No (Table 4 of SANS 241-2:2015)			% Sample Compliance according to SANS 241-2015 Limits		
	2021/2022	2022/2023	2023/2024	2021/2022	2022/2023	2023/2024
Stellenbosch System (Above 100 000 persons)						
Acute Health Microbiological	No (Excellent)	No (Good)	Yes (Unacceptable)	99.28%	97.24%	96.21%
Acute Health Chemical	No (Excellent)	No (Good)	No (Excellent)	100.00%	97.72%	100.00%
Chronic Health	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	99.78%	100.00%
Aesthetic	No (Excellent)	No (Excellent)	No (Excellent)	97.99%	97.61%	96.12%
Operational Efficiency	Yes (Unacceptable)	Yes (Unacceptable)	Yes (Unacceptable)	92.23%	91.69%	86.51%
Blackheath System (Above 100 000 persons)						

Table A.6.6: Percentage compliance of the water quality samples for the last three financial years per performance indicator						
Performance Indicator	**Performance Indicator categorised as unacceptable Yes / No (Table 4 of SANS 241-2:2015)**			**% Sample Compliance according to SANS 241-2015 Limits**		
	2021/2022	**2022/2023**	**2023/2024**	**2021/2022**	**2022/2023**	**2023/2024**
Acute Health Microbiological	Yes (Unacceptable)	Yes (Unacceptable)	No (Excellent)	92.31%	96.00%	100.00%
Acute Health Chemical	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Chronic Health	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Aesthetic	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	99.40%
Operational Efficiency	No (Good)	Yes (Unacceptable)	No (Good)	93.10%	88.10%	93.18%
Faure System (Below 100 000 persons)						
Acute Health Microbiological	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	98.57%	100.00%
Acute Health Chemical	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Chronic Health	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Aesthetic	No (Excellent)	No (Excellent)	No (Excellent)	99.77%	98.61%	99.77%
Operational Efficiency	No (Excellent)	No (Excellent)	No (Excellent)	97.93%	96.89%	96.14%
Franschhoek System (Below 100 000 persons)						
Acute Health Microbiological	No (Excellent)	No (Excellent)	No (Good)	97.67%	100.00%	96.80%
Acute Health Chemical	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Chronic Health	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Aesthetic	No (Excellent)	No (Excellent)	No (Excellent)	97.84%	100.00%	97.78%
Operational Efficiency	No (Excellent)	No (Excellent)	No (Excellent)	93.44%	95.35%	94.09%
Wemmershoek System (Below 100 000 persons)						
Acute Health Microbiological	No (Excellent)	Yes (Unacceptable)	Yes (Unacceptable)	97.07%	90.63%	93.13%
Acute Health Chemical	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	100.00%
Chronic Health	No (Excellent)	No (Excellent)	No (Excellent)	100.00%	100.00%	99.80%
Aesthetic	No (Excellent)	No (Excellent)	No (Excellent)	99.00%	98.39%	99.20%
Operational Efficiency	No (Good)	Yes (Unacceptable)	No (Good)	90.35%	85.04%	92.40%

Notes: The compliance percentages for the Stellenbosch and Blackheath distribution system were calculated against Table 4 of SANS241-2:2015 with a population above 100 000 persons.

The table below gives an overview of the four categories under which the risks posed by micro-organism, physical or aesthetic property or chemical substance of potable water is normally classified:

Table A.6.7: Four categories under which the risks posed by Micro-organism, Physical or Aesthetic Property or Chemical Substance of potable water is normally classified	
Category	**Risk**
Acute Health	Determinand that poses an immediate unacceptable health risk if present at concentration values exceeding the numerical limits specified in this part of SANS 241.
Aesthetic	Determinand that taints water with respect to taste, odour and colour and that does not pose an unacceptable health risk if present at concentration values exceeding the numerical limits specified in SANS 241.
Chronic Health	Determinand that poses an unacceptable health risk if ingested over an extended period if present at concentration values exceeding the numerical limits specified in SANS 241.
Operational	Determinand that is essential for assessing the efficient operation of treatment systems and risks from infrastructure

The following additional operational monitoring parameters are recommended for Stellenbosch Municipality in order to comply with the minimum monitoring requirements of SANS:241-2: 2015 (Table 1: Minimum monitoring for prescribed process risk indicators) for the various WTWs and distribution systems.

- Stellenbosch: Acute Health Microbiological: Additional monthly sampling.
- Stellenbosch: Operational Efficiency: Additional monthly sampling
- Wemmershoek: Acute Health Microbiological: Additional monthly sampling

The table below indicates the compliance of the monthly E.Coli monitoring frequency in the water distribution systems of Stellenbosch Municipality, in terms of the minimum requirements of SANS:241-2: 2015 (Table 2). The period assessed was for samples taken from July 2023 to June 2024.

Table A.6.8: Stellenbosch Municipality's compliance of the monthly E.Coli monitoring frequency in the water distributions systems in terms of the minimum requirements of SANS 241-2:2015 (Table 2).

Distribution System	Population served	Required number of monthly samples (SANS 241-2:2015: Table 2)	Number of monthly E.Coli samples taken by Municipality during 2023/2024 (According to Sampling Programme)
Stellenbosch	121 363	24.3	48
Franschhoek	28 044	5.6	14
Dwars River	16 395	3.3	6
Klapmuts	15 500	3.1	2

It can be noted from the above table that the number of monthly E.Coli samples taken according to the Sampling Programme for the 2023/2024 financial year was more than the required number of samples for all the water distribution systems, except for Klapmuts, where one additional sample per month is required. The current compliances were calculated against the Sampling Programme, but the Municipality needs to measure their future compliance against the actual number of samples taken in each financial year for each of the systems.

Effluent quality: The overall Microbiological, Chemical and Physical compliance percentages of the final effluent samples taken over the last three financial years at the various WWTWs in Stellenbosch Municipality's Management Area are summarised in the table below.

Table A.6.9: Percentage microbiological compliance of the compliance samples taken at the various WWTWs for the last three financial years.

WWTW	2021/2022	2022/2023	2023/2024
Stellenbosch 1	9.1	16.7	0.0
Stellenbosch 2	16.7	0.0	0.0
Wemmershoek	15.4	16.7	33.3
Raithby	58.3	45.5	33.3
Pniel	83.3	11.1	0.0
Klapmuts	53.8	33.3	50.0
Total	**39.7**	**21.0**	**22.2**

Table A.6.10: Percentage chemical compliance of the compliance samples taken at the various WWTWs for the last three financial years.

WWTW	2021/2022					2022/2023					2023/2024				
	Ammonia	Nitrates	COD Filtered	Ortho Phosphate	Overall	Ammonia	Nitrates	COD Filtered	Ortho Phosphate	Overall	Ammonia	Nitrates	COD Filtered	Ortho Phosphate	Overall

All WWTWs	**74.0**	**100.0**	**34.2**	**69.4**	**88.7**	**91.9**	**33.9**	**71.5**	**88.9**	**96.8**	**45.2**	**77.1**

The percentage wastewater quality compliance for the various WWTWs, as included in DWS's 2022 Green Drop Report and DWS's 2023 Green Drop Progress Report, were as follows.

Table A.6.12: Microbiological, Chemical, Physical and Overall compliance percentages, as included in DWS's 2022 Green Drop Report and DWS's 2023 Green Drop Progress Report.						
WWTW	2022 Green Drop Report			2023 Green Drop Progress Report (July 2021 – June 2022 data)		
	Microbiological	Chemical	Physical	Microbiological	Chemical	Physical
Stellenbosch	9%	54%	61%	4.5%	38.6%	73.8%
Wemmershoek	0%	31%	54%	23.1%	34.2%	69.2%
Pniel	92%	52%	66%	53.3%	53.8%	74.4%
Klapmuts	54%	80%	69%	60.0%	72.9%	79.5%
Raithby	58%	54%	80%	53.3%	67.5%	87.2%

Industrial Consumers: The quality of the industrial effluent discharged into the Municipality's sewer system is monitored monthly by Stellenbosch Municipality.

TOPIC 7: FINANCIAL

Capital Budget: The table below gives an overview of Stellenbosch Municipality's historical water and sewerage capital expenditure over the last three financial years.

Table A.7.1: Historical Capital expenditure of the water and sewerage infrastructure projects						
Financial Year	Water Infrastructure			Sewerage Infrastructure		
	Budget	Expenditure	% Spend	Budget	Expenditure	% Spend
2021/2022	R49 250 028	R35 797 206	73%	R73 524 472	R64 838 150	88%
2022/2023	R82 858 090	R73 907 194	89%	R43 409 482	R40 100 719	92%
2023/2024	R75 162 071	R72 954 522	97%	R29 244 591	R18 960 932	65%

Operational Budget: The table below gives a summary of the O&M expenditure and income for Water Management and Waste Water Management for the last five financial years.

Table A.7.2: Summary of Operational and Maintenance expenditure and income budgets for water and sanitation services						
Service	Expenditure / Income	2019/2020	2020/2021	2021/2022	2022/2023	2023/2024
Water	Expenditure	R129 425 045	R133 103 899	R130 660 076	R139 981 129	R188 693 168
	Income	R197 988 808	R155 977 202	R159 947 375	R174 277 325	R219 897 784
	Surplus / (Deficit)	**R68 563 763**	**R22 873 303**	**R29 287 299**	**R34 296 196**	**R31 204 616**
Sanitation	Expenditure	R121 738 318	R141 130 178	R136 010 638	R151 856 835	R168 251 439
	Income	R149 969 988	R143 373 736	R142 903 845	R149 401 570	R169 299 629
	Surplus / (Deficit)	**R28 231 670**	**R2 243 558**	**R6 893 207**	**R2 455 265**	**R1 048 190**

Water Management generated operating surpluses for the last five financial years. Waste Water Management also generated surpluses for four of the last five financial years, except for the 2022/2023 financial year. The surpluses are used to subsidise other services that do not generate enough own revenue to sustain themselves.

Tariff and Charges: Stellenbosch Municipality's current (2024/2025) water and sewer tariffs are based on the following:

- A seven-block step rising residential water tariff structure, with the first 6 kl/month being free for all indigent registered households (Subsidised).
- A fix tariff per Kl for Commercial, Business and Industrial consumers.
- A fix tariff per Kl for Miscellaneous and All Other users (Schools, Sport Bodies, Churches and Charity Organisations).
- A three block step rising water tariff structure for Municipal usage.
- Water restriction tariffs (10%, 20%, 30% and 40%) are also in place.
- The annual sanitation tariffs are based on either one of the following:
  - The size of the erf for properties utilised for dwelling purposes, all vacant erven and all other developed erven.
  - Levies based on the usage and floor areas of the buildings (Offices, Halls, Shops, Educational and Research buildings, Hospitals, etc.).

The cost residential consumers had to pay for their water in Stellenbosch Municipality's Management Area, for the various financial years, is presented on the graphs below.

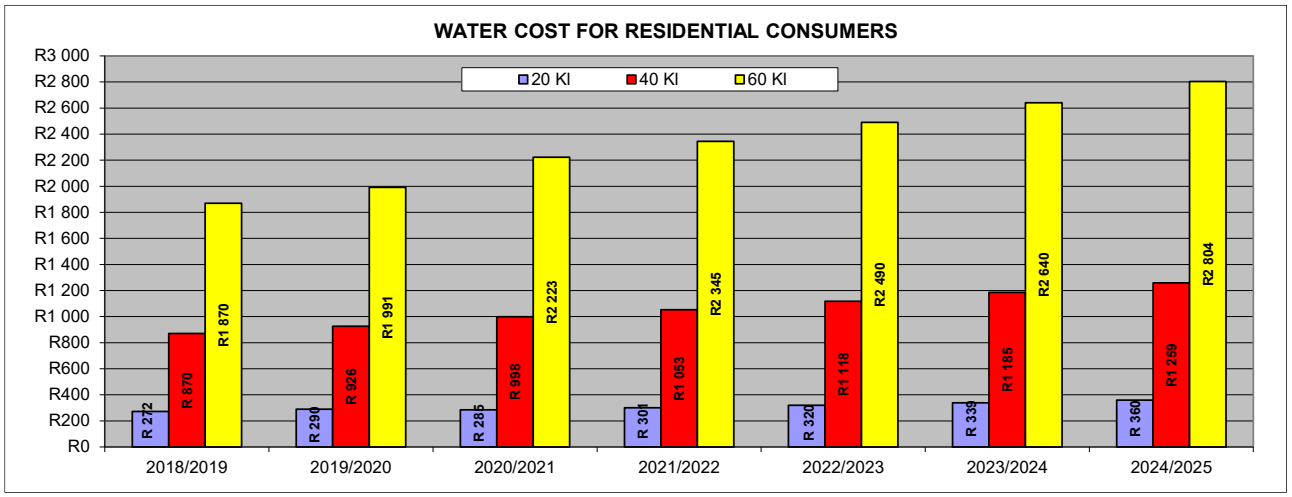

Figure A.7.1: Water Cost for Residential Consumers

TOPIC 8: WATER SERVICES INSTITUTIONAL ARRANGEMENTS AND CUSTOMER SERVICES

Stellenbosch Municipality is the WSA and Water Services Provider for the various towns in Stellenbosch Municipality's Management Area. Raw water is supplied from the WCWSS to the Paradyskloof WTW and bulk potable water is also supplied by the CCT to the greater Stellenbosch system, the Franschhoek system, the Klapmuts system and the Dwars River system. The areas in Stellenbosch Municipality supplied with potable water by the CCT from their WTWs are as follows:

- Wemmershoek WTW: Portion of Franschhoek, La Motte, Wemmershoek, Pniel, Boschendal, Johannesdal, Kylemore, Lanquedoc, Klapmuts, Koelenhof, Elsenburg, Devon Valley and Mudersvlei.
- Blackheath WTW: Polkadraai, Spier and Vlottenburg.
- Faure WTW: Faure, Jamestown, De Zalze, Raithby and Lynedoch.

The existing Water and Sewer Master Plans of Stellenbosch Municipality were updated during 2023/2024 and 2024/2025 and were incorporated into the WSDP. All forward planning for water and sanitation services and water and sewerage infrastructure is guided by the Water and Sewer Master Plans.

W_2RAPs are in place for all the WWTWs and sewer drainage networks (August 2021). Detail WWTW Process Audits were also compiled during June 2021. A Water Safety Plan was also previously drafted (February 2013), which requires updating. The Municipality annually compile the WSDP Performance- and Water Services Audit Report, as required by the Water Services Act and the DWS.

Stellenbosch Municipality is currently effectively managing their water and sanitation services. Special focus is however required to ensure adequate rehabilitation and maintenance of the existing water and sewerage infrastructure, with adequate operational personnel.

The IDP is the Municipality's single most strategic document that drives and directs all implementation and related processes. The Municipality's budget is developed based on the priorities, programmes and projects of the IDP, after which a Service Delivery Budget Implementation Plan (SDBIP) is developed, to ensure that the organisation actually delivers on the IDP targets.

The SDBIP is the process plan and performance indicator / evaluation for the execution of the budget. The SDBIP is being used as a management, implementation and monitoring tool that assists and guide the Executive Mayor, Councillors, Municipal Manager, Senior Managers and the community. The plan serves as an input to the performance agreements of the Municipal Manager and Directors. It also forms the basis for the monthly, quarterly, mid-year and the annual assessment report and performance assessments of the Municipal Manager and Directors.

Municipal Strategic Self-Assessment (MuSSA): Overseen by the DWS the MuSSA conveys an overall business health of municipal water business and serves as a key source of information around municipal performance. The MuSSA also identifies key municipal vulnerabilities that are strategically important to DWS, the Department of Cooperative Government (DCoG), National Treasury, the planning Commission/Office of the Presidency, the South African Local Government Association (SALGA) and the municipalities themselves. The MuSSA team continues to engage (1) DWS directorates and their associated programmes (e.g. Water Services Development Plan, Water Services Regulation), and (2) other sector departments and their associated programmes (e.g. LGTAS, MISA) to minimize duplication and ensure alignment. Through the tracking of current and likely future performance, the key areas of vulnerability identified, allow municipalities to effectively plan and direct appropriate resources that will also enable DWS and the sector to provide support that is more effective.

The Spider Diagram below effectively indicates the vulnerability levels of Stellenbosch Municipality across the eighteen key service areas, as identified through the Municipal Strategic Self-Assessment of Water Services process (2023).

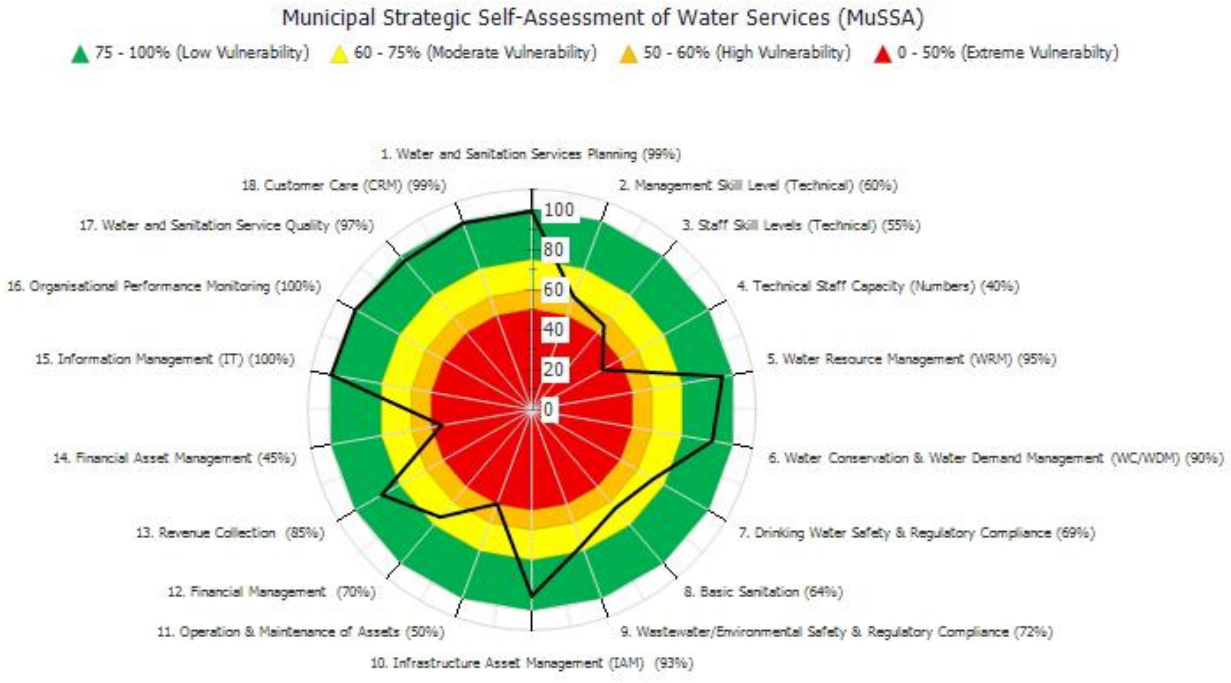

Figure A.8.1: Spider Diagram of the Vulnerability Levels of Stellenbosch Municipality for 2023

Stellenbosch Municipality's Vulnerability Index for 2023 was indicated as 0.44 "Moderate Vulnerability". The areas of concern evident from the 2021 assessment are Operation & Maintenance of Assets (50.0%), Financial Management (45.0%), Staff Skill Levels (Technical) (55.0%) and Technical Staff Capacity (Numbers) (40.0%).

A comprehensive Customer Services and Complaints system is in place at Stellenbosch Municipality and the Municipality has maintained a high and a very consistent level of service to its urban water consumers. A Customer Care Service Charter is also in place.

DWS's No Drop Process: Stellenbosch Municipality also received their 2023 No Drop Score, as calculated through the 2023 Assessment done by the DWS. The 2023 No Drop assessments were performed using a reduced set of No Drop Criteria. These criteria were selected to assess a WSA's understanding of their WC/WDM status, the plans, strategies, budgets, and implementation of remedial projects.

Below is a brief description of the Criteria used for the 2023 assessment.

Table A.8.1: Description of No Drop Criteria	
Criteria 1	WC/WDM status quo, plans and strategies, budgets, and implementation of projects (Water Resource Diagram, Water Balance, Council approved WC/WDM strategies and budgets)
Criteria 2	Asset management as it relates to meter replacement. Monitoring, analysis, and action of high loss District Metered Areas (DMAs) in metropolitan municipalities
Criteria 3	Technical skills of WC/WDM team
Criteria 5	Compliance and Performance based on the water loss and efficiency Key Performance Indicators (KPI) and year on year improvement there-of

The purpose of the 2023 No Drop Assessments was twofold:

- To complete the consultative assessment of the 144 WSAs as per the No Drop Requirements based on the 2021/22 financial year.
- To update the water balance and water loss benchmarking for the 2022/23 financial year. This is reported on in the Status of Water Loss, Water Use Efficiency and Non-Revenue Water in South African Municipalities (2012/13 to 2022/23).

Table A.8.2: No Drop Performance of the Municipality (DWS's 2023 No Drop Report)		
No Drop Score (2021/2022)		**57%**
Criteria	**Weight**	**Score**
1: WC/WDM Strategy, Planning and Implementation	45%	55% (Average)
2: Asset Management	10%	40% (Poor)
3: Technical Skills	10%	20% (Critical)
5: Compliance and Performance	35%	46% (Poor)
Weighted Sub-Total		**47%**
Bonus		10%
Score		**57% (Average)**
Penalty 1: No evidence of approved budget		0.0%
Penalty 2: Section 82 of the Water Servies Act		0.0%
Criteria 1 Sub-Items: WC/WDM Strategy, Planning and Implementation		
Item		**Score (Max = 1)**
1.1: Water Resources		1.0 (Excellent)
1.2: Water Balance		0.8 (Good)
1.2: WC/WDM Strategy and Business Plan		0.0 (Critical)
Penalty 1: No evidence of approved budget		0.0
Criteria 5 Sub-Items: Compliance and Performance		
Item		**Score (Max = 1)**
5.1: Reticulation Leak Repair		0.3 (Poor)
5.2: Physical Water Losses		0.4 (Poor)
5.3: Commercial Water Losses		0.5 (Average)
5.4: Non-Revenue Water		0.4 (Poor)
5.5: Water Use Efficiency		0.7 (Average)
Water Balance Integrity		**High (Excellent)**

Regulatory Impression: The score of 57% indicates an average performance for Stellenbosch Municipality.

- There is ample room for improvement. Stellenbosch Municipality has demonstrated some understanding of its water use situation and WC/WDM Strategy.
- The IWA water balance did not include all the required components and/or did not cover the supply area. The integrity of the water balance was considered to be high.
- Proof of some consumer meter maintenance and replacements was provided, but an insufficient number of interventions were implemented during the 2021/22 audit period.
- There are staff at the WSA responsible for water loss management, but there were shortcomings in the team and/or the related documentation.
- Leak repairs were proven, but an insufficient number of repairs were completed in the 48-hour response time.
- The regulator calculated the key performance indicators for physical water losses (ILI), commercial water losses, NRW, water use efficiencies based on the water balance.

DWS's Blue Drop Process: The DWS completed the Blue Drop process for the WSAs in 2023. Blue drop status is awarded to those towns that comply with 95% criteria on drinking water quality management. The blue drop performance of Stellenbosch Municipality was summarised as follows in the DWS's 2023 Blue Drop Report.

Table A.8.3: Blue Drop Performance of the Municipality (DWS's 2023 Blue Drop Report)	
Municipal Blue Drop Score	**2011 – 95.74%, 2012 – 95.56%, 2014 – 80.12% and 2023 – 84.65%**

Introductions: Stellenbosch Local Municipality supplies approximately 126 795 people with potable water through a total of 5 water supply systems and one water service provider. The municipality is responsible for operating and maintaining the water supply network, treatment systems and distribution of 2 systems: Franschhoek and Stellenbosch CBD. The Stellenbosch CBD system is supplied by 2 WTWs (Idas Valley WTW and Paradyskloof WTW), which are operated and maintained by the Stellenbosch LM. The two water supply systems withdraw water from dams and a fountain in the Berg-Olifants catchment area.

The Water Service Provider (WSP), City of Cape Town, supplies treated water to three of the municipality's systems for distribution, namely: Blackheath, Faure and Wemmershoek. In the distribution and delivery systems, Stellenbosch LM contributes a total SIV of 22 907 kl/d and City of Cape Town 8 933 kl/d (1 675 kl/d via Blackheath WTW; 1 990 kl/d via Faure WTW and 5 268 kl/d via Wemmershoek WTW), accounting for 100% (31 840 kl/d) distributed by Stellenbosch LM.

Regulatory Impression: The Stellenbosch Local Municipality team exhibited a positive attitude towards the Blue Drop assessment process and recognized the value of the assessments in assisting them with improving the management of their water supply systems and optimisation of their operational efficiency. Unfortunately, the position of Manager for Water was vacant at the time of the assessments and the team was not well prepared in terms of uploading documentation on IRIS in advance of the main audit. The audit team acknowledges the involvement and support of the Senior Manager for Water & Wastewater Services, as well as the Manager for Wastewater in rectifying the situation, so that a meaningful assessment can be conducted. The Blue Drop scores for the systems supplied by the City of Cape Town, namely, Blackheath, Faure and Wemmershoek, are consistent with those in 2014, with Wemmershoek showing an improvement. Regrettably, the Blue Drop scores for Franschhoek and Stellenbosch CBD have decreased since the last Blue Drop audit in 2014. The main reasons for this deterioration are the lack of implementation of a coordinated water safety planning process with the associated compliance monitoring programmes, no evidence of operational monitoring programmes and actual operational monitoring and no process audits informing the risk management process. However, despite the deterioration in these scores, the WSA should be lauded for supplying drinking water of excellent quality to its consumers. Overall, both chemical and microbiological compliance is excellent, although the audit team noted a relatively poor microbiological compliance in the Blackheath distribution system managed by the Stellenbosch LM.

Despite not attaining Blue Drop status, the Stellenbosch team should be commended for their actions in several key areas. Design capacities of the WTWs, water balances for all the supply systems and daily flow measurement data are available for the full 12 months of the assessment period. However, flow meters are not calibrated, and the team is encouraged to ensure the meters are calibrated regularly to ensure accuracy of flow measurements. Process controllers for all the WTWs are compliant with the Blue Drop requirements. The WSA employs a full contingent of engineering staff and a professional scientist.

There are, however, several areas identified for improvements. The team is encouraged to focus on enhancing their management processes and procedures to ensure compliance with relevant norms and regulations. Supervisors need to be employed, trained, and registered to ensure compliance with Blue Drop requirements. The WSA has a full multi-disciplinary maintenance team, but a coordinated maintenance programme (preferably informed by a comprehensive asset register) should be developed, implemented and the maintenance records should be formalised to ensure longevity of equipment and infrastructure, as well as reducing the risk of equipment failure. The Stellenbosch Municipality's team is encouraged to review the WaSP that was completed in 2020 and focus on the implementation of a risk-management process supported by associated compliance and operational monitoring programmes. Comprehensive process audits are essential for efficient operation and risk mitigation. The findings and recommendations of the process audits should be integrated into the Water Safety Planning process. Regular inspections and condition assessment of all water reticulation systems need to be undertaken, the findings need to be formally reported and recommendations should be implemented. For the Franschhoek and Idas Valley WTWs the WSA needs to obtain water use authorisations for raw water abstraction. The WSA should review its existing Incident Management Protocols and maintain incident registers and logbooks. The WSA should also improve its supply chain management procedures.

Table A.8.3: Blue Drop Performance of the Municipality (DWS's 2023 Blue Drop Report)

The audit team firmly believes that the Stellenbosch team has the necessary managerial and technical competence to strive for Blue Drop status during the next Blue Drop audit cycle. This will be achieved by focusing on the abovementioned areas of improvement.

Several capital projects are planned for the Stellenbosch CBD WSS to improve asset condition and operational efficiency:
Stellenbosch CBD:

- R1,193,075 Refurbishment - Idas Valley Water Treatment Works
- R500,000 Bulk Water Supply Pipeline and Reservoir – Jamestown
- R11,851,547 New Reservoir – Rosendal.

Blue Drop Findings:

- While process controllers for all Stellenbosch LM's WTW's comply with Blue Drop requirements, supervisors do not comply with regulatory requirements. The WTWs are not officially registered on IRIS in terms of Regulation 2834.
- Although the WSA provided proof of a full maintenance team, there is no evidence of coordinated maintenance plans and maintenance logbooks.
- The WSA employs qualified engineering staff and a professional scientist.
- Water Safety plans were compiled in 2020 but have not been implemented and have not been reviewed. There is no proof of a risk-based compliance monitoring programme.
- There is no evidence of compliant operational monitoring programmes and no proof that operational monitoring is taking place.
- The WSA uses an external laboratory which is fully accredited.
- Incident Management Protocols were compiled in 2020 but have not been formally implemented and reviewed. There is no evidence of any incident registers or logbooks.
- Partial system-specific operational cost determinations are done, including costs of raw water and employee remunerations, but excluding costs for electricity, chemicals, and maintenance.
- Global water specific operational budgets and expenditure systems for water treatment and supply are in place but can be further refined to allow more accurate financial planning and control.
- Supply chain management is lacking. Approved contracts for chemicals and treatment consumables are in place, but there are no service agreements for spares, maintenance, or calibration of flow meters.
- Water use authorisations are only available for the Paradyskloof WTW.
- Design capacities for all WTWs are available and WTWs are operating within their design capacities. While daily flow measurements are taken on all WTWs, flow meters need to be calibrated. Water balances are available for all water supply systems.
- The WSA has not conducted any process audits. Condition assessments by internal staff are available for the Franschhoek and Stellenbosch CBD WTWs; however, findings and recommendations have not been implemented and incorporated in the Water Safety planning and risk management process.
- The WSA does not undertake regular inspections of the reticulation systems for any of the water supply systems.
- Although an asset register is in place, it needs to be expanded to inform maintenance plans and schedules.
- Microbiological and chemical compliance is excellent for all systems, except for the Blackheath distribution system managed by Stellenbosch LM, which has a relatively poor microbiological compliance. While chemical monitoring compliance is adequate for Franschhoek and Stellenbosch CBD, there is room for improvement.

Technical Site Assessment:

The **Paradyskloof WTW** was inspected to determine the condition and functionality of infrastructure, to assess operational performance on site and to verify the Blue Drop audit findings. The WTW received a technical site score of 71% with a VROOM estimated cost of R1 406 900 required to restore the system to full functionality. The WTW is relatively new, and the infrastructure is generally in very good condition and well maintained. A serious concern is that free chlorine is not measured in the final treated water. The WSA relies on intermittent E.coli count measurements in various reservoirs to determine microbiological quality compliance. This is a major risk and the WSA should address this urgently. Refer to the Blue Drop Watch Report 2023 for more detail.

DWS's Green Drop Process: The DWS completed the new Green Drop assessment for the WSAs in 2021 and the results were received early in 2022. Green drop status is awarded to those WSAs that comply with 90% criteria on key selected indicators on wastewater quality management. The green drop performance of Stellenbosch Municipality is summarised as follows in the DWS's 2022 Green Drop Report.

Table A.8.5: Green Drop Performance of the Stellenbosch Municipality (DWS's 2022 Green Drop Report)	
Average Green Drop Score	**2009 – 53%, 2011 – 71%, 2013 – 40%, 2021 – 84%**

Regulator's Comment: Stellenbosch Local municipality has delivered a sterling performance during the 2021 audit cycle, as is evident from an 84% Green Drop score. This marks a progressive upwards movement from the 2013 baseline score of 40%. The Regulator noted the change being brought about by a highly committed and qualified team, coupled by systematic improvements made over several years since the last Green Drop assessments. Four (4) of the 5 systems have scored >80%, and all 5 systems reside in medium- and low risk CRR positions.

An outstanding feature by Stellenbosch has been the persistent refurbishments and amendments to the Stellenbosch WWTW (the largest size plant). Senior management commitment and attention to their staff's needs seems to make a markable difference and is evident in terms of financial and technical support to the staff and systems. Nevertheless, further improvements can be made to move the municipality to Green Drop Certification status in 2023, if they are addressed. These include but are not limited to finalisation of pending authorisations for the works that are still outstanding, implementing plans for using the generated and classified sludge to the benefit of the municipality.

Linking process audits/conditional assessment findings of the works to the respective W_2RAPs and provide practical implementation plan of all the risks identified.

Stellenbosch is appraised for its high standard and modern equipped laboratory that is used for inhouse operational monitoring and river health monitoring. The laboratory renders a professional scientific service to all WWTWs of the municipality. Furthermore, the municipality has a fully-fledged pollution control unit department that focuses on all the industrial discharges and thereby enforcing bylaws. Stellenbosch sets an example for professionalisation of wastewater services and the Regulator is pleased to acknowledge Stellenbosch for its service and performance, notably in the office and in the field, as can been seen by the 84% Green Drop score and 80% TSA score for the Stellenbosch system. Well done.

Green Drop findings:

1. More than 90% has been achieved against KPAs A and B for all systems, except Raithby.
2. Pniel exceeds its design capacity, all other WWTWs are well below.
3. Work is required to classify and allocate Process Controllers to specific systems, or define their allocations across different systems.
4. Zero out of 5 WWTWs complied with all effluent quality categories (i.e., Microbiological, Chemical and Physical) – this was the single reason for not achieving Green Drop excellence status. The good microbiological compliance by Pniel is acknowledged.
5. Energy efficiency management is not practiced; hence, recommendations were made to tap in with existing initiatives by SALGA, DMRE, GIZ and WISA.
6. Most of the licenses/permits are outdated and engagement with DWS must be intensified to resolve this before the next audit.
7. Wemmershoek WWTW is currently undergoing planned upgrades and it is expected to resolve the effluent compliance issues.
8. No plants in the high or critical risk positions.
9. Bonusses have been maximised by offering additional evidence, only one penalty applied for the Pniel system.
10. Budget had been secured for capital projects for replacement, upgrades, and addition of new unit process at some of the WWTWs and associated infrastructure:
    - R989,000: Stellenbosch WWTW upgrades through internal funding and capital replacement reserves.
    - R90,000,000: Wemmershoek WWTW upgrades through internal funding and capital replacement reserves.
    - R47,000,000: Pniel WWTW upgrades through internal funding and capital replacement reserves.
    - R16,000,000: Klapmuts WWTW upgrades through internal funding and capital replacement reserves.
    - R5,000,000: Raithby WWTW upgrades through internal funding and capital replacement reserves.

The Stellenbosch WWTW was inspected to verify the Green Drop Audit Findings: Technical Site Assessment Score 80%

- The plant's installed and design capacity is 35 Ml/day and consist of: 27 Ml/d MBR (submerged membrane bioreactor) plant (new plant commissioned in 2019) and 8 Ml/d conventional activated sludge plant (old plant but recently refurbished and amended configuration).
- A combined inlet works (mechanical screens, vortex degritters and flow measurement) provides preliminary treatment for both parts of the works (new and old). There is no primary settlement, but there are fine screens for the new works to protect the submerged membranes. The final effluent streams are again blended, and disinfection is via UV.

Table A.8.5: Green Drop Performance of the Stellenbosch Municipality (DWS's 2022 Green Drop Report)

- The flow to the plant is only 16 Ml/d which has decreased since the recent water restrictions and COVID (less students at Stellenbosch university). The works appear to be in very good condition and despite a few minor teething problems, appears to be well operated.
- The discharge requirements are 'special limits' which is currently under dispute with DWS, in particular the UV disinfection, noting that the receiving river is under general limit conditions.
- Good quality sludge was produced, as product of aerobic digestion and belt presses. The sludge is taken to the landfill site which will have to be reviewed in future under new legislation.
- The MBR plant and aerobic digestion is (inherently) power intensive and the works SPC and energy efficiency could potentially be further optimized.
- The works has a Dissolved Air Flotation unit that is currently not utilised.

Stellenbosch Municipality also received their 2023 Green Drop Risk Ratings, as calculated from the 2023 assessment done by the DWS.

Table A.8.6: Green Drop Risk Rating of Stellenbosch Municipality (DWS's 2023 Green Drop Progress Report)

Municipal CRR% 2023 (%CRR/CRRmax)	84.1%

Introduction:

Stellenbosch Local Municipality is responsible for the management and operation of the five (5) WWTWs using various technologies and various sizes from the Activated Sludge plant at Stellenbosch (20 400 kl/day) to the 150 kl/day Rotating Biological Contactors at Raithby.

Regulator's Comments: Stellenbosch Local Municipality failed to provide any information at all to the regulator to verify the accuracy of the information on the IRIS and to allow the review of the CRR scores. This dismal performance is of great concern to the regulator as the WWTWs are all high-risk sites due to the high CRR scores. There is a significant lack of correct design capacity information for all sites which has impacted on the successful registration of these sites on the IRIS. No information on the operational flow is available for any of the sites and this represents a critical risk as a lack of flow measurement information impacts on the CRR score significantly. The WSA must confirm the operational capacity of all works with accurate flow records. In addition, the WSA must ensure that inflow meters are installed and that daily flow readings are recorded. Annual flow meter calibration should also be performed to ensure that the operational capacity of the works does not exceed its design capacity.

The final effluent quality at all sites is of concern. Most concerning is the effluent quality from the Stellenbosch and Wemmershoek WWTWs as the effluent from both these sites fails to meet the discharge limits for most of the required parameters including very poor microbiological quality. This presents a significant risk to downstream users. No information on sludge quality is available. The poor effluent quality is a reflection on the lack of skilled operational and maintenance staff at these sites and presents a critical risk for SLM. These positions should be prioritized as effective operation cannot take place without competent staff to operate and maintain the treatment works. The lack of registered skilled process controllers and supervisors at many of the sites is concerning. On a positive note, the availability of a qualified supervisor and sufficient process control staff at Stellenbosch WWTW is to be commended. The WSA should ensure that the other sites area also provided with competent and qualified supervisors and process control staff to ensure effective operation and management of the treatment works including Klapmuts, Pniel, Raithby and Wemmershoek. No information on the maintenance team is available, which is a critical risk to the effective management of a WWTWs. The lack of a maintenance team with required competencies presents a high risk of as this will negatively impact on functionality of the WWTWs.

No information was provided by the WSA for Wastewater Risk Abatement Planning (W_2RAP) and no GDIP or Corrective Action Plan (CAP) documentation was provided. No descriptions of current projects or future capital projects are available as the WSA did not provide any evidence for the GD PAT via the municipal information spreadsheet (MIS) or on the IRIS system. The WSA is encouraged to develop or review and implement the risk-based methodology of the W_2RAP as this ensure minimizing the overall risk rating and improvement in effluent quality compliance. The WSA must also develop and implement a GDIP plan which identifies the shortcomings for all Green Drop criteria and allocates responsibility, budget and time frames to address the gaps. Overall, the lack of interest exhibited by the SLM during the GD PAT does not inspire confidence in the ability of the WSA to manage these treatment works effectively, and it is hoped that the WSA will engage with the Regulator in future to ensure effective wastewater management.

SECTION B: STATE OF WATER SERVICES PLANNING

This updated WSDP is for the 2022-2027 five year cycle. The Municipality also annually compile the WSDP Performance- and Water Services Audit Report, as required by the Water Services Act and the DWS. The last WSDP Performance- and Water Services Audit Report was compiled for the 2023/2024 financial year. The Municipality will continue to compile annual WSDP Performance- and Water Services Audit Reports, as required by the Water Services Act and the DWS. The annual draft WSDP Performance- and Water Services Audit Report needs to be available before the end of October during each financial year and needs to be taken to Council with the Municipality's Annual Report.

W_2RAPs are in place for all the WWTWs and sewer drainage networks (August 2021). Detail WWTW Process Audits were also compiled during June 2021. A Water Safety Plan was also previously drafted (February 2013). Both the existing Water Safety Plan and the W_2RAPs need to be updated. WTW and WWTW Process Audits also need to be compiled regularly.

Water Safety Plans are a form of water quality assurance through a comprehensive risk assessment and risk management approach that encompasses all steps in water supply from catchment to consumer. The multiple barrier principle implies that actions are required at all stages in the process of producing and distributing water in order to protect water quality.

The W_2RAP is an all-inclusive risk analysis tool by which risks associated with the management of collection, treatment and disposal of wastewater are identified and rated (quantified). The W_2RAP is used by Stellenbosch Municipality to manage the identified risks according to its potential impacts on the receiving environment / community / resources.

Stellenbosch Municipality updated their Water and Sewer Master Plans. The Water and Sewer Master Plan process entails the establishment of computer models for the water systems and the sewer systems in Stellenbosch Municipality, the linking of these models to the stand and water meter databases of the treasury financial system, evaluation and master planning of the networks and the posting of all the information to IMQS. The Water and Sewer Master Plans lists the analyses and findings of the study on Stellenbosch Municipality's water distribution and sewer drainage systems.

The existing Water and Sewer Master Plans, which were available for inclusion in Stellenbosch Municipality's WSDP, were as follows:

- Water Master Plan, Stellenbosch Municipality, July 2025, GLS Consulting
- Sewer Master Plan, Stellenbosch Municipality, July 2025 GLS Consulting

The following water and sanitation related investigations were successfully completed during the 2023/2024 financial year.

- The Water Services Audit Report for the 2022/2023 financial year was finalised and approved by the Council as part of the Annual Report. The water balance models were also updated for each of the distribution systems (Up to the end of June 2023) as part of the WSDP Performance- and Water Services Audit Process.

- Stellenbosch Municipality continues with the monitoring of the Minimum Night Flows at various locations in order to identify the areas with unrealistic high night flows. The SCADA system is used to monitor the flows for the different areas.

- Stellenbosch Municipality continues with the implementation of their Drinking Water Quality and Effluent Quality Sampling Programmes (Both Operational and Compliance Monitoring). The effluent discharged by industrial consumers into the Municipality's sewer system is also monitored by Stellenbosch Municipality.

- The water and sewerage infrastructure constructed during the 2023/2024 financial year were added to the Asset Register and the Asset Register was updated.

SECTION C: WATER SERVICES EXISTING NEEDS PERSPECTIVE

The existing needs perspective as presented below was developed through a systematic and comprehensive review of the water services function in terms of the WSDP Guide Framework. The output from this process is presented below and includes compliance assessment in terms of:

- The intervention required to address the gap;
- The proposed solution to address the gap; and
- The Future plan / identified project that would meet the requirement.

The water services situation analysis prompted the development of problem statements which formed the input for the development of the water services objectives and strategies which follows in Section D.

The Vision statement of Stellenbosch Municipality is "**An Integrated Valley of Opportunity and Innovation**"

Stellenbosch Municipality's mission is to deliver services in an enabling environment through sustainable, cost-effective and accountable services for our community.

Stellenbosch Municipality's Strategic Focus Areas and Pre-determined Objectives, as included in the 3rd Review of the 5th Generation IDP 2022 – 2027, May 2025, are as follows:

- Valley of Possibility (SFA 1).
  - Create an environment conducive to business development and job creation.
  - To facilitate and coordinate support to emerging entrepreneurs by utilising internal SCM processes and linking SMMEs with opportunities in the market.
  - To provide, upgrade and maintain an effective engineering infrastructure to support effective service delivery.
  - To ensure the provision of non-motorised transport routes as a functional mode of transport
- Green and Sustainable Valley (SFA 2)
  - Managing human use of the biosphere and its resources.
  - Enhancing the integrity of the environment is imperative for long-term sustainability.
  - Incorporating biodiversity into the environment as an imperative for long-term sustainability.
  - Ensuring spatial sustainability.
  - Facilitate efficient use of all forms of capital available to Stellenbosch.
  - Building Human capacity and ability.
  - Efficient information management.
- Safe Valley (SFA 3)
  - To implement an integrated safety strategy that incorporates multi-stakeholder engagements and social crime preventions.
  - To develop and implement institutional crime prevention strategies, with the focus on improved law enforcement and neighbourhood watches.
- Dignified Living (SFA 4)
  - To develop and maintain sustainable human settlements that will deliver in the diverse range of housing needs.
  - To develop and implement a social infrastructure master plan for the upgrading and maintenance of social facilities in all wards.
  - To involve and build the capacity of stakeholders in the planning and management (governance) of the areas where they live (Promote participatory planning and integrated implementation).

- To provide access to basic services for households in the WC024 area.

- Good Governance and Compliance (SFA 5)
  - To develop, align and implement effective management information systems.
  - An effective asset management system to optimise the use of municipal assets.
  - To manage integrated development planning and the efficient measurement of predetermined objectives as per regulatory framework.
  - To involve the community in the planning and management of programmes and projects impacting their ward(s),
  - To review municipal governance processes as per the Risk-Based Audit Plan
  - A skilled and capable workforce that supports the growth objectives of the municipal area
  - A responsive, accountable, effective and efficient local government system
  - To implement an effective revenue management system.
  - To provide accurate and relevant financial information for decision-making.
  - To develop and implement a responsive, accountable, effective and efficient customer care structure and system.

The **Strategic Risks** identified for Stellenbosch Municipality, as included in the 3rd Review of the 5th Generation IDP 2022 – 2027, May 2025 are as follows:

- Availability and cost of electricity;
- Increased risk of a land invasion;
- Economic downturn due to civil unrest and crime;
- Climate change;
- Scarcity of Landfill Space; and
- Increase in community unrest since the growth in demand for housing exceeds the resources available for development.

The **Operational Risks** identified for Stellenbosch Municipality, as included in the 3rd Review of the 5th Generation IDP 2022 – 2027, May 2025 are as follows:

- Timeous Capital Spending;
- Insufficient burial space in the greater Stellenbosch;
- Water Security;
- High Vacancy Rate; and
- Material misstatements in the AFS that constitute noncompliance with Section 122 of the MFMA. System errors, transactions and events not recognised as they occur and accordingly not recorded in the financial period.

Stellenbosch Municipality's Management Area falls within the Breede-Olifants Catchment Management Area. The Breede-Olifants Catchment Management Agency was established by extending the boundary and area of operation of the Breede-Gouritz CMA Water Management Area (Government Gazette No.47559, 25 November 2022).

The area of operation of the Breede-Olifants Catchment Management Agency includes the previous Breede-Gouritz and Berg-Olifants water management areas as pronounced in the National Water Resource Strategy second edition, 2013.

A Catchment Management Strategy is not yet available for the Breede-Olifants Water Management Area (BOWMA), but the Catchment Management Strategy of the former Breede-Gouritz Water Management Area (BGWMA), July 2017, included the following Vision and three Strategic Focus Areas.

"Healthy water resources, for all, forever,"

- **Strategic Area 1: Protecting for People and Nature:** Focusing primarily on management of streamflow, water quality, habitat and riparian zones related to riverine, wetland, estuarine and groundwater resources, to maintain important ecosystem goods and services and biodiversity.
- **Strategic Area 2: Sharing for Equity and Development:** Focusing primarily on management of water use from surface and groundwater resources through the operation of infrastructure, in order to provide water for productive and social purposes within and outside of the WMA.
- **Strategic Area 3: Co-operating for Compliance and Resilience:** Focusing primarily on co-operation and management of institutional aspects to enable and facilitate the protection and sharing of water, including the more co-operative stakeholders, partnerships, information sharing, disaster risk and adaptation elements of the strategy.

TOPIC 1: SETTLEMENTS AND DEMOGRAPHICS

Table C.1.1: Settlement Demographics and Public Amenities

Section	Intervention Required	% (1)	Solution description as identified by Master Plan	% (2)	Is there an Existing project/activity addressing this problem?	Current Demand Overall Scoring % (3)
Settlements Summary	No	100	Continue with the implementation of the spatial and non-spatial proposals for the various areas as included in the SDF of 2023 and Stellenbosch Municipality's Housing Pipeline and ensure that all new developments are aligned with these proposals.	100	Yes	78.6
	No	100	All resources, especially surface water resources, need to be re-evaluated, especially where demand is close to the safe one in twenty year yields. Establish assurance of supply levels of all water sources. Ensure that the provision of bulk water and sewerage infrastructure are aligned with the Housing Pipeline and that housing projects only continue once the required bulk water and sewerage infrastructure are in place, as indicated in the Water and Sewer Master Plans and this WSDP.	100	Yes	78.6
Summary by Settlement Group	No	100	-	100	-	100
Assessment Score by Settlement Type	No	100	-	100	-	100
Amenities Summary	No	100	-	100	-	100

Notes: (1) Is this section addressed in the WSDP?
(2) Were solutions identified for the possible gaps?
(3) Percentage calculated based on the above two percentages and whether there is an existing project/activity addressing this problem?; Does this current listed project/activity address the problem totally?; Project/Activity approved by Council as part of WSDP database?; Approved by Council in project activity database and part of 5yr IDP cycle projects?; Project/Activity listed in 3yr MTEF Cycle?

Stellenbosch and Klapmuts are the settlements where significant development over the short to medium term is foreseen. The potential of Klapmuts for economic development and associated housing is particularly significant, located as it is on the metropolitan area's major freight route. Over the longer term, the Muldersvlei / Koelenhof and Vlottenburg / Lynedoch areas can potentially develop into significant settlements. Although considerably smaller than Stellenbosch and Klapmuts, these expanded settlements are nevertheless envisaged as balanced, inclusive communities. Over the longer term, these expanded settlements are foreseen to fulfil a role in containing the sprawl of Stellenbosch town, threatening valuable nature and agricultural areas. Importantly, they should not grow significantly unless parallel public transport arrangements can be provided.

The remainder of settlements are not proposed for major growth, primarily because they are not associated with movement routes and other opportunity than can support substantial livelihood opportunity for all community groups. The focus in these settlements should be on on-going improvements to livelihood opportunity for residents, and the management of services and places. The largest of these settlements is Franschhoek, a significant tourism destination.

The Engineering Services Department supports the focus on Stellenbosch and Klapmuts as priority development areas as appropriate bulk service networks exist which could be expanded upon. The secondary investment areas identified along Baden Powell Drive and the R304 will require significant bulk infrastructure development. Extensive development is not supported in these areas until sufficient capital funding is available to fund the required infrastructure.

Engineering Services also support the principle that development in these secondary areas should only be supported once appropriate public transport services are available.

The **objective of Stellenbosch Municipality's Housing Pipeline** is to place more emphasis on the following housing types of programmes:

- Social housing (the National Minister of Human Settlements approved Stellenbosch as a restructuring town and restructuring zones in November 2016;
- Provision of serviced sites;
- Access to affordable housing (GAP housing);
- Upgrading of informal settlements; and
- Mixed-use housing (which includes formalised homeownership, especially employer housing).

The estimated cost of this programme will be approximately R10 billion over 15 years.

- Upgrading of informal settlements (La Rochelle, Klapmuts, Langrug, and Franschhoek);
- Access to basic services (ABS);
- Jamestown, Farm 527 (Phases 2, 3, and 4);
- Upgrading of Zone O, Kayamandi;
- Enumeration of people on farms and backyarders;
- Erf 64, Kylemore;
- Erf 7001, Cloetesville (known as "Soek-mekaar");
- Upgrade of the Kayamandi CBD;
- Adam Tas Corridor Precinct 10 (Northern Extension); and
- Social Housing.

Upgrading of Informal Settlements: The Municipality manages and coordinates the upgrading of informal settlements through the following broad objectives:

- In-situ upgrading of informal settlements;
- Upgrade informal settlements through the provision of basic services;
- Develop emergency housing sites geared to accommodate evictees;
- Enumerate / undertake demographic surveys of identified informal settlements;
- Facilitate tenure security in informal settlements;
- Assist in short-term job creation through linkages with the Expanded Public Works Programme (EPWP) and longer-term job creation through upgrading programmes;
- Facilitate capacity-building and training for residents and stakeholders through direct service provision and partnerships with outside agencies; and
- Manage the provision of services and development programmes to informal settlements.

Informal Backyard Dwellings: The municipality, through the Housing Pipeline, is actively attempting to address the needs and plight of backyard dwellers within the municipal area. Currently, it is required to be registered on the Housing Demand Database, and hopefully, this will result in a permanent dwelling in one of the Council's housing projects. This process is long and tedious, and the chance of actually obtaining a formal house is very slim. Therefore, the Council is actively researching ways in which the service (and basic services) to backyard dwellers can be improved through its various housing programmes, especially Social Housing (affordable rental).

Social Housing: Stellenbosch Municipality was approved as a Restructuring Town in March 2017 by the National Minister of Human Settlements. This approval included the confirmation of the various Restructuring Zones within the municipality, and the latter culminated in a Council decision instructing the administration to attract social housing institutions (SHIs) and / or other development agencies (ODAs) to effect the municipality's social housing programme.

This programme aims to ensure improved quality of life for communities through a rental housing programme. This process of integration speaks to the importance of:

- Economic sustainability: affordability, access to economic opportunities, and promoting job creation via the multiplier effect associated with building medium-density housing stock, etc.;
- Social sustainability: social integration between various income groups, access to educational, recreational, and health facilities, etc.; and
- Ecological sustainability: conservation of scarce resources.

The aim and objective of Social Housing is to offer safe and affordable rental units for families with monthly incomes ranging from R1 850 to R22 000.

Stellenbosch Municipality's housing pipeline and existing housing projects, as summarised in the Priority Housing Projects and Upgrading of Informal Settlements Implementation Plan is summarised in the table below (2025/2026 IDP).

Table C.1.2: Priority housing projects and upgrading of informal settlements in Stellenbosch Municipality.

Key Activity/ Project/ Programme/ Initiative	Description of Unit of Measurement	Project Phase	Number of Housing Opportunities	5-year target 2022 - 2027
Construction of Longlands, Vlottenburg (144 Serviced sites)	Percentage of the Longlands, Vlottenburg Capital Budget actually spent by 30 June	Construction	144	90%
Rectification of Cloetesville: The Steps / Orlean Lounge Houses	Percentage of Cloetesville: The Steps / Orlean Lounge Houses rectification capital budget actually spent by 30 June	Construction	161	90%
Upgrading of Zone O in Kayamandi	Percentage of the Zone O (in Kayamandi) capital budget actually spent by 30 June	Construction will be dealt with in phases	711	90%
Development of the Kayamandi Town Centre	Percentage of the Kayamandi Town Centre development capital budget actually spent by 30 June	Implementation	±1 854	90%
Development of Erf 64 Kylemore	Percentage of the Erf 64 Kylemore development capital budget actually spent by 30 June	Implementation	±171	90%
Development of Erf 2183, La Rochelle, Klapmuts	Percentage of Erf 2183, La Rochelle, Klapmuts development capital budget actually spent by 30 June	Planning (service sites)	±100	N/A
Development of the Stellenbosch Extension	Percentage of Stellenbosch extension, development Capital Budget actually spent by 30 June	Planning (Mix-used development)	± 5 000 - 6 000	90%
To obtain development rights on Erf 7001, Cloetesville to establish GAP housing	Percentage of the Erf 7001, Cloetesville annual capital budget actually spent by 30 June	Planning	360 GAP housing	90%
Finalise the sub-division plan for Jamestown (Phase 2 and 3)	Percentage of the Jamestown, Phase 2 and 3 annual capital budget actually spent by 30 June	Planning	±2 000 housing opportunities (to be determined per phase)	90%
Obtain development rights for mixed-use development for Jamestown Phase 4	Percentage of the Jamestown, Phase 4 annual capital budget actually spent by 30 June	Planning		90%
Submit status reports on Social Housing (affordable rental accommodation) on Farm 81/2 and 81/9, Stellenbosch to the Executive Mayor	Number of quarterly status reports on Social Housing submitted to the Executive Mayor	Planning (SHIs and / or ODAs attract)	±250	20
Submission of Land Use Rights Application for the Northern Extension to the Municipal Planning Terminal (MPT)	Number of Land Use Rights Applications for the Northern Extension submitted to MPT by 30 June	Planning (Mix-used development)	± 5 000 - 6 000	1
Submission of Land Use Rights Applications for the Kayamandi Town Centre to the MPT.	Number of Land Use Rights Applications for the Kayamandi Town Centre submitted to MPT by 30 June	Planning (Mix-used development)	±1 854	1
To obtain development rights for Erf 64 Kylemore	Percentage of the Erf 64 Kylemore annual capital budget actually spent by 30 June	Planning	±171	90%

Table C.1.2: Priority housing projects and upgrading of informal settlements in Stellenbosch Municipality.				
Key Activity/ Project/ Programme/ Initiative	**Description of Unit of Measurement**	**Project Phase**	**Number of Housing Opportunities**	**5-year target 2022 - 2027**
To obtain development rights La Motte: Farm 1339, Farm 1158 and Farm 1158/1	Percentage of the La Motte: Farm 1339, Farm 1158 and Farm 1158/1 annual capital budget actually spent by 30 June	Planning (Mix-used development)	±1 100	90%
To obtain development rights Erf 2183, La Rochelle, Klapmuts	Percentage of the Erf 2183, La Rochelle, Klapmuts annual capital budget actually spent by 30 June	Planning (service sites)	±100	N/A

TOPIC 2: SERVICE LEVELS

Topic C.2.1: Service Levels Profile						
Section	**Intervention Required?**	**% (1)**	**Solution description as identified by Master Plan**	**% (2)**	**Is there an Existing project/activity addressing this problem?**	**Current Demand Overall Scoring % (3)**
Direct Backlog Water	Yes	100	Install communal water services for the informal areas in order to ensure that the ratio of number of households per facility complies with the target of 25 or less households per tap.	100	Yes	78.6
	Yes	100	Assist private landowners as far as possible with the provision of basic water services to all the households in the Municipality's Management Area with existing water service levels below basic water supply services.	100	No	57.1
Direct Backlog Sanitation	Yes	100	Install communal sanitation services for the informal areas in order to ensure that the ratio of number of households per facility complies with the target of 5 of less households per toilet facility.	100	Yes	78.6
	Yes	100	Assist private landowners as far as possible with the provision of basic sanitation services to all the households in the Municipality's Management Area with existing sanitation service levels below basic sanitation services	100	No	57.1
Water Services Infrastructure Supply Level Profile	No	100	-	100	-	100
Water Reliability Profile	Yes	100	Install communal water services for the informal areas in order to ensure that the ratio of number of households per facility complies with the target of 25 or less households per tap.	100	Yes	78.6
	Yes	100	Assist private landowners as far as possible with the provision of basic water services to all the households in the Municipality's Management Area with existing water service levels below basic water supply services.	100	No	57.1
Sanitation Service Infrastructure Supply Level Profile	No	100	-	100	-	100
Sanitation Reliability Profile	Yes	100	Install communal sanitation services for the informal areas in order to ensure that the ratio of number of households per facility complies with the target of 5 of less households per toilet facility.	100	Yes	78.6
	Yes	100	Assist private landowners as far as possible with the provision of basic sanitation services to all the households in the Municipality's Management Area with existing sanitation service levels below basic sanitation services	100	No	57.1
Water Services: Education	Yes	100	Confirm the water service levels of the schools in the rural areas. Provide basic water services to the schools if the current water service levels are below basic water supply services.	100	No	57.1
Water Services: Health	Yes	100	Confirm the water service levels of the clinics in the rural areas. Provide basic water services to the clinics if the current water service levels are below basic water supply services.	100	No	57.1
Sanitation Services: Education	Yes	100	Confirm the sanitation service levels of the schools in the rural areas. Provide basic sanitation services to the schools if the current sanitation service levels are below basic sanitation services.	100	No	57.1
Sanitation Services: Health	Yes	100	Confirm the sanitation service levels of the clinics in the rural areas. Provide basic sanitation services to the clinics if the current sanitation service levels are below basic sanitation services.	100	No	57.1

Topic C.2.1: Service Levels Profile						
Section	**Intervention Required?**	**% (1)**	**Solution description as identified by Master Plan**	**% (2)**	**Is there an Existing project/activity addressing this problem?**	**Current Demand Overall Scoring % (3)**
Health and Educational Facilities	No	100	-	100	-	100

Notes: (1) Is this section addressed in the WSDP?
(2) Were solutions identified for the possible gaps?
(3) Percentage calculated based on the above two percentages and whether there is an existing project/activity addressing this problem?; Does this current listed project/activity address the problem totally?; Project/Activity approved by Council as part of WSDP database?; Approved by Council in project activity database and part of 5yr IDP cycle projects?; Project/Activity listed in 3yr MTEF Cycle?

A separate water and sanitation service level policy is not in place, but the water and sanitation service levels to be provided by the Municipality to the consumers in their Management Area are, however, included in the Water Services By-law. All water services provided by Stellenbosch Municipality to consumers within the Municipal Management Area are linked to the Municipality's Tariff Policy and poor households are incorporated through Stellenbosch Municipality's Indigent Policy.

The large number of residents in the lowest income groups (living in informal areas) places a major challenge on Stellenbosch Municipality to provide suitable housing. Stellenbosch Municipality works towards providing all households in the towns with a water connection inside the erven and connecting all households to a waterborne sanitation system. It is however important to consider the Municipality's capacity (financial and institutional) to operate and maintain complex sewage systems if opting for higher service levels and in particular waterborne sanitation.

Water and Sanitation Services on Privately Owned Land Policy (November 2023)

The roles and responsibilities of the WSA are as follows:

- The role of the WSAs is to comply with the regulatory and support mandates of DWS over provision of water services and resources to residents living on privately owned land.
- WSAs must integrate this policy with their respective local mandates in terms of the Strategic Framework for Water Services.
- WSAs must ensure Water Service Providers perform their responsibilities, which include Operation, maintenance and capital development of water and sanitation services infrastructure outside the boundary and / or within the servitude / of the end user.
- WSAs must identify, register and regulate Water Service Intermediaries / Providers according to their policies, bylaws, national norms and standards.

The roles and responsibilities of the Private Landowner / Water Services Intermediary are as follows:

- Private landowners must provide basic water services to their employees (and the families of employees) living on their land.
- WSAs must ensure that this policy is implemented and must identify, register and regulate water services intermediaries according to their bylaws and national norms and standards.
- Landowners must make an appropriate contribution to the capital cost of basic services.
- While water and sanitation assets, which WSAs install, remain under the ownership of the State, landowners will however have economic rights to the infrastructure once they become intermediaries, and those economic rights will be linked to a contract term.
- Operations and maintenance (and capital development of water and sanitation services on privately owned land) remain the responsibility of property owners.

- The private landowner is encouraged to enter into a contract with the WSA and perform the duties of a Water Services Provider as stipulate din Section 25(1) and (2) of the Water Services Act.

- Private Landowners / Water Services Intermediaries / Water Services Providers should:
  - Support the regulatory and support mandates of DWS over the water services and resources provided to residents living on privately owned land.
  - Integrate and implement this policy in terms of their planning and implementation to ensure compliance with all relevant legislation concerning provision of water services on private land; and to
  - Ensure that this policy is communicated to any person, party or organization affiliated to the "private land" sector.
  - The employers is responsible for providing water and sanitation services to their labourers / employees as per Section 8(1) of the Occupational Health and Safety Act (Act 85 of 1993).

National Sanitation Policy, 2016.

Problem Statement: The ineffectual interpretation and implementation of the Section 78 of the Municipal Systems Act (No. 32 of 2000) process has contributed to municipalities primarily keeping the sanitation provision function in-house, even when the capacity to do so adequately was lacking. They are not appropriately implementing Section 78 provisions. WSAs are not responding to key responsibilities assigned to them in legislation and the SFWS.

Where a WSA has contracted a WSP to provide sanitation services, the responsibility of the two parties is not always clear in the contracts. There is a need for effective contract regulation.

A WSA have the following responsibility:

- Implementation of the Municipal Systems Act (Act 32 of 2000) and Water Services Act (Act 108 of 1997) provisions.

- Prepare sanitation plans such as WSDPs etc., aligned to national sanitation planning.

- Ensure the realisation of the right to access to sanitation services, particularly basic sanitation services, subject to available resources. This includes people living on privately-owned land, in recognised permanent informal settlements and vulnerable groups and others who are provided services by Water Services Intermediaries. Wherever practical and sustainable, Water Services Authorities are expected to plan for and provide higher levels of service.

- Ensure the provision of effective, efficient and sustainable sanitation services. The provision of sanitation services also includes communication activities related to, amongst other things, Hygiene Education, end-user education and the wise use of water.

- Develop an asset management strategy, a maintenance and rehabilitation plan and a register of sanitation services assets and must then put in place a system to manage these assets.

- Provide information concerning the provision of sanitation services as reasonably requested by the Provincial or National governments, end-users and / or organisations.

- Develop an appropriate institutional structure to adequately respond to key WSA functions and responsibilities.

- Account, as per the Municipal Finance Management Act (No. 56 of 2003), to the province and National Treasury for resource allocation (financial, human etc.).

- Provide sanitation hygiene and end user education.

WSAs have a right but not an obligation to accept industrial, agricultural and mining wastewater within their area of jurisdiction.

WSAs must adhere to the following requirements in a transparent manner and in close contact with end-users:

- Sanitation services must be designed, planned and implemented to consider operations and maintenance requirements and to reduce the environmental impact of unmanaged grey-water, human excreta and wastewater disposal.
- Sanitation services must be appropriate and minimise impact on and use of water resources. WSA should strive for systems which utilise minimal water resources.
- Sanitation technologies which consider settlement types.
- Geo-hydrological testing before use of on-site groundwater sources or on-site sanitation services. Exceptional situations may require independent review and advice.
- Technology choices must be appropriate and affordable.
- Roles and responsibility for payments for operations and maintenance must be clear.
- Only appropriate sanitation technologies must be adopted.
- The quality of all building materials used for construction must be durable and fully compliant with the requirements, norms and standards
- Local availability of materials and skills must be part of the choice of technology or construction method. The design of sanitation services facilities must maximise the use of local resources.
- Sanitation technology selection should include resources to develop the necessary local institutional capacity to manage the day to day and future operational needs. In some circumstances there may be considerable merit in engaging a sanitation services provider to carry out certain functions on behalf of a local authority. Government does encourage local authorities to consider various options in this regard.
- Social and cultural practices and preferences should be considered in the selection of appropriate sanitation technology.

WSA must have the billing systems in place to raise sufficient revenue for sanitation services.

WSA must ensure sufficient funds are transferred for a WSP to perform the agreed functions.

WSA must regulate all aspects of sanitation services provision locally.

The WSA is accountable to its citizens.

Sanitation services planning by WSAs should be in conjunction with municipal Environmental Health Practitioners, as well as other stakeholders and departments involved in the sector.

The Revised Compulsory National Water and Sanitation Standards, as published in the Government Gazette No.52814 of 6 June 2025, make provision for the following standards for basic water and sanitation supply services.

Table C.2.2: Basic water and sanitation supply services
Basic water supply services
• A WSA is responsible for the provision of basic water supply services to all consumers or potential consumers in its jurisdictional area inclusive of people residing on privately owned land as guided by the Water and Sanitation Services Policy on Privately Owned Land (2023). • The minimum standard for basic water services must consist of: ➢ Within two years of promulgation of these regulations an access or delivery point which must be at least at the end boundary of the yard (user connection point) of the existing settlement. ➢ A minimum quantity of drinking water of 6 kl/household per month - ▪ at a minimum flow rate of not less than 10 litres per minute. ▪ with an effectiveness such that water is made available for at least 358 days per year.

Table C.2.2: Basic water and sanitation supply services

- not interrupted for longer than 48 consecutive hours.
- at no cost to indigent households, upon depletion of the initial 6 kl per month allocation, qualifying indigent household will be subject to usage restrictions and will be responsible for payment based on the adopted tariff policy for any additional water consumed.

- Water provided which complies with the requirements of SANS 241.

- Maintenance of the infrastructure up to the user connection is the responsibility of the Water Services Institution and the maintenance of the infrastructure within the boundary of the property is the responsibility of the owner.
- All new users applications for water connections must be completed within 21 calendar days by a WSA in areas where the infrastructure allows or exist.
- All user connections for water supply must be metered or measured, controlled and tariffed by the relevant Water Services Institution.
- A Water Services Institution must replace stolen meters and or repair or replace damaged meters within 30 days of it being reported or detected.
- Water meters must be managed and replaced within their asset lifespan.
- The Water Services Institution must ensure the provision of appropriate education in respect of safe, effective and efficient water use, hygiene and groundwater use management.
- Within two years after promulgation of these Regulations, WSA must submit plans to the Department, using the WSDP platform as part of their WSDP on how they are going to upgrade all consumers in formal settlements to basic services (yard connection; user connection point).

Basic sanitation supply services

- A WSA is responsible for the provision of basic sanitation services to all consumers or potential consumers in its jurisdictional area inclusive of people residing on privately owned land as guided by the Water and Sanitation Services Policy on Privately Owned Land (2023).
- The standard for basic sanitation services must include the provision of a toilet with functional hand washing facility in the yard, which is safe, reliable for 24 hours a day, environmentally sound, easy to keep clean, provides privacy and protection against the weather, well ventilated, keeps smells to a minimum and prevents the entry and exit of flies and other disease-carrying pests, providing for an effective and acceptable sanitation technology.
- A WSA must ensure that human excreta and wastewater is safely contained at all times, throughout the sanitation service chain.
- Faecal sludge management must be an integral part of the sanitation service.
- Each household must have uninterrupted access to an adequate, appropriate sanitation facility.
- Hygiene and user education must be an integral part of sanitation service. Households should be supported with knowledge and any other relevant resources to take responsibility for the correct and consistent use of the sanitation service, including but not limited to the toilet facility.
- In providing basic sanitation service, a WSA must consider the following requirements:
  - The need for everyone, including persons with a disability to have a reasonable quality of life.
  - Water efficient sanitation solutions.
  - Groundwater pollution risks in accordance with the Protocol to manage the potential groundwater contamination from on-site sanitation (2003).
  - Water use authorisation in terms of the NWA.
  - Surface water pollution risks and the management thereof.
  - Population density.
  - Economies of scale.
- Subject to the above, a WSA must consider-
  - In high and medium density formal settlements:
    - waterborne sewered sanitation provided that the wastewater treatment system and works have adequate capacity and is performing to acceptable standards under the National Water Act (read with regulation 10); or
    - alternative water efficient sanitation solutions instead of waterborne sewered systems in areas of dense formal and medium settlement where there is resource scarcity and or inadequate capacity or functionality in the sewer system and or the wastewater treatment works.
  - In low density or sparsely populated settlements: water efficient sanitation solutions.
- Water efficient sanitation solutions, as described above, must be shown to include off-grid, on-site sanitation options such as Non-sewered Sanitation Systems (NSSS) as well as Decentralised Wastewater Treatment Systems (DWWTS).
- A WSA may not unreasonably decline a property development to have a water efficient sanitation solution that is not connected to the central system where development will manage the system as a Water Services Intermediary and where the water uses of the system is authorised under the National Water Act.
- Whenever a Water Services Institution is providing new innovative non-sewered sanitation systems, such must be guided by the requirements of SANS 30500 for Non-Sewered Sanitation Systems or the “SANS 24521:2020 Guidelines for the management of basic on-site domestic wastewater services”, whichever is applicable.

Table C.2.2: Basic water and sanitation supply services
• WSA must monitor and regulate safe emptying, transportation, treatment and disposal of faecal sludge to faecal sludge treatment facilities or any other authorised facility. • Faecal sludge treatment plants must be guided by ISO 31800 for prefabricated units or similar standards for non-prefabricated faecal sludge treatment units. • WSA must have community participation procedures of informing communities about the emptying processes, routes and health risks. • Within two years after promulgation of these Regulations, the WSA must submit plans as part of their WSDP, using the WSDP platform, on measures to eradicate unimproved pit toilets and open defaecation in human settlements.

The Revised Compulsory National Water and Sanitation Standards, as published in the Government Gazette No.52814 of 6 June 2025, also make provision for the following standards for interim water and sanitation supply services.

Table C.2.3: Interim water and sanitation supply services
Interim water supply services

• A WSA must take reasonable measures to provide interim water supply services in informal settlements.
• Upon realisation of a new informal settlement, the WSA must provide interim water supply services within 90 days of becoming aware thereof.
• A WSA is responsible for the capital, operation, maintenance and refurbishment actions and cost pertaining to interim water services.
• Where an informal settlement is formalised, a WSA must ensure access to basic water services.
• The minimum standard for interim water services must consist of:
  ➢ An access or delivery point which must be a communal standpipe, within a reasonable walking distance of no more than 200m from the furthest household.
  ➢ A minimum quantity of drinking water of 6 kl/household per month -
  ▪ at a minimum flow rate of not less than 10 litres per minute.
  ▪ with an effectiveness such that water is made available for at least 358 days per year.
  ▪ not interrupted for longer than 48 consecutive hours.
  ➢ Water provided which complies with the requirements of SANS 241.
• All areas supplied with interim water supply services must have zonal meters and measured by the relevant Water Services Institution.
• Whenever interim water supply services are provided through water tankers, it must not exceed 12 consecutive months and WSAs need to keep accurate records as specified in Regulation 4(3)(c).

Interim sanitation supply services

• A WSA is responsible for the capital, operation, maintenance and refurbishment actions and cost pertaining to interim sanitation services including the management of faecal sludge in the entire sanitation service chain.
• A WSA must take reasonable measures to provide appropriate interim sanitation services in informal settlements and during a disaster.
• Upon realisation of a new informal settlement, the WSA must provide interim sanitation services within 90 days.
• Interim sanitation services must provide at least the following:
  ➢ Communal and shared facilities in accordance with the following:
  ▪ Communal toilet: Toilet seat – 1 seat per 10 households; Urinal units – 1 unit per 20 households; Hand washing – 1 basin per 10 households.
  ▪ Shared toilets: Toilet seat – 1 unit per 4 households; Urinal units – 1 unit per 10 households; Hand washing – 1 basin per 4 households.
  ➢ The WSA must put measures in place to keep the toilets hygienic.
  ➢ The toilets must be separated according to gender to meet the needs for women, girls and persons with disability.
  ➢ All portable and mobile toilets must be emptied at least twice a week to appropriate licensed facilities for treatment.
• If the sanitation facility is communal, the maximum walking distance should be 100m, wherever possible.
• Parents and care givers must be provided with information by the Water Services Institution regarding safe disposal of infant's faeces, laundering practices and use of nappies, potties or scoops for effectively managing safe disposal.
• A WSA through its Environmental Health Practitioners are responsible for promoting hygiene and user education for ensuring an environmentally safe approach to sanitation and for monitoring the impact of sanitation processes on the environment.

All the formal households in the urban areas of Stellenbosch Municipality's Management Area are provided with water and sanitation connections inside the erven. Areas without waterborne sewer systems are required to make use of conservancy tanks. Standpipes and communal ablution facilities are provided in the informal areas as a temporary emergency service. The current water and sanitation service levels are included under Sections 2.1 and 2.2 of the Administration, Information and Comprehensive Overview Report.

Communal standpipes represent probably the weakest part of a network's water supply services. Standpipes must be constructed in ways that can withstand excessive use and should not be neglected in terms of operation and maintenance. Malfunctioning standpipes may adversely affect the health of its already vulnerable and poor users. Communal standpipes are also used by poor households who normally don't pay for water. Poor people are the ones that suffer the most from water-related diseases due to:

- Poor quality and maintenance of standpipes and their surroundings. Standpipes are often leaking and poor drainage around standpipes results in standing pools of water and muddy soil.
- Standpipes are not protected and animals lick the taps.
- When people have to walk long distances to fetch water, it is used sparingly and not enough water is used for hygiene.
- Even if water is clean when it leaves the standpipe tap, it is often contaminated by dirty containers used for carrying and storage.

Stellenbosch Municipality is committed to support the private landowners as far as possible with regard to addressing the basic water services backlog that might still exist on the farms in the rural areas once the 2022 Census data becomes available for the farms and the locations of households without basic water services are known. Water Service Levels in the WSDP for the farms are based on the 2011 Census data, because the 2022 Census Community Profiles per subplace are not yet available.

The Cape Winelands District Municipality takes various water quality samples on the farms in the rural areas of Stellenbosch Municipality's Management Area and the water quality information needs to be shared with the private landowners and any Water Services Intermediaries, also the risks associated with storage of water in open reservoirs or tanks and where no filtration or disinfection takes place.

Stellenbosch Municipality is faced with various challenges with regard to the provision of services on private owned land in a financial sustainable manner (enabling the on-going operation of services and adequate maintenance and rehabilitation of the assets), which include the following:

<u>Free basic water policy:</u>

- The provision of the infrastructure (facilities) necessary to provide access to water to all households in a sustainable and economically viable manner.
- The development of subsidy mechanisms which benefit those who most need it.

<u>Free basic sanitation policy:</u>

- Provision of the most viable sanitation facility to the poor household.
- Health and hygiene promotion must be provided in a co-ordinated manner and must be properly managed and adequately funded if free basic sanitation is to become a reality. This requires close collaboration between the EHPs of the Cape Winelands District Municipality responsible for environmental health and Stellenbosch Municipality.
- Subsidising the operating and maintenance costs. If the basic service is to be provided free to the poor then Stellenbosch Municipality must ensure that the costs of providing the service are covered by the local government equitable share and / or through cross-subsidies within Stellenbosch Municipality's Management Area.

The ownership of water services assets may be in the hands of the person owning the land where an "on-site" water or sanitation facility is provided to a household. There is no legal impediment to the use of government grants to fund infrastructure for a poor household on private land not owned by that household, provided that the intermediary (the private land owner) makes a financial contribution (This is because the intermediary

becomes the owner of the infrastructure once it is installed). Government is looking at specific policies with regard to the appropriate level of contribution.

Stellenbosch Municipality needs to put the following measures in place with regard to water and sanitation services in their Management Area:

- A Water and Sanitation Service Level Policy needs to be compiled, which is aligned with the requirements of the National Sanitation Policy (2016), Water and Sanitation Services on Privately Owned Land Policy (November 2023) and the Compulsory National Water and Sanitation Services Standards, 2024 (Gazette No.52814, 6 June 2025).

- Stellenbosch Municipality must comply with the regulatory and support mandates of DWS over provision of water services and resources to residents living on privately owned land.

- Stellenbosch Municipality must ensure that the "Water and Sanitation Services on Privately Owned Land Policy" is implemented and must identify, register and regulate Water Service Intermediaries / Providers according to their policies, bylaws, national norms and standards.

- Stellenbosch Municipality must make provision for private landowners to enter into a contract with them to perform the duties of a Water Services Provider as stipulated in Section 25(1) and (2) of the Water Services Act.

- Stellenbosch Municipality must comply with the Basic water and sanitation supply services requirements as included in Table 2.4 and the Interim water and sanitation supply services requirements as included in Table 2.5 (Compulsory National Water and Sanitation Services Standards, 2024, Gazette No.52814, 6 June 2025).

- Stellenbosch Municipality must ensure the realisation of the right to access to water and sanitation services, particularly basic water and sanitation services, subject to available resources. This includes people living on privately-owned land, in recognised permanent informal settlements and vulnerable groups and others who are provided services by Water Services Intermediaries. Wherever practical and sustainable, WSAs are expected to plan for and provide higher levels of service.

- Stellenbosch Municipality must ensure the provision of effective, efficient and sustainable water and sanitation services. The provision of sanitation services also includes communication activities related to, amongst other things, hygiene education, end-user education and the wise use of water.

- Provide information concerning the provision of water and sanitation services as reasonably requested by the Provincial and National governments, end-users and / or organisations.

- Provide sanitation hygiene and end user education.

- Stellenbosch Municipality must adhere to the sanitation requirements listed on page 2.7 in a transparent manner and in close contact with end-users.

- The billing system must make provision for the sufficient raising of revenue for water and sanitation services. Stellenbosch Municipality must ensure sufficient funds are transferred for a WSP to perform the agreed functions when it becomes applicable.

- Stellenbosch Municipality must regulate all aspects of water and sanitation services provision locally and is accountable to their citizens.

- The provision or distribution of bucket toilets to communities in both formal and informal settlements are prohibited.

- Stellenbosch Municipality is prohibited from approving bulk user connections to existing water and wastewater systems without having the necessary capacity to service such user connections. This means that a municipality may not approve new / additional bulk user connections to an existing water or wastewater treatment system unless that system has the capacity to deal with the additional load (ability to operate according to technical specifications).

- Stellenbosch Municipality may not approve any new developments that will connect to an existing wastewater treatment system unless such a system has the capacity to deal with the load from the development.

- Stellenbosch Municipality must only accept the quantity and quality of industrial wastewater or any other substance into a sewerage system that the sewage treatment works linked to that system is capable of purifying or treating to ensure that any discharge to a water resource complies with the required authorisation and standard prescribed under the National Water Act.

- Stellenbosch Municipality shall prescribe pre-treatment of any effluent to the required standard its wastewater treatment systems can process prior to it being disposed into municipal infrastructure.

All the clinics and hospitals in Stellenbosch Municipality's Management Area have adequate and safe water supply and sanitation services. All the tertiary education facilities and schools in the urban areas of Stellenbosch Municipality's Management Area have adequate and safe water supply and sanitation services. The water and sanitation service levels of the primary schools in the rural areas need to be verified.

It is important for the schools to focus on Water Demand Management activities and for Stellenbosch r Municipality to support the schools with WDM initiatives. This will not only aid in Stellenbosch Municipality's demand management initiative directly by reducing the water consumption, but the education of learners at a young age regarding wise water use is a key component for sustainable supply in the long term.

TOPIC 3: WATER SERVICES ASSET MANAGEMENT

Topic C.3.1: Water Services Asset Management						
Section	**Intervention Required?**	**% (1)**	**Solution description as identified by Master Plan**	**% (2)**	**Is there an Existing project/activity addressing this problem?**	**Current Demand Overall Scoring % (3)**
General Information	Yes	100	Develop an Asset Management Plan.	100	Partially	64.3
	No	100	Implement Groundwater Management Plan for all production boreholes (Water levels, abstraction volumes and water quality).	100	Partially	78.6
Operation	No	100	Implement recommendations from the Water Safety Plans and WTW Process Audits. Implement proposed interim solutions for improving the operation of the WTW, as well as proposed refurbishment and upgrade and extension work. Ensure adequate budget is allocated for the future upgrading and refurbishment work.	100	Partially	85.7
	No	100	Implement recommendations from the W_2RAPs and WWTW Process Audits. Implement proposed interim solutions for improving the operation of the WWTW, as well as proposed refurbishment and upgrade and extension work. Ensure adequate budget is allocated for the future upgrading and refurbishment work.	100	Partially	85.7
Functionality Observation	No	100	Provide additional reservoir storage capacity for the towns with inadequate storage capacity. Upgrade existing water pump stations and provide new water pump stations for the identified areas. Upgrade existing WTWs and WWTWs as recommended. Upgrade existing sewer pump stations and provide new sewer pump stations for the identified areas.	100	Partially	85.7
Asset Assessment Spectrum	No	100	Increase O&M budget for repairs and maintenance of infrastructure. A budget of approximately 2% of the total asset value per annum should be allocated towards the replacement of the existing water and sewerage infrastructure (Best Practice). In the case of operations and maintenance of the system, a budget of approximately 1% to 2% of the value of the system is typically required to ensure that the system remains in good condition (Best Practice).	100	Partially	85.7
Water and Sanitation schemes	No	100	Upgrade sections of the water reticulation network and sewer drainage network as proposed in the Water and Sewer Master Plans.	100	Partially	85.7

Notes: (1) Is this section addressed in the WSDP?
(2) Were solutions identified for the possible gaps?
(3) Percentage calculated based on the above two percentages and whether there is an existing project/activity addressing this problem?; Does this current listed project/activity address the problem totally?; Project/Activity approved by Council as part of WSDP database?; Approved by Council in project activity database and part of 5yr IDP cycle projects?; Project/Activity listed in 3yr MTEF Cycle?

Asset Management Plan: Stellenbosch Municipality's Asset Register needs to be updated to include all the water and sewerage infrastructure as included in the WSDP and the CRC of the assets also needs to be included in the Asset Register. It is essential for any service delivery organisation to compile an Asset Management Plan (AMP) to ensure efficient, effective and optimal management, operation and maintenance of all assets, which includes treatment plants, reservoirs, structures, buildings, pipelines, sites, etc. The purpose of the AMP is to:

- Ensure the operation and maintenance functions are well planned.
- Demonstrate responsible management.
- Justify and communicate funding requirements.
- Service provisioning complies with regulatory requirements.

An AMP normally includes the following:

- documents the nature, extent, age, utilisation, condition, performance and value of the infrastructure work;
- identifies existing and target levels of service, as well as expected changes in demand;
- identifies the life-cycle management needs of the infrastructure (development, renewal, operations and maintenance);
- assesses capital and operational budget needs; and
- identifies infrastructure asset management improvement needs.

Stellenbosch Municipality needs to differentiate between budget allocated towards the operation and maintenance of the water and sewerage infrastructure and the budget allocated towards the replacement of the water and sewerage infrastructure (Best Practice). A budget of approximately 2% of the total asset value per annum should be allocated towards the replacement of the existing water and sewerage infrastructure. In the case of operations and maintenance of the system, a budget of approximately 1% to 2% of the value of the system is typically required to ensure that the system remains in good condition (Best Practice).

The objective of an Asset Management Plan is to support the achievement of the strategic goals of the Municipality and facilitate prudent technical and financial decision-making. It is also a vehicle for improved internal communication and to demonstrate to external stakeholders the Municipality's ability to effectively maintain its existing infrastructure as well as the new infrastructure to be developed over the next 20 years.

Priority should be given to rehabilitating existing infrastructure as this generally makes best use of financial resources and can achieve an increase in (operational) services level coverage's most rapidly. The preparation of maintenance plans and the allocation of sufficient funding for maintenance are required to prevent the development of a large condition backlog. The potential renewal projects for water and sanitation infrastructure need to be identified from the Asset Register. All assets with a condition grading of "poor" and "very poor" need to be prioritised.

The Asset Management Plan must be based on the principle of preventative maintenance in order to ensure that, as far as this is practical, damage to assets is prevented before it occurs. Stellenbosch Municipality must ensure that the maintenance and rehabilitation plan is part of the WSDP and that the plan is implemented. Assets must be rehabilitated and / or replaced before the end of their economic life and the necessary capital funds must be allocated for this purpose.

One of the key challenges of Stellenbosch Municipality is to identify adequate funds for the rehabilitation and maintenance of their existing infrastructure, which is critical to ensure the sustainability of the services that are provided by the Municipality. It is important for the Municipality to secure adequate funding for major refurbishment and maintenance work, the provision of bulk water and sewerage infrastructure and the augmentation of the existing water resources in order to keep up with the high demand for services.

Disaster Management Plan: A Disaster Management Plan is in place for Stellenbosch Municipality.

Untreated Effluent Management Plan: There are no known untreated effluent discharge to the environment. The W_2RAPs include Management Procedures and Incident Response and Emergency Protocols for the management of all effluent.

Future Water and Sewerage Infrastructure Requirements: The Water and Sewer Master Plans indicate the future water and sewerage requirements to accommodate the future developments and are regularly updated by the Municipality. The sections below indicate the future water and sewerage requirements, as included in the 2025 Water and Sewer Master Plans, but it is important to note that it can change as the Municipality might reprioritise some of the developments.

GROUNDWATER INFRASTRUCTURE

Stellenbosch Municipality will implement a Groundwater Monitoring Programme for all their production boreholes when these boreholes are utilised in the future. The groundwater monitoring data will then be processed, analysed and reported on by an experienced hydrogeologists in order to ascertain whether the resources are being sustainably utilised and to ensure compliance with the approved Groundwater Monitoring Programmes and water use licenses. Managing groundwater for water supply purposes should have the following three main functions:

- Ensure that the aquifer is used optimally: The aquifer should not be over-pumped as that would negatively impact on its long-term sustainable yield or on the environment. It also means that if the aquifer is being under-utilised, this will become known.

- Ensure that the water quality in the aquifer is not negatively affected: This may be as a result of high abstraction from the aquifer, or from poor groundwater protection (from latrines, animal enclosures, etc.).

- Optimise borehole pumping rates so that the pumping equipment operates efficiently: Pumping rates are frequently set too high and this cause unnecessarily high pumping heads, a waste of energy, and at times, pump failure.

An additional function, which is usually captured in the first two points, is to ensure that environmental integrity is maintained. A botanical and streamflow monitoring programme is therefore also required. It is important for Stellenbosch Municipality to focus on aquifer protection, groundwater monitoring and wellfield management, in order to meet the town's future water requirements. The table below gives an overview of the key groundwater management functions.

Table C.3.2: Key Groundwater Management Functions (Best Practice)

Activity	Responsible Person	Skills and qualifications required	Resources, tools and equipment	Remarks
Measuring and recording of water levels.	Pump operator	Literacy, numeracy, trained in taking water levels	Dip meter, ruler, log book, pen.	Done as part of operators' regular O&M activities.
Measuring and recording abstraction	Pump operator	Literacy, numeracy, trained in reading water meters.	Log book, pen	Done as part of operators' regular O&M activities.
Providing data to the authority that is responsible for water supply on a regular basis.	Pump operator and pump operator supervisor	Literacy, numeracy, keeping records.	Postal service or public transport.	Including as part of the reporting requirements of the pump operator.
Taking water samples	The authority that is responsible for water supply.	Trained in taking water samples, driving license.	Transport, sample bottles, cooler box.	Sampling routine defined by sampling plan.
Sending water samples for testing.	The authority that is responsible for water supply.	Keeping records.	Transport to laboratory	Sent to nearest accredited laboratory.
Defining the monitoring requirements of an individual borehole.	Technical manager of operations or hydrogeologist.	Hydrogeological degree or diploma, experience of hydrogeological conditions.	Reports and records on borehole, monitoring data.	
Ensuring that boreholes are equipped with piezometer tubes for measuring water levels and water meters for measuring abstraction.	The authority that is responsible for water supply.	Project management	In house technical staff, suppliers, contractors, specifications.	
Ensuring that operators have the equipment and skills to do monitoring.	The authority that is responsible for water supply.	Project management	Trainers, suppliers, specifications.	

Table C.3.2: Key Groundwater Management Functions (Best Practice)				
Activity	**Responsible Person**	**Skills and qualifications required**	**Resources, tools and equipment**	**Remarks**
Monitoring the pump operator's competence to collect and record data.	Pump operator supervisor	Staff supervision, knowledge of pump operators' tasks.	Transport	Done as part of the supervision of O&M activities.
Processing data collected at the local level	Data clerk	Data capture, record keeping, filing, trained in operating software.	Computer, spreadsheet or groundwater management software, files.	Maintains an electronic and physical record of data.
Studying water level, water quality and abstraction data on a regular basis.	Technical manager of operations.	Technical training, operations experience.	Project files, monitoring data	Done as part of the management of O&M
Revising pumping recommendations, and adjusting the monitoring requirements. Ensuring the recommendations are carried out and monitoring the implementation of the recommendations.	Technical manager with hydrogeologist as required.	Technical training, operations experience.	Reports and records on borehole, monitoring data, operational information.	Ongoing management of operations and groundwater resources.
Reporting to council and pump operator, providing summary data to the CMA.	Data clerk with supervision from technical manager.	Training in operating software.	Computer, spreadsheet or groundwater management software, printer.	Summary data defined by license (frequency, what data, form of data)

The Future groundwater infrastructure required is indicated in the table below.

Table C.3.3: Future groundwater infrastructure required					
System	**Recommendations included in the Water Master Plan**	**Item**	**Capacity**	**Year**	**Estimated Cost**
Stellenbosch	Potential new production borehole for system, detailed investigation required first	SSW.B56	864 m³/d @ 60m EGL	2035	R614 000
	Potential new production borehole for system, detailed investigation required first	SSW.B57	864 m³/d @ 60m EGL	2035	R614 000
	Potential new production borehole for system, detailed investigation required first	SSW.B58	864 m³/d @ 60m EGL	2035	R614 000
Total					**R1 842 000**

SURFACE WATER INFRASTRUCTURE (ABSTRACTION POINTS)

The preventative maintenance activities, as included under Section 4.1.2 of the Future Demand and Functionality Requirements Report, are to be implemented by Stellenbosch Municipality for their surface water infrastructure.

BULK WATER PIPELINE AND RETICULATION NETWORK INFRASTRUCTURE

The Water Master Plan (June 2025) has indicated that based on the most likely land-use development scenario, the following future bulk water pipeline and water reticulation infrastructure components will be necessary.

Table C.3.4: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Stellenbosch					
Required to control inflow into reservoir.	SSW.B13	200	FCV	2025	R489 000
Required to augment supply to Paradyskloof no. 2 reservoir.	SSW.B8	400	37	2025	R601 000
Supply pipe to network.	SSW13.1	315	126	2025	R652 000
Required to improve network conveyance when new 7.0 Ml reservoir in constructed.	SSW14.1	160	39	2025	R111 000
Remove old PRV from the network.	SSW8.6	160	8	2025	R59 000
Dedicated supply from Idas Valley to Papegaaiberg.	SSW.B20a	450	4582	2026	R45 218 000
Required to improve network conveyance.	SSW4.1	700	443	2026	R9 189 000
Required to improve network conveyance (Item can be implemented earlier with item SPW.B7).	SSW4.2	550	956	2026	R14 082 000
Inter-connection pipe.	SSW4.3	355	10	2026	R383 000

Table C.3.4: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Inter-connection pipe.	SSW4.4	250	6	2026	R119 000
Required to improve network conveyance (Item can be implemented earlier with item SPW.B7).	SSW4.5	500	173	2026	R2 256 000
Inter-connection pipe to improve network conveyance in Central zone.	SSW6.1	200	25	2026	R115 000
Required to improve network conveyance.	SSW6.11	315	445	2026	R1 892 000
Inter-connection pipe to improve network conveyance in Central zone.	SSW6.2	200	21	2026	R110 000
Network upgrade to improve network conveyance to area (Replace existing 90Ø).	SSW6.3	200	577	2026	R1 199 000
Required to improve network conveyance (Replace existing 90Ø and 100Ø).	SSW6.5	160	226	2026	R382 000
Replace existing 75Ø pipe to improve fire flow capacity.	SSW6.6	160	260	2026	R473 000
Required to augment supply from Idas Valley to Papegaaiberg.	SSW6.8a	450	238	2026	R1 950 000
Required to improve network conveyance.	SSW6.8b	450	1556	2026	R11 298 000
Required when future areas S77 to S79 develop.	SSW1.4	200	241	2027	R522 000
Required when future areas S77 to S79 develop.	SSW1.5	160	237	2027	R397 000
Required to reduce high pressure in Techno Park.	SSW3.7	100	PRV	2027	R291 000
Required to reduce high static pressures in Uniepark 1 zone.	SSW7.1	100	PRV	2027	R291 000
Required to rezone network.	SSW7.2g	100	Valve	2027	R114 000
Required to improve network conveyance.	SSW7.4	160	134	2027	R245 000
Required to improve network conveyance.	SSW7.6	110	47	2027	R84 000
Dedicated bulk supply pipe to Uniepark and Helshoogte reservoirs	SSW.B11	450	1088	2028	R10 707 000
Supply pipe from Helshoogte reservoir to Papegaaiberg system.	SSW.B20b	450	854	2028	R8 515 000
Required to augment supply from Helshoogte to Rosendal.	SSW.B35	450	687	2028	R4 698 000
Inter-connection pipe to Uniepark reservoirs.	SSW.B36	450	48	2028	R824 000
Required to augment bulk supply to Rozendal reservoir.	SSW.B37	400	338	2028	R2 341 000
Inter-connection pipe to Arbeidslus supply.	SSW.B38	315	19	2028	R238 000
Network upgrade to improve network conveyance to area (Replace existing 150Ø AC pipe).	SSW15.3	200	260	2028	R614 000
Network upgrade to improve network conveyance to area (Replace existing 50Ø pipe).	SSW15.4	160	16	2028	R72 000
Network upgrade to improve network conveyance to area (Replace existing 160Ø pipe).	SSW15.5	200	406	2028	R919 000
Network upgrade to improve network conveyance to area (Replace existing 110Ø pipe).	SSW15.6	160	55	2028	R136 000
Required to reduce pressure in the Brandwacht area.	SSW22.4	100	PRV	2028	R291 000
Replace existing network pipe (Existing pipe reported to be in disrepair).	SSW23.1	110	163	2028	R227 000
New supply pipe to supply Plankenburg from Papegaaiberg reservoir	SSW4.18	355	1194	2028	R5 939 000
Network upgrade to improve network conveyance to area	SSW4.19	315	528	2028	R2 214 000
Inter-connection pipe	SSW4.22a	160	4	2028	R53 000
Inter-connection	SSW1.9b	200	14	2030	R95 000
Required when future areas S1 & S2 develop.	SSW13.10	110	135	2030	R180 000
Required when future areas S1 & S2 develop.	SSW13.11	160	131	2030	R260 000
Required when future area S120 develops (Replace existing 75Ø).	SSW13.15	110	184	2030	R252 000
Required to improve network conveyance (Replace existing 110Ø).	SSW13.16	160	122	2030	R246 000
Required when future area S5 develops.	SSW13.9a	110	269	2030	R354 000
Required when future area S5 develops.	SSW13.9b	110	85	2030	R134 000
Required when Kayamandi A develops.	SSW15.10	200	297	2030	R628 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 50Ø and 75Ø).	SSW15.12	160	123	2030	R248 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 50Ø and 75Ø).	SSW15.13	200	233	2030	R558 000
Inter-connection pipe required to accommodate Kayamandi town centre redevelopment.	SSW15.14	200	76	2030	R229 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 75Ø and 100Ø AC pipes).	SSW15.7	160	228	2030	R389 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 75Ø).	SSW16.1	160	293	2030	R526 000
Required to accommodate Kayamandi town centre redevelopment (Replace existing 50Ø and 75Ø).	SSW16.2	160	312	2030	R558 000
Required when future areas S15, S17, S80 & S82 develop.	SSW18.1	400	203	2030	R1 436 000
Required when future areas S15, S17, S80 & S82 develop.	SSW18.2	400	206	2030	R1 453 000
Required when future areas S17, S81 & S82 develop.	SSW18.3	200	851	2030	R1 669 000
Required when future areas S15 and S99 develop.	SSW18.4	355	115	2030	R818 000
Required when future areas S15 and S99 develop.	SSW18.5	250	827	2030	R2 152 000
Required when future areas S15, S17, S80 & S82 develop.	SSW18.6	200	986	2030	R1 921 000
Required when future areas S15, S17, S80 & S82 develop.	SSW18.7	160	331	2030	R538 000
Require to reduce high static pressures.	SSW19.1a	200	PRV	2030	R489 000
Require to reduce high static pressures.	SSW19.1b	150	PRV	2030	R376 000

Table C.3.4: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Required when future areas S15 and S99 develop.	SSW19.2	250	443	2030	R1 201 000
Required when future area S15 develops.	SSW19.3	150	PRV	2030	R376 000
Required when future areas S15 and S99 develop.	SSW19.4	250	243	2030	R706 000
Required when future area S81 develops.	SSW20.1	160	66	2030	R143 000
Required when future areas S56 & S57 develop.	SSW3.2a	200	106	2030	R4 184 000
Required as interim connection until supply from Adam Tas corridor development is constructed.	SSW3.2b	100	PRV	2030	R291 000
Required when future areas S56 & S57 develop.	SSW3.3	200	510	2030	R1 028 000
Required when future area S58 develops.	SSW3.4	200	1110	2030	R2 155 000
Required when future area S55 develops.	SSW4.10	250	501	2030	R1 346 000
Required to improve network conveyance to future area S91.	SSW4.14	200	1095	2030	R2 304 000
Required when future areas S115 and S133 develop.	SSW4.16	200	131	2030	R316 000
Required when future area S115 develops.	SSW4.17	110	185	2030	R235 000
Required when future area S131 develops.	SSW5.3	160	342	2030	R554 000
Required when future area S36 develops.	SSW7.5	110	368	2030	R435 000
Required when higher lying erven of future area S34 develops.	SSW8.1	160	431	2030	R686 000
Required when higher lying erven of future area S34 develops.	SSW8.2	110	492	2030	R571 000
Isolate 200Ø from network (200Ø to be utilised as bulk pipeline for groundwater from boreholes)	SSW.B48	200	Valve	2035	R194 000
Inter-connection pipe to improve network conveyance & redundancy when 200Ø is isolated from the network.	SSW.B49	160	8	2035	R67 000
New raw water pipeline between boreholes in Stellenbosch Centre wellfield and existing 225Ø to Papegaaiberg reservoir site.	SSW.B50	200	628	2035	R1 386 000
Required to accommodate supply from Van der Stel & Stb Centre BH1 boreholes.	SSW.B51	160	164	2035	R315 000
Required to dedicate existing 225Ø pipe to Papegaaiberg borehole scheme.	SSW.B54	250	Valve	2035	R239 000
Required to accommodate supply from Stb Centre BH10 & Stb Centre BH12 boreholes.	SSW.B55	160	371	2035	R655 000
Required to improve network conveyance when future area S79 develops.	SSW1.3	315	246	2035	R1 011 000
Required to improve network conveyance when area S74 develops.	SSW1.6	160	153	2035	R297 000
Required to improve network conveyance when area S74 develops.	SSW1.7	160	1007	2035	R1 698 000
Required when Snake Valley is formalised	SSW15.1	100	PRV	2035	R291 000
Required when Snake Valley is formalised	SSW15.2	100	PRV	2035	R291 000
Required to improve network conveyance (Replace existing 150Ø AC pipe).	SSW22.2	200	435	2035	R945 000
Required to improve network conveyance (Replace existing 150Ø AC pipe).	SSW22.3	200	266	2035	R590 000
Required to improve network redundancy.	SSW3.5	200	682	2035	R1 500 000
Required to reduce high pressure in Techno Park.	SSW3.6	100	PRV	2035	R291 000
Required when future area S79 develops.	SSW1.8	200	485	2040	R980 000
Required when future area S14 develops.	SSW16.3	160	403	2040	R707 000
Required when future areas S49 - S52, S55, S57 & S58 develop.	SSW4.6	450	503	2040	R6 184 000
Required when future areas S50 & S52 develop.	SSW4.7	160	1087	2040	R1 659 000
Required when future areas S51, S55, S57 & S58 develop.	SSW4.8	315	186	2040	R804 000
Required when future areas S51, S55, S57 & S58 develop.	SSW4.9	250	889	2040	R2 307 000
Required to improve network conveyance.	SSW5.1	250	253	2040	R730 000
Required to improve network conveyance.	SSW5.2	200	284	2040	R603 000
New supply pipe from borehole to old Kayamandi sump & PS.	SSW.B64	160	233	2045	R372 000
New supply pipe from borehole to proposed package plant.	SSW.B69	160	74	2045	R155 000
Required when future area S99.1 develops	SSW18.9	100	PRV	2045	R291 000
Required when future areas S55, S57 & S58 develop.	SSW4.11	200	768	2045	R1 512 000
Required when future area S58 develops.	SSW4.12	160	812	2045	R1 250 000
Network upgrade to improve network conveyance to area.	SSW4.20	200	110	2045	R299 000
Network upgrade to improve network conveyance to area.	SSW4.21	160	119	2045	R241 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW.B16	160	1062	2055	R2 801 000
Required to control inflow into reservoir (Outside urban edge, potential longer term item).	SSW.B17	100	FCV	2055	R291 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW11.1	250	371	2055	R1 024 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW11.2	250	615	2055	R1 629 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW12.1	150	PRV	2055	R376 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW12.2	200	40	2055	R145 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW12.3	160	380	2055	R609 000

Table C.3.4: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW12.4	110	100	2055	R142 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW13.6	200	56	2055	R1 547 000
Required when future areas S20.1 and S20.2 develop (Outside urban edge, potential longer term item).	SSW13.7	200	Valve	2055	R194 000
Required when future areas S66 & S67 develop (Outside urban edge, potential longer term item).	SSW2.1	200	283	2055	R601 000
Required when future area S67 develops (Outside urban edge, potential longer term item).	SSW2.2	160	402	2055	R642 000
Required when future area S66 develops (Outside urban edge, potential longer term item).	SSW2.3	160	289	2055	R476 000
Required when higher lying areas of future areas S66 & S67 develop.	SSW22.1	160	182	2055	R317 000
Telemetry at reservoirs, PRVs and bulk water meters	SSW.M1	-	-	Next 3 yrs	R800 000
Sub-Total					**R201 808 000**
Klapmuts					
Replace existing 200Ø PS inlet manifold (to Lower & Upper pumps).	SKW.B2a	500	10	2026	R657 000
Replace existing 200Ø PS inlet & outlet manifold (Upper pump).	SKW.B2b	400	17	2026	R511 000
Required to improve network conveyance.	SKW1.18	200	398	2028	R1 303 000
Required to improve network conveyance.	SKW1.19	200	224	2028	R2 068 000
Required to improve network conveyance.	SKW1.20	200	39	2028	R142 000
Required to improve network conveyance.	SKW1.35	200	437	2028	R986 000
Inter-connection pipeline from Klapmuts boreholes to Koelenhof PS.	SKW.B19	160	1025	2030	R1 567 000
Required when future areas K24.1 and K24.2 develop.	SKW1.10	250	674	2030	R1 773 000
Required when future areas K24.1 and K24.2 develop.	SKW1.11	200	735	2030	R1 450 000
Required when future area K24.1 develops.	SKW1.15	250	166	2030	R514 000
Required to improve network conveyance.	SKW1.16	200	261	2030	R559 000
Required when future area K24.1 develops.	SKW1.27	160	353	2030	R570 000
Required when future areas K13 and K22 develop.	SKW1.28	160	415	2030	R661 000
Required when future area K1.4 develops.	SKW1.31	250	133	2030	R432 000
Required when future area K1.3 develops.	SKW1.34	200	356	2030	R739 000
Required when future areas K24.1 and K24.2 develop.	SKW1.9a	315	160	2030	R713 000
Required when future area K24.1 develops.	SKW1.9b	250	140	2030	R451 000
Required to improve network conveyance.	SKW2.3	200	134	2030	R321 000
Required when future areas K24.1 and K24.2 develop.	SKW3.1	355	377	2030	R1 905 000
Required when future areas K15.2, K17 and K24.2 develop	SKW3.12	250	54	2030	R237 000
Required when future areas K16 and K24.2 develop.	SKW3.2	355	639	2030	R2 992 000
Required when future area K24.2 develops.	SKW3.3	250	311	2030	R874 000
Required when future area K24.2 develops.	SKW3.4	160	606	2030	R945 000
Replace existing 200Ø bulk pipe to Klapmuts Upper reservoir.	SKW.B4a	250	68	2040	R364 000
Inter-connection between existing 200Ø and existing 250Ø Klapmuts Upper reservoir feeder main.	SKW.B4b	250	4	2040	R118 000
Isolate existing 250Ø from Klapmuts Lower reservoir zone.	SKW.B4c	250	Valve	2040	R239 000
Inter-connection between existing 200Ø and existing 250Ø Klapmuts Upper reservoir feeder main.	SKW.B4d	250	3	2040	R113 000
Replace existing 200Ø feeder main to Klapmuts Upper reservoir.	SKW.B4e	250	355	2040	R1 092 000
Required to improve network conveyance (parallel reinforcement).	SKW1.13	200	255	2040	R548 000
Required when future areas K8. K9, K11, K12 and K24.1 develop.	SKW1.21	250	310	2040	R2 177 000
Required when future areas K8, K11 and K12 develop.	SKW1.22	250	591	2040	R1 568 000
Required when future area K12 develops.	SKW1.26	200	501	2040	R1 011 000
Required when future areas K15.2 and K17 develop	SKW3.14	250	924	2040	R2 393 000
Required when future areas K14.1, K21.1 and K21.2 develop.	SKW1.23	200	471	2045	R955 000
Required when future area K9 develops.	SKW1.25	160	161	2045	R285 000
Required to improve network conveyance.	SKW1.7	250	152	2045	R481 000
Required to improve network conveyance.	SKW2.4	200	546	2045	R1 095 000
Required when future areas K15.2 and K17 develop.	SKW3.15	200	401	2045	R822 000
Required when future areas K15.2 and K20 develop.	SKW3.16	160	1567	2050	R2 371 000
Telemetry at reservoirs, PRVs and bulk water meters	SKW.M1	-	-	Next 3 yrs	R460 000
Sub-Total					**R38 462 000**
Franschhoek					
Required to utilise storage capacity in Franschhoek reservoir for Groendal zone.	SFW1.2	250	728	2025	R1 907 000
Required as interim connection until Central Lower reservoir is constructed.	SFW1.6	100	PRV	2025	R291 000
Required when future area FH5 develops.	SFW1.7	200	253	2025	R544 000

Table C.3.4: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
New PRV installation.	SFW11.1	100	PRV	2026	R291 000
Required to implement Franschhoek PRV 1 zone.	SFW11.13	110	6	2026	R38 000
New PRV installation.	SFW11.2	100	PRV	2026	R291 000
Required to implement Franschhoek PRV 2 zone.	SFW12.10	150	Valve	2026	R153 000
Inter-connection pipe.	SFW12.13	160	14	2026	R67 000
Required to implement Franschhoek PRV 2 zone	SFW12.2	75	Valve	2026	R100 000
Required to implement Franschhoek PRV 2 zone	SFW12.7	150	Valve	2026	R153 000
Move connection over to higher pressure zone when Franschhoek PRV 1 zone is implemented.	SFW2.11	110	12	2026	R44 000
New bulk supply pipeline to new reservoir.	SFW.B24	200	267	2028	R570 000
Required when Langrug Upper reservoir is constructed.	SFW.B7	110	331	2028	R395 000
Required when future area LM3 develops.	SFW13.1	160	386	2028	R619 000
Required when future area LM4 develops.	SFW13.2	160	473	2028	R748 000
Required when Langrug Upper reservoir is constructed.	SFW7.1	160	337	2028	R546 000
New supply pipe for network.	SFW7.2	160	253	2028	R421 000
Inter-connection pipe for Upper reservoir network.	SFW7.3	110	15	2028	R48 000
Required to implement Langrug Upper reservoir zone.	SFW7.4	110	Valve	2028	R114 000
Required to implement Langrug Upper reservoir zone.	SFW7.5	110	Valve	2028	R114 000
Required when La Motte Upper reservoir is constructed.	SFW9.1	250	272	2028	R779 000
Implement with construction of new reservoir.	SFW9.2	250	259	2028	R745 000
Required to improve flow through the PS inlet/outlet manifold	SFW.B12	355	31	2030	R469 000
Required to augment bulk supply to Franschhoek.	SFW.B18	450	4158	2030	R35 072 000
Required when future area FH4 develops.	SFW1.9	160	153	2030	R274 000
Required to supply sufficient fire flow to Wemmershoek (after old supply to town is transferred to the raw water system).	SFW10.1a	250	86	2030	R316 000
Required to supply sufficient fire flow to Wemmershoek (after old supply to town is transferred to the raw water system).	SFW10.1b	200	306	2030	R644 000
Required to supply sufficient fire flow to Wemmershoek (after old supply to town is transferred to the raw water system).	SFW10.2	200	256	2030	R550 000
Required when future areas WH2 and WH3 develop.	SFW10.3	200	316	2030	R663 000
Insert valve and close to transfer network pipe to raw water system.	SFW10.5	200	Valve	2030	R194 000
Required to improve network conveyance.	SFW2.2	160	38	2030	R103 000
Replace existing 75Ø pipe.	SFW2.3	160	61	2030	R137 000
Required to improve network conveyance and redundancy.	SFW2.4	110	240	2030	R295 000
Inter-connection pipe.	SFW6.4	160	13	2030	R65 000
Required when future areas FH19 and FH20 develop.	SFW8.1	200	198	2030	R441 000
Required when future area FH19 develops.	SFW8.2	200	216	2030	R475 000
Required when future area FH22 develops.	SFW8.3	160	120	2030	R223 000
Required when future areas LM1 to LM6 develops.	SFW9.3	250	254	2030	R733 000
Required to augment bulk supply to Franschhoek.	SFW.B11	355	2909	2035	R12 413 000
Bulk pipe to transfer water from Bagatelle reservoir to FH Estate reservoirs.	SFW.B27	160	1349	2035	R2 047 000
Replace existing 100Ø feeder main to Bagatelle reservoir.	SFW2.1	160	114	2035	R215 000
Dedicated bulk supply from Franschhoek Lower reservoir to old Franschhoek Upper reservoir.	SFW.B10	250	14	2040	R138 000
Required to control flow into Groendal reservoir when Franschhoek Lower reservoir is constructed.	SFW.B39	200	FCV	2040	R489 000
Inter-connection pipe for dedicated bulk supply to Franschhoek Lower reservoir	SFW.B4	250	19	2040	R151 000
Inter-connection pipe to pump directly from La Motte bulk PS to new Franschhoek Lower reservoir.	SFW.B40	315	20	2040	R240 000
Required when Franschhoek Lower reservoir is constructed.	SFW1.10	315	662	2040	R2 441 000
Inter-connection pipe.	SFW1.3	160	42	2040	R109 000
Required when Franschhoek Lower reservoir is constructed.	SFW1.8	200	898	2040	R1 757 000
Required when future area LM2 develops.	SFW14.1	110	132	2040	R176 000
Required when future areas LM2, LM5 and LM6 develop.	SFW14.2	200	168	2040	R385 000
Required when future areas LM5 and LM6 develop.	SFW14.3	200	316	2040	R662 000
Required when future areas LM1 to LM6 develops.	SFW9.4	200	306	2040	R643 000
Required when future area LM6 develops.	SFW14.4	200	1079	2045	R2 097 000
Required when future area FH22 develops (Replace existing 200Ø AC pipe).	SFW2.5	160	325	2045	R528 000
Telemetry at reservoirs, PRVs and bulk water meters	SFW.M1	-	-	Next 3 yrs	R860 000
Sub-Total					**R74 983 000**
Dwars River					
Replace existing 150 Ø CCT connection.	SDW.B20	400	45	2026	R670 000
Replace existing 250Ø PS inlet manifold.	SDW.B4	300	8	2026	R143 000

Table C.3.4: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Required to improve flow through the PS outlet manifold.	SDW.B7	300	14	2026	R157 000
Replace existing supply to Pniel Upper reservoir.	SDW.B29	110	124	2027	R181 000
Required to improve network conveyance.	SDW9.1	110	191	2027	R241 000
Required bulk supply to Lanquedoc reservoir.	SDW.B23	250	3238	2028	R9 114 000
Emergency connection from Lanquedoc reservoir to Kylemore PS 3.	SDW.B8	315	80	2028	R440 000
Emergency connection from Lanquedoc reservoir to Kylemore PS 3.	SDW.B9	200	PRV	2028	R489 000
New Lanquedoc PRV.	SDW10.1	200	PRV	2028	R489 000
Required when future areas DR19 - 21 & DR27 - 29 develop.	SDW10.10	200	440	2028	R896 000
Required when future areas DR19 - 21 & DR27 - 29 develop.	SDW10.11	200	586	2028	R1 171 000
New supply pipeline to Boschendal Village.	SDW10.2	315	1616	2028	R5 725 000
New supply pipeline to Boschendal Village.	SDW10.3	315	774	2028	R2 826 000
Required to reduce high static pressures.	SDW6.1	100	PRV	2028	R291 000
Required to rezone network.	SDW6.2	110	Valve	2028	R114 000
Required to improve network conveyance.	SDW6.3	160	33	2028	R95 000
Required to improve network conveyance.	SDW6.4	110	152	2028	R198 000
Required to improve network conveyance.	SDW7.1	160	267	2028	R442 000
Required to improve network conveyance.	SDW7.2	160	220	2028	R373 000
New supply pipe from Lanquedoc reservoir.	SDW8.0	400	536	2028	R3 114 000
New supply pipe from Lanquedoc reservoir.	SDW8.1	355	1116	2028	R4 972 000
New supply pipeline to Boschendal Village.	SDW8.2	315	699	2028	R2 570 000
Required when future areas DR14 & DR20 develop.	SDW10.8	200	366	2030	R756 000
Required when future area DR14 develops.	SDW10.9	160	603	2030	R940 000
New supply pipeline to Lanquedoc.	SDW8.3	200	625	2030	R1 244 000
New supply pipeline to Lanquedoc.	SDW8.4	160	452	2030	R716 000
New supply pipeline to Lanquedoc.	SDW8.5	200	499	2030	R1 007 000
New supply pipeline to Lanquedoc.	SDW8.6	160	306	2030	R548 000
Required to improve network redundancy when future area DR4 develops.	SDW2.4	160	33	2035	R95 000
Required to improve network conveyance.	SDW5.1	160	447	2035	R709 000
Replace existing 300Ø supply pipeline when it reaches capacity or reaches end of operational life.	SDW.B21	400	2887	2040	R16 872 000
Required when future areas DR3 & DR5 develop.	SDW1.1	200	416	2040	R851 000
Required when future area DR15 develops.	SDW10.13	110	381	2040	R450 000
Required when future areas DR16 - 18 & DR21 develop.	SDW10.14	200	389	2040	R800 000
Required when future area DR16 develops.	SDW10.15	110	265	2040	R322 000
Required when future areas DR17, DR18 & DR21 develop.	SDW10.16	160	407	2040	R650 000
Required when future area DR21 develops.	SDW10.17	160	382	2040	R613 000
Required when future areas DR13 & DR25 develop.	SDW8.7	200	615	2040	R1 224 000
Required when future area DR31 develops.	SDW10.18	160	294	2045	R482 000
Required when future area DR29 develops.	SDW10.4	160	174	2045	R304 000
Required when future areas DR27, DR28 and DR31 develop.	SDW10.5	200	326	2045	R937 000
Required when future area DR28 develops.	SDW10.6	160	51	2045	R122 000
Required when future area DR27 develops.	SDW10.7	160	275	2045	R454 000
Telemetry at reservoirs, PRVs and bulk water meters.	SDW.M1	-	-	Next 3 yrs	R580 000
Sub-Total					**R65 387 000**
Raithby					
Required to improve network conveyance (Replace existing 75Ø pipes).	SRW1.3	200	695	2026	R1 375 000
Inter-connection pipe to booster zone (after Raithby reservoir & booster PS are decommissioned).	SRW1.4	160	16	2026	R70 000
Close supply but maintain for emergencies.	SRW.B2	150	Valve	2030	R153 000
Dedicated bulk supply to CCT Faure service reservoir from Raithby bulk PS.	SRW.B3	160	219	2030	R616 000
Inter-connection pipe with bulk meter from Faure service reservoir to Raithby supply pipe.	SRW1.1	250	9	2030	R138 000
Required when future area R5 develops.	SRW1.6	110	118	2030	R161 000
Replace existing 150Ø pipe when pressure problems occur.	SRW1.2	250	3414	2045	R8 564 000
Telemetry at bulk water meter to town.	SRW.M1	-	-	Next 3 yrs	R20 000
Sub-Total					**R11 097 000**
Faure					
Required when Welmoed future area develops.	RFW1.1	250	254	2030	R812 000
Required when Welmoed future area develops.	RFW1.2	200	1534	2030	R3 286 000
Required when Welmoed future area develops.	RFW1.5	160	287	2030	R517 000
Required when Welmoed future area develops.	RFW1.6	200	23	2030	R118 000
Sub-Total					**R4 733 000**
Polkadraai					

Table C.3.4: Future bulk water pipeline and water reticulation infrastructure required					
Recommendations included in the Water Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
New supply pipe to Papegaaiberg from Polkadraai.	SPW.B7	400	5210	2026	R41 264 000
Network upgrade to accommodate development along Vlottenburg Road.	SPW1.8	315	1070	2027	R4 319 000
Implement new PRV to manage high static pressures.	SPW1.7	200	PRV	2030	R489 000
Required when Welmoed future area develops.	SPW3.1	200	2116	2030	R4 506 000
Required when Welmoed future area develops.	SPW3.2	100	PRV	2030	R291 000
Required when Welmoed future area develops.	SPW3.3	200	257	2030	R609 000
Emergency supply to Welmoed from Skilpadsvlei.	SPW3.4	200	137	2030	R356 000
Required when future area PD4.1 develops.	SPW4.1	160	209	2030	R390 000
Telemetry at reservoirs, PRV and bulk water meters.	SRW.M1	-	-	Next 3 yrs	R120 000
Sub-Total					**R52 344 000**
Koelenhof					
Required to augment bulk supply to Koelenhof area.	RKW.B6a	560	4143	2028	R57 387 000
Required to augment supply to Sonop and Devon Valley reservoirs.	RKW2.2	315	1206	2030	R4 844 000
Required when future area KP6 develops.	RKW2.5	160	219	2030	R370 000
Required to improve network conveyance.	RKW4.1	110	518	2030	R600 000
Required to improve network conveyance.	RKW4.2	110	763	2030	R870 000
Required when future area KP20 develops (Replace existing 75Ø pipe).	RKW5.1	110	680	2030	R779 000
Required when future area KP20 develops (Replace existing 50Ø pipe).	RKW5.2	110	237	2030	R292 000
Bulk supply pipeline to Kriekbult reservoir.	RKW.B10	315	1446	2035	R5 777 000
Required to control flow into the Kriekbult sump.	RKW.B7	300	FCV	2035	R797 000
Supply pipeline from Kriekbult reservoir to network.	RKW2.1	355	1463	2035	R6 411 000
Isolate Koelenhof and Kriekbult zones.	RKW2.4a	200	Valve	2035	R194 000
Isolate Koelenhof and Kriekbult zones.	RKW2.4b	355	Valve	2035	R335 000
Isolate Koelenhof and Kriekbult zones.	RKW2.4c	315	Valve	2035	R335 000
Isolate Kriekbult and Sonop zones.	RKW2.7a	160	10	2035	R62 000
Isolate Kriekbult and Sonop zones.	RKW2.7b	160	Valve	2035	R153 000
Isolate Kriekbult and Sonop zones.	RKW2.7c	300	Valve	2035	R285 000
Inter-connection pipe required to supply areas east of R304 from Kriekbult reservoir.	RKW2.8	315	9	2035	R200 000
Isolate Kriekbult and Sonop zones.	RKW2.9a	200	Valve	2035	R194 000
Inter-connection bulk pipeline between Koelenhof and Kayamandi systems.	RKW.B14	355	7578	2040	R35 885 000
Required when future areas KP10 & KP11 develop.	RKW1.2	250	89	2040	R323 000
Required when future areas KP10 & KP11 develop.	RKW1.3	200	968	2040	R1 888 000
Second bulk connection for Koelenhof rural water scheme.	RKW.B1	560	-	2045	R2 175 000
Required to isolate the bulk supply from existing Koelenhof system.	RKW.B16	250	Valve	2045	R239 000
Dedicated bulk supply to Koelenhof.	RKW.B2	560	934	2045	R13 539 000
Required to control flow from CCT.	RKW.B3	300	FCV	2045	R797 000
Dedicated bulk supply to Koelenhof.	RKW.B6b	560	1154	2045	R16 541 000
Telemetry at reservoirs, PRVs and bulk water meters.	SRW.M1	-	-	Next 3 yrs	R700 000
Sub-Total					**R151 972 000**
Muldersvlei					
Inter-connection pipe between Koelenhof and Muldersvlei systems to improve residual pressure in the Muldersvlei system.	RMW1.1	160	423	2026	R740 000
Sub-Total					**R740 000**
Total					**R601 526 000**

WATER TREATMENT WORKS INFRASTRUCTURE

The table below gives a summary of the existing hydraulic design capacities and average daily flows and peak month average daily flows for the 2023/2024 financial year for each of the WTWs.

Table C.3.5: Existing hydraulic design capacities and average flows at each of the WTWs and water quality failures in network					
WTW	**Existing Hydraulic Capacity**	**Peak Month Average Daily Flow (2023/2024)**	**Average Daily Flow (Jul 2023 – Jun 2024)**	**Required Treatment Capacity (1.5 x AADD10yr)**	**2023/2024 Water Quality Failures for Network (SANS0214:2015)**
	Ml/d	**Ml/d**	**Ml/d**	**Ml/d**	
Idas Valley	21.000	16.309 (Oct)	11.872	21.708	Microbiological, Operational
Paradyskloof	17.000	15.040 (Jan)	12.004	22.001	Microbiological, Operational
Franschhoek	2.000	0.680 (Dec)	0.516	0.943	Microbiological

Note: The Idas Valley WTW was originally designed for a hydraulic capacity of 27.0 Ml/d, but due to the age of the plant the current available hydraulic capacity is only 21.0 Ml/d.

The Idas Valley WTW was operating at 56.5% (AADD) of its design capacity of 21.0 Ml/d for the 2023/2024 financial year. 42.9% of the 2023/2024 System Input volume of the Greater Stellenbosch system was treated at the Idas Valley WTW. The peak monthly flows at the WTW for the 2022/2023 and 2023/2024 financial years were 10.979 Ml/d (Aug.) and 19.991 Ml/d (Oct). The existing reduced hydraulic capacity of 21.0 Ml/d for the Idas Valley WTW is inadequate for the future required treatment capacity.

The Paradyskloof WTW was operating at 70.6% (AADD) of its design capacity of 17.0 Ml/d for the 2023/2024 financial year. 43.5% of the 2023/2024 System Input volume of the Greater Stellenbosch system was treated at the Paradyskloof WTW. The peak monthly flows at the WTW for the 2022/2023 and 2023/2024 financial years were 11.358 Ml/d (Febr.) and 15.040 Ml/d (Jan.). The existing hydraulic capacity of 17.0 Ml/d for the Paradyskloof WTW is inadequate for the future required treatment capacity.

The upgrading of both the Idas Valley WTW and the Paradyskloof WTW depends on increased allocations from the Eerste River and the WCWSS and no costs were therefore linked to these upgrades at this stage.

The Franschhoek WTW was operating at 25.8% (AADD) of its design capacity of 2.0 Ml/d for the 2023/2024 financial year. 14.9% of the 2023/2024 System Input volume of the Franschhoek system was treated at the Franschhoek WTW. The peak monthly flows at the WTW for the 2022/2023 and 2023/2024 financial years were 0.772 Ml/d (Nov.) and 0.602 Ml/d (Febr). The existing hydraulic capacity of 2.0 Ml/d for the Franschhoek WTW is adequate for the future treatment requirements.

The WTWs are all operational and the treatment plants are in a good condition, with no non-functional treatment processes. Some of the minor items to be addressed at the WTWs, as identified through the WSDP inspection process during May 2023, are as follows.

Idas Valley WTW:

- Inadequate water quality testing equipment.
- Raw water inflow meters faulty for Tower 1 and Tower 3. No final water outflow meter.
- Valve of Filter No.13 is problematic.
- Lime stone tank No.2 not in use. Safety railings of lime stone tanks to be repaired, safety risk.

Paradyskloof WTW:

- Lime feeder for filters No.5-8 not operational.
- No final water outflow meter.
- Only one of the sodium aluminate dosing pumps is operational.

Franschhoek WTW: No access.

The following upgrades are required with regard to the WTWs.

Table C.3.6: Future upgrades of the WTWs

WTW	Short description	Time Frame	Estimated cost
All WTWs	Upgrade chlorination installations	2025-2027	R750 000
Idas Valley WTW	Upgrade Idas Valley WTW	2025-2028	R52 000 000
Total			**R52 750 000**

WATER PUMP STATIONS

The water pump stations, as inspected during the WSDP site visits in May 2023, are all operational and well maintained. Duty and Standby pumps are available for most of the pump stations. Leaks were observed at some of the pumps during the site visits. The pump stations are fenced and locked and some are supplied with alarms to prevent any possible theft or vandalism. Key issues to be addressed at the water pump stations, as identified through the WSDP inspection process, are as follows:

- Pump stations without any standby pumps: Brandwacht PS (at WTW), Paradyskloof PS, Pniel PS and Winery Booster PS.

- Pump No.2 of the Rozendal PS was removed for repairs.
- Ceiling of Welgelegen PS building needs to be replaced.
- Motor No.2 at Blackheath PS not connected.
- Pump stations with leaks: Kylemore PS No.3, Pniel PS, Uniepark PS, Pappegaaiberg and Kleinvallei PS, Blackheath PS, De Zalze PS, Koelenhof PS and Devon Valley PS.
- Kleinvallei and Kayamandi PS: Not fenced and electrical installations were vandalised.

The Water Master Plan (June 2025) has indicated that based on the most likely land-use development scenario, it will be necessary for the following future water pump stations.

Table 3.7: Future water pump stations required

System	Recommendations included in the Water Master Plan	Item	Year	Capacity (l/s)	Head (m)	Cost (R Million)
Stellenbosch	170 L/s to new Helshoogte reservoir	SSW.B10a	2028	170	71	R10 323 000
	80 L/s to Rozendal reservoir	SSW.B10b	2028	80	15	R1 191 000
	Required to augment bulk supply to Polkadraai (Pumps only)	SSW.B26	2030	50	35	R4 132 000
	Required when future area S81 develops	SSW20.2	2030	7	30	R2 843 000
	Required when future areas S17 and S82 develop	SSW21.1	2030	7	30	R2 843 000
	Sub-Total					**R21 332 000**
Klapmuts	Add second pump as standby for Upper pump	SKW.B3	2026	60	40	R1 616 000
	Upgrade capacity of pumps to 185 L/s	SKW.B7	2035	185	55	R4 259 000
	Sub-Total					**R5 875 000**
Franschhoek	Existing pump station at capacity	SFW.B2	2025	40	50	R749 000
	Required when Langrug Upper reservoir is constructed	SFW.B6	2028	10	55	R3 039 000
	Required to augment bulk supply to Franschhoek	SFW.B13	2030	185	56	R3 242 000
	Required to augment bulk supply to Franschhoek	SFW.B19	2030	160	123	R5 517 000
	Pump station to pump water from Bagatelle reservoir to FH Estate reservoirs	SFW.B26	2035	6	110	R3 148 000
	Dedicated bulk supply from Franschhoek Lower reservoir to Franschhoek Upper reservoir	SFW.B9	2040	50	57	R4 676 000
	Sub-Total					**R20 371 000**
Dwars River	Required to augment bulk supply to Pniel & Johannesdal	SDW.B11	2026	66	60	R2 144 000
	Required to augment bulk supply to Pniel & Johannesdal	SDW.B6	2026	70	70	R1 847 000
	Required when existing pump station reaches capacity	SDW.B28	2027	5	12	R839 000
	Required bulk supply to Lanquedoc reservoir	SDW.B22	2028	64	155	R7 371 000
	Required when existing pump station reaches capacity	SDW.B15	2035	12	77	R413 000
	Sub-Total					**R12 614 000**

	Required for dedicated bulk supply to CCT Faure service reservoir	SRW.B1	2030	10	40	R3 897 000
	Sub-Total					**R6 668 000**
Koelenhof	Upgrade/refurbish Sonop and Devon Valley pumps (Sonop pumps currently not operational)	RKW.B12	2026	45	100	R2 327 000
	New sump for Kriekbult pump station	RKW.B8	2035	100	150	R1 408 000
	Required when Kriekbult reservoir is constructed	RKW.B9	2035	90	76	R6 874 000
	Required to supply bulk water from the Koelenhof system to the Kayamandi system	RKW.B15	2040	60	120	R3 252 000
	New sump for Koelenhof bulk pump station no. 2	RKW.B4	2045	100	150	R1 408 000
	New Koelenhof bulk PS	RKW.B5	2045	150	30	R7 328 000
	Sub-Total					**R22 597 000**
Total						**R89 457 000**

RESERVOIR INFRASTRUCTURE

Most of the reservoirs and water towers in Stellenbosch Municipality's Management Area are in a good condition and well maintained. The levels of the reservoirs are monitored through the scada systems. No leaks were noticed at any of the reservoirs during the WSDP site visits in May 2023. Most of the reservoir sites are fenced and locked, the reservoir covers are locked and the air vents are covered.

Some of the issues to be addressed at the water reservoirs and towers, as identified through the WSDP inspection process, are as follows.

- Reservoirs not fenced: La Motte and Pniel Upper.
- Reservoirs with covers not locked: Wemmershoek, La Motte, Bagatelle, Pniel Lower and Upper and Uniepark No.2
- Roof of Uniepark No.1 vandalised and needs to be repaired.

The 2023/2024 storage factors of the total reservoir storage capacity for the various systems, based on 1 x PDD (24 hours storage capacity), are 1.31 for Stellenbosch, 1.86 for Franschhoek, 2.27 for Dwars River and 3.05 for Klapmuts. Even though the overall storage capacity might be adequate for all of the towns there can be distribution zones within some of the towns with inadequate storage capacity, which require additional reservoirs.

The Water Master Plan (June 2025) has indicated that based on the most likely land-use development scenario, it will be necessary for the following future reservoirs.

Table 3.8: Future reservoir storage capacities required

System	Recommendations included in the Water Master Plan	Item	Capacity (Ml)	Year	Estimated Cost
Stellenbosch	Additional reservoir capacity at Cloetesville	SSW.B14	7.000	2025	R25 308 000
	Required to augment bulk supply to Stellenbosch	SSW.B19	30.000	2028	R79 170 000
	Additional reservoir storage capacity for Papegaaiberg zone (20.0 ML as first phase, additional 20.0 ML required in future))	SSW.B21	20.000	2028	R58 290 000
	Additional reservoir storage capacity for Papegaaiberg zone (Phase 2)	SSW.B22	20.000	2045	R58 290 000
	Required when future areas S19, S20.1 and S20.2 develop (Outside urban edge, potential longer term item)	SSW.B18	1.500	2055	R8 255 000
	Additional reservoir storage capacity for Brandwacht zone	SSW.B32	1.500	2055	R8 255 000
	Additional reservoir capacity at Paradyskloof 2 (Potential longer term upgrade)	SSW.B6	1.500	2055	R8 255 000
	Sub-Total				**R245 823 000**
Klapmuts	Additional reservoir storage capacity for Klapmuts Lower reservoir site	SKW.B10	9.000	2035	R30 798 000
	Additional reservoir storage capacity for Klapmuts Upper	SKW.B5	5.000	2040	R19 575 000
	Sub-Total				**R50 373 000**
Franschhoek	Additional reservoir storage capacity for Langrug (Existing storage capacity insufficient. Additional 1.0 ML higher lying reservoir also proposed for Langrug area)	SFW.B3	1.000	2025	R6 192 000
	New reservoir storage capacity for La Motte (can be phased)	SFW.B25	3.000	2028	R13 398 000
	Decommission existing La Motte reservoir once La Motte Upper reservoir is constructed.	SFW.B23	0.500	2028	-
	Reservoir storage capacity for Langrug Upper zone (required to service higher lying structures in Langrug)	SFW.B8	1.000	2028	R6 192 000
	Additional reservoir storage capacity for Wemmershoek	SFW.B17	0.750	2030	R5 132 000
	Additional reservoir capacity for future areas	SFW.B5	5.000	2040	R19 575 000
	Sub-Total				**R50 489 000**
Dwars River	Additional reservoir capacity for Pniel area	SDW.B27	1.000	2027	R6 192 000
	Reservoir storage capacity for Lanquedoc reservoir development area (3.5 ML as phase 1; 5.0 ML as phase 2)	SDW.B5	3.500	2028	R15 149 000
	Additional reservoir capacity for future areas	SDW.B16	1.500	2035	R8 255 000
	Additional reservoir storage capacity for Lanquedoc reservoir development areas (Longer term)	SDW.B24	5.000	2040	R19 575 000

BULK SEWER PIPELINE AND SEWER DRAINAGE NETWORK INFRASTRUCTURE

The Sewer Master Plan (June 2025) has indicated that based on the most likely land-use development scenario, it will be necessary for the following bulk sewer pipeline and sewer drainage network infrastructure.

Table 3.9: Future bulk sewer pipeline and sewer drainage network infrastructure required					
Recommendations included in the Sewer Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
Stellenbosch WWTW					
Investigate existing Gravity pipelines	SSS12.1, SSS12.2, SSS12.3, SSS14.3, SSS14.4, SSS17.12, SSS17.13, SSS17.14, SSS17.6, SSS18.10, SSS18.14, SSS18.6, SSS18.7, SSS19.4, SSS19.5, SSS19.7, SSS19.8, SSS20.12, SSS20.4, SSS20.8, SSS26.2, SSS26.4, SSS9.1, SSS9.5	-	-	2025	R96 000
Investigate existing Flow Diversion	SSS17.3	-	-	2025	R11 000
Investigate existing Rising pipelines	SSS23.1, SSS24.1, SSS6.1, SSS8.1, SSS8.3	-	-	2025	R20 000
Upgrade existing 225mm dia. outfall gravity sewer to a 315mm uPVC sewer	SSS1.8	315	183	2026	R886 000
Upgrade existing 160mm dia. outfall gravity sewer to a 315mm dia. uPVC sewer	SSS1.9	315	427	2026	R1 830 000
Replace existing rising main (Existing pipe in bad state of repair)	SSS14.1	315	325	2026	R3 442 000
Upgrade existing 160mm dia. gravity section to 250mm dia. uPVC. Replace existing 200mm dia. Vitrified Caly pipe to a 250mm dia. uPVC if existing pipe is in a bad state of repair.	SSS19.2a	250	317	2027	R1 192 000
Upgrade existing 250mm dia. gravity Vitrified Caly pipe with a 250mm dia. uPVC pipe if the existing pipe is in a bad state of repair.	SSS19.2b	250	367	2027	R1 358 000
Upgrade existing Gravity (To address operational problems)	SSS19.3	200	844	2027	R2 520 000
New gravity sewer when future areas S64, S65 and S66 develop.	SSS17.1	160	463	2028	R1 030 000
Upgrade existing bulk Gravity when existing outfall sewer reaches capacity.	SSS1.2	600	757	2030	R7 141 000
Upgrade existing Flow Diversion	SSS1.4	-	-	2030	R638 000
Upgrade existing bulk Gravity when existing outfall sewer reaches capacity	SSS1.5	600	186	2030	R1 952 000
Upgrade existing Flow Diversion	SSS1.6	-	-	2030	R638 000
Upgrade existing bulk Gravity when existing outfall sewer reaches capacity	SSS1.7	600	449	2030	R4 339 000
New gravity sewer when future areas S36 develops	SSS17.18	160	379	2030	R856 000
Upgrade existing Gravity when existing collector sewer reaches capacity.	SSS19.1	400	875	2030	R4 532 000
New bulk rising main when future areas in the Fleurbaix PS drainage area develop.	SSS2.1	400	29	2030	R373 000
New gravity sewer when future area S58 develops	SSS2.17	250	1329	2030	R3 622 000
New rising main to divert flow to the Fleurbaix PS	SSS2.4	355	19	2030	R261 000
New gravity sewers when Kayamandi Northern extensions develop	SSS27.10	160	679	2030	R1 473 000
	SSS27.11	160	708	2030	R1 533 000
	SSS27.13	160	650	2030	R1 413 000
	SSS27.2	160	307	2030	R708 000
	SSS27.3	400	198	2030	R915 000
	SSS27.4	315	891	2030	R2 940 000
	SSS27.5	250	411	2030	R1 177 000
	SSS27.6	200	433	2030	R1 072 000
	SSS27.8	200	206	2030	R553 000

Table 3.9: Future bulk sewer pipeline and sewer drainage network infrastructure required					
Recommendations included in the Sewer Master Plan	**Item**	**Diameter (mm)**	**Length (m)**	**Year**	**Estimated Cost**
New gravity sewer when future areas S47 and S91 develop.	SSS3.3	160	111	2030	R305 000
New gravity sewer when future area KP19 develops	SSS30.10	160	2053	2030	R4 299 000
New gravity sewer when future area KP17 develops	SSS30.11	160	350	2030	R797 000
Upgrade existing Gravity when overflow problems occur.	SSS30.3	250	17	2030	R221 000
Investigate existing Gravity	SSS30.4	-	-	2030	R4 000
New gravity sewer when future areas KP8.1, KP8.2, KP9, KP10 and KP11 develop	SSS30.5	250	278	2030	R823 000
New gravity sewer when future areas KP8.1, KP8.2 and KP11 develop	SSS30.6	160	190	2030	R469 000
New gravity sewer required when future areas KP8.2 and K9 develop	SSS30.8	200	323	2030	R820 000
New gravity sewer when future areas PD3.1 and PD3.2 develop	SSS4.4	160	1066	2030	R2 268 000
New gravity sewer when future areas PD4.1 to PD4.3 develop.	SSS4.5	160	380	2030	R859 000
New rising main when future areas in the Welmoed PS drainage area develop	SSS5.1	160	4084	2030	R6 082 000
New gravity sewers when future areas in the Welmoed PS drainage area develop	SSS5.3	200	8	2030	R98 000

SEWER PUMP STATIONS

Most of the sewer pump stations, as inspected during the WSDP site visits in May 2023, are operational and well maintained. Duty and Standby pumps are available for most of the pump stations. No spillages were observed at any of the sewer pump stations during the site visits. Most of the pump stations are also fenced and locked and some are supplied with alarms to prevent any possible theft or vandalism. Some of the issues to be addressed at the sewer pump stations, as identified through the WSDP inspection process, are as follows.

- Pump Stations where the electrical fence is not working: Klapmuts PSs No.1, No.2 and No.3.
- Mechanical screen at Klapmuts PS No.2 not operational.
- Erosion and part of fence at Digteby PS to be repaired.

The Sewer Master Plan (June 2025) has indicated that based on the most likely land-use development scenario, it will be necessary for the following future sewer pump stations.

Table 3.10: Future sewer pump stations required					
Drainage System	**Recommendations included in the Sewer Master Plan**	**Item**	**Capacity (l/s)**	**Year**	**Estimated Cost**
Stellenbosch WWTW	Investigate existing Pump Station (Distell 1 system)	SSS10.3	-	2025	R32 000
	Investigate existing Pump Station (KWV system)	SSS12.4	-	2025	R32 000
	Investigate existing Pump Station (Distell 2 system)	SSS13.3	-	2025	R32 000
	Investigate existing Pump Station (Stellentia (Gilbeys) system)	SSS16.2	-	2025	R32 000
	Investigate existing Pump Station (Nuutgevonden system)	SSS21.1	-	2025	R32 000
	Investigate existing Pump Station (Welgevonden 2 (Stellenvista) system)	SSS23.2	-	2025	R32 000
	Investigate existing Pump Station (Welgevonden 1 system)	SSS24.2	-	2025	R32 000
	Investigate existing Pump Station (De Zalze 3 system)	SSS6.2	-	2025	R32 000
	Investigate existing Pump Station (Audacia PS 2 system)	SSS8.2	-	2025	R32 000
	Investigate existing Pump Station (Audacia PS 1 system)	SSS8.4	-	2025	R32 000
	Investigate existing Pump Station (Die Boord system, potentially downsize pump station)	SSS14.2	-	2026	R32 000
	New Pump Station required when future areas in the Fleurbaix PS drainage area develop (Initial capacity of 150 l/s, ultimate capacity of 285 l/s)	SSS2.3	150	2030	R12 551 000
	New Pump Station required when future areas in the Welmoed PS drainage area develop.	SSS5.2	-	2030	R2 834 000
	New Pump Station required when future areas in the Droe Dyke PS drainage area develop.	SSS2.24	-	2040	R3 443 000
	Upgrade existing Pump Station (Investigate the capacity of the Plankenburg pumping system first, potentially upgrade pump station)	SSS25.2	-	2040	R1 178 000
	Abandon existing Pump Station when the outfall sewer to Fleurbaix PS is complete.	SSS3.2	-	2040	R286 000

Table 3.10: Future sewer pump stations required					
Drainage System	**Recommendations included in the Sewer Master Plan**	**Item**	**Capacity (l/s)**	**Year**	**Estimated Cost**
	Upgrade capacity of PS when future areas in the Fleurbaix PS drainage area develop (Initial capacity of 150 l/s, ultimate capacity of 285 l/s)	SSS2.30	135	2045	R2 580 000
	New Pump Station when future area S99.1 develop.	SSS29.2	-	2045	R2 533 000
	Sub-Total				**R25 757 000**
Wemmershoek WWTW	Decommission La Motte PS & rising main when item SFS3.1 is implemented.	SFS3.2	-	2028	R286 000
	New PS required when future area LM1, LM2, LM5 and LM6 develops.	SFS4.2	-	2030	R2 684 000
	Sub-Total				**R2 970 000**
Pniel WWTW	New Pump Station when Boschendal Village develops (16 l/s as first phase, 37 l/s ultimate capacity).	SDS4.12	-	2026	R4 070 000
	New 16 l/s Banhoek bulk PS required when Boschendal Village develops (16 l/s as first phase, 87 l/s ultimate capacity)	SDS8.2	16 - 87	2026	R6 443 000
	Abandon existing Pump Station when proposed Banhoek PS is commissioned.	SDS2.6	-	2027	R286 000
	Abandon existing Pump Station when proposed Banhoek PS is commissioned.	SDS3.2	-	2027	R286 000
	Abandon existing Pump Station when proposed Banhoek PS is commissioned.	SDS7.2	-	2028	R286 000
	Interim PS & rising main to service upstream areas (decommission PS & rising main when flow is diverted in future to Allee Bleue PS)	SDS9.2	-	2035	R2 483 000
	New Pump Station for future development areas DR27, DR28 and DR29 (re-direct flow from Meerlust to new PS)	SDS5.2	-	2040	R3 034 000
	Sub-Total				**R16 888 000**
Klapmuts WWTW	New PS required to decommission Klapmuts PSs 1, 2 and 3	SKS1.13	-	2026	R4 702 000
	Decommission when by-pass to Rozenmeer PS is complete.	SKS5.3	-	2026	R286 000
	Decommission when by-pass to Rozenmeer PS is complete.	SKS6.3	-	2027	R286 000
	Decommission when by-pass to Rozenmeer PS is complete.	SKS7.3	-	2028	R286 000
	New PS required if future areas K8, K9, K11 or K12 develop prior to the new Klapmuts WWTW and outfall sewer.	SKS8.2	-	2040	R2 834 000
	New PS required when future areas K21.1 and K21.2 develop.	SKS20.5	-	2040	R2 633 000
	Sub-Total				**R11 027 000**
Total					**R56 642 000**

WASTE WATER TREATMENT INFRASTRUCTURE

The table below gives a summary of the existing hydraulic design capacities and current flows at each of the WWTWs, as well as the final effluent quality compliance percentages for the 2023/2024 financial year.

Table C.3.11 Existing hydraulic design capacities and flows at each of the WWTWs						
WWTW	**Existing Hydraulic Capacity**	**Peak Month Average Daily Flow**	**Average Daily Flow (2023/2024)**	**Average Wet Weather Flow (April to September)**	**Average Daily Flow as a % of Design Capacity**	**Final Effluent Compliance for 2023/2024**
	Ml/d	**Ml/d**	**Ml/d**	**Ml/d**	**%**	
Stellenbosch	35.000	36.963 (Sept)	23.718	25.978	67.77	Stellenbosch 1 Microbiological: 0.0% Chemical: 25.0% Physical: 44.4% Stellenbosch 2 Microbiological: 0.0% Chemical: 50.0% Physical: 69.4%
Wemmershoek	3.600	11.442 (Jun)	4.120	5.327	114.44	Microbiological: 33.3% Chemical: 27.1% Physical: 66.7%
Pniel	4.500	3.856 (Sept)	2.347	2.649	52.16	Microbiological: 0.0% Chemical: 47.9% Physical: 91.7%
Klapmuts	2.400	2.209 (Nov)	1.537	1.593	64.04	Microbiological: 50.0% Chemical: 62.5% Physical: 77.8%
Raithby	0.150	0.206 (Oct)	0.065	0.062	43.33	Microbiological: 33.3% Chemical: 77.1% Physical: 88.6%

Note: The Wemmershoek WWTW was originally designed for a hydraulic capacity of 5.0 Ml/d, but due to design errors the current hydraulic capacity of the plant is only 3.6 Ml/d.

The organic design capacities of the WWTWs and the current loadings at the WWTWs are indicated in the table below.

Table C.3.12: Existing organic design capacities and loadings at the WWTWs

WWTW	Organic Design Capacity	2022/2023		2023/2024	
		Average Load	% of Organic Design Capacity	Average Load	% of Organic Design Capacity
	kg COD/d	kg COD/d	%	kg COD/d	%
Stellenbosch	35 000	17 201	49.15	24 237	69.25
Wemmershoek	4 350	1 953	44.90	2 979	68.48
Pniel	4 500	1 511	33.58	937	20.82
Klapmuts	2 700	1 372	50.81	1 715	63.52
Raithby	53	61	115.09	39	73.58

The projected future WWTW flows are included in the future water requirement projection models. The table below gives an overview of the average daily future projected WWTW flows.

Table C.3.13: Average daily and peak month future projected WWTW flows (Ml/d)

WWTW	Existing Hydraulic Capacity	Average Daily Future Projected WWTW Flows					Peak Month Average Daily Future Projected WWTW Flows				
		2028	2033	2038	2043	2048	2028	2033	2038	2043	2048
Stellenbosch	35.000	26.535	31.769	38.165	43.690	50.301	33.434	40.029	48.088	55.049	63.379
Wemmershoek	3.600	3.723	4.409	5.252	6.288	7.566	5.585	6.614	7.878	9.432	11.349
Pniel	4.500	2.212	2.334	2.478	2.646	2.839	2.765	2.918	3.098	3.308	3.549
Klapmuts	2.400	1.759	2.127	2.748	3.381	4.425	1.935	2.340	3.023	3.719	4.868
Raithby	0.150	0.087	0.117	0.156	0.209	0.280	0.134	0.180	0.240	0.322	0.431

Note: The peak month factors used in the above table is 1.26 for Stellenbosch, 1.50 for Wemmershoek, 1.25 for Pniel, 1.10 for Klapmuts and 1.54 for Raithby.

Stellenbosch WWTW: The 2022 Green Drop Score for the Stellenbosch WWTW was 84% and the DWS's Wastewater Risk Rating increased from 55.6% (Medium Risk) in 2021 to 86.4% in 2023 (High Risk). The capacity of the WWTW is adequate to meet the short term future treatment requirements (Next three years), but the Municipality will need to budget for the upgrading of the WWTW in the nearby future. The following operational problems were noticed during the WSDP site visit in May 2023.

- Inlet works: Only one of the three mechanical front raked screens was operational. One of the wash compactors was not operational. Seepage pump was not operational due to blockages from the broken wash compactor. Odour system not operational. One of the degritters was not operational.
- Four rotating brush fine screens: Screens No.1 and No.4 were not working.
- Bio-reactor: One of the five aerators was not operational.
- MBR: Valve broken off, to be repaired. The shaft of one of the actuators was broken. Hach inline sampler not operational. Membrane pumps No.2 and No.4 not working.
- SST No.1 and No.3: Scum plates were removed at various sections. SST No.2 leaking at floor and bridge wheel was removed.
- UV disinfection system: Not operational due to broken sensor.
- Belt press: Only one of the two sludge pumps was operational. Pumps need to be operated manually.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Stellenbosch WWTW were as follows:

- The plant is in general in a good condition and seems well managed.
- The plant is not fully compliant with the stringent special limits, but comply well within the general limits.
- The application for relaxing for effluent limits of Conductivity, COD, Ammonia, E.Coli and Nitrate limits with DWS should be followed up . It is reported that the application has been in review by DWS since 2018.

Wemmershoek WWTW: The 2022 Green Drop Score for the Wemmershoek WWTW was 83% and the DWS's Wastewater Risk Rating increased from 63.6% (Medium Risk) in 2021 to 82.4% in 2023 (High Risk). The reduced capacity of 3.6 Ml/d of the Wemmershoek WWTW is inadequate to meet the current and future treatment requirements and the capacity of the WWTW needs to be increased. The following operational problems were noticed during the WSDP site visit in May 2023.

- Lighting at plant not adequate, which is a safety and security risk.
- Office building: Geyser is not working. No sampling equipment for operational sampling.
- Inlet works: Two mechanical front raked screens were not operational. Service water pumps for water at inlet works not operational.
- Raw feed tank: Level sensors were faulty. One of the three submersible pumps was not operational.
- SBR: Valve malfunctioning (SBR No.2). One of the four blowers was not working.
- Two linear screen and belt wash pumps were not operational (Alignment). One of the service water pumps was not operational. Compressor for linear screen and belt wash pumps was not operational.
- Silo for belt press: No control valve, dried sludge push out when full. Level sensor also faulty.
- Chlorine Disinfection: Door of chlorine building to be replaced. No BA sets or other chlorine safety equipment. No water at emergency shower. Vacuum regulator for second chlorine cylinder not operational, only one cylinder can be used. Extraction fan is not operational.
- Electrical fence was vandalised, not operational.
- No final effluent flow meter.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Wemmershoek WWTW were as follows:

- The plant is generally in good condition regarding civil structures, but various mechanical equipment is not operational.
- The works is organically overloaded and additional to this, the works was never designed to achieve Special Limits at these high organic loads.
- Phase 1 of the planned upgrade was underway during writing which will address most of the short falls and operational challenges.

Pniel WWTW: The 2022 Green Drop Score for the Pniel WWTW was 83% and the DWS's Wastewater Risk Rating increased from 58.8% (Medium Risk) in 2021 to 82.4% in 2023 (High Risk). The capacity of the WWTW is adequate to meet the medium to long term future treatment requirements (Next ten years). The WWTW was in a very good condition during the WSDP site visit in May 2023. Only two items were noticed during the site visit.

- Bio-reactor: Anoxic Basin: One of the two mixers were removed for repairs.
- Sludge drying beds to be cleaned of weeds and grass.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Pniel WWTW were as follows (Before upgrade):

- The plant is generally in good condition regarding civil structures, but various mechanical equipment is not operational.
- The works is organically overloaded and additional to this, the works was never designed to achieve Special Limits at these high organic loads.
- Upgrade is currently underway which will address most of the short falls and operational challenges.

Klapmuts WWTW: The 2022 Green Drop Score for the Klapmuts WWTW was 82% and the DWS's Wastewater Risk Rating increased from 41.2% (Low Risk) in 2021 to 70.6% in 2023 (High Risk). The capacity of the WWTW is adequate to meet the short to medium term future treatment requirements (Next three to five years), but the Municipality will need to budget for the upgrading of the WWTW in the nearby future. The Klapmuts WWTW was in a very poor condition during the WSDP site visit in May 2023 and the following operational problems were noticed.

- General: WWTW terrain overgrown with grass, inadequate maintenance. Grass also to be removed from sludge holding tank.
- No sampling equipment for operational sampling.
- Inlet works: Mechanical front raked screen was removed for repairs.
- Bio-reactor: Only one of the a-cycle pumps was operational. Both submersible waste sludge pumps were not operational. Inline DO and Turbidity meters were not working.
- SST No.2 not operational, because of faulty RAS PS valve. One of the submersible pumps is not working.
- Chlorine disinfection: No disinfection was done at the time of the site visit, due to chlorine shortage. The chlorine tablet disinfection system was also not operational.
- Only one of the pumps for the final effluent for the Belt Press was operational, the other pump was removed for repairs. The Belt Press was not operational due to loose belt.
- Maturation pond to be cleaned and full of scum on the surface. Sludge lagoon also overgrown with grass and needs to be cleaned.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Klapmuts WWTW were as follows:

- There is a serious theft problem at the works in spite of the presence of 24 hours security present. Due to this, and lengthy parts/ equipment replacement period, the operation of the works is affected resulting in violating the license effluent limits.
- The emergency sludge lagoon remains filled to capacity resulting in zero sludge handling capacity in case of belt press breakdowns.
- The security on site needs to be tighten and emergency sludge handling capacity needs to be created.

Raithby WWTW: The 2022 Green Drop Score for the Raithby WWTW was 73% and the DWS's Wastewater Risk Rating increased from 64.7% (Medium Risk) in 2021 to 76.5% in 2023 (High Risk). The capacity of the WWTW is adequate to meet the short term future treatment requirements (Next three years), but the Municipality will need to budget for the upgrading of the WWTW in the nearby future. The following operational problems were noticed during the WSDP site visit.

- Inlet works: Mechanical front raked screen needs to be reset after each load shedding period.
- Only one of the six rotating biological contactors was operational.
- Back-up emergency sludge lagoon needs to be cleaned, also overgrown with grass and reeds.

The conclusions and actions for consideration included in the 2021 Process Audit Report for the Raithby WWTW were as follows:

- The plant is generally in good condition regarding civil structures with only few mechanical equipment not operational.
- The works is organically overloaded and require additional treatment capacity.
- An upgrade for the works was at planning state.

The following future upgrades are required with regard to the WWTWs.

Table C.3.14: Future upgrades of the WWTWs			
WWTW	**Short description**	**Time Frame**	**Estimated cost**
Stellenbosch	Pond rehabilitation and pond pumping systems construction	2025-2028	R4 400 000
Stellenbosch	Extension of WWTW	2025-2028	R82 200 000
Wemmershoek	Upgrade of WWTW	2025-2027	R31 000 000
Klapmuts	Upgrade of WWTW	2025-2028	R81 000 020
Raithby	Refurbish plant and equipment	2025-2027	R10 000 000
Stellenbosch	Upgrade WWTW with an additional 15 Ml/d	2030	R375 000 000
Stellenbosch	Upgrade WWTW with an additional 15 Ml/d	2040	R375 000 000
Wemmershoek	Upgrade WWTW with an additional 4.5 Ml/d	2034	R112 500 000
Total			**R1 071 100 020**

WATER SCHEMES

The Water Master Plan (July 2025) indicates the future water reticulation network components that will be necessary for the various developments and the required changes to the existing networks (Proposed distribution zones, future systems and required works).

SANITATION SCHEMES

The Sewer Master Plan (July 2025) indicates the future sewer drainage network components that will be necessary for the various developments and the required changes to the existing networks (Proposed drainage zones, future systems and required works).

TOPIC 4: WATER SERVICES OPERATION AND MAINTENANCE

Table C.4.1: Water Services O&M						
Section	**Intervention Required?**	**% (1)**	**Solution description as identified by Master Plan**	**% (2)**	**Is there an Existing project/activity addressing this problem?**	**Current Demand Overall Scoring % (3)**

No	100	Operation and Maintenance tasks for the various water and sewerage infrastructure components, as indicated under Sections 4.1.1 to 4.1.10 of the "Future Demand and Functionality Requirements" WSDP Master Plan should be implemented. Ensure the required O&M schedules are in place and signed off.	100	Partially	78.6
Resources	No	100	A budget of approximately 2% of the total asset value per annum should be allocated towards the replacement of existing water and sewerage infrastructure (Best Practice). In the case of operations and maintenance of the system, a budget of approximately 1% to 2% of the value of the system is typically required to ensure that the system remains in good condition (Best Practice).	100	Partially	92.9
	No	100	Stellenbosch Municipality needs to ensure that the number of process controllers at each of the WTWs and WWTWs and the class of process controller complies with the required number of process controllers and class of process controller per plant (New Regulation 3630).	100	Partially	78.6
Information	No	100	All incidents at the WTWs and WWTWs and on the water reticulation networks and sewer drainage networks need to be recorded and Incident Management Protocols, as included in the Water Safety Plans and W_2RAPs, need to be followed after an incident.	100	Yes	85.7
	No	100	Ensure that the required O&M Manuals are in place for all the water and sewerage infrastructure.	100	Partially	78.6
Activity Control & Management	No	100	Groundwater: Implement recommended daily, weekly, monthly and six monthly O&M activities for the boreholes.	100	Partially	85.7
	No	100	Surface water infrastructure: Implement preventative maintenance procedures.	100	Partially	85.7
	No	100	Bulk and water reticulation networks and fittings: Compile daily, weekly, monthly and annual maintenance checklists for the maintenance activities for the water reticulation networks and fittings.	100	Partially	85.7

Table C.4.1: Water Services O&M						
Section	**Intervention Required?**	**% (1)**	**Solution description as identified by Master Plan**	**% (2)**	**Is there an Existing project/activity addressing this problem?**	**Current Demand Overall Scoring % (3)**
	No	100	WTWs: Evaluate the existing O&M schedules for the WTWs against the recommended O&M tasks and ensure all required activities are adequately monitored and recorded.	100	Partially	85.7
	No	100	Water PSs: Compile weekly and monthly maintenance checklists for the recommended activities for all the water PSs and all PSs need to be inspected on at least a weekly basis.	100	Partially	85.7
	No	100	Reservoirs: Compile maintenance checklists for the recommended reservoir maintenance activities and document all inspections.	100	Partially	85.7
	No	100	Remote monitoring and Control Systems: Ensure adequate maintenance is carried out on the SCADA systems and compile maintenance checklists for the recommended activities.	100	Partially	85.7
	No	100	Sewer PSs: Compile weekly and quarterly maintenance checklists for the recommended activities for all the sewer PSs and all centrifugal pump stations need to be inspected on at least a weekly basis.	100	Partially	85.7
	No	100	Bulk and sewer drainage networks: Annual, monthly and weekly schedules for maintenance should be drawn up for the bulk and sewerage networks. Regular cleaning of sewer lines and all blockages and their precise locations should be recorded.	100	Partially	85.7
	No	100	WWTWs: Evaluate the existing O&M schedules for the WWTWs against the recommended O&M tasks and ensure all required activities are adequately monitored and recorded.	100	Partially	85.7

Notes: (1) Is this section addressed in the WSDP?
(2) Were solutions identified for the possible gaps?
(3) Percentage calculated based on the above two percentages and whether there is an existing project/activity addressing this problem?; Does this current listed project/activity address the problem totally?; Project/Activity approved by Council as part of WSDP database?; Approved by Council in project activity database and part of 5yr IDP cycle projects?; Project/Activity listed in 3yr MTEF Cycle?

It is important for Councils to understand the value of maintenance and provide the necessary funding to properly operate and maintain infrastructure. It is the responsibility of the municipal and technical managers to educate and inform Councils on this and help councillors explain these issues to their communities. **Successful municipalities depend to a large extent on a single principle – effective and efficient management!**

Much of the routine work of technical departments involves managing and undertaking the O&M of services that is done in-house by municipal staff. A second major aspect of work is managing O&M undertaken by external service providers. The third major area is new or capital projects, also usually undertaken by external service providers.

Each service area in Stellenbosch Municipality needs an O&M system that monitors and assesses infrastructure condition and plans for the required preventative maintenance, and when necessary, rehabilitation, upgrading or replacement of the infrastructure. This is a major part of an overall Asset Management System, which

- records, describes all infrastructure assets;
- monitors and assesses their condition;
- plans and monitors maintenance;
- plans upgrading, rehabilitation and replacement; and
- values assets and the costs of maintenance, upgrading, rehabilitation and replacement.

There is a wide range of **desirable objectives** that should be achieved with the help of maintenance.

- Retain an asset in a serviceable condition during its designed life span.
- Optimize the reliability of equipment and infrastructure.
- Ensure that the equipment and infrastructure are kept in a good condition.
- Ensure prompt emergency repair of equipment and infrastructure to sustain service delivery.
- Take action before repair costs become too high.

- Ensure operation by eliminating breakdown risks or limiting them as much as possible.
- Improve delivery by upgrading infrastructure.
- Enable repairs under the best possible conditions.
- Improve operational safety and remove causes of accidents.
- Reduce the overall management burden through better work preparation and reduced unforeseen production stoppages.
- Protect the environment.

To achieve these objectives, it is necessary to train personnel in specific maintenance skills and to influence their attitudes, as better operational results depend on motivated staff who are committed to proper maintenance procedures and standards.

Setting up a preventative maintenance programme is one of the most effective ways of reducing breakdowns and keeping equipment and infrastructure in good condition. It is important to implement such a programme as soon as new equipment or infrastructure is put into service.

Implementing a preventative maintenance programme requires a **maintenance plan**, with particular emphasis placed on the following:

- Periodic inspection of equipment according to a pre-established programme so that working conditions may be checked.
- Systematic servicing – the first step in devising this programme is to forecast the life of parts and components subject to wear, i.e. the study of reliability, failure modes and effects and fault analysis.
- Overhauls, which often require considerable work, should be planned during low production periods.

The complexity of maintenance activities should be analysed to set up an efficient maintenance plan and to take management decisions, e.g. regarding use of own resources and unskilled or skilled resources. **Five levels of maintenance** can be distinguished, depending on the complexity of the work and the urgency of action.

- Simple adjustments are generally applicable to accessible components and require no dismantling or opening of the equipment. These adjustments involve the completely safe replacement of accessible consumable components such as signal lights or some types of fuses. Servicing of this type may be performed by the operator on site, without tools, following the instructions for use. The stock of consumable parts required is very small.

- Troubleshooting entails minor preventative maintenance operations such as greasing or checking for proper functioning. Servicing of this type may be performed on site by an authorised technician. An authorised technician has received training that enables him/her to perform such maintenance work safely and is well aware of potential problems.

- Breakdowns require identification, diagnosis and repairs by replacing components or working parts. Servicing of this type must be carried out by trained persons, on site or in the maintenance shop, using the documentation (manuals, spare part lists, etc.) necessary for maintenance of equipment.

- Major maintenance work covers all major corrective or preventative work except modernization and rebuilding. Servicing of this type must be carried out by a team that comprises highly skilled technical specialists, using the relevant documentation.

- Modernising and rebuilding equipment or executing major repairs is usually done by the manufacturer or builder. Resources are specified and usually very similar to those used in the original manufacturing or construction.

In order to ensure **good quality O&M**, technical managers firstly need to ensure that staff responsible for in-house O&M

- understand equipment and infrastructure;
- understand and implement the proper O&M requirements and procedures;
- understand the required service and operating standards;
- have and develop the necessary O&M skills;
- assess equipment and infrastructure conditions;
- understand and identify typical defects and problems;
- solve problems and make necessary repairs, or engage experts to do so; and
- record all activities to provide data for planning and analysis of O&M.

Secondly technical managers must ensure that they contact competent external service providers.

The bulk of O&M activities should be of a preventative nature. That is regular checking all the water and sewerage infrastructure and ensuring that everything is in good operational condition. There are a number of standard recommended O&M tasks, for the various water and sewerage infrastructure components, which should be implemented by Stellenbosch Municipality.

A budget of approximately 2% of the total asset value per annum should be allocated towards the replacement of existing infrastructure. In the case of the operations and maintenance of the systems, a budget of approximately 1% to 2% of the value of the system is typically required to ensure that the systems remain in good condition (Best Practice).

The table below gives an overview of the Opening Cost and Book Value of the water and sewerage infrastructure included in Stellenbosch Municipality's Asset Register (June 2024). The recommended budgets for the replacement of the existing infrastructure and the operation and maintenance of the existing infrastructure, based on the Opening Cost, are also indicated.

Table C.4.2: Recommended budgets for the replacement and the operation and maintenance of the existing water and sewerage infrastructure.

Asset Type	Asset Register June 2024		CRC	Recommended Annual Replacement Budget (Best Practice)	Recommended Annual O&M Budget (Best Practice)	Depreciation and Amortisation: Actual Expenditure
	Opening Cost	Book Value		2.0% of CRC	1.5% of CRC	2023/2024

TOPIC 5: CONSERVATION AND DEMAND MANAGEMENT

Table C.5.1: Conservation and Demand Management - Water Resource Management

Section	Intervention Required?	% (1)	Solution description as identified by Master Plan	% (2)	Is there an existing project/activity addressing this problem?	Current Demand Overall Scoring % (3)
Reducing unaccounted water and water inefficiencies	No	100	Implement the proposed WC/WDM Strategy and the 25 WC/WDM items. Ensure adequate budget is allocated under the Capital and Operational budgets towards the implementation of the WC/WDM initiatives.	100	Partially	85.7
	No	100	Set up meeting with the Large Water Users to discuss water consumption status, potential water saving volumes and to cultivate a water saving awareness within each large water user.	100	Partially	85.7
Leak and meter repair programmes.	No	100	Implement a Leak Repair and Assistance Programme that investigates and repairs leaks at all domestic households in low cost housing developments and poor areas with consumption above 15 kl/month. An exercise could also be initiated to check for visual leakage at public buildings, using more than 60 kl/month.	100	No	71.4
	No	100	Continue with the implementation of the pipeline replacement programme. The location of pipe failures should in the future be recorded preferably with accurate GPS coordinates. This improves the integrity of the output of the pipe failure model. If a longer and more comprehensive pipe failure record could be established, the integrity of the output could be further enhanced. Pipes with the highest PRP values should be considered to be replaced first.	100	Partially	92.9
	No	100	Install water meters at all the unmetered erven and inspect metered erven with zero consumption.	100	Partially	85.7
Consumer/end-use demand management: Public Information & Education Programmes	Yes	100	At least once a year, a schools education programme on water conservation should be undertaken. The Municipality should assist the school(s) with the monitoring (water audit) of their water consumption. Stellenbosch Municipality can also focus on the implementation of an extensive schools WDM programme, which can include annual competitions between schools (Say with a prize for the lowest consumption, the lowest per capita consumption and for the best WDM Strategy poster design, etc.). A schools WDM programme should receive a high priority.	100	Partially	85.7
	Yes	100	Continue to focus on the installation of water saving devices (specific water efficient toilets) and raising awareness regarding conservation projects and the installation of these products in order to reduce water demand. The use and installation of these fittings should be included as a condition for the approval of building plans as well as provided for in the Water Services By-law.	100	Partially	85.7
Conjunctive use of surface - and groundwater	No	100	-	100	-	100
Working for Water	No	100	-	100	-	100

Notes: (1) Is this section addressed in the WSDP?
(2) Were solutions identified for the possible gaps?
(3) Percentage calculated based on the above two percentages and whether there is an existing project/activity addressing this problem?; Does this current listed project/activity address the problem totally?; Project/Activity approved by Council as part of WSDP database?; Approved by Council in project activity database and part of 5yr IDP cycle projects?; Project/Activity listed in 3yr MTEF Cycle?

Table C.5.2: Conservation and Demand Management - Water Balance

Section	Intervention Required?	%	Solution description as defined by topic situation assessment	%	Is there an Existing project/activity addressing this problem?	Current Demand Overall Scoring %
Water Balance	No	100	Ensure that the volume of water supplied from all water resources are metered (each individual source separately), the raw water and final water at the WTWs and the volume of water supplied to the various zones (at Reservoirs). The inflow at the WWTWs, the volume of treated effluent re-used and the volume of treated effluent returned to the water resource system also need to be metered at all the WWTWs.	100	Partially	85.7

Notes: (1) Is this section addressed in the WSDP?
(2) Were solutions identified for the possible gaps?

(3) Percentage calculated based on the above two percentages and whether there is an existing project/activity addressing this problem?; Does this current listed project/activity address the problem totally?; Project/Activity approved by Council as part of WSDP database?; Approved by Council in project activity database and part of 5yr IDP cycle projects?; Project/Activity listed in 3yr MTEF Cycle?

The Revised Compulsory National Water and Sanitation Standards, as published in Government Gazette No.52814 of 6 June 2025, include the following WC/WDM requirements:

- Where spillages or leaks in its water supply network are detected or reported, a Water Services Institution must record such cases and ensure that they repair all leaks within 48 hours of becoming aware thereof.
- A Water Services Institution must isolate 95% of detected or reported water pipe bursts in its water supply system within a maximum of four (4) hours of becoming aware thereof.
- Where spillages or sewer blockages in its wastewater collection network are detected or reported, a Water Services Institution must record such cases and ensure that they are contained and must be repaired within 24 hours of becoming aware thereof. The affected surface area must be cleaned and or disinfected.
- A Water Services Institution must have a 24-hour consumer care facility supported by the system to which leaks, spillages or water service related enquiries and complaints can be reported and feedback be given to the consumer.
- Whenever emergency or alternative water supply is provided in terms of Regulation 4(1), the Water Services Institution must ensure that taking of water from a bulk line, if applicable, is appropriately metered and recorded (i.e. if alternative water is provided through tankering the number of tankers and their volume must be recorded when taking from a bulk metered pipeline).
- A Water Services Institution must implement a Pressure Management Programme allowing water reticulation systems to be operated at a minimum pressure of 20 m and maximum of 90 m.
- Where water pressure in a water reticulation system could rise above 90 m, a Water Services Institution must install a pressure control device to prevent the pressure at any domestic consumer connection from rising above 90m.
- A Water Services Institution must take steps to measure and progressively reduce losses, maintain the water use efficiency KPIs including the quantity of water losses, the quantity of NRW, ILI and per capita usage to within international accepted standards as follows:
  - NRW 20% – 30%;
  - Water Losses 10% - 20%;
  - Infrastructure Leakage Index 2 – 4; and
  - Per Capita Usage 120 l/c/d – 180 l/c/d
- Water Services Institutions must develop and implement a 10-year Council approved WC/WDM Strategy and an Annual Plan within 6 months of the publication to be uploaded on the IRIS system and must consist of at least the following:
  - Situation Assessment;
  - Key issues and challenges;
  - Focus areas of interventions;
  - List of proposed interventions;
  - Set targets for demand, NRW, water losses (commercial and real losses), ILI and per capita usage in line with subsection above; and
  - Budgets and Multi-year Implementation timelines.

- WSAs must require greenfield developments or major brownfield redevelopments, prior to planning approval, to indicate the manner and extent in which WC/WDM and water efficient sanitation solutions (WESS) has been accommodated and accounted for in their selected technology options, in terms of efficient water use and off-grid sanitation.

DWS's Municipal Scorecard for assessing the potential for WC/WDM efforts in Municipalities was used to assess the potential for WC/WDM efforts in Stellenbosch Municipality. The proposed WC/WDM Strategy for Stellenbosch Municipality is based on the 25 items included in the Scorecard and the sections below discuss each of these items in detail.

Table C.5.3: Proposed WC/WDM Strategy items for Stellenbosch Municipality

Item 1: Development of a Standard Water Balance

Recommendation and Strategy:

- Continue with the monthly updating of the IWA Water Balances for all the systems and reporting on the NRW and Water Losses for each of the systems to management. Continue to manage NRW analysis on a monthly basis.
- Continue with the drafting of an annual WSDP Performance and Water Services Audit Report, as required by the Water Services Act, which include the IWA Water Balances.
- Implement the recommended WC/WDM activities in order to reduce the NRW and Water Losses even further.
- Determine all unbilled authorized consumption by firstly identify all the relevant consumers, e.g. Municipal buildings, parks, fire services, sport fields, etc. Unbilled consumption do not generate income, but will enable the municipality to better quantify their actual water losses.

Funding and Budget Requirements:

The IWA Water Balances for the systems are updated on a monthly basis by the municipality.

Item 2: Pressurised System at all times

Recommendation and Strategy:

- Adequate human resources, technical skills and O&M budgets need to be allocated towards the operation, maintenance and refurbishment of the existing infrastructure, in order to ensure that systems are always pressurised.
- Ensure proper maintenance of the existing PRVs.
- The Water Master Plans to be consulted in conjunction with the WC/WDM priority projects to identify future areas where pressure reduction can be implemented. Recommended future PRV zones are included in Table 5.1.1.3.2. of the Future Demand and Functionality Requirements Report.

Funding and Budget Requirements:

- Budgets as indicated under the individual items of the WC/WDM Strategy.
- Increase O&M budget allocations towards the refurbishment and replacement of old water infrastructure.
- An estimated budget of R3 500 000 is required for the implementation of the future recommended PRV zones.

Items 3 and 4: Metering System

Recommendation and Strategy:

- All un-metered water connections need to be provided with water meters. Meters need to be read on a monthly basis and consumers need to be billed monthly according to their actual water usage. In addition to water theft, many water accounts go unnoticed in the system or have some type of data inconsistency that results in no revenue being generated for the particular water use event. The SWIFT data needs to be used to clean the Treasury data and the municipality needs to identify and correct any inaccurate data in the system (Linkage of Treasury data with cadastral data).
- Consumer consumption checks / investigations need to be carried out where water usage are very low, but there are households on the property (Use SWIFT data). This project will give a clear indication of where illegal or unregistered connections is being made and whether the meter is under reading the actual consumption, thus water is being used but not billed or recorded.
- Use the SWIFT data to identify all unmetered erven and all meters with zero consumption. All illegible / broken / old meters should be replaced. Any un-metered stands should be metered and meter readings in the billing system should be updated where required. All meter chambers should also be cleaned as part of the inspections.
- Municipality needs to continue with the implementation of their Meter Management / Replacement program. An effective Meter Management / Replacement Program needs to achieve the following objectives:
  - Determine the on-going meter replacement programme;
  - Determine exception reports on meters which are suspected to be faulty;
  - Test and replace faulty meters; and
  - Size meters correctly.

  The activities of this program that needs to be budgeted for are as follows:
  - SWIFT analysis of treasury data.
  - Research and development of a meter replacement policy and meter management / replacement programme;
  - Implementation of a uniform meter management information system;
  - Testing and replacing faulty meters reported by consumers (Part of reticulation function).
  - Replacement of domestic meters with AMR enabled format (where appropriate) in accordance with meter management / replacement programme.

Funding and Budget Requirements:

Table C.5.3: Proposed WC/WDM Strategy items for Stellenbosch Municipality

Allow a budget of approximately R200 000 for an annual SWIFT analysis to identify unmetered erven and erven with no or very low consumption. Estimated budget of R4 070 000 is necessary for the installation of water meters at the potential unmetered erven and the erven with a meter, but with zero demand (814 connections).

Item 5: Effective and Informative Billing System

Recommendation and Strategy:

- Municipality needs to continue to ensure that all customer's meters are read on a monthly basis and that the customers are billed on a monthly basis according to the actual volume of water used for the specific month.
- Municipality needs to continue with the commercial data analysis done on the billed metered consumption data, which include the identification of un-metered erven, investigating meters with zero consumption, investigating abnormal low and high consumption readings, oversized / undersized meters, etc.
- The Municipality can consider the following additional measures to make the current consumer bills more informative.
  - Adding a graph of the previous 12 months' consumption and helpful hints on effective water usage on the monthly bills.
  - Alert consumers of possible leaks on their properties. For instance if the consumption for a particular month is >25% than the average consumption of the previous months the consumer may be alerted of a possible leak on the property.
  - Monitor trends and follow up telephonically.

Funding and Budget Requirements:

Estimated cost to enhance the user friendliness of the municipal bill is R450 000.

Items 6 and 7: General Complaints System

Recommendation and Strategy:

The municipality needs to ensure that all consumers are familiar with the telephone numbers to lodge complaints and report leaks. Telephone numbers to lodge complaints and report leaks are included on the monthly water bills and on the Municipality's website. Suggestions would be to also include it on strategically located notice boards, radio broadcasts, etc.

The projects and measures that can be implemented for passive leakage control are as follows:

- Improve the help-line and install an automated answering system.
- Advertise the help-line.
- Investigate current problems in responding to leaks and allocate adequate resources to avoid lengthy delays.
- Review and develop a policy regarding responses to leaks with the aim of reducing response time, prioritising and keeping consumers informed.
- Develop a monitoring system and quality assurance measures to ensure problems are resolved adequately. Link such a KPI to the SDBIP.

The Customer Care Service Charter should include the following information:

- Commitment to deliver excellent services to our clients (Executive Mayor and Municipal Manager).
- Standards of services (Enquiries written and telephonic; Accounts enquiries and distribution of accounts).
- Response times for different services (Water: Repairs to networks, installation of new household water connections, etc.)
- Contact details for different areas.

Funding and Budget Requirements:

Budget requirement for improved customer awareness raising with regard to the Municipality's Customer Complaints System R150 000/annum.

Item 8: Asset Register for Water Infrastructure

Recommendation and Strategy:

- Continue with the annual updating of the Asset Register.
- Continue to ensure that all the existing water and sewerage infrastructure are included in the Asset Register.
- The Conditions of the assets need to be included in the Asset Register.

Funding and Budget Requirements:

None - To be done as part of the annual updating of the Asset Register by the municipality.

Item 9: Asset Management Capital Works

Recommendation and Strategy:

Allocate a budget of at least 2% of the total water asset value per annum towards the replacement of existing infrastructure. Municipality needs to differentiate in their capital budget between new projects and projects that are for the replacement of existing infrastructure, in order to accurately calculate the annual percentage allocated towards the replacement of existing infrastructure.

Funding and Budget Requirements:

Capital budget of at least 2% of the total water and sewerage asset value allocated towards the replacement of the existing water and sewerage infrastructure.

Item 10: Asset Management Operation and Maintenance

Recommendation and Strategy:

The municipality needs to differentiate between budget allocated towards the operation and maintenance of the water infrastructure and the budget allocated towards the replacement of the water and sewerage infrastructure. A budget of approximately 1% to 2% of the value of the system is typically required for the operations and maintenance of the system to ensure that the system remains in good condition.

Table C.5.3: Proposed WC/WDM Strategy items for Stellenbosch Municipality

The municipality needs to compile an Asset Management Plan (AMP) to ensure efficient, effective and optimal management, operation and maintenance of all assets, which includes treatment plants, reservoirs, structures, buildings, pipelines, sites, etc. The purpose of the AMP is to:

- Ensure the operation and maintenance functions are well planned.
- Demonstrate responsible management.
- Justify and communicate funding requirements.
- Service provisioning complies with regulatory requirements.

An AMP normally includes the following:

- documents the nature, extent, age, utilization, condition, performance and value of the infrastructure work;
- identifies existing and target levels of service, as well as expected changes in demand;
- identifies the life-cycle management needs of the infrastructure (development, renewal, operations and maintenance);
- assesses capital and operational budget needs; and
- identifies infrastructure asset management improvement needs.

It is important for the municipality to develop an AMP from their Asset Register. The objective of an AMP is to support the achievement of the strategic goals of the Municipality and facilitate prudent technical and financial decision-making. It is also a vehicle for improved internal communication and to demonstrate to external stakeholders the Municipality's ability to effectively manage its existing infrastructure as well as the new infrastructure to be developed over the next 20 years.

This plan must be based on the principle of preventative maintenance in order to ensure that, as far as this is practical, damage to assets is prevented before it occurs. The municipality needs to ensure that the maintenance and rehabilitation plan is part of the WSDP and that the plan is implemented. Assets must be rehabilitated and / or replaced before the end of their economic life and the necessary capital funds must be allocated for this purpose. Priority should be given to rehabilitating existing infrastructure as this generally makes best use of financial resources and can achieve an increase in (operational) services level coverage's most rapidly. The preparation of maintenance plans and the allocation of sufficient funding for maintenance are required to prevent the development of a large condition backlog. The potential renewal projects for the water infrastructure need to be identified from the Asset Register. All assets with a condition grading of "poor" and "very poor" need to be prioritised.

The O&M Budget allocated towards repairs and maintenance should include the replacement of malfunctioning and old bulk water meters and consumer water meters, clearing of meter chambers, buying replacement mechanisms for bulk water meters, speedy repair of leaks, leak detection in areas with high water losses and NRW and higher than expected night flows, etc. The budget should also be used for preventative maintenance, which include the following:

- Inspection of isolation valves and packing.
- Control valve inspection and maintenance.
- Inspection of cathodic protection of steel pipes.

Funding and Budget Requirements:

Additional budget should be allocated towards the repairs and maintenance of the existing water and sewerage infrastructure. The additional budget should be determined by the municipality once an AMP is developed. A budget of approximately 1% to 2% of the value of the system is typically required for the operations and maintenance of the system to ensure that the system remains in good condition (Best Practice).

An estimated budget for the drafting of an AMP for all the water and sewerage infrastructure is R1 000 000.

Item 11: Dedicated WC/WDM Support

Recommendation and Strategy:

The municipality should allocate at least one (1) person to head WC/WDM for a start. The number of people involved with WC/WDM measures can later be increased as and when required.

Funding and Budget Requirements:

The municipality may be able to use one of their existing staff members. If a new person has to be appointed the municipality can determine the costs involved with such an appointment.

Item 12: Active Leakage Control

Recommendation and Strategy:

The following process needs to be followed for active leakage control of the reticulation network:

Decide on how the work will be undertaken:

- The appointment and training of additional staff.
- The training of existing staff.
- Appoint an external contractor in the first few years with the objective of using this contractor to train the internal teams and build capacity to do all work internally.
- The above three options need to include the purchase or re-allocation of equipment.
- Complete outsourcing of the activity.

Leak detection: Identify areas with highest leaks and send teams into the field to detect leaks.

Repair of leaks once identified: Once leaks were detected they will need to be repaired. Depending on the extent of the leaks and other workloads, the leak repairs need to be carried out by either the internal teams or a contractor.

Funding and Budget Requirements:

R1 000 000 to undertake leak detection in zones with high excess night flows. In addition allocate approximately R350 000 per year for general visual leak inspections.

Table C.5.3: Proposed WC/WDM Strategy items for Stellenbosch Municipality
Item 13: Sectorization of Reticulation Systems
Recommendation and Strategy: The billed metered data is currently linked to the distribution systems and should also be linked to the different zones in the future where possible, in order to accurately determine the NRW and water losses for the specific zones in the future. Faulty bulk water meters need to be replaced and new meters need to be installed for the zones with no bulk water meters. The Financial Department needs to continue to provide the billed metered consumption data separately for each of the systems. Sectorization will assist with the following: • Clear indication of how much water is being used per area / zone. • Areas with high NRW and water losses can easily be identified. • Leakage and pressure control can be better managed. • Water demand per area / zone can be determined. Night flows need to be measured for zones with expected high water losses. It is recommended to re-log the night flows every few years to determine if there was an increase in leakage.
Funding and Budget Requirements: The estimated cost for the logging of flows and pressures for zones with expected high water losses is R1 000 000. The logging exercise should be repeated at least every three years. A budget should be allocated to investigate and resolve possible zone interconnections. It is, however, difficult to price such investigations at this stage.
Item 14: Effective Bulk Metering Management System
Recommendation and Strategy: • Municipality needs to continue to read all the bulk water meters at the existing sources, WTWs, reservoirs and pump stations and need to record the readings on at least a monthly basis. • All bulk water meters need to be installed in lockable meter chambers and reservoir sites and water pump stations need to be secured in order to prevent unauthorised access and possible damage to the water meters. • New bulk water meters need to be installed correctly. Ideally a straight pipe section upstream of the meter of at least 5x the meter dia. and 3x the meter dia. downstream of the meter. Strainers need to be installed to protect the meters. These strainer elements must be removable from the top, for ease of cleaning. Gate valves are required for maintenance before and after meters. • Every informal area with unmetered communal services to be supplied with a bulk water meter in order to determine the unbilled metered consumption. All discrete zones are to be supplied with a bulk water meter. The meter readings must be recorded on at least a monthly basis. The readings can be used to quantify both the water supplied and the leakage for a specific area.
Funding and Budget Requirements: Allow an annual budget of approximately R800 000 for the installation of new bulk water meters, the replacement of faulty bulk water meters and to adequately protect existing bulk water meters.
Item 15: Effective Zone Meter Management and Assessment of Night Flows
Recommendation and Strategy: See recommendations under Item 14 “Effective bulk metering management system”.
Recommendation and Strategy: See funding and budget requirements under Item 14 “Effective bulk metering management system”.
Item 16: Pressure Management
Recommendation and Strategy: See recommendations under Item 2 “Pressurised System at all times”.
Funding and Budget Requirements: See funding and budget requirements included under Item 2 “Pressurised System at all times”.
Item 17: As-built Drawings of Bulk and Reticulation Infrastructure
Recommendation and Strategy: Continue with the updating of as-built drawings on an ongoing basis. Continue also with the regular updating of the Water and Sewer Master Plans.
Funding and Budget Requirements: Allow a budget of approximately R2.000 million for the updating of the Water and Sewer Master Plans every three to five years.
Item 18: Schematic Layouts of Water Reticulation Systems
Recommendation and Strategy: Municipality needs to continue to update the schematic layouts on a regular basis, in order to ensure they remain accurate.
Funding and Budget Requirements: None
Item 19: Regulation and Bylaws
Recommendation and Strategy: Allocate sufficient budget and personnel for the enforcement of the Water Services By-law.
Funding and Budget Requirements: To be determined by Municipality.
Item 20: Tariffs
Recommendation and Strategy:

Table C.5.3: Proposed WC/WDM Strategy items for Stellenbosch Municipality
See Section 7.3 under Topic 7 of the Future Demand and Functionality Requirements Report.
Funding and Budget Requirements: Financial study to determine the impact of changing the sanitation tariff structure from a fixed monthly amount, which is based on the size of the erf, to a stepped tariff based on water consumption in the future. Estimated cost of a financial analysis is R400 000.
Item 21: Technical Support to Customers
Recommendation and Strategy: The objective of a Technical Support programme is not limited to assisting consumers in reducing their water demand, but is also to look at wastewater, monitor compliance with by-laws and service conditions and offer general customer support. Once a dedicated person has been allocated to WC/WDM it is recommended to engage with large customers and to identify areas where the municipality can provide assistance. The proposed activities of this programme that can be budgeted for are as follows: • Train existing staff; • Identify and visit large consumers (Checking that large consumers are correctly metered and billed, providing tips on WC/WDM, test the accuracy of all large consumer meters, install data-loggers on all large consumer meters and informing consumers of any sudden change in consumption patterns). • Arrange leakage inspections in public buildings; • Provide assistance and technical know-how for large consumers; and • Introduce compulsory water management plans for large consumers.
Funding and Budget Requirements: No additional funding – pending the appointment of a dedicated person for WC/WDM.
Item 22: Removal of Un-authorised Connections
Recommendation and Strategy: Stellenbosch Municipality should continue to remove un-authorised connections as and when they are detected. See Section 5.1.1.5. of the Future Demand and Functionality Requirements Report.
Funding and Budget Requirements: Estimated annual budget of R500 000 is required to install water meters at any unmetered erven.
Item 23: Community Awareness on WDM
Recommendation and Strategy: See Section 5.1.3 of the Future Demand and Functionality Requirements Report.
Funding and Budget Requirements: It is estimated that R250 000 / year should be allocated for WC/WDM awareness campaigns and activities, material to be included with monthly water bills, placing notices in newspapers, billboards, competitions, etc.
Item 24: Schools Education on WDM
Recommendation and Strategy: See Section 5.1.3.1 of the Future Demand and Functionality Requirements Report.
Funding and Budget Requirements: Allow a budget of approximately R100 000 per year for the implementation of WC/WDM measures at schools (Competitions, Awareness Raising events, etc.). The DWS can also assist the municipality with pamphlets and posters on WC/WDM initiatives.
Item 25: Retrofitting
Recommendation and Strategy: See Sections 5.1.2.1 and 5.1.2.2 of the Future Demand and Functionality Requirements Report.
Funding and Budget Requirements: Leak repair assistance programmes: R1 000 000 per annum for ongoing exercise to repair leakages at indigent properties using in excess of 20 kl/month. WSIG funding from DWS can be requested in this regard. Retrofitting: R1 000 000 for a pilot project in one of the public buildings.

The way forward for Stellenbosch Municipality with the implementation of the proposed WC/WDM Strategy is as follows:

- Develop a detailed methodology for measuring the performance criteria for each of the twenty-five (25) WC/WDM Strategy items;
- Allow for budget required to implement the various measures;
- Monitor the impact of all WC/WDM measures on an on-going basis;
- Develop key benchmarks for all KPIs and categories and assign responsibility; and
- Review WC/WDM Strategy as necessary.

Stellenbosch Municipality needs to ensure that adequate funding is allocated under their Capital and Operational budgets towards the implementation of the WC/WDM Strategy. Key WDM projects to be taken into account during Stellenbosch Municipality's capital budgeting process are as follows:

- Replacement of old water networks (Areas with regular pipe bursts);
- Replacement of old bulk and consumer water meters (Meter replacement programme);
- Scada systems to provide for early warning;
- Installation of zone meters;
- Pressure Management;
- Leak detection; and
- Data loggers to establish MNFs.

The WDM initiatives can deliver excellent return on investment if well implemented and well managed. All external funding that could be utilised by Stellenbosch Municipality for this purpose should be sourced. The O&M Budget allocated to repairs and maintenance should be increased to address amongst other tasks the following:

- Replacement of malfunctioning and old bulk water meters and consumer meters;
- Construction of meter chambers for all bulk water meters not adequately protected against vandalism;
- Cleaning of bulk water meter boxes;
- Buying replacement mechanisms for bulk meters;
- Speedy repair of leaks; and
- Leak detection in areas with higher than expected night flows.

Stellenbosch Municipality has responded to the need to address NRW and water losses within their jurisdiction by implementing various WC/WDM initiatives over the last number of years. The Municipality will also continue to actively implement their WC/WDM Strategy in order to reduce the percentage of NRW and Water Losses even further and improve water use efficiency within the various schemes as follows.

Table C.5.4: Commitment to reduce water losses and water inefficiencies

Distribution System	2023/2024		Committed Future Water Losses	
	NRW	Water Losses	2028	2048
Stellenbosch	30.7%	27.5%	25.0%	10.0%
Franschhoek	28.9%	25.7%	20.0%	10.0%
Dwars River	40.8%	37.6%	30.0%	10.0%
Klapmuts	32.6%	29.4%	25.0%	10.0%

IWA Water Balances: **The Revised Compulsory National Water and Sanitation Standards, as published in Government Gazette No.52814 of 6 June 2025, include the following water and wastewater balance analysis and determination of water losses requirements:**

- A Water Services Institution must install and monitor appropriate water measuring devices or volume controlling devices to measure, detect and account for the volume of water abstracted (surface or groundwater), treated and consumed, as applicable to the technical configuration of infrastructure and the water use authorisation conditions.

- A Water Services Institution must install and monitor appropriate water measuring devices or volume controlling devices to measure, detect and account for the volume of water consumed to all user connections as applicable to the technical configuration of infrastructure.

- A Water Services Institution must install and monitor appropriate measuring devices or volume controlling devices to measure, detect and account for the volume of wastewater received at pump stations and the inlet of the WWTW. A WSA shall record minimum night flows, peak wet weather flow and average dry

weather flow received at the inlet of a WWTW received from all user connections conveyed, as applicable to the technical configuration of infrastructure and the water use authorisation conditions.

- A Water Services Institution must install and monitor appropriate measuring devices or volume controlling devices to measure, detect and account for the volume of wastewater discharged into the water resource as applicable to the technical configuration of infrastructure and the water use authorisation conditions.
- A Water Services Institution must ensure that all measuring devices or meters are properly maintained and in good working order, implementing a programme for meter in-situ verification and / or calibration.
- A Water Services Institution must account for its water balance on a monthly basis as follows:
  - Measure the daily volume abstracted and treated; and
  - Measure the quantity of water provided to each supply zone within its supply area.
- A Water Services Institution must account for its wastewater balance on a monthly basis as follows:
  - daily inflows in Ml/d; and
  - daily outflows in Ml/d.
- A Water Services Institution must determine the quantity of water losses and NRW in accordance with the Guideline for the preparation of an IWA Water Balance to determine NRW and Water Losses.
- The results of the water balance analysis and the records of the quantities of water measured must be reported to the Department's National Regulatory Information Management System on a quarterly basis.

A segregated single variable future water requirement model was developed for the WSDP and is available in electronic format. The future water requirement for each of the schemes is obtained by means of this model. It is used in this analysis to estimate the future water requirement for each of the distribution systems. The model differentiates between the different income levels.

Water services must be provided in a manner that is consistent with the broader goals of integrated water resources management. There is therefore a need for an integrated planning approach between the development of water services and water resources.

The Infrastructure Leakage Index (ILI) can be used by Stellenbosch Municipality to determine an appropriate benchmark for managing the water losses according to their own specific circumstances. This ILI can also be compared with the averages for other towns within South Africa. The annual water losses within the various towns' distribution networks are therefore important indicators of the performance of the water supply and distribution systems.

Stellenbosch Municipality should conduct an assessment of strategic gaps in their IWA water balance data and to record those flows, both water and sewerage, which are strategic in terms of medium to long term planning. A prioritisation of these locations should subsequently follow with budget allocated to improve the availability and accuracy of the IWA water balance data.

Stellenbosch Municipality should continue to update their IWA water balance models on a monthly basis in order to determine the locations of wastage and to enable the Municipality to manage their NRW and Water Losses. The water balance will not directly lead to the reduction of the demand, but is an imperative management tool that will inform the implementation of demand side management initiatives. **All bulk zone water meters need to be recorded on at least a monthly basis (Meters at reservoirs and pump stations). Meters need to be located in lockable meter chambers and the meter chambers need to be cleaned regularly.**

Stellenbosch Municipality needs to focus on the following for the IWA water balances of all the systems.

- The Swift Analysis needs to be used to inspect the following erven:
  - Identified potential unmetered erven need to be inspected and water meters need to be installed if the connections are found to be unmetered.
  - Identified erven with water meters, but with zero demand, need to be inspected and new water meters need to be installed if the existing water meters are found to be faulty.
  - Metered erven with very low consumption (<3kl / month) need to be inspected.
  - Metered erven with a drastic increase or decrease in consumption need to be inspected.
- Continue with the daily and monthly reading and recording of all bulk water meters (Sources, WTWs, WWTW, Reservoirs and Pump Stations).

The following areas need to be focused on for the IWA water balance of the **Stellenbosch system**.

- Install bulk water meters at the Idas Valley and Paradyskloof WTWs to measure the final flow supplied from the plants (System Input Volumes).

The following areas need to be focused on for the IWA water balance of the **Franschhoek system**.

- All raw water supplied from Franschhoek own water sources needs to be metered and recorded on at least a weekly basis.
- Flow meter needs to be installed to measure the final effluent discharged from the Wemmershoek WWTW.

Non-Revenue Water and Water Losses:

Water losses from distribution systems are inevitable and cannot be completely eliminated. Such losses may be due to infrastructure-related problems, administrative related problems or theft and do have financial implications for Stellenbosch Municipality.

The effective implementation of the proposed WC/WDM Strategy will enable Stellenbosch Municipality to reduce their current NRW and Water Losses for the various distribution systems over the next five years.

Stellenbosch: Two additional bulk water meters need to be installed at the Idas Valley and Paradyskloof WTWs to measure the bulk potable water supplied from these two WTWs and to accurately calculate the treatment losses. The NRW and water losses increased drastically during the last financial year. The NRW is just above DWS's NRW target of 30%. The Municipality needs to work towards a NRW target of 25% and a water losses target of 20%. The ILI of 6.59 indicates a poor management system, which requires attention and the Municipality needs to work towards an ILI of between 2 and 4.

Franschhoek: The NRW and Water Losses decreased by approximately 10% during the last financial year, which are excellent. The current NRW is below DWS's NRW target of 30%. The Municipality needs to continue with the implementation of specific WC/WDM measures to work towards a NRW target of 25% and a water losses target of 20%. The ILI of 4.71 indicates a poor management system, which requires attention and the Municipality needs to work towards an ILI of between 2 and 4.

Dwars River: The NRW and Water Losses were extremely high for the last two financial years and are above DWS's NRW target of 30%. The Municipality needs to continue with the implementation of specific WC/WDM measures to work towards a NRW target of 30% and a water losses target of 25%. The ILI of 7.30 indicates a poor management system, which requires attention and the Municipality needs to work towards an ILI of between 2 and 4.

Klapmuts: The NRW and Water Losses increased drastically during the last financial year. The NRW is above DWS's NRW target of 30%. The Municipality needs to continue with the implementation of specific WC/WDM measures to work towards a NRW target of 25% and a water losses target of 20%. The current ILI value of 3.84 is good and no urgent action is required, but the NRW and Water Losses should however be monitored carefully.

The NRW and Water Losses for all the systems combined increased during the last financial year and the NRW is currently above DWS's NRW target of 30%. The Municipality needs to continue with the implementation of specific WC/WDM measures to work towards a NRW target of 25% and a water losses target of 20% for all the systems combined.

TOPIC 6: WATER RESOURCES

Table C.6.1: Water Resource

Section	Intervention Required?	% (1)	Solution description as identified by Master Plan	% (2)	Is there an Existing project/activity addressing this problem?	Current Demand Overall Scoring % (3)
Current Water Sources	No	100	Ensure the required authorisations (licences) are in place for all the water resources, as well as the required registrations.	100	Yes	100.0
Additional Sources Available	Yes	100	Continue with investigations of the augmentation of the existing bulk water sources for the various towns.	100	Partially	85.7
Monitoring	No	100	Ensure that the key groundwater management functions are implemented. The monitoring data must be analysed by a geohydrologist on an annual basis in order to assess the effects of abstraction and recharge on the boreholes and aquifer. Groundwater monitoring must continue on at least a monthly basis. Monthly monitoring of water levels, water chemistry and abstraction must be conducted by the Municipal staff. Stellenbosch Municipality needs to ensure that all electronic data (i.e. dataloggers) are downloaded once quarterly by a geohydrologist. Monitoring data must be annually reviewed by a geohydrologist.	100	Partially	78.6
Water Quality	No	100	-	100	-	100.0
Operation	No	100	The current approach adopted by Stellenbosch Municipality in which the various parameters at all industrial consumers are monitored should be continued, as well as volumetric monitoring at the larger users. Adaptation of the current procedures must be undertaken in accordance with any changes to the wastewater discharge criteria set by DWS. It will also be necessary to consider limits above which volumetric monitoring will be necessary at new industries and existing smaller industries, where expansion is likely to take place.	100	Yes	100.0

Notes: (1) Is this section addressed in the WSDP?
(2) Were solutions identified for the possible gaps?
(3) Percentage calculated based on the above two percentages and whether there is an existing project/activity addressing this problem?; Does this current listed project/activity address the problem totally?; Project/Activity approved by Council as part of WSDP database?; Approved by Council in project activity database and part of 5yr IDP cycle projects?; Project/Activity listed in 3yr MTEF Cycle?

Metering of all water supplied is one of the most significant steps in order to properly plan and manage water sources. Without metering no management is possible. Stellenbosch Municipality needs to continue with the monthly reading of all their existing bulk water meters, which is a valuable source of information.

The uncertainty in projected water-related climate change impacts is one of the biggest challenges facing water managers. The managers must understand how this uncertainty influences the management decisions to be made and that decisions must be appropriate to a possible range of scenarios. A critical tool in this regard is adaptive management, in which water resource systems are carefully monitored and management actions are tailored and revised in relation to the measured changes on the ground. One cannot predict climate change impacts with any certainty, and the recognition of this uncertainty must be built into all climate change response strategies.

Future water requirement projection models were developed for each of the towns within Stellenbosch Municipality's Management Area. The future water requirement projection models include the future projections up to 2048 and were calibrated by using the historical IWA Water Balance data. The percentage of water losses was determined for each of the distribution systems and growth in future water requirement was based on agreed population and growth figures.

The projected future water requirements and the yield surplus or shortfalls, based on the WSDP model, are indicated in the table below for each of the systems.

Table C.6.2: Projected future water requirements of towns

Distribution System	Projection	PROJECTED FUTURE WATER REQUIREMENTS (Ml/a)				
		2028	2033	2038	2043	2048
Stellenbosch	3.0% Annual Growth	11 662.859	13 520.451	15 673.908	18 170.355	21 064.421
	5.0% Annual Growth	12 840.012	16 387.470	20 915.026	26 693.462	34 068.373
	WSDP Model	11 431.870	12 931.552	14 723.400	16 866.630	19 433.789
	Allocation surplus (+) / shortfall (-)	**+4 821.899**	**+3 322.217**	**+1 530.369**	**-612.861**	**-3 180.020**
Franschhoek	3.0% Annual Growth	1 464.347	1 697.580	1 967.961	2 281.406	2 644.774
	5.0% Annual Growth	1 612.147	2 057.553	2 626.017	3 351.537	4 277.505
	WSDP Model	1 430.378	1 694.049	2 017.789	2 416.034	2 906.795
	Allocation surplus (+) / shortfall (-)	**+1 360.750**	**+1 097.079**	**+773.339**	**+375.094**	**-115.667**
Dwars River	3.0% Annual Growth	981.483	1 137.808	1 319.031	1 529.119	1 772.668
	5.0% Annual Growth	1 080.546	1 379.081	1 760.095	2 246.377	2 867.010
	WSDP Model	850.013	896.870	952.160	1 016.521	1 090.784
	Allocation surplus (+) / shortfall (-)	**+636.003**	**+589.146**	**+533.856**	**+469.495**	**+395.232**
Klapmuts	3.0% Annual Growth	738.387	855.993	992.330	1 150.383	1 333.609
	5.0% Annual Growth	812.914	1 037.507	1 324.150	1 689.989	2 156.902
	WSDP Model	755.506	913.338	1 114.493	1 371.357	1 700.001
	Allocation surplus (+) / shortfall (-)	**+367.566**	**+209.734**	**+8.579**	**-248.285**	**-576.929**

The table below gives an overview of the years in which the annual water requirements are likely to exceed the total allocations from the various resources.

Table C.6.3: Years in which the annual water requirements are likely to exceed the total allocations or licence volumes for the various resources

Distribution System	Total Allocation / Licence Volume (Ml/a)	Annual Growth on 2023/2024 Demand (3% growth)	Annual Growth on 2023/2024 Demand (5% growth)	WSDP Projection Model
Stellenbosch	16 253.769 *	2038 (3.0%)	2032 (5.0%)	2041
Franschhoek	2 791.128 *	> 2048 (3.0%)	2039 (5.0%)	2046
Dwars River	1 486.016 *	2041 (3.0%)	2034 (5.0%)	> 2048
Klapmuts	1 123.072 *	2041 (3.0%)	2034 (5.0%)	2038

Note: * Agreement volume of 6 848 000 m³/a split proportional according to the 23/24 System Input Volume from the CCT for the various areas.

A Bulk Water Resources: Drought Intervention Projects Study was completed in June 2019 for Stellenbosch Municipality. The Study included the following recommended future resources for Stellenbosch Municipality.

- Groundwater; ***Licence was received for 2.04 million m³/a, 2019.***
- Wastewater reclamation;
- Increase existing allocations from the CCT (This can only be done after the CCT has increased the reliability of their existing water resources);
- Increase existing allocation from the DWS (from the Theewaterskloof tunnel); ***Agreement was signed with DWS for BRVAS Project for a volume of 1.64 million m³/a, 2023.*** and
- Rainwater harvesting.

Groundwater: The potential future supply from groundwater resources for Stellenbosch Municipality was calculated at 10.042 Ml/d. The future groundwater contributions for each of the water distribution systems were indicated as follows.

- Stellenbosch system: 4.378 Ml/d
- Dwars River system: 1.001 Ml/d
- Franschhoek system: 2.887 Ml/d

- Klapmuts system: 1.296 Ml/d
- Meerlust system: 0.065 Ml/d
- Koelenhof system: 0.415 Ml/d

Wastewater reclamation: It was recommended that the feasibility of reclamation of wastewater as a future bulk water resource be investigated at the Klapmuts, Dwars River, Wemmershoek and the Stellenbosch WWTWs.

CCT Allocation (Short Term): The current allocation of bulk water to Stellenbosch Municipality was indicated at 6 848 Ml/a. It was recommended that the allocation should be increased in the future to supply the future water demand to Stellenbosch Municipality as calculated in the water master plan (after the groundwater and wastewater reclamation projects for Stellenbosch Municipality were implemented).

- Stellenbosch main system: In the Water Master Plan it was proposed that bulk water supply to Stellenbosch town is augmented in the future through a new bulk supply system from the CCT Blackheath WTW to the existing Papegaaiberg reservoir in the Stellenbosch system. This will give Stellenbosch town more redundancy in their bulk supply system and the Stellenbosch system will be able to be supplied with bulk water from three separate sources, i.e. the Idas Valley WTW, the Paradyskloof WTW and the CCT Blackheath WTW. This bulk system will also reinforce the Polkadraai system and enable the Stellenbosch Municipality to develop the Vlottenburg node.

  The Water Master Plan proposed that this new bulk system should have the capacity to supply a peak demand of 5.0 Ml/d of water to the Stellenbosch system. The required annual allocation from the CCT to the Stellenbosch system was calculated at 1 140 Ml/a.

- Other urban and rural systems: The minimum required increase in allocation from the CCT to the other urban and rural systems (Dwars River system, Franschhoek system, Klapmuts system and rural supply areas in Stellenbosch Municipality) was calculated at an additional 502 Ml/a.

Paradyskloof Tunnel Allocation (Short Term): The minimum required increase in allocation from the DWS to the Stellenbosch system, in order to supply the future water demand, was calculated at an additional 627 Ml/a.

Proposed increase in allocation from the CCT and the WCWSS (Long Term): Over the long term it could be more cost effective for Stellenbosch Municipality to utilize the groundwater and the reclamation of wastewater resources during drought periods when surface water is under stress, and utilize the available surface water from the WCWSS on a more permanent basis (especially during times of high rainfall when there is excess water available from surface water resources).

It was therefore proposed that the allocations from the CCT and the WCWSS are increased to allow for a scenario where the available water from groundwater and wastewater reclamation are only utilize during periods when the surface water is under stress (drought conditions).

The proposed increases in the allocations from the CCT and the WCWSS were calculated as follows:

CCT Allocation:

Future demand	=	11 747 Ml/a (Excluding Stellenbosch town)
Minus existing CCT allocations	=	6 848 Ml/a
Minus existing Perdekloof resource	=	901 Ml/a
Minus Pniel surface water resources	=	78 Ml/a (Proposed future project)
Plus Blackheath allocation	=	1 140 Ml/a (Required for Stellenbosch town)
Total	**=**	**5 060 Ml/a**

WCWSS Allocation:

Future demand	=	15 706 Ml/a (For Stellenbosch town)
Minus Jonkershoek resource	=	7 224 Ml/a
Minus existing WCWSS allocation	=	3 000 Ml/a
Minus Blackheath CCT allocation	=	1 140 Ml/a (Proposed at CCT Blackheath WTW)
Total	**=**	**4 342 Ml/a**

It was proposed that the existing WCWSS allocation of 3 0000 Ml/a is increased in two phases (First phase of 2 000 Ml/a and second phase of 2 350 Ml/a) to a total allocation of 7 350 Ml/a.

The DWS is currently busy with the updating of the All Towns Reconciliation Strategies for the Western Cape. The table below gives an overview of the recommended potential future water resources as included in the 2015 All Towns Reconciliation Strategies for the towns in Stellenbosch Municipality.

Table C.6.4: Potential future water resources for the various towns (Summary of DWS's All Towns Reconciliation Strategies)

Distribution System	Recommended Summary Options
Stellenbosch	**There is not adequate supply for the current water sources to cater for future medium and longer-term water requirements. The following sources have been identified as potential sources to augment the current water supply:** • Full implementation of the WC/WDM measures to reduce non-revenue water and water losses. • Water re-use. • Reallocation of "lei"- water. • Allocation of water from the Berg River Dam. • A share in future schemes for the WCWSS. • Rainwater harvesting. • Groundwater development.
Franschhoek	**The current water sources have adequate water to cater for future water requirements in the medium and longer-term. The following sources have been identified as potential sources to augment the current water supply:** • Full implementation of the Water Conservation and Water Demand Management Strategy. • Re-use of water. • A further allocation from the Western Cape Water Supply System. • Groundwater development. • Rainwater harvesting.
Dwars River (Pniel, Kylemore & Groot-Drakenstein)	**The following sources are identified as potential sources to augment the water supply (In order of priority and implementation sequence):** • Full implementation of the Water Conservation and Water Demand Management Strategy. • Groundwater development. • Re-use water. • A further allocation from the Wemmershoek Dam (WCWSS). • A water allocation from the Berg River Dam (WCWSS). • Integration of the existing local sources into the bulk water supply. • A water allocation from the Tunnel System (WCWSS). • Rainwater harvesting.
Klapmuts	**Supply from the current water sources is not adequate to cater for the current water requirements and is currently hampering development in the town. The following sources have been identified as potential sources to augment the current water supply:** • Full implementation of the WC/WDM measures to reduce non-revenue water and water losses. • Groundwater development for the new anticipated developments. • Water re-use. • A further allocation from the Wemmershoek Dam.

Volumes are registered on the DWS's WARMS for the various resources. A Service Level Agreement is also in place with the CCT for the provision of bulk potable water to the various areas. A registered water use however does not guarantee that the water use is accurate or lawful. Validation and verification of the accuracy and lawfulness of the water use is needed to qualify as an Existing Lawful Use. It is important for the municipality to confirm the correct registration volumes and existing lawful use volumes for all their sources. This information, with the safe yields of the surface and groundwater sources, is critical to accurately determine which sources need to be augmented for the different schemes. Stellenbosch Municipality further needs to continue to ensure that all the individual sources are metered and that the abstraction volumes are recorded on at least a monthly basis.

Water Quality: The minimum monitoring requirements of the SANS 241-2:2015 (Table 1: Minimum monitoring for prescribed process risk indicators) for the various WTWs and distribution systems, are summarised below.

Table C.6.5: Minimum nonitoring frequency for process risk indicators (SANS241-2:2015: Table 1)			
Determinand	**Raw Water**	**Final Water**	**Distribution System**
Conductivity or total dissolved solids	Daily	Daily	Not applicable
pH value	Daily	Once per shift [a]	Fortnightly
Turbidity	Daily	Once per shift [a]	Fortnightly
Disinfectant residuals	Not applicable	Once per shift [a]	Fortnightly
E.Coli (or faecal coliforms) [b]	Not applicable	Weekly	Fortnightly but dependent on population served [d]
Heterotrophic plate count [c]	Not applicable	Weekly	Fortnightly
Treatment chemicals [d]	Not applicable	Monthly	Not applicable
a: A shift is defined as an eight-hour work period.			
b: If non-compliant with the numerical limits specified in SANS 241-1, implement corrective action and immediate follow-up sampling at an increased sampling frequency.			
c: If non-compliant with the numerical limits specified in SANS 241-1, implement corrective action and follow-up sampling. d: Includes all risk determinands that are added or formed as a result of the use of treatment chemicals (for example aluminium, iron and chlorine). If non-compliant with the numerical limits specified in SANS 241-1 in the final water, the distribution system monitoring frequencies of Table 3 in SANS241-2:2015 apply.			

The current and proposed operational and compliance water quality sampling programmes of Stellenbosch Municipality for the various water distribution systems are summarised in the table below.

Table C.6.6: Current and proposed water quality parameters sampled by Stellenbosch Municipality: Routine monitoring of Process Indicators				
Current / Proposed	**Sampling Point**	**Frequency of sampling**	**Samples taken by**	**Current and Proposed Parameters to be sampled**
Stellenbosch / Faure / Blackheath				
Idas Valley WTW

Effluent Quality: Comprehensive Operational and Compliance Sampling programmes of the wastewater at the WWTWs are implemented by Stellenbosch Municipality. The Compliance Monitoring Programme includes the monthly sampling of the final effluent at the various WWTWs and analyses of all the main quality criteria. Results of the samples taken are loaded onto DWS's IRIS. Monthly monitoring and inspection reports are also compiled by the external Service Provider for all the WWTWs. The Municipality takes immediate action to rectify problems and / or improve operational aspects as and when may be required. For serious failures, an Incident Response Management Protocol is followed to ensure rapid remedying of the problems, which includes notification to the DWS as may be necessary.

Operational Alert Levels are also in place for the various WWTWs in order to ensure that the various unit processes in the plant performs optimally. If these pre-determined Alert Levels are exceeded at any of the control points where samples are taken for operational purposes, then certain actions are taken by the Process Controllers to bring the operational parameters back to within the target ranges.

The DWS also followed a risk-based regulatory approach that provides early warning signs of WWTWs that contain a certain measure of risk, and in directing the type of intervention required to manage and mitigate the identified risk and move to a more favourable position of compliance and ultimately, excellence. The current Cumulative Risk Ratios (CRR = A*B+C+D) of the WWTWs in Stellenbosch Municipality's Management Area, as calculated by the DWS during 2011, 2013, 2022 and 2023, are indicated in the table below.

Table C.6.7: Cumulative Risk Ratio of the various WWTWs (% Deviation = Actual CRR / Max CRR)				
WWTW	**2011**	**2013**	**2022**	**2023**
Stellenbosch	74.1%	81.8%	55.6%	86.4%
Wemmershoek	58.8%	76.5%	63.3%	82.4%
Pniel	64.7%	82.4%	58.8%	82.4%
Klapmuts	58.8%	94.1%	41.2%	70.6%
Raithby	47.1%	76.5%	64.7%	76.5%

Note: Low < 50%, Medium 50% - < 70%, High 70% - < 90%, Critical 90% - 100%

Industrial Consumers: Stellenbosch Municipality can promote WDM activities at the wet industrial consumers in order for them to potentially lower their current water demand by means of improved practices or reuse of waste water. The revenue could potentially decrease as a result of re-use practices. It is suggested that a detailed financial analysis should be conducted as part of the investigation into wastewater re-use.

Stellenbosch Municipality can encourage the large users to implement suggested re-use practices by means of incentives, informative billing to communicate monthly water consumption and monitoring and communicating actual savings achieved.

All industries formally apply for the discharge of industrial effluent into the Municipality's sewer system. The quality and volume of industrial effluent discharged into the sewer system are monitored by the Municipality, in order to determine whether the quality comply with the standards and criteria. It is also necessary to consider limits above which volumetric monitoring will be necessary at new industries and existing smaller industries, where expansion is likely to take place. The Municipality needs to continue to ensure that all industrial consumers apply for discharge permits and they must supply and maintain a flow meter measuring the volume of water that is discharged into the sewer system. It is also recommended that the accounts generated by the Municipality include for each cycle a summary of the COD and flow results to enable industries to keep a record and look at ways of improving where possible.

Stellenbosch Municipality is committed to ensure that no industrial effluent is discharged into the sewer system unless it complies with the required standards and criteria.

TOPIC 7: FINANCIAL

Stellenbosch Municipality's 2023/2024 Annual Report list the following Financial Viability Challenges:

- Financial Viability: The traceability of all debtors poses a challenge to the debt collection process. Low economic growth, an increase in unemployment, and above-inflation increases in the cost of water impact the affordability of municipal accounts.
- Revenue Leakage: An integrated revenue enhancement approach was followed to combat revenue leakages.

Stellenbosch Municipality's 2022-2027 IDP, Draft 3rd Review March 2025, list the following key Financial Strategies:

- Financial viability and sustainability through long-term financial planning
  - Long-term financial planning tool, effective implementation and monitoring.
- Clean Audit
  - Audit Action Plan
  - Annual Financial Statement compilation standard operating procedure
  - Monthly Reconciliations
  - Training Sessions
  - Participation in Forums
- Staffing
  - Revised Organogram
  - Fill critical vacancies
- Capital Expenditure
  - Implementation of Project Management System including in-year reporting
- Revenue Enhancement Strategy
  - Implementation of Revenue Enhancement Strategy.
  - Roll-out of WMD and Pre-payment Water Meters.
  - Data cleansing

- Validity of registered indigent households
- Billing System Enhancement
  - Web-based billing system
  - Review of Municipal Account Layout
  - Investigate payment methods.
- Debt Management
  - Debt Review Committee
  - Quarterly Report on Debt and Possible Debt to be written off.

The following Financial Policies are in place:

- Grant-In-Aid Policy
- Indigent Policy
- Asset Management Policy
- Travel and Subsistence Policy
- Tariff Policy
- Rates Policy
- Non-Financial Asset Management Policy
- Petty Cash Policy
- Irrecoverable Debt Policy
- Credit Control and Debt Collection Policy
- Cash Management and Investment Policy
- Budget Implementation and Monitoring Policy
- Borrowing Policy
- Acting Allowance Policy
- Accounting Policy
- Development Charges Policy
- Special Ratings Area Policy

Expenditure:

Operational: The table below gives a summary of the future planned expenditure by type for Stellenbosch Municipality, as included in the 2024/2025 Budget.

Table C.7.1: Expenditure items by type, as included in the 2024/2025 Budget

Expenditure Items	% of total 2023/2024 Expenditure	2023/2024 Pre-audit Outcome	2024/2025	2025/2026	2026/2027
Employee related costs	31.5%	R393 880 000	R656 455 000	R671 809 000	R713 730 000
Remuneration of Councillors	1.2%	R15 351 000	R23 422 000	R24 828 000	R26 317 000
Bulk Purchases – Electricity	29.5%	R369 607 000	R714 397 000	R805 126 000	R907 377 000
Inventory Consumed	5.0%	R62 772 000	R112 641 000	R119 350 000	R126 520 000
Debt Impairment	0.0%	-	R74 711 000	R78 259 000	R81 975 000
Depreciation and amortisation	10.1%	R126 325 000	R249 408 000	R259 395 000	R269 782 000
Interest	2.0%	R25 147 000	R69 589 000	R72 873 000	R77 164 000
Contracted Services	12.2%	R152 988 000	R297 434 000	R322 301 000	R372 815 000
Transfers and Subsidies	1.1%	R13 759 000	R20 739 000	R21 493 000	R22 276 000
Irrecoverable debts written off	0.0%	R42 000	R121 383 000	R126 845 000	R132 553 000
Operational costs	7.3%	R91 057 000	R169 885 000	R176 959 000	R182 325 000
Losses on disposal of Assets	0.0%	-	-	-	-
Other Losses	0.0%	R3 000	-	-	-
Total	**100.0%**	**R1 250 931 000**	**R2 510 064 000**	**R2 679 238 000**	**R2 912 834 000**

Source: 2024/2025 Medium Term Revenue and Expenditure Framework for Stellenbosch Municipality: Table A4 – Budgeted Financial Performance (Revenue and Expenditure)

Maintenance activities have been increasingly focused on reactive maintenance as a result of the progressive deterioration and failure of old infrastructure. Consequently, there has been dilution of preventative maintenance of other infrastructure. Expenditure on repairs and maintenance does not keep track with the increase in asset values as well as the ageing of the infrastructure.

An Integrated Maintenance Plan is necessary that optimises maintenance activities, appropriate to its specific needs and the local environment, and identifies the systems and resources required to support this. A regime of planned preventative maintenance should be established for all infrastructure assets classified as critical and important in the Asset Register. Consideration should be given to the establishment of a maintenance management system to enable Stellenbosch Municipality to better manage its risks, and more effectively plan and prioritise the wave of renewals that are going to be required over the next 20 years.

It is important to note that the maintenance budget requirements are going to increase substantially over the next twenty years in real terms, in line with the envisaged pace of development, and the upgrading of the treatment works. It is estimated that the budget requirements will double over this period.

The recommendations for Stellenbosch Municipality, with regard to their Operational Budgets, are as follows:

- Develop an AMP, which will indicate the real replacement values and service lives of the assets and the funds required to provide for adequate operation and maintenance of the infrastructure. Current gaps include unrealistically low depreciation charges, which have to be rectified and ring-fenced into an asset replacement fund, as well as additional budget requirements above inflation for infrastructure development.

- The new depreciation charges will have to form part of the operating budget and subsequent tariffs, linked to a ring-fenced asset replacement fund.

- It is critical for Stellenbosch Municipality to ensure that sufficient funding is allocated towards an asset replacement fund, in order to ensure adequate rehabilitation and maintenance of the existing water and sewerage infrastructure.

- Water services operational surpluses have to be allocated to essential water services requirements in the future.

- Stellenbosch Municipality needs to continue with the strict enforcement of their Credit Control and Debt Collection Policy and By-law.

Capital: The future estimated capital expenditure per standard classification are summarised in the table below.

Table C.7.2: Estimated capital expenditure per standard classification of Stellenbosch Municipality's future capital budgets

Capital Expenditure: Functional Classification	2023/2024 Pre-audit outcome	2024/2025	2025/2026	2026/2027
Executive and Council	R35 000	R40 000	R40 000	R50 000

Source: 2024/2025 Medium Term Revenue and Expenditure Framework for Stellenbosch Municipality: Table A5 – Capital Expenditure by Vote, Functional and Funding

The Opening Cost of the water and sewerage infrastructure that will need to be replaced over the next five years (RUL < 5 yrs) is R115.251 million. The asset renewal needs for the **water infrastructure assets** over the next 10 years is R21.290 million per year. The reinvestment required is R96.455 million in the first 5 years and R116.446 million in the second 5-year period. The asset renewal needs for the **sewerage infrastructure assets** over the next 10 years is R5.663 million per year. The reinvestment required is R18.795 million in the first 5 years and R37.837 million in the second 5-year period. These values are based on the Opening Cost of the water and sewerage infrastructure currently included in the Asset Register. Table C.4.2 however indicates the required annual budget for the replacement of the old water and sewerage infrastructure and the required annual O&M budget, which is based on the CRC of the water and sewerage infrastructure included in the WSDP.

The extent to which each type of water and sewerage asset portfolio has been consumed are summarised under Topic 3 of this Executive Summary. The infrastructure components with low percentage figures (% Book Value/Opening Cost) need dedicated renewals programmes targeting these assets. If this is not done, there is the risk that the on-going deterioration will escalate to uncontrolled proportions, with considerable impact on consumers, the economy of the area and the service levels that can be provided in Stellenbosch Municipality.

The recommendations for Stellenbosch Municipality, with regard to their Capital Funding, are as follows:

- Take the recommended projects, as identified through the Water and Sewer Master Plans and the WSDP, into account during the planning and prioritization process for new infrastructure. Prioritize from the desired list, those items which can be implemented from available funding in the particular financial year.

- Undertake revised master planning at least every three to five years and use the Master Plans to list the desired infrastructure development requirements and reflect these in the IDP.

- Assign a high priority to the implementation of the WC/WDM Strategy in order to postpone additional capital investment for as long as possible, both from the water availability perspective as well as from the treatment of increased effluent volumes. The costs of physical water loss, the capital requirements for new water resources infrastructure, and the constraints of poor water availability on water dependent economic growth means that WC/WDM is a critical management priority for stretching the financial resources of the Municipality. WC/WDM is almost always a more cost-effective solution than the implementation of new infrastructure, and no new infrastructure should be developed until unauthorized water has been reduced to manageable volumes.

- To adopt appropriate technology solutions for the water and sewerage infrastructure challenges. Techniques such as value engineering should also be adopted to ensure that investments in infrastructure and other solutions are cost effective over the full life-cycle and designed to be fit for purpose.

- To ensure adequate funding for the full lifecycle cost of the new water and sewerage infrastructure, which will include funds for the operation and maintenance of the infrastructure and regular refurbishment.

- Balance land-use and development planning (SDFs) in accordance with the availability of water and the capacity of WTWs and WWTWs that are in place or that will be implemented.

- To focus strongly on revenue collection, in order to improve the Municipality's own funding sources, over and above the Grants received from National and Provincial Government. The Municipality also needs to actively implement their Credit Control and Debt Collection Policy in order to minimize the percentage of non-payment for municipal services.

- To identify all possible sources of external funding over the next three years to assist Stellenbosch Municipality to address the bulk infrastructure backlogs that exist in the various towns as indicated in the tables under Topic 3.

- Develop IAMPs for all water and sewerage infrastructure, which will indicate the real replacement values, the service life of the assets and the funds required to provide for adequate asset replacement. The renewals burden is set to increase sharply over the next 20 years and it is therefore important for Stellenbosch Municipality to commit to a substantial and sustained programme of capital renewal works. The current level of expenditure on capital renewal is inadequate and there is a critical need for Council to commit to increase the budget for the maintenance and rehabilitation of the existing infrastructure substantially.

Income:

Operational: The table below gives a summary of the future planned revenue by source for Stellenbosch Municipality, as included in the 2024/2025 Budget.

Table C.7.3: Revenue items by source, as included in the 2024/2025 Budget					
Revenue Item	**% of total 2023/2024 Expenditure**	**2023/2024 Pre-audit Outcome**	**2024/2025**	**2025/2026**	**2026/2027**
Service Charges – Electricity	37.2%	R646 395 000	R1 029 704 000	R1 167 018 000	R1 322 068 000
Service Charges – Water	8.3%	R144 132 000	R182 522 000	R190 924 000	R199 712 000
Service Charges - Waste Water Management	4.9%	R85 877 000	R122 772 000	R132 593 000	R143 201 000
Service Charges – Waste Management	4.3%	R74 240 000	R115 082 000	R120 375 000	R125 913 000

Source: 2024/2025 Medium Term Revenue and Expenditure Framework for Stellenbosch Municipality: Table A4 – Budgeted Financial Performance (Revenue and Expenditure)

Capital: It is important for Stellenbosch Municipality to manage their charges for water and sanitation services and the control of consumer payments effectively, in order to ensure that adequate income is generated to fund their water and sanitation capital projects. The future funding sources of Stellenbosch Municipality's total capital budget are summarised in the table below.

Table C.7.4: Sources of funding for the future capital budgets of Stellenbosch Municipality				
Capital Funding Source	**2023/2024 Pre-audit**	**2024/2025**	**2025/2026**	**2026/2027**
National Government	R43 014 000	R72 056 000	R56 821 000	R59 216 000

Source: 2024/2025 Medium Term Revenue and Expenditure Framework for Stellenbosch Municipality: Table A5 - Capital Expenditure by Vote, Functional and Funding

Tariff and Charges: The state of the economy has an adverse effect on the consumers. As a result municipalities' revenues and cash flows are expected to remain under pressure. Furthermore municipalities should carefully consider affordability of tariff increases, especially as it relates to domestic consumers while considering the level of services versus the associated cost.

Water tariffs should always be cost reflective and the water tariff structure must therefore ensure that:

- Water tariffs are fully cost-reflective, including the cost of maintenance and renewal of purification plants, water networks and the cost associated with reticulation expansion;
- Water tariffs are structured to protect basic levels of service and ensure the provision of free water to the poorest of the poor (indigent); and
- Water tariffs are designed to encourage efficient and sustainable consumption.

Stellenbosch Municipality's current seven block step water tariff structure for residential consumers adequately promotes the efficient use of water by consumers and discourages the wastage of water. Higher tariffs are charged for the higher consumption blocks. The first 6 kl of water is provided free to residential consumers who qualify for indigent relief. It is expected that this tariff structure will continue to be implemented in the future.

The sustainable supply of potable water is becoming an ever increasing challenge. This scarce commodity has to be optimally managed. The increase in the price of electricity, load shedding and the chemicals for purification has contributed to the cost of delivering the service.

The table below gives some comments on the specific blocks, with regard to Stellenbosch Municipality's residential block stepped water tariff structure, for the various financial years.

Table C.7.5: Comments on the Municipality's residential block step tariff structure

Block (kl/month)	20/21	21/22	22/23	23/24	24/25	Comments
0 – 6 kl	R6-06	R6-39	R6-79	R7-19	R7-64	Free Basic Water
> 6 – 12 kl	R9-17	R9-67	R10-27	R10-89	R11-56	Low volume use
> 12 – 20 KL	R15-51	R16-36	R17-37	R18-42	R19-56	Typical use volume, including garden irrigation
> 20 – 25 kl	R27-58	R29-09	R30-90	R32-75	R34-78	
>25 – 40 kl	R38-33	R40-43	R42-94	R45-52	R48-34	Above average use, including garden irrigation
> 40 – 70 kl	R61-24	R64-61	R68-61	R72-73	R77-24	Wasteful use and/or severe garden irrigation
> 70 kl	R95-85	R101-12	R107-39	R113-83	R113-83	Significant waste and/or unnecessary garden irrigation

Wasteful or inefficient use of water is discouraged through increased tariffs. It is suggested that the following tariff structure characteristics should remain in Stellenbosch Municipality's Structure in order to ensure efficient water use (WDM Strategy):

- Maintain a rising block tariff structure.
- Keep number of blocks in the tariff to a minimum. One block to address free basic water (the first step) and another to address the "cut-off" volume where consumers are discouraged to use water above this monthly volume (highest block) are required. In addition another three blocks could be used to distinguish between low users, typical use of high water use. Six blocks in a tariff often make good sense, as indicated in Table C.7.5.
- The volumetric steps should be kept the same for all the areas within Stellenbosch Municipality's Management Area.
- The cost of water in the maximum step should severely discourage use in this category. The volumetric use for the highest category could be 60 kl/month, above which residential water use could be considered to be wasteful or unnecessary. Garden use requiring in excess of this volume should be reduced in accordance with xeriscape practices.

The MFMA Circular No.78 of 7 December 2015 stipulated the following w.r.t. the water and sanitation tariff increases:

Municipalities should consider the full cost of rendering the water and sanitation services when determining tariffs related to these two services. If the tariffs are low and result in the municipality not recovering their full costs, the municipality should develop a pricing strategy to phase-in the necessary tariff increases in a manner that spreads the impact on consumers over a period of time.

Municipalities are urged to design an Inclining Block Tariff structure that is appropriate to its specific circumstances, and ensures an appropriate balance between low income consumers and other domestic, commercial and business customers, and the financial interests of the municipality. While considering this structure, municipalities are advised to evaluate if the IBT system will be beneficial to them depending on consumption patterns in their areas.

In light of the current drought being experienced across large parts of the country, and to mitigate the need for water tariff increases, municipalities must put in place appropriate strategies to limit water losses to acceptable levels. In this regard municipalities must ensure that water used by their own operations is charged to the relevant service, and not simply attributed to water losses.

The recommendations for the water and sewerage tariffs of Stellenbosch Municipality are as follows:

- Stellenbosch Municipality can investigate the financial viability of changing the sanitation tariff structure from a fixed monthly amount, which is based on the size of the erven, to a stepped tariff based on water consumption in the future (Financial analysis needs to be done). Volumetric usage for sanitation services, whereby charges are determined according to water usage, with maximum ceilings and charged accordingly. This will need to include a free sanitation bracket, similar for free water, for indigent households. This will also further deter wasteful water use.

- Stellenbosch Municipality will continue to re-evaluate the tariffs they charge for their water and sanitation services on an annual basis in order to put the Municipality in a better financial position and to ensure that all the O&M expenditure for water and sanitation services are recovered through their water and sanitation services income, to address the bulk infrastructure backlogs and to ensure the adequate rehabilitation and maintenance of all existing water and sewerage infrastructure within the various towns.

- The large commercial and industrial consumers could lower their current water demand by means of improved practices or re-use of wastewater. Stellenbosch Municipality should note that revenue could potentially decrease as a result of reuse practices.

- Stellenbosch Municipality will continue to monitor the volume and nutrient loading of all industrial effluent discharged by industrial consumers into the sewer system. A formula for the calculation of the extraordinary treatment cost to industrial consumers for the industrial effluent they discharged into Stellenbosch Municipality's sewer system is in place and form part of the existing tariff structure. The performance of the WWTWs in general can be severely compromised by certain industrial effluent discharges. It is therefore also important for Stellenbosch Municipality to recalculate their treatment costs annually, in order to ensure that there is no under or over recovery of costs from industrial consumers. The charges for wastewater discharged by industrial consumers can also be linked to their water usage in the future.

  Stellenbosch Municipality needs to continue to regularly sample the quality of industrial effluent discharged into the sewer system and all industrial consumers need to be charged according to the quality of the effluent discharged into the Municipality's sewer system.

- The current water tariff codes adequately differentiate between the different type of consumers and their water usage. The Municipality can investigate the possibility to uniquely describe the "Municipal Tariff" water usage with a distinction between the different user types, for example parks, office usage, fire-fighting, etc.

TOPIC 8: WATER SERVICES INSTITUTIONAL ARRANGEMENTS AND CUSTOMER SERVICES

Sections 12 and 13 of the Water Services Act (Act No 108 of 1997) place a duty on WSAs to prepare and maintain a WSDP, as part of the process of preparing an IDP. The DWS has developed a new eWSDP website to assist WSAs with the WSDP process and to provide a framework for the capturing of the data. The WSDP of Stellenbosch Municipality needs to be updated regularly.

The Municipality will also continue to report annually and in a public way on progress in implementing the plan (WSDP Performance- and Water Services Audit Report), as part of Stellenbosch Municipality's Annual Report, as required in terms of Section 18 of the Water Services Act, 1997 (Act No.108 of 1997), as well as the "Regulations relating to compulsory national standards and measures to conserve water", as issued in terms of Sections 9(1) and 73(1)(j) of the Water Services Act.

The Water Safety Plans for the various WTWs and water distribution systems and the W_2RAPs for the WWTWs and sewer drainage networks need to be updated regularly. Both the existing Water Safety Plans and W_2RAPs need to be updated. WTW and WWTW Process Audits also needs to be compiled regularly.

The 2025 Water and Sewer Master Plans of Stellenbosch Municipality summarise the projects (Master Plan Items) necessary in order to cope with the increased future demands and developments within the Stellenbosch Municipality's systems. The Water and Sewer Master Plans need to be updated regularly (At least once every three to five years).

A Work Place Skills Plan is in place, which lists the training to be provided during the new financial year. The training of Stellenbosch Municipality's personnel involved in the management of water and sanitation services are the most important factors that determine the ability of Stellenbosch Municipality to deliver safe and reliable water and to treat the effluent at the WWTWs to an acceptable standard. Training of all staff involved in water supply and sanitation services on matters related to treatment processes and quality monitoring and control is essential because their actions (or failure to act) will have a major impact on the well-being of the communities and the environment.

It is important for Stellenbosch Municipality to classify all WTWs and WWTWs and Process Controllers along the lines of the new Regulation 3630 requirements by establishing a programme for certification of works, operators, technicians and managers. The process will include reviewing the skills needed and aligning resources to these needs as well as reviewing total staff numbers necessary to meet all the objectives in the National Water Act.

The table below provides an overview of the current Process Controllers at the WTWs and WWTWs and whether additional Process Controllers are required in order to comply with Regulation 3630.

Table C.8.1: Required number of Process Controllers at the WTWs and WWTWs	
WTWs	
Idas Valley	The minimum requirement for a Class C WTW is one Class III Process Controller per shift, plus one on standby. For the Idas Valley WTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. The existing Class II Process Controllers need to receive the required training to be classified as a Class III Process Controllers in order to ensure compliance.
Paradyskloof	The minimum requirement for a Class C WTW is one Class III Process Controller per shift, plus one on standby. For the Paradyskloof WTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. The current number of Process Controllers at the plant is adequate.
Franschhoek	No permanent PC
WWTWs	
Stellenbosch	The minimum requirement for a Class A WWTW is one Class IV Process Controller per shift, plus one on standby. For the Stellenbosch WWTW, with two shifts, there should therefore be three Process Controllers with minimum Class IV classifications. Current number and Class of Process Controllers are adequate for the plant.
Wemmershoek	The minimum requirement for a Class C WWTW is one Class III Process Controller per shift, plus one on standby. For the Wemmershoek WWTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. Current number and Class of Process Controllers are adequate for the plant.
Pniel	The minimum requirement for a Class C WWTW is one Class III Process Controller per shift, plus one on standby. For the Pniel WWTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. One additional Class III Process Controller needs to be appointed for the Pniel WWTW.
Klapmuts	The minimum requirement for a Class C WWTW is one Class III Process Controller per shift, plus one on standby. For the Klapmuts WWTW, with two shifts, there should therefore be three Process Controllers with minimum Class III classifications. Current number and Class of Process Controllers are adequate for the plant.

Table C.8.1: Required number of Process Controllers at the WTWs and WWTWs	
Raithby	The minimum requirement for a Class D WWTW is one Class II Process Controller per shift, plus one on standby. For the Raithby WWTW, with one shift, there should therefore be two Process Controllers with minimum Class II classifications. Current number and Class of Process Controllers are adequate for the plant.

The Occupational Health and Safety Act contain provisions directing employers to maintain a safe workplace and to minimize the exposure of employees and the public to workplace hazards. It is therefore important for Stellenbosch Municipality to compile a Legal Compliance Audit of their WTWs and WWTWs, which will provide the management Stellenbosch Municipality with the necessary information to establish whether the Municipality is in compliance with the legislation or not. It is further recommended that Stellenbosch Municipality arrange for chlorine audits to be done at all their disinfection facilities, in order to identify any potential shortcomings.

Stellenbosch Municipality has a comprehensive Performance Management System in place. The performance indicators as included in the SDBIP are regularly reviewed in order to promote a culture of performance management among its political structures, political office bearers and councillors and in its administration and administer its affairs in an economical, effective, efficient and accountable manner.

Access to safe drinking water is essential to health and is human right. Safe drinking water that complies with the SANS:241 Drinking Water specifications do not pose a significant risk to health over a lifetime of consumption, including different sensitivities that may occur between life stages. Stellenbosch Municipality is therefore committed to ensure that their water quality always complies with SANS241:2015 limits.

Stellenbosch Municipality is committed to maintain the existing high level of customer service in their urban areas and to record all the necessary information for the WSDP on an annual basis. The present Customer Services and Complaints Management System allows for the recording and management of all water and sanitation related complaints. The Municipality is committed to ensure that all water and sanitation related complaints are recorded and that the complaints are addressed within the required time period.

SECTION D: WATER SERVICES OBJECTIVES AND STRATEGIES

The water services strategies presented below were derived from the 2023/2024 SDBIP and the water services situational analysis as summarized in Section C: Water Services Existing Needs Perspective and presents the 5-year Water Services strategies as established in Stellenbosch Municipality's WSDP.

.

SECTION E: WATER SERVICES MTEF PROJECTS

The approved 2025/2026 Water Services Medium-Term Expenditure Framework (MTEF) projects are presented below and outline the water services projects which might be funded for implementation within the next three financial years. Table E.2a provides the projects identified for implementation in FY2025/26, Table E.2b provides the projects identified for implementation in FY2026/27 and Table E2c provides the projects identified for implementation in FY2027/28.

It should be highlighted that the projects included herein, represents only projects for which funding might be secured, and therefore does not comprise the comprehensive water services project requirements of Stellenbosch Municipality.

The summary of the MTEF water services projects are indicated in the table below.

Table E.1: Summary of MTEF Projects

Project Main Category	FY2025/26		FY2026/27		FY2027/28		MTEF Total	
	Nr	Value (R'000)	Nr	Value (R'000)	Nr	Value (R'000)	Nr	Value (R'000)
Water Projects	17	R148 159	12	R116 967	8	R57 700	**17**	**R322 826**
Sanitation Projects	14	R87 200	13	R104 800	12	R71 250	**16**	**R263 250**

		Total						**R0**	**R128 950**								**R128 950**	

SECTION F: WSDP PROJECTS

Stellenbosch Municipality's approved 2025/2026 Capital Budget list the following major water and sewerage infrastructure projects (Value above R5 million over the three years), which are planned for the short term (Next three years).

- Implementation of water and sewer pipeline replacement programmes.
- Bulk water supply pipeline and reservoir for Stellenbosch.
- Bulk water supply pipeline and pump stations for Franschhoek.
- Bulk water supply pipeline Cloetesville / Idas Valley
- New reservoir and pipeline Vlottenburg.
- Upgrade and replacement of water meters.
- Implementation of Water Conservation and Water Demand Management measures.
- Water Telemetry upgrade.
- Upgrade of Idas Valley WTW.
- Upgrade Wemmershoek and Klapmuts WWTWs.
- Extension of Stellenbosch WWTW.
- Refurbish plant and equipment: Raithby WWTW.
- Construction of new Dwars River sewer pump station.
- Sewer pump station and telemetry upgrade.
- Specialised vehicles for Sanitation.

The NWRS 2 list the following steps to raise the water profile in development planning:

- Water must be placed at the center of integrated planning and decision-making, with a specific aim to respond to and support the achievement of national development and sector goals.
- Current budgets need to adequately provide for water, which might mean they have to be doubled to cater for the present needs.
- Current financial values need to appreciate water as a scarce resource and should thus reflect the real value of water. This requires a new value system across all sectors and stakeholders.
- Water efficiency and curbing water losses should be high on the agenda of each individual and institution in the country.
- Water management must be formally embedded in the sector businesses with associated accountability.

The DWS will insist in the future that all water infrastructure which they fund is value engineered against the life-cycle cost with a specific emphasis on energy costs. Evidence will be required that the technical design is appropriate for the nature of the resource and that operation and maintenance of the assets is reasonably within the capability of the responsible institution. New water resources infrastructure will also not be developed or authorized unless effective WC/WDM interventions have been put in place in the affected area.

The identification of projects necessary to ensure the provision of adequate levels of water and sanitation services is based primarily on the findings of the Water and Sewer Master Plans. Master Planning is typically based on a forward planning horizon of 20 years, but is usually updated every three to five years, taking into account improved water demand estimates and subsequent infrastructure developments which may have taken place. The recommended projects from the Stellenbosch Master Plans were incorporated into the WSDP.

The Master Plans represent the ideal infrastructure development required to meet projected future water requirements over the next few years, while realistic capital investment in infrastructure projects is determined by budget availability. As a result, prioritization of projects is necessary to identify what can be done within the available and projected budget constraints. The prioritization of projects is done through the IDP and annual budget planning process.

Recommended infrastructure projects for implementation in the future by Stellenbosch Municipality will be based on the following plans and processes:

- Water and Sewer Master Plans and Water and Waste Water Treatment Works Master Plans;
- Infrastructure replacement needs (Asset Register);
- Budget proposals; and
- Asset Management Plans.

The current needs projects are estimated at R674.651 million of which 87% are funded, as included in the three year MTEF project list. It should however be emphasised that additional funding will be required to address the full achievement of the water services strategies as outlined in Section D, but that the extent of such additional funding can only be determined, once initial investigations and activities have been concluded.

WSDP EXECUTIVE SUMMARY 2022-2027

Table F.1: WSDP FY2025/26: LIST OF CONCEPTUAL PROJECTS

Nr	Situation Assessment (Problem Definition)	Solution description as defined by topic situation assessment (Strategy)	Conceptual project	Is there an existing project addressing this problem?	Existing Projects Information			Does this current listed project address the problem totally?	Approved by Council, in project database and part of 5 year IDP cycle projects?	Project listed in 3yr MTEF - cycle?
					Project Number (Dept)	Project Title	Project Cost R'000			
CURRENT NEEDS										
Topic 1: Settlements and Demographics										
	Done by other Department									
Topic 2: Service Levels										
2.1	There are still an estimated 212 households on the farms in the rural areas without basic water supply services.	Assist private landowners as far as possible with the provision of basic water services to all the households in the Municipality's Management Area with existing water service levels below basic water supply services.	WSDP	No	SB2526001	Provide basic water services to the households on the farms without basic water services	R2 120	Yes	No	No
2.2	There are still an estimated 1 270 households on the farms in the rural areas without basic sanitation services.	Assist private landowners as far as possible with the provision of basic sanitation services to all the households in the Municipality's Management Area with existing sanitation service levels below basic sanitation services.	WSDP	No	SB2526002	Provide basic sanitation services to the households on the farms without basic sanitation services	R12 700	Yes	No	No
2.3	There are still 2 623 households in the informal areas without interim water supply services.	Install communal water services for the informal areas in order to ensure that the ratio of number of households per facility complies with the target of 25 or less households per tap.	WSDP	No	SB2526003	Install additional communal water services for the informal areas.	R1 635	Yes	No	No
2.4	There are still 6 320 households in the informal areas without interim sanitation services.	Install communal sanitation services for the informal areas in order to ensure that the ratio of number of households per facility complies with the target of 5 of less households per toilet facility.	WSDP	No	SB2526004	Install additional communal sanitation facilities for the informal areas.	R19 050	Yes	No	No
2.5	Water and Sanitation Service Level Policy is not in place.	Ensure a Water and Sanitation Service Level Policy is in place.	WSDP	No	SB2526005	Draft a Water and Sanitation Service Level Policy.	R200	Yes	No	No
Topic 3: Water Services Asset Management (Infrastructure)										
3.1	Capacity of existing bulk water pipeline and storage capacity not adequate.	Ensure adequate bulk water pipeline capacity and storage capacity.	MTREF Project	Yes	SB2526006	Bulk Water Supply Pipe and Reservoir: Stellenbosch	R143 786	Yes	Yes	Yes
3.2	Capacity of existing bulk water pipeline and pump capacity not adequate.	Ensure adequate bulk water pipeline capacity and pump capacity.	MTREF Project	Yes	SB2526007	Bulk Water Supply Pipe Line and Pump stations: Franschhoek	R12 000	Yes	Yes	Yes
3.3	Capacity of existing bulk water pipeline is not adequate.	Ensure adequate bulk water pipeline capacity.	MTREF Project	Yes	SB2526008	Bulk Water Supply Pipe: Cloetesville/ Idas Valley	R28 000	Yes	Yes	Yes
3.4	Capacity of existing bulk water pipeline is not adequate.	Ensure adequate bulk water pipeline capacity.	MTREF Project	Yes	SB2526009	Bulk Water Upgrades Franschoek	R1 000	Yes	Yes	Yes
3.5	Capacity of existing bulk water pipeline and storage capacity not adequate.	Ensure adequate bulk water pipeline capacity and storage capacity.	MTREF Project	Yes	SB2526010	New Reservoir and Pipeline: Vlottenburg	R30 940	Yes	Yes	Yes
3.6	Capacity of existing bulk water pipeline and storage capacity not adequate.	Ensure adequate bulk water pipeline capacity and storage capacity.	MTREF Project	Yes	SB2526011	Uniepark and Helshoogte Storage and Supply scheme	R4 000	Yes	Yes	Yes
3.7	Capacity of existing sewer bulk pipeline is inadequate.	Ensure adequate bulk sewer pipeline capacity, in order to prevent possible spillages.	MTREF Project	Yes	SB2526012	Dorp Street Bulk Sewer Upgrade	R3 000	Yes	Yes	Yes
3.8	Capacity of existing WWTW is inadequate to meet future wastewater treatment requirements.	Ensure adequate wastewater treatment capacity and final effluent compliance.	MTREF Project	Yes	SB2526013	Extention of WWTW: Stellenbosch	R82 200	Yes	Yes	Yes
3.9	Some of the existing sewer drainage networks with insufficient capacity.	Replace sewer pipelines with inadequate capacity.	MTREF Project	Yes	SB2526014	Sewerpipe replacement	R20 000	Partly	Yes	Yes
3.10	Capacity of existing WWTW is inadequate to meet future wastewater treatment requirements.	Ensure adequate wastewater treatment capacity and final effluent compliance.	MTREF Project	Yes	SB2526015	Upgrade of WWTW Wemmershoek	R31 000	Yes	Yes	Yes
3.11	Capacity of existing WWTW is inadequate to meet future wastewater treatment requirements.	Ensure adequate wastewater treatment capacity and final effluent compliance.	MTREF Project	Yes	SB2526016	Upgrade of WWTW: Klapmuts	R81 000	Yes	Yes	Yes
3.12	New pump station needs to be constructed in order to adequately service new households with waterborne sewer system.	Ensure adequate sewage pump capacity, in order to prevent possible spillages.	MTREF Project	Yes	SB2526017	Construction of New Dwars River Sewer Pump station.	R7 000	Yes	Yes	Yes
3.13	Capacity of existing sewer drainage network pipelines is inadequate.	Ensure adequate sewer drainage capacity, in order to prevent possible spillages.	MTREF Project	Yes	SB2526018	Upgrade of Dwars River Bulk Sewer network and pump lines	R4 000	Yes	Yes	Yes
Topic 4: Water Services Operation and Maintenance										
4.1	Existing disinfection facilities need to be upgraded	Ensure microbiological water quality compliance	MTREF Project	Yes	SB25626019	Chlorination Installation: Upgrade	R750	Yes	Yes	Yes
4.2	Additional furniture are required for some of the offices and tools and equipment.	Ensure a good working environment and adequate tools and equipment.	MTREF Project	Yes	SB25626020	Furniture, Tools and Equipment: Water	R600	Yes	Yes	Yes
4.3	Safety Inspections need to be done for some of the reservoirs and dams.	Ensure compliance with regard to safety requirements.	MTREF Project	Yes	SB25626021	Reservoirs and Dam Safety	R2 500	Yes	Yes	Yes
4.4	Some of the existing vehicles need to be replaced.	Ensure adequate vehicles for operations (Service Delivery)	MTREF Project	Yes	SB25626022	Specialized Vehicles: Water	R1 000	Yes	Yes	Yes
4.5	Some of the existing vehicles need to be replaced.	Ensure adequate vehicles for operations (Service Delivery)	MTREF Project	Yes	SB25626023	Vehicles: Water	R1 000	Yes	Yes	Yes
4.6	Some parts of the existing water telemetry system needs to be upgraded	Effective monitoring and management of water supply volumes	MTREF Project	Yes	SB25626024	Water Telemetry Upgrade	R6 250	Yes	Yes	Yes
4.7	Capacity of existing WTW is inadequate and some components need refurbishment	Ensure adequate future water treatment capacity and water quality compliance.	MTREF Project	Yes	SB25626025	Upgrade of IdasValley WTP	R52 000	Yes	Yes	Yes
4.8	Additional furniture are required for some of the offices and tools and equipment.	Ensure a good working environment and adequate tools and equipment.	MTREF Project	Yes	SB25626026	Furniture, Tools & Equipment: Sanitation	R1 200	Yes	Yes	Yes
4.9	Existing ponds need rehabilitation and pumping system needs to be constructed.	Ensure adequate wastewater treatment capacity and final effluent compliance.	MTREF Project	Yes	SB25626027	Pond rehabilitation and pond pumping systems construction WWTW	R4 400	Yes	Yes	Yes
4.10	Capacity of existing WWTW is inadequate to meet future wastewater treatment requirements and some components need to be refurbished.	Ensure adequate wastewater treatment capacity and final effluent compliance.	MTREF Project	Yes	SB25626028	Refurbish Plant & Equipment - Raithby WWTW	R10 000	Yes	Yes	Yes
4.11	Some parts of the existing sewage telemetry system needs to be upgraded	Effective monitoring and management of sewage flows.	MTREF Project	Yes	SB25626029	Sewer Pump station and Telemetry Upgrade	R5 500	Yes	Yes	Yes
4.12	Some of the existing vehicles need to be replaced.	Ensure adequate vehicles for operations (Service Delivery)	MTREF Project	Yes	SB25626030	Specialized Vehicles: Sanitation	R9 000	Yes	Yes	Yes
4.13	Additional laboratory equipment is needed	Ensure adequate sample testing equipment	MTREF Project	Yes	SB25626031	Upgrade Laboratory Equipment	R250	Yes	Yes	Yes
4.14	Some of the existing vehicles need to be replaced.	Ensure adequate vehicles for operations (Service Delivery)	MTREF Project	Yes	SB25626032	Vehicles: Sanitation	R2 000	Yes	Yes	Yes
4.15	Water Safety Plan not regularly updated.	Water Quality Risk Management - Regular updating of Water Safety Plan	WSDP	No	SB25626033	Regular updating of the Water Safety Plan	R300	Yes	No	No
4.16	W2RAP not regularly updated.	Wastewater Risk Management - Regular updating of W2RAP	WSDP	Partly	SB25626034	Regular updating of the W2RAP	R300	Yes	No	No
4.17	WTW and WWTW Process Audits not regularly done.	Compile regular WTW and WWTW Process Audits	WSDP	Partly	SB25626035	WTW and WWTW Process Audits	R400	Yes	No	No
4.18	Asset Management Plan is not in place.	Ensure sufficient budget allocation toward refurbishment of existing water and sewerage infrastructure.	WSDP	No	SB25626036	Compile an Asset Management Plan	R1 000	Yes	No	No
Topic 5: Conservation and Demand Management (Topic 5.1 Water Resources)										
5.1	WC/WDM measures need to be implemented to further reduce NRW and Water Losses.	Implementation of WC/WDM Strategy measures	MTREF Project	Yes	SB2526037	Water Conservation & Demand Management	R6 500	Yes	Yes	Yes
5.2	Some sections of the water reticulation network are old, which result in regular pipe bursts	Implementation of pipeline replacement programme	MTREF Project	Yes	SB2526038	Waterpipe Replacement	R22 000	Partly	Yes	Yes
5.3	WC/WDM measures need to be implemented to further reduce NRW and Water Losses.	Implementation of WC/WDM Strategy measures	WSDP	No	SB2526039	Implement propopsed WC/WDM Strategy measures as included in WSDP (1-3 yrs)	R20 020	Yes	Partly	Partly
5.4	WC/WDM measures need to be implemented to further reduce NRW and Water Losses.	Implementation of WC/WDM Strategy measures	WSDP	No	SB2526040	Implement propopsed WC/WDM Strategy measures as included in WSDP (4-7 yrs)	R18 300	Yes	Partly	Partly
5.5	WC/WDM measures need to be implemented to further reduce NRW and Water Losses.	Implementation of WC/WDM Strategy measures	WSDP	No	SB2526041	Implement propopsed WC/WDM Strategy measures as included in WSDP (8-10 yrs)	R12 550	Yes	Partly	Partly
Topic 5: Conservation and Demand Management (Topic 5.2 Water Balance)										
5.6	Potential unmetered erven were identified through Swift process	Ensure all water usage is metered. Implementation of WC/WDM Strategy in order to reduce NRW and Water Losses.	MTREF Project	Yes	SB2526042	Upgrade and Replace Water Meters	R9 000	Yes	Yes	Yes
Topic 6: Water Resources										
Topic 7: Financial										
	Done by other Department									
Topic 8: Institutional Arrangements and Customer Care										
8.1	Water Infrastructure planning needs to be aligned with the future potential developments.	Water Infrastructure Planning, aligned with SDF.	MTREF Project	Yes	SB2526043	Update Water Masterplan	R1 500	Yes	Yes	Yes
8.2	WSDP needs to be updated regularly, according to the Water Services Act.	Water and Sanitation Services Planning. Legislative compliance	MTREF Project	Yes	SB2526044	Compilation of Water Service Development Plan (tri-annually)	R1 200	Yes	Yes	Yes
8.3	Sewerage infrastructure planning needs to be aligned with the future potential	Sewerage Infrastructure Planning, aligned with SDF.	MTREF Project	Yes	SB2526045	Update Sewer Masterplan	R1 500	Yes	Yes	Yes

FUTURE NEEDS										
Infrastructure										
F.1	Inadequate capacity of existing bulk water pipeline and water reticulation network infrastructure.	Ensure adequate bulk water pipeline and water reticulation network capacity.	Water Master Plan	No	SB2526046	Stellenbosch: Upgrade bulk water pipeline and reticulation networks (2025-2035).	R172 920	Yes	No	No
F.2			Water Master Plan	No	SB2526047	Stellenbosch: Upgrade bulk water pipeline and reticulation networks (2036-2045).	R18 094	Yes	No	No
F.3			Water Master Plan	No	SB2526048	Stellenbosch: Upgrade bulk water pipeline and reticulation networks (>2045).	R10 794	Yes	No	No
F.4			Water Master Plan	No	SB2526049	Klapmuts: Upgrade bulk water pipeline and reticulation networks (2025-2035).	R22 830	Yes	No	No
F.5			Water Master Plan	No	SB2526050	Klapmuts: Upgrade bulk water pipeline and reticulation networks (2036-2045).	R13 261	Yes	No	No
F.6			Water Master Plan	No	SB2526051	Klapmuts: Upgrade bulk water pipeline and reticulation networks (>2045).	R2 371	Yes	No	No
F.7			Water Master Plan	No	SB2526052	Franshhoek: Upgrade bulk water pipeline and reticulation networks (2025-2035).	R65 167	Yes	No	No
F.8			Water Master Plan	No	SB2526053	Franschhoek: Upgrade bulk water pipeline and reticulation networks (2036-2045).	R9 816	Yes	No	No
F.9			Water Master Plan	No	SB2526054	Dwars River: Upgrade bulk water pipeline and reticulation networks (2025-2035).	R41 306	Yes	No	No
F.10			Water Master Plan	No	SB2526055	Dwars River: Upgrade bulk water pipeline and reticulation networks (2036-2045).	R24 081	Yes	No	No
F.11			Water Master Plan	No	SB2526056	Raithby: Upgrade bulk water pipeline and reticulation networks (2025-2035).	R2 533	Yes	No	No
F.12			Water Master Plan	No	SB2526057	Raithby: Upgrade bulk water pipeline and reticulation networks (2036-2045).	R8 564	Yes	No	No
F.13			Water Master Plan	No	SB2526058	Faure: Upgrade bulk water pipeline and reticulation networks (2030).	R4 733	Yes	No	No
F.14			Water Master Plan	No	SB2526059	Polkadraai: Upgrade bulk water pipeline and reticulation networks (2025-2030).	R52 344	Yes	No	No
F.15			Water Master Plan	No	SB2526060	Koelenhof: Upgrade bulk water pipeline and reticulation networks (2025-2035).	R80 585	Yes	No	No
F.16			Water Master Plan	No	SB2526061	Koelenhof: Upgrade bulk water pipeline and reticulation networks (2036-2045).	R71 387	Yes	No	No
F.17			Water Master Plan	No	SB2526062	Muldersvlei: Upgrade bulk water pipeline and reticulation networks (2026).	R740	Yes	No	No
F.18	Inadequate capacity of existing water pump stations.	Ensure adequate water pump station capacity.	Water Master Plan	No	SB2526063	Stellenbosch: Future upgrades and new water pump stations.	R21 332	Yes	No	No
F.19			Water Master Plan	No	SB2526064	Klapmuts: Future upgrades and new water pump stations.	R5 875	Yes	No	No
F.20			Water Master Plan	No	SB2526065	Franschhoek: Future upgrades and new water pump stations.	R20 371	Yes	No	No
F.21			Water Master Plan	No	SB2526066	Dwars River: Future upgrades and new water pump stations.	R12 614	Yes	No	No
F.22			Water Master Plan	No	SB2526067	Raithby: Future upgrades and new water pump stations.	R6 668	Yes	No	No
F.23			Water Master Plan	No	SB2526068	Koelenhof: Future upgrades and new water pump stations.	R22 597	Yes	No	No
F.24	Inadequate capacity of existing reservoir storage capacity.	Ensure adequate bulk water storage capacity.	Water Master Plan	No	SB2526069	Stellenbosch: Additional reservoirs required to ensure adequate storage capacity	R245 823	Yes	No	No
F.25			Water Master Plan	No	SB2526070	Klapmuts: Additional reservoirs required to ensure adequate storage capacity	R50 373	Yes	No	No
F.26			Water Master Plan	No	SB2526071	Franschhoek: Additional reservoirs required to ensure adequate storage capacity	R50 489	Yes	No	No
F.27			Water Master Plan	No	SB2526072	Dwars River: Additional reservoirs required to ensure adequate storage capacity	R49 171	Yes	No	No
F.28			Water Master Plan	No	SB2526073	Koelenhof: Additional reservoirs required to ensure adequate storage capacity	R20 648	Yes	No	No
F.29	Inadequate capacity of existing bulk sewer pipeline and sewer drainage network infrastructure.	Ensure adequate bulk sewer pipeline and sewer drainage network capacity.	Sewer Master Plan	No	SB2526074	Stellenbosch: Upgrade bulk sewer pipeline and sewer drainage networks (2025-2035).	R103 915	Yes	No	No
F.30			Sewer Master Plan	No	SB2526075	Stellenbosch: Upgrade bulk sewer pipeline and sewer drainage networks (2036-2045).	R40 228	Yes	No	No
F.31			Sewer Master Plan	No	SB2526076	Stellenbosch: Upgrade bulk sewer pipeline and sewer drainage networks (>2045).	R1 412	Yes	No	No
F.32			Sewer Master Plan	No	SB2526077	Wemmershoek: Upgrade bulk sewer pipeline and sewer drainage networks (2025-2035).	R13 168	Yes	No	No
F.33			Sewer Master Plan	No	SB2526078	Wemmershoek: Upgrade bulk sewer pipeline and sewer drainage networks (2036-2045).	R1 693	Yes	No	No
F.34			Sewer Master Plan	No	SB2526079	Pniel: Upgrade bulk sewer pipeline and sewer drainage networks (2025-2035).	R48 314	Yes	No	No
F.35			Sewer Master Plan	No	SB2526080	Pniel: Upgrade bulk sewer pipeline and sewer drainage networks (2036-2045).	R18 746	Yes	No	No
F.36			Sewer Master Plan	No	SB2526081	Klapmuts: Upgrade bulk sewer pipeline and sewer drainage networks (2025-2035).	R26 503	Yes	No	No
F.37			Sewer Master Plan	No	SB2526082	Klapmuts: Upgrade bulk sewer pipeline and sewer drainage networks (2036-2045).	R11 764	Yes	No	No
F.38			Sewer Master Plan	No	SB2526083	Klapmuts: Upgrade bulk sewer pipeline and sewer drainage networks (>2045).	R50 883	Yes	No	No
F.39			Sewer Master Plan	No	SB2526084	Raithby: Upgrade bulk sewer pipeline and sewer drainage networks (2025-2030).	R529	Yes	No	No
F.40	Inadequate capacity of existing sewer pump stations.	Ensure adequate sewer pump station capacity.	Sewer Master Plan	No	SB2526085	Stellenbosch: Future upgrades and new sewer pump stations.	R25 757	Yes	No	No
F.41			Sewer Master Plan	No	SB2526086	Wemmershoek: Future upgrades and new sewer pump stations.	R2 970	Yes	No	No
F.42			Sewer Master Plan	No	SB2526087	Pniel: Future upgrades and new sewer pump stations.	R16 888	Yes	No	No
F.43			Sewer Master Plan	No	SB2526088	Klapmuts: Future upgrades and new sewer pump stations.	R11 027	Yes	No	No
F.44	Inadequate capacity of existing WWTWs.	Ensure adequate wastewater treatment capacity.	WSDP	No	SB2526089	Upgrade Stellenbosch WWTW (2030, Additional 15 Ml/d)	R375 000	Yes	No	No
F.45			WSDP	No	SB2526090	Upgrade Stellenbosch WWTW (2040, Additional 15 Ml/d)	R375 000	Yes	No	No
F.46			WSDP	No	SB2526091	Upgrade Wemmershoek WWTW (2034, Additional 4.5 Ml/d)	R112 500	Yes	No	No
Resources										
F.47	Current allocations and yields from the various water resources are inadequate to meet the future water requirements.	Implement Water Resource Augmentation projects to meet the future water requirements	WSDP	No	SB2526092	Groundwater development for Stellenbosch (Additional 4.378 Ml/d)	Costs of these water resource augmentation projects still need to be determined.	Yes	No	No
F.48			WSDP	No	SB2526093	Groundwater development for Dwars River (Additional 1.001 Ml/d)		Yes	No	No
F.49			WSDP	No	SB2526094	Groundwater development for Franschhoek (Additional 2.887 Ml/d)		Yes	No	No
F.50			WSDP	No	SB2526095	Groundwater development for Klapmuts (Additional 1.296 Ml/d)		Yes	No	No
F.51			WSDP	No	SB2526096	Groundwater development for Meerlust (Additional 0.065 Ml/d)		Yes	No	No
F.52			WSDP	No	SB2526097	Groundwater development for Koelenhof (Additional 0.415 Ml/d)		Yes	No	No
F.53			WSDP	No	SB2526098	Stellenbosch Wastewater Reclamation (Additional 5.000 Ml/d)		Yes	No	No
F.54			WSDP	No	SB2526099	Dwars River Wastewater Reclamation (Additional 1.000 Ml/d)		Yes	No	No
F.55			WSDP	No	SB2526100	Franschhoek Wastewater Reclamation (Additional 2.000 Ml/d)		Yes	No	No
F.56			WSDP	No	SB2526101	Klapmuts Wastewater Reclamation (Additional 0.699 Ml/d)		Yes	No	No
F.57			WSDP	No	SB2526102	External Sources: Stellenbosch (CCT, Blackheath WTW, Additional 3.123 Ml/d)		Yes	No	No
F.58			WSDP	No	SB2526103	External Sources: Stellenbosch (WCWSS, Second Phase, Additional 7.425 Ml/d)		Yes	No	No
F.59			WSDP	No	SB2526104	External Sources: Other areas (CCT, Additional 10.740 Ml/d)		Yes	No	No

DESCRIPTION **PAGE NO**

LIST OF TABLES ..... **vii**

ABBREVIATIONS AND DEFINITIONS ..... **xiii**

KEY TERMS ..... **xvii**

A. WATER SERVICES AUTHORITY ADMINISTRATION **A.1**

A.1 ROLE PLAYER DETAILS A.6
A.2 SECTOR INTEGRATION A.7
A.3 SERVICE PROVIDER A.13

INFORMATION AND COMPREHENSIVE OVERVIEW

1. SETTLEMENT DEMOGRAPHICS AND PUBLIC AMENITIES **1.1**

1.1 SETTLEMENTS DEMOGRAPHICS 1.7
1.2 PUBLIC AMENITIES 1.8
1.3 SOCIO ECONOMIC BACKGROUND (INFORMATION) 1.10
1.3.1 Population and Households 1.10
1.3.2 Population Growth Rates 1.11
1.3.3 Age and Gender Profile 1.11
1.3.4 Employment Profile 1.13
1.3.5 Household Income 1.14

2. SERVICE LEVELS PROFILE **2.1**

2.1 RESIDENTIAL WATER PROFILE 2.6
2.2 RESIDENTIAL SANITATION PROFILE 2.10
2.3 PUBLIC AMENITIES 2.13
2.3.1 Water Services 2.13
2.3.2 Sanitation Services 2.13
2.3.3 Public Amenities Services 2.14

3. WATER SERVICES ASSET MANAGEMENT **3.1**

3.1 GENERAL INFORMATION 3.1
3.1.1 Asset Management Plan 3.1
3.1.2 Disaster Management Plan 3.6
3.1.3 Untreated Effluent Management Plan 3.7

3.2 OPERATION ..... 3.12 – 3.47
3.3 FUNCTIONALITY OBSERVATION ..... 3.12 – 3.47
3.4 ASSET ASSESSMENT SPECTRUM ..... 3.12 – 3.47
3.5 WATER AND SANITATION SCHEMES 3.48
3.5.1 Water Schemes 3.48
3.5.2 Sanitation Schemes 3.49

4. WATER SERVICES OPERATION AND MAINTENANCE 4.1

4.1 OPERATION AND MAINTENANCE PLAN 4.2

5. CONSERVATION AND DEMAND MANAGEMENT 5.1

5.1 WATER RESOURCE MANAGEMENT 5.3
5.1.1 Reducing Water Losses and Water Inefficiencies 5.4
5.1.1.1 Night Flow Metering 5.4
5.1.1.2 Day Flow Metering 5.4
5.1.1.3 Reticulation Leaks 5.4
5.1.1.4 Illegal Connections 5.9
5.1.1.5 Un-metered Connections 5.9
5.1.2 Leak and Meter Repair Programmes 5.10
5.1.2.1 Leak Repair Assistance Programme 5.10
5.1.2.2 Retro-fitting of Water Inefficient Toilets 5.11
5.1.2.3 Meter Repair Programme 5.11
5.1.3 Consumer / End-use Demand Management: Public Information and Education Programmes 5.12
5.1.3.1 Schools Targeted by Education Programmes 5.13
5.1.3.2 Consumers Targeted by Public Information Programmes 5.14
5.1.4 Conjunctive Use of Surface- and Groundwater 5.14
5.1.5 Working for Water 5.14
5.1.6 Water Resource Management Projects 5.15
5.2 WATER BALANCE 5.15
5.2.1 Water Balance for Stellenbosch 5.19
5.2.2 Water Balance for Franschhoek 5.20
5.2.3 Water Balance for Dwars River 5.21
5.2.4 Water Balance for Klapmuts 5.22
5.2.5 Total influent received at treatment works 5.23
5.2.6 Total returns to the water resource system 5.24
5.3 WATER LOSSES 5.25

6. WATER RESOURCES 6.1

6.1 SOURCES AND VOLUMES 6.1
6.2 MONITORING 6.5
6.2.1 Percentage of Water Abstracted Monitored: Surface Water 6.5
6.2.2 Percentage of Water Abstracted Monitored: Groundwater 6.6
6.2.3 Percentage of Water Abstracted Monitored: External Sources (Bulk Purchase) 6.6
6.2.4 Surface Water Levels 6.6
6.2.5 Groundwater Water Levels 6.7
6.2.6 Water Quality for Formal Schemes 6.7
6.2.7 Water Quality for Rudimentary Schemes 6.8
6.2.8 Borehole Abstraction 6.8
6.3 WATER QUALITY 6.8
6.3.1 Reporting on Quality of Water taken from Source: Urban and Rural 6.18
6.3.2 Quality of Water Returned to the Resource: Urban 6.20
6.3.3 Quality of Water Returned to the Resource: Rural 6.22
6.3.4 Pollution Contingency Measures Plan 6.22
6.3.5 Quality of Water taken from Source: Urban – Percentage Monitored by WSA 6.23
6.3.6 Quality of Water taken from Source: Rural – Percentage Monitored by WSA 6.23
6.3.7 Quality of Water Returned to the Source: Urban – Percentage Monitored by WSA 6.23
6.3.8 Quality of Water Returned to the Source: Rural – Percentage Monitored by WSA 6.23
6.3.9 Water Quality Results in Electronic Format 6.24
6.3.10 Percentage Time (Days) within SANS241 Standards per Year 6.24
6.4 OPERATION 6.24

7. FINANCIAL PROFILE 7.1

7.1 EXPENDITURE 7.2
7.1.1 Ratios and Efficacy Indicators 7.2
7.1.2 Water Balance Cost / Revenue 7.5
7.1.3 Operating Cost 7.5
7.1.3.1 Operating Cost: Water 7.6
7.1.3.2 Operating Cost: Sanitation 7.7
7.1.4 Capital Expenditure 7.9
7.1.4.1 Capital Expenditure: Water 7.9
7.1.4.2 Capital Expenditure: Sanitation 7.10
7.2 INCOME 7.11
7.2.1 Operating Income 7.11
7.2.1.1 Operating Income: Subsidies 7.11
7.2.1.2 Operating Income: Water 7.12
7.2.1.3 Operating Income: Sanitation 7.14

7.2.2 Capital Income 7.15
7.2.2.1 Capital Income: Water....7.17
7.2.2.2 Capital Income: Sanitation 7.17
7.3 TARIFF AND CHARGES 7.17
7.4 FREE BASIC SERVICES....7.22
7.5 METERING, BILLING AND INCOME 7.23

8. WATER SERVICES INSTIUTIONAL ARRANGEMENTS AND CUSTOMER SERVICES.....8.1

8.1 MUNICIPAL STRATEGIC SELF-ASSESSMENT (MuSSA) 8.3
8.1.1 Water and Sanitation Services Planning....8.6
8.1.2 Management Skill Level (Technical) 8.7
8.1.3 Staff Skill Level (Technical)....8.7
8.1.4 Technical Staff Capacity (Numbers) 8.12
8.1.5 Water Resource Management (WRM)....8.13
8.1.6 Water Conservation and Water Demand Management (WC/WDM) 8.14
8.1.7 Drinking Water Safety and Regulatory Compliance....8.16
8.1.8 Basic Sanitation 8.23
8.1.9 Waste Water / Environmental Safety and Regulatory Compliance 8.24
8.1.10 Infrastructure Asset Management (IAM) 8.32
8.1.11 Operation and Maintenance of Assets....8.33
8.1.12 Financial Management....8.33
8.1.13 Revenue Collection 8.34
8.1.14 Financial Asset Management....8.34
8.1.15 Information Management (IT)....8.35
8.1.16 Organisational Performance Monitoring 8.36
8.1.17 Water and Sanitation Service Quality 8.38
8.1.18 Customer Care (CRM) 8.38

ANNEXURES

ANNEXURE A (Aerial Photos)

Map 1A: Locality Plan
Map 1B: WSA Management Area
Map 1C: Topographical Profile
Map 2A1: Stellenbosch Water Distribution System
Map 2A2: Stellenbosch Sewer Distribution System
Map 2B: Kylemore Water and Sewer Distribution Systems
Map 2C: Pniel and Lanquedoc Water and Sewer Distribution Systems
Map 2D: Franschhoek Water and Sewer Distribution Systems

Map 2E: Klapmuts Water and Sewer Distribution Systems
Map 2F: Raithby Water and Sewer Distribution Systems
Map2 Ga: Rural Water Supply Scheme: Muldersvlei and Koelenhof Distribution System
Map 2Ga: Rural Water Supply Scheme: Polkadraai and Faure Distribution System

ANNEXURE B (Water and Sewer Master Plans)

Figure SS2.2f: Existing Sewer Drainage Area – Polkadraai
Figure SS2.2g: Existing Sewer Drainage Area – Koelenhof and Muldersvlei

ANNEXURE C (Water Balance Models)

WTWs flows and capacities

WWTWs flows and capacities and rainfall

IWA Water Balance Model for Stellenbosch

IWA Water Balance Model for Franschhoek

IWA Water Balance Model for Dwars River

IWA Water Balance Model for Klapmuts

IWA Water Balance Model for Stellenbosch Municipality

Billed Metered Consumers and Consumption

ANNEXURE D (Infrastructure Leakage Indexes)

Municipal Scorecard for assessing the potential for WC/WDM efforts in Stellenbosch Municipality

ILI for Stellenbosch

ILI for Franschhoek

ILI for Dwars River

ILI for Klapmuts

ANNEXURE E (Sample Results)

Water Quality Compliance Sample Results for 2023/2024

Final Effluent Quality Compliance Sample Results for 2023/2024

Industrial Effluent Quality Sample Results for 2023/2024

ANNEXURE F

Summary of Water and Sanitation Operational Budgets for period 2019/2020 to 2023/2024.

ANNEXURE G

AADD	Average Annual Daily Demand
ABET	Adult Basic Education And Training
AC	Asbestos Cement
ADWF	Annual Dry Weather Flow
AIDS	Acquired Immune Deficiency Syndrome
ALC	Adult Learning Centre
BD	Blue Drop
BDRR	Blue Drop Risk Rating
BGWMA	Breede-Gouritz Water Management Agency
BH	Borehole
BNR	Biological Nutrient Removal
BOWMA	Breede-Olifants Water Management Agency
CAP	Corrective Action Plan
CBD	Central Business District
CCT	City of Cape Town
CF	Consequence of Failure
CLC	Community Learning Centre
CMA	Catchment Management Agency
CMS	Catchment Management Strategy
COD	Chemical Oxygen Demand
CRC	Current Replacement Cost
CRM	Customer Care Management
CRR	Cumulative Risk Ratio
DC	District Council
DCoG	Department of Cooperative Government
DLG	Department of Local Government
DM	District Municipality
DMA	District Management Area
DMP	Disaster Management Plan
DPW	Department of Public Works
DWA	Department of Water Affairs
DWQ	Drinking Water Quality
DWS	Department of Water and Sanitation
EC	Electrical Conductivity
EHP	Environmental Health Professional
EPWP	Expanded Public Works Programme
ESETA	Energy and Water Services Sector Education and Training Authority
ESKOM	Electrical Supply Commission
FC	Finance Charges
GA	General Authorisation
GD	Green Drop
GDIP	Green Drop Improvement Plan
GDP	Gross Domestic Product
GDPR	Gross Domestic Product of Region
GIS	Geographic Information Systems
GPS	Global Positioning System
GRAP	Generally Recognised Accounting Practice
HH	Household

HIV	Human Immunodeficiency Virus
HOD	Head of Department
HTH	High Test Hypochlorite
IAM	Infrastructure Asset Management
ICT	Information and Communications Technology
IDP	Integrated Development Plan
ILI	Infrastructure Leakage Index
IMP	Incident Management Protocol
IMQS	Infrastructure Management Query System
IRIS	Integrated Regulatory Information System
ISP	Internal Strategic Perspective
IWA	International Water Association
IUDG	Integrated Urban Development Grant
Kl	Kilolitre
KPA	Key Performance Area
KPI	Key Performance Indicator
LED	Local Economic Development
LF	Likelihood of Failure
LG	Local Government
LGTAS	Local Government Turn Around Strategy
LM	Local Municipality
l/p/d	Litre per Person per Day
m	Metre
MBR	Membrane Biological Reactor
MCC	Motor Control Center
MFMA	Municipal Finance Management Act
MIG	Municipal Infrastructure Grant
mSCOA	Municipal Standard Chart of Accounts
MISA	Municipal Infrastructure Support Agent
Ml	Mega Litre
Ml/a	Mega Litre per Annum
Ml/d	Mega Litre per Day
MLSS	Mixed Liquor Suspended Solids
Mm^3/a	Million Cubic Metre per Annum
MNF	Minimum Night Flow
MTREF	Medium-Term Revenue Expenditure Framework
MuSSA	Municipal Strategic Self-Assessment
NDP	National Development Plan
NMR	No Monitoring Required
NRW	Non-Revenue Water
NWA	National Water Act
NWRS	National Water Resource Strategy

KEY TERMS	INTERPRETATION
Current replacement cost (CRC)	The cost of replacing the service potential of an existing asset, by reference to some measure of capacity, with an appropriate modern equivalent asset. GAMAP defines CRC as the cost the entity would incur to acquire the asset on the reporting date.
Depreciated Replacement Cost (DRC)	The replacement cost of an existing asset after deducting an allowance for wear or consumption to reflect the remaining economic life of the existing asset.
Financial Year	Financial year means in relation to- • a national or provincial department, the year ending 31 March; or • a municipality, the year ending 30 June.
Integrated Development Plan (IDP)	An IDP is a legislative requirement for municipalities, which identifies the municipality's key development priorities; formulates a clear vision, mission and values; formulates appropriate strategies; shows the appropriate organisational structure and systems to realise the vision and the mission and aligns resources with the development priorities.
International Water Association (IWA) Water Balance	
System Input Volume	The volume of treated water input to that part of the water supply system to which the water balance calculation relates.
Authorised Consumption	The volume of metered and/or un-metered water taken by registered customers, the water supplier and others who are implicitly or explicitly authorised to do so by the water supplier, for residential, commercial and industrial purposes. It also includes water exported across operational boundaries. Authorised consumption may include items such as fire-fighting and training, flushing of mains and sewers, street cleaning, watering of municipal gardens, public fountains, frost protection, building water, etc. These may be billed or unbilled, metered or unmetered.
Water Losses	The difference between System Input and Authorised Consumption. Water losses can be considered as a total volume for the whole system, or for partial systems such as transmission or distribution schemes, or individual zones. Water Losses consist of Physical Losses and Commercial Losses (also known as Real Losses and Apparent Losses).
Billed Authorised Consumption	Those components of Authorised Consumption which are billed and produce revenue (also known as Revenue Water). Equal to Billed Metered Consumption plus Billed Unmetered Consumption.
Unbilled Authorised Consumption	Those components of Authorised Consumption which are legitimate but not billed and therefore do not produce revenue. Equal to Unbilled Metered Consumption plus Unbilled Unmetered Consumption.
Commercial Losses	Includes all types of inaccuracies associated with customer metering as well as data handling errors (meter reading and billing), plus unauthorised consumption (theft or illegal use). Commercial losses are called "Apparent Losses" by the International Water Association and in some countries the misleading term "Non-Technical Losses" is used.
Physical Losses	Physical water losses from the pressurized system and the utility's storage tanks, up to the point of customer use. In metered systems this is the customer meter, in unmetered situations this is the first point of use (stop tap/tap) within the property. Physical losses are called "Real Losses" by the International Water Association and in some countries the misleading term "Technical Losses" is used.
Billed Metered Consumption	All metered consumption which is also billed. This includes all groups of customers such as domestic, commercial, industrial or institutional and also includes water transferred across operational boundaries (water exported) which is metered and billed.
Billed Unmetered Consumption	All billed consumption which is calculated based on estimates or norms but is not metered. This might be a very small component in fully metered systems (for example billing based on estimates for the period a customer meter is out of order) but can be the key consumption component in systems without universal metering. This component might also include water transferred across operational boundaries (water exported) which is unmetered but billed.

KEY TERMS	INTERPRETATION
Unbilled Metered Consumption	Metered Consumption which is for any reason unbilled. This might for example include metered consumption by the utility itself or water provided to institutions free of charge, including water transferred across operational boundaries (water exported) which is metered but unbilled.
Unbilled Unmetered Consumption	Any kind of Authorised Consumption which is neither billed nor metered. This component typically includes items such as fire-fighting, flushing of mains and sewers, street cleaning, frost protection, etc. In a well-run utility it is a small component which is very often substantially overestimated. Theoretically this might also include water transferred across operational boundaries (water exported) which is unmetered and unbilled – although this is an unlikely case.
Unauthorised Consumption	Any unauthorised use of water. This may include illegal water withdrawal from hydrants (for example for construction purposes), illegal connections, bypasses to consumption meters or meter tampering.
Customer Metering Inaccuracies and Data Handling Errors	Commercial water losses caused by customer meter inaccuracies and data handling errors in the meter reading and billing system.
Leakage on Transmission and /or Distribution Mains	Water lost from leaks and breaks on transmission and distribution pipelines. These might either be small leaks which are still unreported (e.g. leaking joints) or large bursts which were reported and repaired but did obviously leak for a certain period before that.
Leakage and Overflows at Utility's Storage Tanks	Water lost from leaking storage tank structures or overflows of such tanks caused by e.g. operational or technical problems.
Leakage on Service Connections up to point of Customer Metering	Water lost from leaks and breaks of service connections from (and including) the tapping point until the point of customer use. In metered systems this is the customer meter, in unmetered situations this is the first point of use (stop tap/tap) within the property. Leakage on service connections might be reported breaks but will predominately be small leaks which do not surface and which run for long periods (often years).
Revenue Water	Those components of Authorised Consumption which are billed and produce revenue (also known as Billed Authorised Consumption). Equal to Billed Metered Consumption plus Billed Unmetered Consumption.
Non-Revenue Water	Those components of System Input which are not billed and do not produce revenue. Equal to Unbilled Authorised Consumption plus Physical and Commercial Water Losses.
MIG	A conditional grant from national government to support investment in basic municipal infrastructure.
Municipal Finance Management Act (MFMA)	Municipal Finance Management Act, 2003 (Act No. 56 of 2003)
Remaining useful life (RUL)	The time remaining over which an asset is expected to be used.
Service Delivery Budget Implementation Plan (SDBIP)	The SDBIP is a management, implementation and monitoring tool that enable the Municipal Manager to monitor the performance of senior managers, the Mayor to monitor the performance of the Municipal Manager, and for the community to monitor the performance of the municipality.
Strategic Framework for Water Services (SFWS)	The Strategic Framework provides a comprehensive summary of policy with respect to the water services sector in South Africa and sets out a strategic framework for its implementation over the next ten years.
Water Conservation	The minimisation of loss or waste, the care and protection of water resources and the efficient and effective use of water.
Water Demand Management	The adaptation and implementation of a strategy by a water institution or consumer to influence the water demand and usage of water in order to meet any of the following objectives: economic efficiency, social development, social equity, environmental protection, sustainability of water supply and services, and political acceptability.
Water Services Authority (WSA)	A water services authority means a municipality with the executive authority and the right to administer water services as authorised in terms of the Municipal Structures Act, 1998 (Act No.117 of 1998). There can only be one water services authority in any specific area. Water services authority area boundaries cannot overlap. Water services authorities are metropolitan municipalities, district municipalities and authorised local municipalities.
Water Services Development Plan (WSDP)	A plan to be developed and adopted by the WSA in terms of the Water Services Act, 1997 (Act No.108 of 1997)
WSDP Guide Framework	Modular tool which has been developed by the DWS to support WSAs in complying with the Water Services Act with respect to Water Services Development Planning and which is also used by the DWS to regulate such compliance.
Water Services Provider (WSP)	A WSP means any person or institution who provides water services to consumers or to another water services institution but does not include a water services intermediary.

A. WATER SERVICES AUTHORITY ADMINISTRATION

Introduction: Strategic Perspective and Methodology

Every WSA has a duty to all customers or potential customers in its area of jurisdiction to progressively ensure efficient, affordable, economical and sustainable access to water services that promote sustainable livelihoods and economic development.

Sections 12 and 13 of the Water Services Act (Act No 108 of 1997) place a duty on WSAs to prepare and maintain a WSDP. The DWS has developed a new WSDP website (Rolled-out to all WSAs during 2017) to assist WSAs with their WSDP process and to provide a framework for the capturing of the data. The business elements included in the new WSDP website are as follows:

- Administration
  - Role Player Details
  - Sector Integrations
  - Service Provider
- Information and Comprehensive Overview
  - Settlement Demographics and Public Amenities
  - Service Levels Profile
  - Water Services Asset Management (Information)
  - Water Services O&M
  - Conservation and Demand Management
  - Water Resources
  - Finance
  - Water Services Institutional Arrangements and Customer Services
- Master Plan
  - Settlement Demographics and Public Amenities
  - Service Levels Profile
  - Water Services Asset Management
  - Water Services O&M
  - Conservation and Demand Management
  - Water Resources
  - Existing Needs Perspective
  - Water Master Plan Perspective
  - Overall Topic Strategies
- Project Management

WSDP Process

This 2022-2027 WSDP of Stellenbosch Municipality is an update of the previous WSDP. The WSDP was drafted according to the DWS's new WSDP website, as rolled out to the Municipalities in the Cape Winelands Region on the 8th of November 2017. The WSDP is aligned and integrated with the 3rd Review of the 5th Generation IDP 2022 – 2027, May 2025 and needs to form an integrated part of the IDP public participation and consultation process. The IDP is predominantly strategic as opposed to the WSDP that are more operationally orientated with regard to water and sanitation services.

Part of the WSDP is to identify strategies (Master Plan) that need to be developed to address the information shortfalls and other constraints, which impact on service delivery. The implementation strategies should not constitute a wish-list, but must be reasonable and achievable within the capital and operational budget and staff constraints of Stellenbosch Municipality. The WSDP should be revised regularly, reporting the information for the previous five years and the projected future requirements. It is not a stagnant document, but rather a living process reliant on improvement and enhancement through the input provided by councillors, officials and technical assistants.

The 2022-2027 WSDP include the following documents.

- WSDP-IDP Sector Input Report (Executive Summary Report that can be used for Council approval and for the Public Participation Process);
- Administration, Information and Comprehensive Overview Report;
- Master Plan: Future Demand and Functionality Requirements Report; and
- Updated WSDP website.

WSDP'S as set out in the Strategic Framework for Water Services (September 2003)

The primary instrument of planning in the water services sector is the WSDP. The following principles apply to the WSDP:

- All WSAs must develop a WSDP.
- A new plan must be developed every five years and the plan should be updated as necessary and appropriate in the interim years.
- The WSDP must be integrated with the IDP of the municipality, as required in terms of the Municipal Systems Act.
- The WSDP must integrate water supply planning with sanitation planning.
- The WSDP must integrate technical planning with social, institutional, financial and environmental planning. The planning of capital expenditure must also be integrated with the associated operation and maintenance requirements and expenditures.
- The WSDP must be informed by the business plans developed by water services providers and with the plans of any regional water services providers, as relevant.
- The plan must take into account the impact of HIV/Aids on future water demand.
- The WSDP must integrate with the catchment management strategy.
- The planning process must take into account the views of all important stakeholders, including communities, through a consultative and participatory process. Every effort must be made to ensure the adequate and meaningful participation of women in consultation forums.
- The draft plan must be made available for public and stakeholder comment and all comments made must be considered when preparing the final plan.
- The contents of the WSDP must be communicated to all important stakeholders, including DWA.
- A WSA must report annually and in a public way on progress in implementing the plan.

WSDP: ADMINISTRATION, INFORMATION AND COMPREHENSIVE OVERVIEW
A: WSA ADMINISTRATION

The primary purpose of the WSDP is to assist WSAs to carry out their mandate effectively. It is an important tool to assist the WSA to develop a realistic long-term investment plan which prioritises the provision of basic water services, promotes economic development and is affordable and sustainable over time.

The progressive development of the WSDP is two-phased. On the one hand it involves updating of the information content on which to base latest planning initiatives. On the other hand the structure and functionality of the framework itself will progressively be enhanced and improved.

The current guideline introduces a strategic theme to each of the business elements. Strategic approaches need to be defined and implemented in order to bridge the gap between the status quo, its existing information levels and the proposed visions and objectives for the Municipality, in relation to the delivery of water services. In particular:

- What needs to be done to bridge the gap?
- What are the different options towards achieving the objectives / priorities?
- What are the constraints in terms of the options?
- What is feasible within the existing constraints?
- What assumptions are being made?
- What aspects need to be flagged as being or relatively higher importance than others?

Name of WSA

Stellenbosch Municipality is responsible for ensuring provision of water services within their area of jurisdiction and has the constitutional responsibility for planning, ensuring access to, and regulating provision of water services within their area of jurisdiction.

One of the visions of the Sector is that water supply and sanitation services are provided by effective, efficient and sustainable institutions that are accountable and responsive to those whom they serve (SFWS).

One of the goals of the Sector is that all WSAs are accountable to their citizens, have adequate capacities to make wise choices (related to water services providers) and are able to regulate water services provision effectively (SFWS).

Stellenbosch Municipality consists of 23 individual wards and is the only WSA within the Stellenbosch Municipality's Management Area. The Municipality is also the Water Services Provider (WSP). Bulk potable water is also supplied to the Municipality by the City of Cape Town (CCT). Stellenbosch Municipality's responsibility as WSA also extends to the rural areas within its boundary, which prior to July 2003 had fallen under the jurisdiction of the former Boland District Municipality.

Table A.1: Name of WSA	
Name	Stellenbosch Municipality
Street Address	Plein Street, Stellenbosch
Postal Address	PO Box 17, Stellenbosch, 7599
Reference No.	WC024

The table below gives an overview of the 23 wards, the sub-places or townships in each of the wards and the linkage with the various water distribution systems, as included in the 2025/2026 IDP.

Table A.2: Wards in Stellenbosch Municipality

Ward	Sub-places or Townships	Water Distribution System
1	Mooiwater, Franschhoek Town and Surrounding Farms	Franschhoek
2	Langrug, La Motte, Dennegeur, Groendal	Franschhoek
3	Lanquedoc, Wemmershoek to La Motte Wine Farm and Leopard Leap Wine Farm	Franschhoek, Stellenbosch Rural, Dwars River
4	Kylemore, Johannesdal, Pniël and Surrounding Farms	Dwars River
5	Ida's Valley (Hillside Village, La Gratitude Park (Kreefgat), The Ridge, La Roche, Lindida, Bloekomlaan(Moses / Martin) Lindley)	Stellenbosch
6	The Hydro, Rustenberg and Surrounding Farms, Kelsey Farm	Stellenbosch Rural
7	Mostersdrift, Karindal, Rozendal, Uniepark, Simanswyk and Unirversiteitsoord	Stellenbosch
8	Stellenbosch University campus and university residence area; Coetzenburg, (partially:) Koloniesland	Stellenbosch
9	Stellenbosch CBD, Part of US campus (residential areas within both these areas), Southern border is the Eerste River, Northern border is Merriman Street, Eastern border is Die Laan and the Western border is Bird Street	Stellenbosch
10	Tennantville, Lakay Street, Titus Street, Langsuid Street up to Lakay Street, Tennant Street, Lapan Street, Bell Street, Bird Street, La Colline (Dr Malan Street, Dan Pienaar Street, Paul Roos Street, Tobruk Park, Irene Park, La Colline Road, Conde Street, Taylor Street, Mount Albert Street), Kromrivier Road, Jan Celliers Street, Hammanshand, Ds Botha Street, Voorplein Street, Bird Street, Langenhoven Street, Du Toit Station, Ryneveld Street, Karee Street, Olienhout Street, Banghoek Rd, Acedemia, Bosman Street, Smuts Rd, Joubert Street, De Beer Rd, De Villiers Rd from Ryneveld Street to Cluver Rd on the lefthand side	Stellenbosch
11	Boundaries of the ward are: Kridge Rd, Herte Street, Skone Uitsig Rd onto Alexander Street onto Du Toit Street toward Merriman Avenue towards Adam Tas Rd onto George Blake Street, Mark Street, Distillery Rd, Santhagen Rd, Swawel Avenue, Kanarie Rd, Tarentaal Rd, Bokmakierie Rd, Fisant Rd, Devon Valley Rd, Kiewiet Rd, Dagbreek Rd, Pelikaan Street, Patrys Rd, Hammerkop Rd, Loerie Rd, Muldersvlei Landgoed, and all areas in Onder Papegaaiberg and businesses	Stellenbosch
12	Kayamandi: Zone A, Chris Hani Drive, 10th and 13th Street, School Crescent, Snake Valley, Enkanini, Watergang, Watergang TRA 2 and Watergang Informal Settlements	Stellenbosch
13	Kayamandi: Zone J, Red Bricks, Zone K and L, Hostels, Dairy and University Hostels, Old Bricks Houses Red Roofs, Zwelitsha, Costaland	Stellenbosch
14	Kayamandi: Zone P, I, F, D and O, Costaland, Marikana, Watergang, Smarties (Mgabadeli Street), Monde Crescent	Stellenbosch
15	Kayamandi: Zone M, N, O, 4th and 5th Avenue, 10th, 12th and 14th Street, Long Street, Retreat Street, Forest Drive	Stellenbosch
16	The borders are Tenant Rd, Long streets, Crombi Rd to end of Gabriels Rd. Asalea Rd, 2nd Road, Noble Rd, Bailey Rd, Eike Street, Curry Street, Hoop Rd, Pansy Rd, West Rd, Laai Rd, Anthony Rd, Carriem Rd, Archilles Rd, Bergstedt Rd, Davidse Rd, Cupido Rd, Pearce Rd, Robyn Rd, Gonzalves Rd, Hercules Rd, Chippendale Rd, Afrika Rd, Arnolds Rd, September Rd, Jakaranda Street, Short Rd, Quarry Rd, Middle Rd, Primrose Street, Pine (Bo en Onder), North End, Vredelust, Gemsbok, Daffodil Single, Steps, Sylvia Street, Eiland Street, Last Street (White City), Frikkadel Dorp, September Street	Stellenbosch
17	A part of Cloetesville (Lakay Rd towards Langstraat -Suid Rd, Kloof Street, Fir Street, Fontein Rd, Williams R towards Gabriels Rd towards February Rd, Valentyn Rd, Pool Rd, Raziet Rd, Ortell Rd, Rhode Rd, King Rd, Hine Rd, Hendrikse Rd, Rhode Rd), as well as Welgevonden, Green Oaks, Stellita Park, Weltevrede, Welgevonden Estate (Red Oak Rd, Belladonna Street, Wildeklawer Welgevonden Boulevard, Olive Rd, Sonnedou Rd, Mountain Silver Rd, Silver Oak Rd, Froetang Rd, Katbos Rd, Everlasting, Fynbos Street, Sourfig Street, Scarlet Cresent, Pin Oak Street, Evergreen, Autumn Close, Nenta, Cherrywood, Candelabra, Froetang, Candelabra, Kouter, Protea Street, Minaret, Gooseberry, Honeybush), Klein Welgevonden (La Belle Vie, Chablis) and the Municipal Flats in Rhode, Kloof and Long Streets, Bertha Wines and Weltevreden Estate, 15 Weltevreden Estate,) The borders of the ward are the R44 Klapmuts road and Long streets.	Stellenbosch, Stellenbosch Rural
18	Klapmuts Town Centre, Bennitsville, Weltevrede Park, Klapmuts New Houses, Mandela City and La Rochelle Informal Settlement, Klapmuts Farms (The Purple Windmill, Arra Vineyards, Hidden Gems Wines, Gravel Junction Wine and Spirtis Company, Wine Estate Le Bonheur, Anura Vinyard, Dalewood Farms, Blueberry Bar, Klapmust Transfer Station, Trophy SA, DKL Transport Pty, Welgelee Estate)	Klapmuts, Stellenbosch Rural
19	De Novo, Kromme Rhee, Vaaldraai, Muldersvlei, Koelenhof and surrounding Farms, Koelenhof Station, Slayley, Hunting, Koelenhof Farms, Poultrey / Mariendahl, De Hoop,	Stellenbosch Rural

Table A.2: Wards in Stellenbosch Municipality		
Ward	**Sub-places or Townships**	**Water Distribution System**
	Nooitgedacht Village, Bottelary and Surrounding Farms, De Waalshof, Weltevrede 1, Weltevrede 2, Smartie Town.	
20	Vlottenberg, Raithby, Mooiberge, Lynedoch	Raithby, Stellenbosch Rural
21	Brandwacht Aan Rivier, Paradyskloof, Stellenbosch Golf Course, Blaauwklippen / Stellenzicht Farms, De Zalze, Jamestown, Mountainview, Stellenbosch Airfield	Stellenbosch, Stellenbosch Rural
22	Die Boord, Dalsig, Brandwacht, Krigeville, Libertas Farm	Stellenbosch
23	Dorp Street, Krige, Hamman Streets, Schroder Rd, Die Braak, Bird Street from Dorp Street, Denniseg area, Muller Rd, Banghoek Road, Reyneveld Street, Plankenburg Industrial area and Kayamandi Corridor.	Stellenbosch

Status of WSDP

The final WSDP will be taken to the Council on the 27th of May 2026 for final approval. Stellenbosch Municipality will forward the Council Resolution for the approval to the DWS once approved. Councilors must be aware of the targets and funding commitments made within the WSDP since they will be responsible for ensuring that these commitments are fulfilled. The WSDP will also serve as a project management tool to monitor the achievement of these commitments.

WSDP: ADMINISTRATION, INFORMATION AND COMPREHENSIVE OVERVIEW

A.2 SECTOR INTREGRATION

Integration between the WSDP and the IDP is important in order to coordinate that the timing for the update of the WSDP is aligned with that of the IDP process implementation plan. The IDP process itself will form the primary route for political stakeholder involvement in the WSDP. In so doing, recommended actions to support the strategic planning of water services will be reflected in the IDP.

Process Followed

The following process was followed for the updating of Stellenbosch Municipality's WSDP.

- All the water and sewerage infrastructure in the Municipality's Management Area were visited during May 2023.
- The final 2024-2027 MTREF Budget and the 2025/2026 IDP were incorporated into the WSDP where applicable.
- The draft WSDP documents were taken to Council on the 31st of March 2026 for approval for public participation.
- The draft WSDP-IDP Sector Input report was placed on the Municipality's website for public comment.
- The draft WSDP documents were distributed to the DWS, the DLG and the neighbouring WSAs for their comments. The draft WSDP documents were made available to the public by the Municipality.
- No Comments were received on the draft WSDP documents, where after the WSDP documents were finalised and taken to Council for final approval.

Section 14 of the Water Services Act requires that the WSA must take reasonable steps to bring its draft WSDP to the notice of a number of different stakeholders so that they have the opportunity to comment on it. Section 15 of the Act requires that the WSA must supply a copy of the WSDP to the Minister of Water Affairs, Minister of Provincial and Local Government, the relevant Province and all neighbouring WSAs.

Community Participation

Stellenbosch Municipality's website is essential for transparency, allowing stakeholders to access critical documents and monitor municipal activities. In line with Stellenbosch Municipality's Communication Policy adopted in July 2020, the municipality remains committed to transparency, accountability, and fostering participatory democracy. During the 2023/24 financial year, the municipality's communication platforms played a significant role in ensuring timely information dissemination through multiple channels, including the website, social media, and traditional media outlets. Proactive media engagements, official statements, and news releases further enhanced the municipality's corporate identity and public presence.

The municipal website remains a hub for public engagement, offering regular updates on official notices, tenders, news, and meeting agendas. Enhancements to improve user experience and satisfaction are planned for the near future. Additionally, the municipality's social media platforms— Facebook, X (Twitter), Instagram, and LinkedIn—continue to be key tools for reaching a broad audience and providing real-time updates while driving traffic to the website. During the 2023/2024 financial year, the municipality also launched its first WhatsApp Channel which has been growing steadily since its inception.

Embracing the Digital Age: Stellenbosch Municipality recognises the importance of engaging with residents and stakeholders through digital platforms. The website, social media channels, WhatsApp, and handheld devices enable the dissemination of information in a timely and accessible manner, ensuring broader community reach. As the municipality continues to expand its digital presence, the municipality is leveraging technology to enhance communication and better serve the evolving needs of the community.

The municipality's growing presence on Instagram and LinkedIn, alongside other platforms, reflects the municipality's ongoing commitment to digital engagement. Additionally, monthly newsletters, providing updates and insights into municipal activities, help keep the community well-informed.

Building a Strong Stellenbosch Brand and Corporate Identity: Beyond communication, Stellenbosch Municipality is dedicated to establishing a strong, recognisable brand and corporate identity that resonates with the community and stakeholders. This focus on branding reinforces the municipality's commitment to creating a positive and impactful presence.

Leading in Social Media Presence: The municipality is proud to announce that it now boasts the largest following page of any municipality in the Western Cape, apart from the metro. This achievement reflects the municipality's commitment to effectively engaging with its community and keeping them informed through the most widely used social media platform.

Stellenbosch Municipality's Communication Checklist include the following:

- Regular updates on the municipal website;
- Active engagement across social media platforms (Facebook, X (Twitter), Instagram, LinkedIn);
- Placement of advertisements in community and regional newspapers;
- Newsletters from the Executive Mayor, as well as pamphlets, posters, notice-boards, and regular IDP / Ward meetings;
- An interdepartmental communication forum to enhance internal communication;
- An intranet for use by all internal staff; and
- Internal newsletters and memorandums

Below is a communication checklist for compliance with the communication requirements.

- Communication Unit (Yes);
- Communication Strategy (Yes);
- Communication Policy (Yes);
- Customer satisfaction surveys (No);
- Functional compliant management systems (Yes); and
- Newsletters distributed at least quarterly (Yes).

Table A.2.1: Consultation Process

Consultation	Process and Communication	Date	Comments
Users	Notice was placed on the 9th of April 2026 in Die Burger and Eikestad News requesting comments on the draft WSDP.	April – May 2026	No comments were received
Public			
Water Services Institutions			
Neighbouring WSAs	Copy of draft WSDP was provided.	April – May 2026	No comments were received

ISP	Yes	Administration
Health	Partial	Service Levels
LED	Partial	Settlement Demographics and Public Amenities
DMP	Partial	Water Services Asset Management
Institutional	Yes	Water Services Institutional Arrangements and Customer Services

Comments

The draft 2022-2027 WSDP was advertised for public comment after approval by the Council on the 31st of March 2026. The draft WSDP was also distributed to all the neighbouring WSAs, the DLG and the DWS's Regional Office for their comments. The due date for the submission of comments on the draft documents was the 8th of May 2026 No comments received on the draft WSDP documents and the WSDP was therefore finalised.

Table A.2.3: Comments received on the draft WSDP				
Date	**Components**	**Interest Group**	**Consideration**	**Comments**
April 2026	All	DWS	All draft WSDP documents	No comments were received

April 2026	All	Public	All draft WSDP documents	

IDP Goals and Integration

To comply with the Water Services Act, the WSDP should be prepared as part of the IDP process unless there is no IDP process in which case it can be prepared separately. The WSDP is a sectoral plan that falls within the inter-sectoral umbrella plan of the IDP. The WSDP sectoral planning and integrated development planning, must inform each other. It is therefore important to start the WSDP planning process by orientating the water services development goals against the overall development goals of the IDP. This in essence becomes the overall framework within which detailed water services needs and development projects can be benchmarked and tested.

The Vision statement of Stellenbosch Municipality is "**An Integrated Valley of Opportunity and Innovation**"

Stellenbosch Municipality's mission is to deliver services in an enabling environment through sustainable, cost-effective and accountable services for our community.

Stellenbosch Municipality's Strategic Focus Areas and Pre-determined Objectives, as included in the 3rd Review of the 5th Generation IDP 2022 – 2027, May 2025, are as follows:

- Valley of Possibility (SFA 1).
  - Create an environment conducive to business development and job creation.
  - To facilitate and coordinate support to emerging entrepreneurs by utilising internal SCM processes and linking SMMEs with opportunities in the market.
  - To provide, upgrade and maintain an effective engineering infrastructure to support effective service delivery.

  - To ensure the provision of non-motorised transport routes as a functional mode of transport

- Green and Sustainable Valley (SFA 2)
  - Managing human use of the biosphere and its resources.
  - Enhancing the integrity of the environment is imperative for long-term sustainability.
  - Incorporating biodiversity into the environment as an imperative for long-term sustainability.
  - Ensuring spatial sustainability.
  - Facilitate efficient use of all forms of capital available to Stellenbosch.
  - Building Human capacity and ability.
  - Efficient information management.

- Safe Valley (SFA 3)
  - To implement an integrated safety strategy that incorporates multi-stakeholder engagements and social crime preventions.
  - To develop and implement institutional crime prevention strategies, with the focus on improved law enforcement and neighbourhood watches.

- Dignified Living (SFA 4)
  - To develop and maintain sustainable human settlements that will deliver in the diverse range of housing needs.
  - To develop and implement a social infrastructure master plan for the upgrading and maintenance of social facilities in all wards.
  - To involve and build the capacity of stakeholders in the planning and management (governance) of the areas where they live (Promote participatory planning and integrated implementation).
  - To provide access to basic services for households in the WC024 area.

- Good Governance and Compliance (SFA 5)
  - To develop, align and implement effective management information systems.
  - An effective asset management system to optimise the use of municipal assets.
  - To manage integrated development planning and the efficient measurement of predetermined objectives as per regulatory framework.
  - To involve the community in the planning and management of programmes and projects impacting their ward(s),
  - To review municipal governance processes as per the Risk-Based Audit Plan
  - A skilled and capable workforce that supports the growth objectives of the municipal area
  - A responsive, accountable, effective and efficient local government system
  - To implement an effective revenue management system.
  - To provide accurate and relevant financial information for decision-making.
  - To develop and implement a responsive, accountable, effective and efficient customer care structure and system.

The **Strategic Risks** identified for Stellenbosch Municipality, as included in the 3rd Review of the 5th Generation IDP 2022 – 2027, May 2025 are as follows:

- Availability and cost of electricity;
- Increased risk of a land invasion;
- Economic downturn due to civil unrest and crime;
- Climate change;
- Scarcity of Landfill Space; and
- Increase in community unrest since the growth in demand for housing exceeds the resources available for development.

The **Operational Risks** identified for Stellenbosch Municipality, as included in the 3rd Review of the 5th Generation IDP 2022 – 2027, May 2025 are as follows:

- Timeous Capital Spending;
- Insufficient burial space in the greater Stellenbosch;
- Water Security;
- High Vacancy Rate; and
- Material misstatements in the AFS that constitute noncompliance with Section 122 of the MFMA. System errors, transactions and events not recognised as they occur and accordingly not recorded in the financial period.

The table below gives an overview of the key water and sanitation priorities per Ward, as included in the IDP.

Table A.2.4: Water and Sanitation Priority Needs per Ward

Ward	Priority	Water and Sanitation Priorities for Wards
1	2	• Removal of the decommissioned ablution facility in Klein Mooiwater Informal Settlement. • Installation and upgrading of ablution facilities within the Riverside and Klein Mooiwater informal settlements. • Provision and upgrading of water access points and sewerage infrastructure within the Riverside and Klein Mooiwater informal settlements.
2	2	• Sewerage problem from Langrug to Blossom Street.
3	3	• Repairing of sewer Y junction on properties in Wemmershoek. • Connection of boreholes in Wemmershoek and Lanquedoc.
4	1	• Drains overflowing in winter / rainy days in the areas of Kylemore; Johannesdal: Pniël. • Restructuring of the sewage network in Pniël, East End Crescent. Removal of a pump station in the area.
5	3	• Removal of the sewer pipes from the house in Gorridon; Davy Streets and Adendorff Street in Ida's Valley to the road. • Cleaning of drains in Ida's Valley. • Replace all outdated water pipes and sewerage pipes in Ida’s Valley.
6	2	• Replacement of current outdated gravity sewers in Luckhoff Street and Baker Street. • Regular cleaning of the drains to prevent overflowing during rainy conditions for the winter readiness programme.
7	1	• Fair treatment is required concerning the municipal reading of water meters. Residents should first be informed by the municipality about irregular readings instead of just billing them. Unknown underground leaks may be the cause of the problem and not just over-usage. The current water tariff scale should be revised urgently to acceptable levels for all. Correct and consistent water meter readings are required. Municipal officials should be more helpful when residents approach them for assistance with a bill that is incorrect. • Completely replace old water pipelines in Lanzerac and Rheezucht streets, Thibault street needs to be prioritised. Mostertsdrift is the oldest suburb in Stellenbosch therefore has the oldest water pipes infrastructure.
8	-	-
9	4	• Public toilets for use by visitors and tourists (possibly with an entrance fee).
10	3	• Waterpipe bursts in Bird and Mount Albert Street and lower areas of Cloetesville.

Table A.2.4: Water and Sanitation Priority Needs per Ward		
Ward	**Priority**	**Water and Sanitation Priorities for Wards**
		• Waterpipe/s breaks at AF Louw School affecting the La Colline area.
11	2	• Replacement of waterpipes where necessary in Ward 11.
12	2	• Regular unblocking of drains in the Watergang area, Snake Valley and the rest of Ward 12. • Maintaining the existing toilets in Nkanini and Azania. • Additional ablution facilities in Enkanini and Azania. • Drain blockage in Sections A and B in Enkanini.
13	1	• Construction of more ablution facilities and repair of the current ablution facilities servicing in each Hostel block in Kayamandi. • Investigate the drainage system at the hostel blocks.
14	-	-
15	-	-
16	2	• Municipality to provide basic services for backyarders in Cloetesville.
17	-	-
18	1	• Installation and upgrading of ablution facilities within the La Rochelle and Mandela City informal settlements for all residents.
19	-	-
20	3	• Water pipes are to be upgraded and the removal of asbestos pipes in Raithby Main Road / Watson Way Raithby.
	5	• Clearing of alien vegetation in the biodiversity area / municipal properties / water streams in Raithby.
21	-	-
22	-	-
23	-	-

The Water Sector's Vision, Goal and Objectives for the NWRS 2, as aligned with the vision of South Africa 2030, are as follows:

- Vision: Sustainable, equitable and secure water for a better life and environment for all.
- Goal: Water is efficiently and effectively managed for equitable and sustainable growth and development.
- Objectives:
  - Water supports development and the elimination of poverty and inequality;
  - Water contributes to the economy and job creation; and
  - Water is protected, used, developed, conserved, managed and controlled in an equitable and sustainable manner.

Catchment Management Agency Catchment Management Strategy Integration

Stellenbosch Municipality's Management Area falls within the Breede-Olifants Catchment Management Area. The Breede-Olifants Catchment Management Agency was established by extending the boundary and area of operation of the Breede-Gouritz CMA Water Management Area (Government Gazette No.47559, 25 November 2022).

The area of operation of the Breede-Olifants Catchment Management Agency includes the previous Breede-Gouritz and Berg-Olifants water management areas as pronounced in the National Water Resource Strategy second edition, 2013.

A Catchment Management Strategy is not yet available for the Breede-Olifants Water Management Area (BOWMA), but the Catchment Management Strategy of the former Breede-Gouritz Water Management Area (BGWMA), July 2017, included the following Vision and three Strategic Focus Areas.

"Healthy water resources, for all, forever,"

- **Strategic Area 1: Protecting for People and Nature:** Focusing primarily on management of streamflow, water quality, habitat and riparian zones related to riverine, wetland, estuarine and groundwater resources, to maintain important ecosystem goods and services and biodiversity.
- **Strategic Area 2: Sharing for Equity and Development:** Focusing primarily on management of water use from surface and groundwater resources through the operation of infrastructure, in order to provide water for productive and social purposes within and outside of the WMA.
- **Strategic Area 3: Co-operating for Compliance and Resilience:** Focusing primarily on co-operation and management of institutional aspects to enable and facilitate the protection and sharing of water, including the more co-operative stakeholders, partnerships, information sharing, disaster risk and adaptation elements of the strategy.

The NWA envisages that all water resources management functions, excluding those that have national strategic implications, should be delegated to the CMAs. The functions to be delegated to the CMAs will include the following:

- Water use authorisation
- Water resources protection
- Compliance monitoring and enforcement
- Coordination of WC/WDM programmes.
- Water quality management
- Establishment and oversight of WUAs
- Water resource planning
- Water resources information management
- Billing and collection of water use charges
- Coordination of disaster management

1. SETTLEMENT DEMOGRAPHICS AND PUBLIC AMENITIES

An important component of planning is to characterise the WSA in terms of physical, topographical and socio-economic attributes that might influence the provision of services.

Description of settlement types

- Urban – Formal towns within vicinity of urban cores.
- Dense – Dense rural settlements with population > 5000.
- Village – Rural village with population between 500 and 5000.
- Scattered – Scattered rural village with population less than 500.
- Farmlands – Farming.

Location

The WSA is the Stellenbosch Municipality and the boundaries of the area are indicated on Map 1A in Annexure A. The Municipality is situated within the Breede-Olifants Catchment Management Area. The Municipality is located within the Cape Winelands Region of the Western Cape Province, in which the following Municipalities are also located:

- Drakenstein Municipality;
- Witzenberg Municipality;
- Breede Valley Municipality;
- Langeberg Municipality; and
- Cape Winelands District Municipality.

WSA Perspective

Stellenbosch Municipality has been classified as a high capacity and Category 'B' municipality. A category 'B' municipality shares municipal executive and legislative authority with a category 'C' or district municipality within whose area it falls, in this case the Cape Winelands District Municipality (DC2). Stellenbosch Municipality share their borders with the Drakenstein Municipality, Theewaterskloof Municipality, Breede Valley Municipality and the City of Cape Town.

The Stellenbosch Municipality covers an area of approximately 831 km². The municipality is bounded to the east and south by the Drakenstein, Wemmershoek and Limietberg mountain ranges. The Hottentots Holland range (i.e. Stellenbosch, Jonkershoek and Simonsberg Mountains) and the Bottelary Hills form the backdrop to the town of Stellenbosch itself. These mountains, and the fertile agricultural valleys which they shelter, are key elements contributing to the sense of place of the municipal area. Significant portions of the municipality fall within globally recognised biosphere areas with large tracts of land designated as public and private conservation areas (SDF, 2023).

Aerial photos of the various urban areas (towns) and the existing water and sewerage infrastructure are included as Maps 2A to 2G in Annexure A.

Physical Perspective

Topography

The topographical profile of Stellenbosch Municipality's Management Area is indicated on Map1C in Annexure A.

Climate

The Mediterranean climate of the region results in hot and dry summers with cool and wet winters. Rainfall figures range from 500mm on low lying areas to above 3 000mm in the high mountains providing an abundance of runoff. The table and graph below give an overview of the monthly rainfall for the town of Stellenbosch for the past six financial years.

Table 1.1: Monthly rainfall in Stellenbosch (mm)

Year	Jul	Aug	Sept	Oct	Nov	Dec	Jan	Febr	Mar	Apr	May	Jun	Annual Total
18/19	66	99	178	17	13	28	39	39	23	40	56	81	**679**
19/20	264	55	16	100	5	28	20	1	1	61	48	152	**751**
20/21	138	142	98	11	46	20	3	9	52	8	134	133	**794**
21/22	166	114	21	54	84	11	4	4	13	7	70	137	**685**
22/23 *	45	112	32	2	13	225	16	24	71	90	209	272	**1 111**
23/24	No rainfall data received												

Climate Change

It is necessary for WSAs to develop climate response strategies and include these in their WSDPs, implement WC/WDM and reduce levels of non NRW. Water-related climate change adaptation and mitigation planning should be incorporated into all WSDPs and IDPs. The implementation of WC/WDM is a critical element of adapting to climate change. This must be implemented by all water sector institutions and water users, and should include the optimisation of dam and groundwater operation, as well as the reduction of physical water losses and the introduction of water-efficient appliances, processes and crops.

The Climate Change Adaption Summary Report was developed through the Local Government Climate Change Support program in partnership with the Western Cape Climate Change Municipal Support Programme. A summary of the key vulnerability indicators is provided in the table below.

Table 1.2: Key high priority indicators for Climate Change

Sector	Indicator Title	Exposure	Sensitivity	Adaptive Capacity
Agriculture	Change in viticulture (grapes) production	Yes	High	Low
Agriculture	Change in fruit production	Yes	High	Low
Agriculture	Increased risks to livestock	Yes	High	Low
Biodiversity and Environment	Loss of High Priority Biomes	Yes	High	Low
Biodiversity and Environment	Increased impacts on environment due to land-use change	Yes	High	Low
Human Settlements, Infrastructure and Disaster Management	Loss of industrial and labour productivity	Yes	High	Low
Human Settlements, Infrastructure and Disaster Management	Increased impacts on strategic infrastructure	Yes	High	Low
Human Settlements, Infrastructure and Disaster Management	Increased impacts on traditional and informal dwellings	Yes	High	Low
Human Settlements, Infrastructure and Disaster Management	Increased isolation of rural communities	Yes	High	Low
Water	Decreased water quality in ecosystem due to floods and droughts	Yes	High	Low
Water	Less water available for irrigation and drinking	Yes	High	Low

In terms of adapting for climate change, water systems will need to be more robust and new / alternative sources of supply may need to be found. Increased skills will be required from water managers and long-term water projections are required. Although an overall decrease in rainfall is generally not forecasted, increased variability in the climate and frequency of extreme events, as well as increased temperature and wind could have an impact on water sources, particularly surface waters.

Due to the uncertainty associated with the impact of climate change on water demand and on water resources, it would be prudent to adopt the precautionary principle. The following scenario is likely:

- As a result of uncertainty about future rainfall, all resources, especially surface water resources, may be under pressure and may have lower safe yields.
- Due to increased heat units water demand from agriculture, as well as from towns (approximately 62% of all water) will rise sharply.
- Even in the event that average annual rainfalls would not reduce much, it is anticipated that much greater variability of rainfall will occur within a year and also between years due to more extreme climatic conditions.

It is therefore advisable for Stellenbosch Municipality that a conservative approach be followed regarding the management of water sources. It is proposed that the following approach be adopted to mitigate and adapt to the impacts of climate change:

- All resources, especially surface water resources, need to be re-evaluated, especially where demand is close to the safe one in twenty year yields. It is therefore important to establish assurance of supply levels of all water sources;
- increase assurance of supply of the water resources by ensuring that there is at least 10% additional capacity (headroom), when considering the maximum 24 hour demand on the peak month of the year;
- do not undertake new developments unless a proper investigation of the implication on water sources and sustainability in the long term has been undertaken;
- vigorously implement WDM measures, especially in terms of the following:
  - increased water efficiency
  - frequent monitoring of the water supply system, from the sources to the consumers; and
  - regular and adequate system maintenance and repairs.
- Diversify water resources, e.g. surface water, groundwater, wastewater re-use and sea water desalination.

The recommended projects and sub-projects for the different Sectors were indicated as follow in the Cape Winelands District Municipality's draft Climate Change Adaption Summary Report, November 2017.

Table 1.3: Sector Projects for the Adaptation to Climate Change

Project	Sub-Project
Agriculture	
Mange the change in viticulture (grapes) production	• Commission research and improve understanding of climate change impacts on viticulture production. • Optimise climate change land-uses of existing agricultural areas. • Promote knowledge generation, knowledge sharing, stakeholder participation and awareness-raising regarding the alternative agricultural production in the western and southern Cape. • Promote knowledge generation, knowledge sharing, stakeholder participation and awareness-raising regarding viticulture in new growth areas.
Manage the change in fruit production	• Generate and share scientific, social and indigenous knowledge that will minimise the loss of areas suitable for the growth of fruit. • Identify climate resilient land-uses that will support new agricultural opportunities that will minimise the new areas and new crops thus reducing climate change impacts on current agricultural potential. • Implement evidence based monitoring initiatives that feed into the management systems for fruit production. • Promote knowledge generation, knowledge sharing, stakeholder participation and awareness-raising regarding the decline in suitable areas for the growth of fruit.

Table 1.3: Sector Projects for the Adaptation to Climate Change	
Project	**Sub-Project**
	• Research and improve understanding of climate change impacts on fruit. • Strengthen management plans, to enable continuous monitoring and the ability to effectively respond to the change.
Manage increasing risks to livestock	• Commission research and improve understanding of climate change impacts livestock and land availability. • Develop a framework that will assist and educate farmers with adjusting to reduce rainfall. • Generate and share scientific, social and indigenous knowledge that will assist with adapting to the reduction in herbage yields. • Improve collaboration and partnership on existing programs (e.g. LandCare Programme, EPWP and River Health Programmes). • Strengthen management plans, to enable continuous monitoring of water and herbage availability for livestock.
Biodiversity and Environment	
Manage Loss of High Priority Biomes	• Implementation of fire breaks in local municipalities by 2022 through the Disaster Management Unit. • Identification / Inclusion of high priority biomes in local Spatial Development Frameworks during the review process.
Manage Increased impacts on environment due to land-use change	• Develop program to diversify community livelihoods strategies to earn income from other activities such as ecotourism and other non-farming activities. • Incentivize small scale farmers to practice sustainable and conservative agriculture. • Incorporate sustainable land use management and planning into other sectors plans. • Research and improve understanding of land use change in the municipality. • Strengthen institutional capacity to deal with pressure on land use change.
Disaster Management, Infrastructure and Human Settlements	
Manage potential loss of industrial and labour productivity	• Research and implement water efficiency projects in industrial processes to improve the efficiency of water usage.
Manage potential increased impacts on strategic infrastructure	• Implement a water augmentation project that will help reduce reliance on surface water and seek alternative sources of water (e.g. recycling of water). • Upgrade and maintain stormwater infrastructure so that it considers extreme weather events such as flooding. • Upgrading and maintenance of road infrastructure.
Manage increased impacts on traditional and informal dwellings	• Develop and upgrade informal settlements. • Partner with research institutions to implement a research project to develop a model aimed at achieving sustainable informal settlements with lower risk exposure.
Manage potential increased isolation of rural communities	• Build Climate change resilient road infrastructure that serves as a link for rural areas. • Develop economic nodes and improved service provision in rural areas to improve connectivity. • Identify alternative access routes to rural communities. • Identify local responses that will reduce isolation of rural communities. • Identify roads at risk of flooding and erosion and prioritise those for upgrading and maintenance. • Implement flooding drainage systems that will reduce impacts on rural roads.
Water	
Manage decreased water quality in ecosystem	• Invasive aquatic weeds removal and management in Berg and Breede Rivers by the Cape Winelands District Municipality, B municipalities, DOWA, property/landowners and water user associations. Continuous clearing should be done annually between September and April. The specific area to be targeted is between the R45 and Hermon.
Manage the quantity of water available for irrigation and drinking	• Cape Winelands District Municipality to facilitate research into the re-use of wastewater within the District Municipality, with B-municipalities indicating which towns should be included in the research. The economic viability and quantities are important selection criteria. The replenishment of aquifers by infusion of purified waste water should form part of the research. Implementation by relevant Engineering Departments of B-municipalities. • Cape Winelands District Municipality to facilitate the assessment of existing infrastructure for water storage. Implementation by Engineering Departments of B-municipalities. • Increase alien clearing in catchments located throughout the entire District and B municipalities in partnership with DWS and LandCare Programme.

Floods

One of the climate change threats in some parts of the Western Cape is the likelihood of floods with greater intensity and longer-term impacts. There is likely to be increases in the severity and unpredictability of weather patterns. Flooding and storms are predicted which could have devastating effects on agricultural production. It is important for Stellenbosch Municipality to ensure that Stormwater Management Plans are in place for all the towns.

Natural Environment

Significant portions of Stellenbosch Municipality fall within globally recognized biosphere areas and designated public and private conservation areas. Eleven public conservation areas cover some 28 741 ha or 34,6% of the municipal area, with a further 3 000 ha managed as private conservation areas. The municipality's landscape consists of a series of valleys on a base of rolling hills to the west culminating in steep and dramatic mountain backdrops to the east and south-east, highly valued for its scenic beauty and sense of place.

Stellenbosch Municipality falls within the Cape Floral Kingdom, internationally recognised as one of the six floral kingdoms of the world (occupying 0,06% of the earth's surface). The Cape Floral Kingdom is the only floral kingdom contained within a single country and characterised by its exceptional richness in plant species and its endemicity.

Critical and vulnerable habitats are mostly found in the mountainous south-eastern parts of the municipality, where large tracts of land are already formally protected. However, within the municipal area nearly all the remaining vegetation is Critically Endangered or Vulnerable (SDF, June 2023).

The Stellenbosch Municipality owns various properties regarded as nature areas. Three of these areas have formally been designated to be conservation areas. These are Mont Rochelle Nature Reserve, Jan Marais Park (Nature Reserve) and Papegaaiberg Nature Reserve (3rd Review of the 5th Generation IDP 2022 – 2027, May 2025).

The conservation areas and vegetation profiles of Stellenbosch Municipality are indicated on Map 1B in Annexure A.

Demographic Perspective

The Municipality is characterised by scenic landscape, precious natural and cultural heritage, quality educational institutions and sporting facilities, thriving agricultural economy and unrivalled access to the regional and logistics networks.

Economics: In 2023, the economic landscape of the Stellenbosch municipal area boasted a Gross Domestic Product at regional level (GDPR) totaling R16.405 billion. The municipality's economy thrives on a robust agriculture sector, primarily specializing in grape cultivation for its globally acclaimed wineries, serving as a pivotal driver for trade and tourism. Additionally, Stellenbosch houses the corporate headquarters of influential entities such as Capitec, Remgro, and PSG, along with local branches of financial service providers including Citadel Wealth Management, Brenthurst, and Adviceworx. Notably, the finance sector emerged as the primary contributor to the local economy, constituting 29 percent of the total GDPR, further solidifying the area's economic significance.

Moreover, the potential for overall Gross Domestic Product at the regional level (GDPR) growth was impeded by declines in the primary and secondary sectors. These contractions, driven by factors such as rising input costs, economic uncertainty, and external market challenges, hindered economic expansion. Addressing these setbacks through strategic interventions will be crucial for fostering sustainable growth and stability in the region (2024 Socio-Economic Profile Stellenbosch Municipality).

Social: The table below gives an overview of the Socio-Economic Profile of Stellenbosch Municipality.

Table 1.4: 2024 Socio Economic Profile of Stellenbosch Municipality			
Education (2023)		**Poverty (2023)**	
Matric Pass Rate	80.2%	Gini Coefficient	0.60
Learner-Teacher Ratio	26.3	Poverty Head Count Ratio (UBPL)	71.4%
Retention Rate	81.5%		
Health (2023/24)		**Safety and Security (Actual number of reported cases in 2023/2024)**	
Primary Health Care Facilities	8	Residential Burglaries	998
Immunisation Rate	58.1%	DUI	252
Maternal Mortality Ratio (per 100 000 live births)	0.0	Drug-related Crimes	1 470
Teenage Pregnancies – Delivery rate to women U19	0.6%	Murder	79
		Sexual Offences	255
Access to Basic Service Delivery (Percentage of households with access to basic services 2023)		**Labour (2023)**	
Water	98.5%	Unemployment Rate	12.6%
Refuse Removal	87.6%	**Demographics (2024)**	
Electricity	96.6%	Population (2024 MYPE):	209 831
Sanitation	96.2%	Households (2024 MYPE):	57 520
Housing	86.3%		
Socio-economic Risks		**Largest Three Sectors (Contribution to GDP, 2023)**	
Job losses	Risk 1	Finance, insurance, real estate and business services	29.0%
Low learner retention	Risk 2	Wholesale and retail trade, catering and accommodation.	16.0%
Low skills base (Labour)	Risk 3	Manufacturing	16.0%

Regional Perspective

At the heart of the picturesque landscape of the Cape Winelands District are iconic wine farms that produce some of the world's finest wines. The landscape is also dotted with fruit orchards, which are a lifeline for local communities engaged in primary production and processing activities. Stellenbosch is surrounded by lush vineyards and internationally acclaimed wineries. This town hosts numerous finance and tech head offices and Stellenbosch University, which attracts students from across South Africa and abroad.

In 2023, the Cape Winelands District's economy grew by 0.7 percent in GDPR, while total employment increased by 5.9 percent. Drakenstein contributed the largest portion to economic growth at 0.2 percentage points, followed by Stellenbosch and Breede Valley, each contributing 0.2 percentage points. These municipalities also made significant contributions to employment growth, with Drakenstein contributing 1.7 percentage points, Stellenbosch at 1.2 percentage points and Breede Valley adding 1.3 percentage points. Witzenberg also played a vital role in the District's economic performance, contributing 0.1 percentage points to GDPR growth and 1.0 percentage points to employment growth. Langeberg added 0.1 percentage points to GDPR growth and 0.8 percentage points to employment growth. The relatively larger contributions to employment growth underscore the labour-intensive nature of sectors such as agriculture and services, which are key drivers of economic activity in the District (2024-25 Cape Winelands District Municipal Economic Review and Outlook, Western Cape Government).

1.1 SETTLEMENT DEMOGRAPHICS

The table below gives a summary of the population and households for the various water distribution and sewer drainage systems.

Table 1.1.1: Settlement Demographics

Settlement Name	Scheme ID	Main Type (Urban / Rural)	Type	2011 Census Data			2023/2024 Projected Population and Households			WSDP General Fields

Notes: 1) % of Settlement Metered and Billed: 100 - (2023 Swift calculated developed erven without a meter / Number of projected 2023/2024 households x 100)
2) No of HH requiring free basic water: (23/24 Estimated number of households for town / Total number of estimated households in the Urban areas) x 5 584 (23/24 registered indigent households that received free basic water)
3) No of HH requiring free basic sanitation: (23/24 Estimated number of households for town / Total number of estimated households in the Urban areas) x 5 584 (23/24 registered indigent households that received free basic sanitation)

The residential Water and Sanitation Service Levels Profiles for the above settlements are included under Topic 2.

The Growth Potential Study 2014 of the Western Cape Government determined the growth potential and socio-economic needs of settlements in the Western Cape using quantitative data (e.g. factors relating to socio-economic, economic, physical-environmental, infrastructure and institutional aspects). The growth potential of the towns in Stellenbosch Municipality's Management Area was indicated as follows.

Table 1.1.2: Growth potential of the towns in Stellenbosch Municipality's Management Area

Town	Growth Potential Score (Out of 100)	Growth Category
Stellenbosch/Jamestown	91	Very High
Pniel/Kylemore	64	High
Franschhoek	58	Medium
Klapmuts	51	Medium

The table below gives an overview of the growth potential indicators for the towns in Stellenbosch Municipality's Management Area, as included in the Growth Potential Study.

Table 1.1.3: Growth potential indicators for the towns in Stellenbosch Municipality's Management Area (Settlement Level Classification)

Indicator	Stellenbosch/Jamestown	Pniel/Kylemore	Franschhoek	Klapmuts
Absolute socio-economic needs	Very High	Low	Medium	Low

1.3 SOCIO ECONOMIC BACKGROUND (Information)

1.3.1 Population and Households

The 2025/26 IDP of Stellenbosch Municipality and the 2024 Socio Economic Profile of Stellenbosch Municipality indicate the 2024 population at 209 831 persons and the 2024 permanent households at 57 520, with an estimated population of 231 712 by 2029, at an annual growth rate of 1.7%. The table below gives an overview of the historical population figures for Stellenbosch Municipality for the various years.

Table 1.3.1.1: Historical population and household data of Stellenbosch Municipality				
Year	**Source**	**Population**	**Households**	**Person / Household**
2001	Census 2001 Community Profiles	117 758	35 458	3.3
2011	Census 2011 Community Profiles	155 733	43 420	3.6
2016	2016 Community Survey	173 419	52 374	3.3
2022	Census 2022 Community Profile	175 411	59 626	2.9

The published 2022 Census population for Stellenbosch Municipality was 175 411 persons (Annual growth rate of 1.1% over the period 2011 to 2022) and the number of permanent households was 59 626. The 2022 Census data is not yet available per town and it was therefore not possible to update Stellenbosch Municipality's projected population and households per town (system) according to the 2022 Census data.

The 2023/2024 population for the various water distribution systems were estimated by applying the annual growth rates as indicated in the table below to the 2011 Census data. The current projected population figures and the annual population growth percentages, as indicated in the table below, are aligned with the figures used in DWS's GeoDatabase. The future estimated annual population growth percentages, as listed in the table below, were agreed with the Engineering Department during January 2014.

Table 1.3.1.2: Historical population and household figures and population growth rates and projected present population and households							
System	**Census 2011**			**Future Population Growth per year (2011 Onwards)**	**Projected for 2023/2024**		
	P	**H**	**P/H**		**P**	**H**	**P/H**
Stellenbosch	80 961	24 521	3.3	3.5%	121 363	36 767	3.3
Franschhoek	15 741	5 172	3.0	5.0%	28 044	9 216	3.0
Dwars River	11 591	2 666	4.3	3.0%	16 395	3 771	4.3
Klapmuts	7 765	1 974	3.9	6.0%	15 500	3 942	3.9
Raithby	915	219	4.2	2.0%	1 152	275	4.2
Farms	38 760	8 868	4.4	1.5%	45 973	10 521	4.4
Total	**155 733**	**43 420**	**3.6**	**3.3%**	**228 426**	**64 492**	**3.6**

Notes: Abbreviations P – Persons, H – Households and P/H - Person / Household.

The size of the population provides an indication of the volume of demand for government services in a particular area. It also serves as a planning measure to assist budget planners to match available resources to the relative demand for infrastructural and social services including water, sanitation, electricity, housing and health care.

1.3.2 Population Growth Rates

The effective population growth rate will most likely change over the next 5 years considering the effect of economic development, social development (e.g. education) and the HIV / Aids pandemic. The projected population growth rates included in the WSDP are as follows:

Table 1.3.2.1: Projected population growth rate for the next five years

Scheme	Estimated annual population growth for next 5 Years (%/a)
Stellenbosch	3.5%
Franschhoek	5.0%
Dwars River	3.0%
Klapmuts	6.0%
Raithby	2.0%
Farms	1.5%
Stellenbosch Municipality	**3.3%**

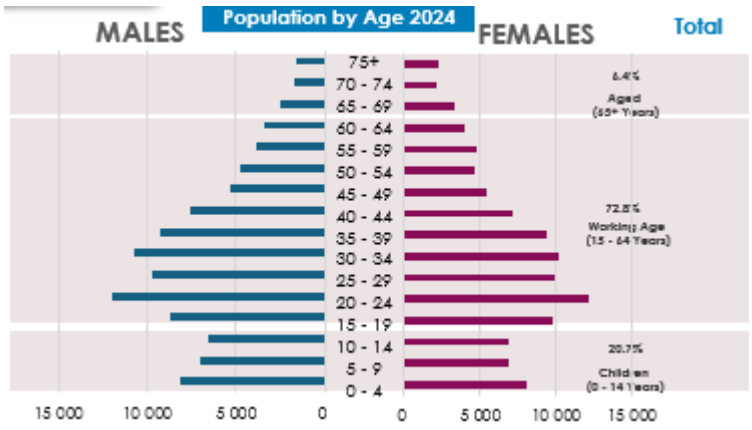
1.3.3 Age and Gender Profile

The age and gender profile of the various communities may be indicative of development needs and socio-economic status and the statistics provides important insights into the age groups, where the bulk of the population is located and to target government, civil society and non-governmental programmes more effectively.

The overall sex ratio in Stellenbosch, indicating the number of males per 100 females in the population, reveals a balanced demographic pattern. As of 2024, the data estimates a gender distribution of approximately 49.2 percent males and 50.8 percent females, leading to a sex ratio of about 101. Projections suggest that this trend will remain stable over the next few years, with minimal variation anticipated through 2029. Fluctuations in the sex ratio could be influenced by various factors, including migration patterns and employment trends in sectors that attract more males. Understanding these demographic dynamics is crucial for economic analysis, as it highlights potential shifts in labor force participation, workforce composition, and societal patterns, providing valuable insights for strategic economic planning.

The demographic distribution within Stellenbosch showcases distinct age groups represented through a dependency ratio, which compares the workforce (ages 15 - 64) to dependents (children and seniors). As of 2024, the population aged 65 and older is projected to grow from 13 457 to 15 010 by 2029, reflecting an increase of approximately 11.5 per cent. This trend suggests factors such as improved life expectancy or the area becoming increasingly attractive as a retirement destination. Conversely, the working-age population is expected to remain stable, with figures ranging from 152 859 to 165 475 during the same period. Consequently, the dependency ratio is anticipated to remain stable around 37.3, indicating ongoing pressure on social services due to the increasing proportion of dependents. This demographic insight is essential for economic planning, highlighting potential challenges in resource allocation and social welfare programs as the municipality adapts to an evolving age structure.

Analyzing age and gender together reveals both opportunities and challenges in Stellenbosch's demographic structure. The increasing proportion of elderly individuals, along with a balanced gender ratio, necessitates careful consideration of healthcare services, social support systems, and community engagement initiatives. The Cape Winelands District faces similar challenges, highlighting the need for collaborative strategies to address the implications of aging populations. Ensuring that both young and elderly residents have access to appropriate resources and support is vital for fostering a thriving, inclusive community. By addressing these dynamics, Stellenbosch can better position itself for sustainable growth in the coming years (2024 Socio Economic Profile of Stellenbosch Municipality).



The 2022 age and gender Census data is not yet available per Community Profile. The information below for Stellenbosch Municipality is as taken from the 2011 Census data.

Table 1.3.3.1: Age and gender profile per scheme for 2011

Scheme	Permanent resident population 2011	Residents (15 to 65 years)		Youth and aged residents (< 15 years &>64 years)		Male residents		Female residents	
		Number	%	Number	%	Number	%	Number	%
Stellenbosch	80 315	60 174	74.92%	20 141	25.08%	38 697	48.18%	41 616	51.82%
Franschhoek	15 618	10 813	69.23%	4 805	30.77%	7 732	49.52%	7 882	50.48%
Dwars River	11 498	8 086	70.33%	3 412	29.67%	5 780	50.27%	5 718	49.73%
Klapmuts	7 703	5 254	68.21%	2 449	31.79%	3 859	50.10%	3 844	49.90%
Raithby	910	614	67.47%	296	32.53%	438	48.29%	469	51.71%
Rural	38 457	26 725	69.49%	11 732	30.51%	19 080	49.61%	19 381	50.39%
TOTALS	**154 501**	**111 666**	**72.28%**	**42 835**	**27.72%**	**75 586**	**48.92%**	**78 910**	**51.08%**

From the above table it can be noted that there was not a big difference between the male and female population within the various towns in 2011.

The figure below provides an overview of the population by age for 2024, as included in the 2024 Socio Economic Profile of Stellenbosch Municipality.

Stellenbosch's age cohort distribution reveals a diverse demographic landscape. The population aged 0 - 14 is projected to grow slightly from 43 515 in 2024 to 46 279 by 2029, indicating a need for expanded educational resources and childcare services. The working-age group (15 - 64) is expected to stabilize, suggesting a robust labour force. However, the significant increase in the elderly population (65+) necessitates targeted policies addressing healthcare and social support. This demographic shift indicates potential socio-economic challenges, including increased healthcare costs and a greater demand for age-appropriate services, which will require strategic planning to foster an inclusive environment for all age groups.

The gender and age dynamics for 2024 are as follows:

- Female: 50.8%
- Male: 49.2%
- Dependency ratio: 37.3%
- Ageing Index: 30.9%

1.3.4 Employment Profile

The status and type of employment indicates the nature of household income and income security. The 2022 employment Census data is not yet available per Community Profile. The employment profile for Stellenbosch Municipality for 2011, as taken from the 2011 Census data, was as follows:

Table 1.3.4.1: Employment profile per scheme for 2011

Scheme	Employed		Unemployed		Discouraged Work Seeker		Other not Economically Active		Not Applicable	
	Number	%	Number	%	Number	%	Number	%	Number	%

Franschhoek	5 437	34.82%	1 925	12.33%	510	3.27%	2 941	18.83%	4 803	30.76%
Dwars River	4 459	38.78%	483	4.20%	71	0.62%	3 073	26.72%	3 413	29.68%
Klapmuts	2 746	35.65%	568	7.37%	226	2.93%	1 715	22.27%	2 447	31.77%
Raithby	361	39.71%	37	4.07%	12	1.32%	205	22.55%	294	32.34%
TOTALS	**17 179**	**44.66%**	**13 73**	**3.57%**	**456**	**1.19%**	**7 719**	**20.07%**	**11 736**	**30.51%**

2023 Employment Profile: In 2022, monetary intermediation emerged as the primary driver of formal employment in the Stellenbosch municipal area, employing 14 117 individuals. Beverage manufacturing, predominantly in the wine industry, followed closely, providing jobs for 7 142 people. The significant disparity in median monthly incomes between these sectors, with figures of R27 446 and R8 940 respectively, vividly illustrates the pervasive socioeconomic inequality within the municipality. This inequality not only poses challenges for the well-being of residents but also carries implications for municipal revenue generation. Disparities in income levels can impact local tax revenues, potentially affecting the municipality's capacity to fund essential services and infrastructure projects. Addressing this inequality is crucial not only for social equity but also for sustaining a stable and prosperous municipal economy.

The presence of Stellenbosch University and the diverse industries in the area have led to a significant workforce composition, with 26.2 percent classified as skilled workers and 42.5 percent as semi-skilled workers. Informal sector activities, particularly in trade, agriculture, and personal services, contribute significantly to employment, accounting for 22.6 percent of the workforce in 2023. However, a notable challenge exists for low-skilled workers, constituting 31.3 percent of the workforce, as recent job creation trends have favored semi-skilled and skilled workers, limiting opportunities for this demographic. To address this issue and promote social upliftment, facilitating access to education and skills development initiatives in communities with high unemployment rates is crucial. Not only does this initiative enhance the socio-economic landscape, but it also has implications for municipal revenue, as a skilled and educated workforce can contribute to a more vibrant local economy, generating higher tax revenues to support municipal projects and services (2024 Socio-Economic Profile Stellenbosch Municipality).

The formally employed workers in the Stellenbosch labour force in 2023 was dominated by semi-skilled workers (42.5%), as indicated below.

- Skilled: 26.2%
- Semi-skilled: 42.5%
- Low-skilled: 31.3%
- Informal: 22.6%

The table below gives an overview of the percentage unemployment rates for Stellenbosch Municipality and the Cape Winelands District.

Table 1.3.4.2: Unemployment rates for period 2019 to 2023

Area	2019	2020	2021	2022	2023
Stellenbosch Municipality	11.6%	11.6%	15.4%	14.5%	12.6%

1.3.5 Household Income

The economic profile is directly related to the development prospects, affordability of services and projected water use. Poverty can be defined as a lack of resources to meet basic needs, such as adequate food, shelter and basic amenities. It also represents the inability to meet higher order needs, such as the need for personal fulfilment, recreation and freedom. Income related factors are direct determinants of poverty levels. The 2022 household income Census data is not yet available per Community Profile. The household income for Stellenbosch Municipality for 2011, as taken from the 2011 Census data, was as follows.

Table 1.3.5.1: Household income per scheme for 2011

Household Income Categories	Stellenbosch	Franschhoek	Dwars River	Klapmuts	Rural	Total
No Income	6 280	407	240	1 272	726	8 925
R1 – R4 800	492	65	33	224	94	908
R4 801 – R9 600	755	95	51	379	228	1 508
R9 601 – R19 600	2 131	285	298	811	846	4 371
R19 601 – R38 200	3 617	483	468	993	1 525	7 086

R1 228 801 – R2 457 600	232	1	7	24	165	429
R2 457 601 +	161	0	4	12	125	302
Unspecified	2	0	0	0	0	2
Total	**24 544**	**1 959**	**2 642**	**5 132**	**8 798**	**43 075**

A key constraint in planning for infrastructure delivery is household affordability. Knowing the existing situation regarding household incomes is a key part to understanding consumers' affordability levels. These levels should be considered when setting service level targets.

The National Development Plan (NDP) envisions a transformed South Africa by 2030. Key goals include eliminating households with a monthly income below R419 per person, reducing this percentage from 39.0 percent to zero, and decreasing the Gini coefficient from 0.690 to 0.600. Achieving these objectives requires addressing the root causes of poverty and inequality, shifting from short-term to evidence-based policies, and ensuring a "decent standard of living" for all South Africans by 2030. The table below gives an overview of the Gini coefficient from 2019 to 2022.

Table 1.3.5.2: Gini coefficient from 2019 to 2022

Year	Western Cape	Cape Winelands District	Stellenbosch Municipality
2019	0.622	0.613	0.628
2020	0.627	0.616	0.631
2021	0.627	0.605	0.620
2022	0.601	0.593	0.607

The Cape Winelands' Gini coefficient decreased from 0.613 in 2019 to 0.593 in 2022 and Stellenbosch Municipality's Gini coefficient decreased from 0.628 in 2019 to 0.607 in 2022.

The Stellenbosch municipal area stands out for the significant income inequality levels recorded there between 2019 and 2022. This phenomenon can be attributed to the unequal earnings of its residents. A notable proportion of the population in this area is employed in the finance sector, which tends to offer comparatively higher incomes. The unequal distribution of income in the District is further emphasised by the divide between residents in the towns of Kayamandi and Idas Valley, who earn substantially less than those in Stellenbosch Central, and the inhabitants of the Techno Park, De Zalze and Paradyskloof areas. This contrast implies a lower standard of living in Kayamandi and Idas Valley, potentially higher levels of poverty and limited access to economic opportunities (2024-25 Cape Winelands Municipal Economic Review and Outlook, Western Cape Government).

2. SERVICE LEVELS PROFILE

Having an understanding of the current situation allows the most important aspect of the plan to be addressed, which is the service level targets. This section sets out what services will be provided to consumers, both in terms of *level of service* and *quality of service (reliability)*.

The concept of service levels relates to the options which consumers can be given with regard to the convenience of the service and hence the amount of water which they will consume and the associated wastewater they will generate.

There are a range of different service types which can be provided. These are clarified below according to the types reported in the tables.

Service Types:

None or inadequate: This refers to the number of consumer units (or households) that do not have access to basic water or sanitation supply services. See requirements for basic water and sanitation supply services as included in Table 2.4 of the Future Demand and Functionality Requirements WSDP Report.

Water and Sanitation Service Levels:

Interim water and sanitation supply services: This refers to the number of consumer units (or households) that do have access to interim water or sanitation supply services. See requirements for interim water and sanitation supply services as included in Table 2.5 of the Future Demand Functionality Requirements WSDP Report.

Controlled volume of water supply (e.g. Yard Tanks): Each house is provided with a tank which holds about 200 litres. The tank gets filled up once a day. This type of service is often referred to as an intermediate level of supply.

Uncontrolled volume of water supply: There are generally two types: either the tap stands outside the house on its own or on the wall of an outside toilet (yard tap) or water is piped into the house to take water to taps in the kitchen, bathroom, toilet etc.

Dry sanitation consumer installation:

Ventilated pit: A basic pit latrine structurally reinforced without preventing water seepage into surrounding soil, a slab that seals the edges of the pit and a screened air pipe that vents smells from the pit into the air above the privy. The concrete slab over the pit is not standard requirement for all VIP toilets, but necessary under certain geotechnical conditions and it must comply with ground water protocol.

Eco San option: one of a range of sanitation options that covert the waste products into re-usable agricultural soil conditioners of fertilizers on-site (usually without water use).

Wet sanitation consumer installation (Septic Tanks): Water is flushed into a digester where certain bacteria and other organisms breakdown the solids. Digester effluent flows into the soak away, then the ground and it must be ensured that the soak away does not cause pollution of the ground water. There can be a build-up of sludge in the digester that has to be pumped out occasionally. In some cases the effluent from the septic tank is discharged into the bulk sewer network, which leads to a WWTWs.

Sanitation connection that discharge to the WWTWs:

Here there are generally two types: intermediate (e.g. aqua-privy with solids free sewer, which is similar to a septic tank, but instead of a soak-away the digester effluent flows into a pipe which connects to a small sewer in the road reserve).

Full waterborne refers to the situation where a flushing toilet is used; the wastewater flows to a sewer on the site, then to sewers on the street. Effluent discharged from WWTWs must meet national effluent discharge quality standards in order to avoid polluting the water resources.

Water and Sanitation Service Level Policy:

The key issue in preparing a service level policy is that higher than basic services should be provided only where households can afford these levels of service, due to the necessity of recovering the increased capital and operating and maintenance costs. While politically difficult, this is likely to be the only way in which sustainable services can be provided in the long term. There are numerous examples of unaffordable service levels being provided with catastrophic results for both households and municipalities.

Key issues to take into account when formulating a service level policy: The following should be taken into account when formulating a service level policy.

- The types of service levels decided upon have a major impact on capital and operating costs and hence on the long-term viability of service provision. If service levels are set too high the consumers who receive them will not be able to afford to pay for them and are likely to default on their payment which will in turn, impact on the viability of the service provider.

- Service levels are related to the quantity of water used and thus there is an impact on the environment from which this water has to be abstracted and returned to. Similarly, the availability of adequate water for waterborne sanitation should be considered.

- Risks of pollution associated with the various levels of services must be considered; higher levels of service have higher risk of pollution.

- The size and density of the settlement should be taken into account when deciding levels of service. In general large settlements produce more waste and hence higher risks of pollution while pollution from smaller settlements is easier to manage.

- Desludging of septic tanks, pit emptying service and capacity of bulk sewer network and WWTWs.

Service level targets:

a) **New consumer units** – this refers to new units that will need to be provided as a result of natural population increase or migration to the area.

b) **Current backlogs** – this refers to those households that are currently not adequately served, for example those having a supply less than basic standards.

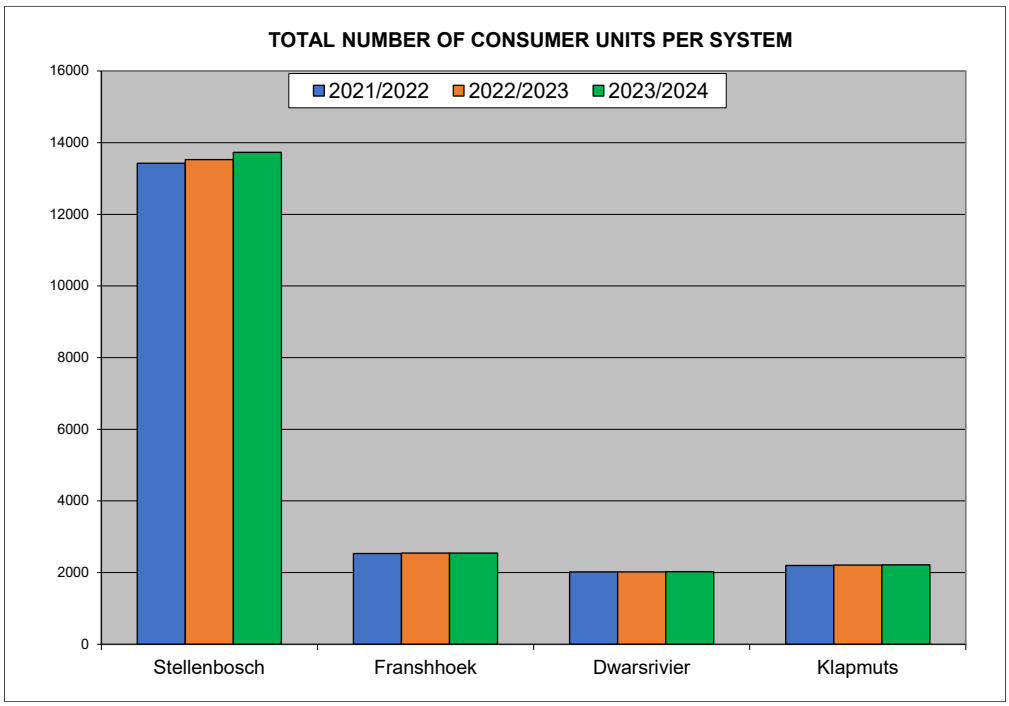
c) **Upgrading** – this refers to those households which currently have adequate services but are to be upgraded to a higher level.

The projected number of households, the number of residential consumer units, as calculated from the financial system, and the confirmed number of households in the informal areas were used to populate the residential water and sanitation service levels in the urban areas in the Municipality's Management Area. The 2011 Census data was also used for the farms in the rural areas. The 2011 Census Sub-Places were grouped together as follows for the various distribution systems.

Table 2.1: Grouping of the 2011 Census data Sub- Places for the various distribution systems

Distribution System	2011 Census Sub-Places
Stellenbosch	Welgevonden, Weltevrede, Cloetesville, Khayamandi, Pappergaai, La Colline, Tennantville, Idasvallei, Stellenbosch, Die Boord,,Onder Papegaaiberg, Devon Valley, Dalsig, Kleingeluk, Paradyskloof, Brandwacht, Jamestown

Table 2.1: Grouping of the 2011 Census data Sub- Places for the various distribution systems	
Distribution System	**2011 Census Sub-Places**
Franschhoek	Langrug, Groendal, Hugenote
Dwars River	Pniel, Franschhoek SP, Languedoc, Kylermore
Klapmuts	Bennetsville, Klapmuts, Weltevrede Park, Mandela City
Raithby	Raithby
Other Areas (Rural)	Stellenbosch NU, Elsenburg, Koelenhof, Wiesiesdraai, Robertsvlei, Lynedoch



Consumer units in this Topic refer to number of billed metered consumers within the Municipality. It may well be that an entire residential development (e.g. a block of flats) consisting of many households, is metered with one bulk meter (One consumer). Consequently, the term "billed metered consumer units" does not necessarily equate to the number of households. The number of user connections in each user sector as calculated from the financial data (Billed Metered Consumers), for the various distribution systems in Stellenbosch Municipality's Management Area, are as indicated in the table below.

Table 2.2: Total number of billed metered consumers per category and distribution system					
Distribution System	**Year**	**Residential**	**Business**	**Other**	**Total**
Stellenbosch	21/22	12 510	694	221	13 425
	22/23	12 593	699	234	13 526

Dwars River	0.02%	2 020	2 020	2 021
Klapmuts	0.48%	2 195	2 210	2 216
Total	**0.84%**	**20 171**	**20 299**	**20 512**

The graph below provides an overview of the number of billed metered consumers per water distribution system.

The graph below provides an overview of the number of billed metered consumers per category for all the water distribution systems.

The current number of informal dwellings in Stellenbosch Municipality's Management Area is 11 452. Stellenbosch Municipality's works towards a ratio of at least one communal standpipe for every five households and one communal toilet to every twenty five households. The table below gives a summary of the communal services levels in the informal areas in Stellenbosch Municipality's Management Area.

Table 2.4: Communal service levels in informal areas (June 2024)

No.	Informal Settlement	No. of informal dwellings	Sanitation						Water

Notes: No Services, Ratios above Targets, Ratios meeting Targets

* Backlog Sanitation: Households where the ratio of one toilet seat for every 5 households is exceeded.

** Backlog Water: Households where the ratio of one communal tap for every 25 households is exceeded.

It can be noted from the above table that an additional 1 270 toilets and 109 communal taps are required for the informal areas in order to comply with the ratios of one toilet for every five households and one communal tap for every twenty-five households. 179 Toilets and 190 communal taps also need to be repaired. Some of the challenges experienced by Stellenbosch Municipality with regard to the informal areas and the provision of services to these areas include the following:

- Lack of space for new facilities;
- Lack of access for maintenance and emergency vehicles (narrowed roads);
- Uncooperative community members, don't want to move to create space for services;
- Vandalism of existing infrastructure, budget for new infrastructure must be used to maintain existing infrastructure; and
- Illegal water connections that must be removed.

All the households on formal erven in the urban areas of Stellenbosch Municipality's Management Area are provided with water connections inside the erven. Informal areas are supplied with shared services (Communal standpipes and toilets) as an intermediary measure.

Stellenbosch Municipality is committed to support the private landowners as far as possible in order to ensure that at least basic water and sanitation services are provided to those households in the rural areas with existing services still below basic standard.

2.1 RESIDENTIAL WATER PROFILE

The 2022 Census Community Profiles per Sub-Place are not yet available. The 2011 residential household water service levels for the areas in Stellenbosch Municipality's Management Area, as taken from the 2011 Census Data, are indicated in the table below.

Table 2.1.1: 2011 Census household water service levels

Town	Inside Dwelling	Inside Yard	Communal Water Services				No Access	Total
			< 200m	200m – 500m	500m – 1000m	> 1000m

Notes: 1) Number of residential consumer units for the urban areas for 2023/2024, as taken from the financial system.
2) Census 2011: Number of households with no access to piped (tap) water 92.
3) Census 2011: Number of households with communal services (200m – 500m) 94, (500m – 1000m) 18 and (>1000m) 8.
4) Below Housing Interim in the above table is the number of households in informal areas without basic water services or with a ratio above 1 communal tap per 25 households as confirmed by the Municipality for June 2024.
5) Adequate Housing Permanent in the above table is the number of households in informal areas with communal water services at a ratio of 1 communal tap per 25 households or less as confirmed by the Municipality for June 2024.
6) Estimated number of backyard dwellers (Projected number of households – residential CUs – households in informal areas).

The table below provides a summary of the Water Service Infrastructure Supply Level Profile for the various settlements in Stellenbosch Municipality's Management Area.

2.3 PUBLIC AMENITIES

2.3.1 Water Services

The previous section dealt with the water and sanitation service levels and reliability for residential stands within the municipality. The water service levels of the health and education facilities in Stellenbosch Municipality's Management Area are indicated in the table below.

Table 2.3.1.1: Water Services of education and health facilities

Associated services facility	Number of facilities	Facilities with adequate services	Facilities with no services	Facilities with inadequate services	Total potential cost (basic level) (Rmil)
Education Plan					
Primary school	28	20	8 (To be verified)		Unknown
Secondary school	12	11	1 (To be verified)		Unknown
Tertiary	8	8	-	-	-
Combined	5	2	3 (To be verified)		Unknown
Special needs	2	2	-	-	-
Other	-	-	-	-	-
Total	**55**	**43**	**12 (To be verified)**		**Unknown**
Health Plan					
Hospitals	2	2	-	-	-
Health Centers	1	1	-	-	-
Clinics	13	10	3 (To be verified)		Unknown
Other	-	-	-	-	-
Total	**16**	**13**	**3 (To be verified)**		**Unknown**

All schools, tertiary- and health facilities in the urban areas of Stellenbosch Municipality's Management Area are supplied with adequate water services. **The water service levels of the educational and health facilities in the rural areas need to be verified.**

2.3.2 Sanitation Services

The sanitation service levels of the health and education facilities in Stellenbosch Municipality's Management Area are indicated in the table below.

Table 2.3.2.1: Sanitation Services of education and health facilities

Associated services facility	Number of facilities	Facilities with adequate services	Facilities with no services	Facilities with inadequate services	Total potential cost (basic level) (Rmil)
Education Plan					
Primary school	28	20	8 (To be verified)		Unknown
Secondary school	12	11	1 (To be verified)		Unknown
Tertiary	8	8	-	-	-
Combined	5	2	3 (To be verified)		Unknown
Special needs	2	2	-	-	-
Other	-	-	-	-	-
Total	**55**	**43**	**12 (To be verified)**		**Unknown**
Health Plan					
Hospitals	2	2	-	-	-
Health Centers	1	1	-	-	-
Clinics	13	10	3 (To be verified)		Unknown
Other	-	-	-	-	-
Total	**16**	**13**	**3 (To be verified)**		**Unknown**

All schools, tertiary- and health facilities in the urban areas of Stellenbosch Municipality's Management Area are supplied with adequate sanitation services. **The sanitation service levels of the educational and health facilities in the rural areas need to be verified.**

2.3.3 Public Amenities Services

The table below gives an overview of the service levels at public amenities in Stellenbosch Municipality's Management Area.

Table 2.3.3.1: Service levels at public amenities in Stellenbosch Municipality's Management Area

Facility Name	Adequate for Basic Services (Yes/No)	Adequate for Higher Level Services (Yes/No)	Facility Water Metered (Yes/No)	Facility Water Billed (Yes/No)	% Income Received	Total Potential Cost to bring to basic water level (Rmil)	Total Potential Cost to bring to basic sanitation level (Rmil)	Settlement Main Type (Urban / Rural / Farming)	Water Status (Adequate / Inadequate / None)	Sanitation Status (Adequate / Inadequate / None)	Water Supply Type (Communal / Controlled / Uncontrolled)	Sanitation Supply Type (Waterborne / On site Wet / On site Dry / Bucket / None)

3. WATER SERVICES ASSET MANAGEMENT

3.1 GENERAL INFORMATION

3.1.1 Asset Management Plan

An updated Asset Management Policy (2025/2026) is in place, which includes the following objectives:

- Specifying Council's practice regarding accounting for assets;
- Ensure consistency in accounting treatment; and
- To assist officials in understanding their legal and managerial responsibilities with regard to key asset functions such as safeguarding of assets; maintaining assets; establishing and maintaining a management, accounting and information system; that accounts for the assets of the municipality; asset valuation principles in accordance with GRAP; establishing and maintaining systems of internal controls over assets; establishing and maintaining asset registers and clarifying responsibilities and accountabilities for the asset management process.

Each Directorate must develop a maintenance strategy that will ensure that the assets of Stellenbosch Municipality are maintained at an adequate operational level or standard by ensuring that all statutory, technical and operational objectives are achieved. This strategy must ensure that tangible assets under the custody and control of the relevant directors are properly maintained and repaired so that their possible maximum useful lives are realised.

Each Directorate is responsible for ensuring:

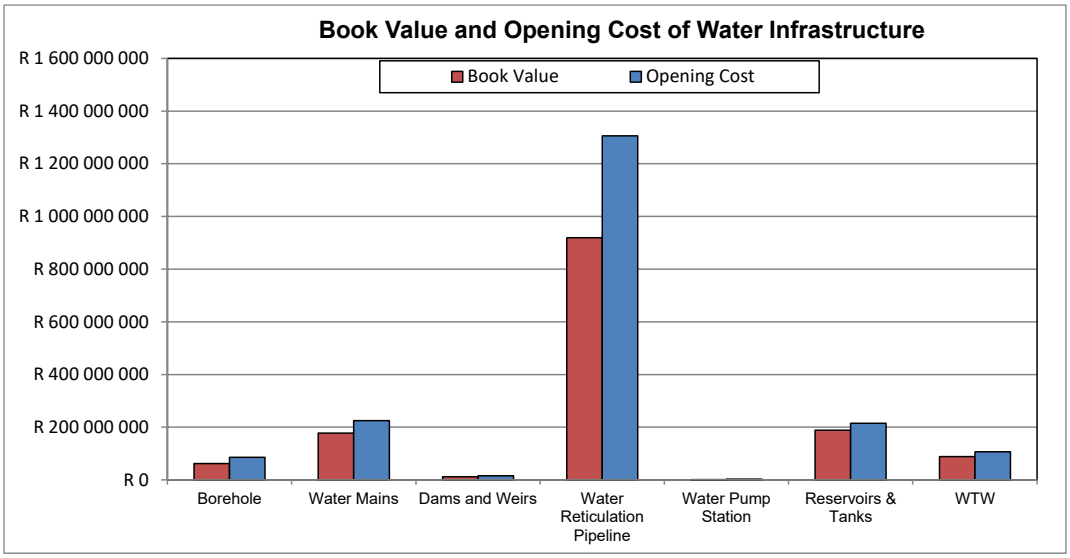
- That all tangible assets under their control are maintained in a good working condition. The directorates must take adequate care that the working environments for the various assets are appropriate and suitable for such types of tangible assets.
- That their assets are not misused or used for personal use or benefit.
- That repair and maintenance costs incurred is reviewed and properly controlled.
- The development of a maintenance program according to their operating budget resources. The program must provide a schedule of the repairs and maintenance to be done. The program must also consist of planned and unplanned repairs and maintenance to be performed.
- The following matrix will assist in distinguishing capital expenditure from maintenance expenditure:

  Capital Expenditure:

  - Acquiring a new asset;
  - Replacing an existing asset;
  - Enhancing an existing asset so that its use is expanded; or
  - Further developing an existing asset so that its original useful life is extended.

  Maintenance:

  - Restoring an asset so that it can continue to be used for its intended purpose; or
  - Maintaining an asset so that it can be used for the period for which it was initially intended.



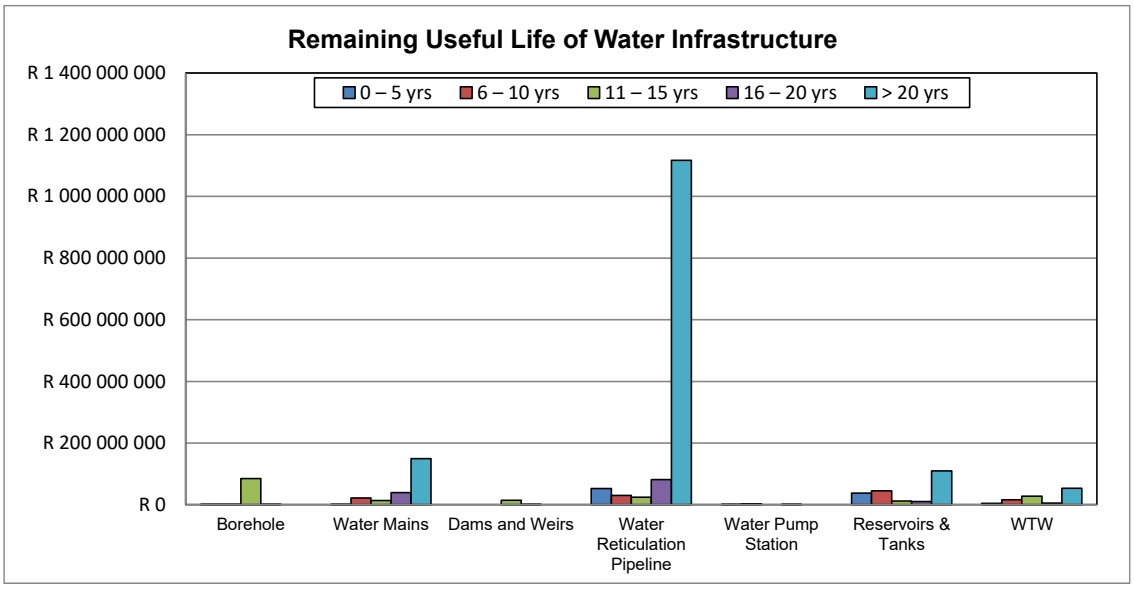
When assets are capitalized a distinction should be made on whether the new asset is purchased to replace an existing asset or whether it is a total new asset that is purchased.

Asset Register: Stellenbosch Municipality updated their current Asset Register after June 2024, in order to include the new assets constructed during the 2023/2024 financial year. The tables that follow give an overview of the current water and sewerage infrastructure included in Stellenbosch Municipality's Asset Register.

Water Infrastructure: The Opening Cost and Book Value of the water infrastructure of Stellenbosch Municipality is summarised in the table below (June 2024).

Table 3.1.1.1: Opening Cost and Book Value of the water infrastructure

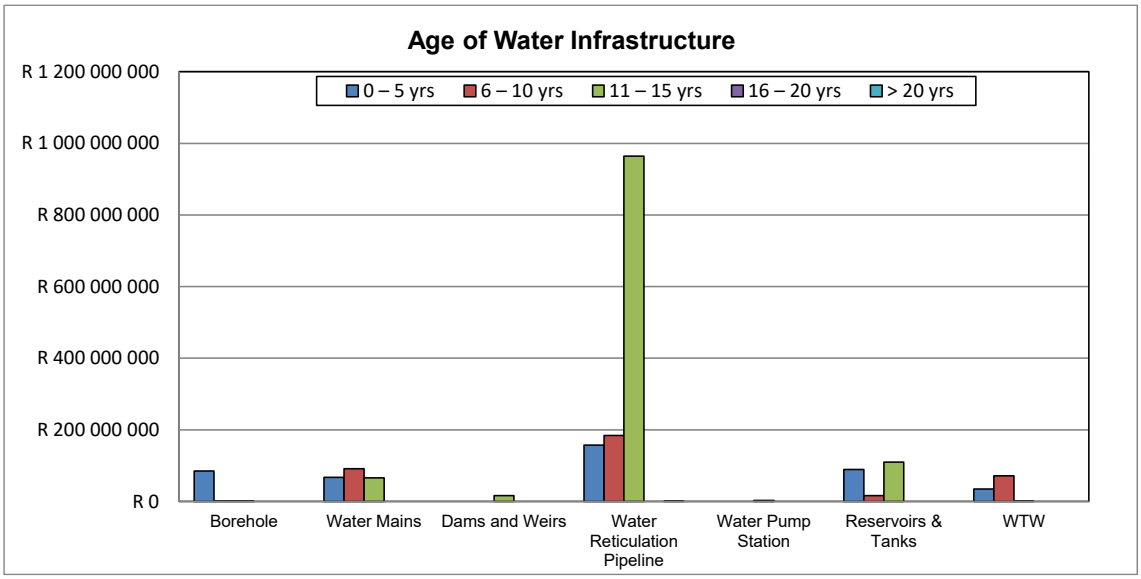
Asset Type	Opening Cost	Book Value	Book Value / Opening Cost
Borehole	R86 227 551	R61 774 220	71.64%
Water Mains	R225 179 114	R178 123 277	79.10%
Dams and Weirs	R16 166 313	R12 038 177	74.46%
Water Reticulation Pipeline	R1 305 772 600	R919 260 997	70.40%
Water Pump Station	R2 905 428	R679 144	23.37%
Reservoirs & Tanks	R214 592 898	R188 575 179	87.88%
WTW	R107 159 498	R88 391 666	82.49%
Total	**R1 958 003 402**	**R1 448 842 660**	**74.00%**



The information in the previous table indicates that 26.00% of the value of the water infrastructure has been consumed.

The following table gives an overview of the remaining useful life by facility type for the water infrastructure (Opening Cost):

Table 3.1.1.2: Overview of the remaining useful life by facility type for the water infrastructure (Opening Cost):



Asset Type	0 – 5 yrs	6 – 10 yrs	11 – 15 yrs	16 – 20 yrs	> 20 yrs
Borehole	R433 575	R477 147	R85 196 336	R120 493	R0

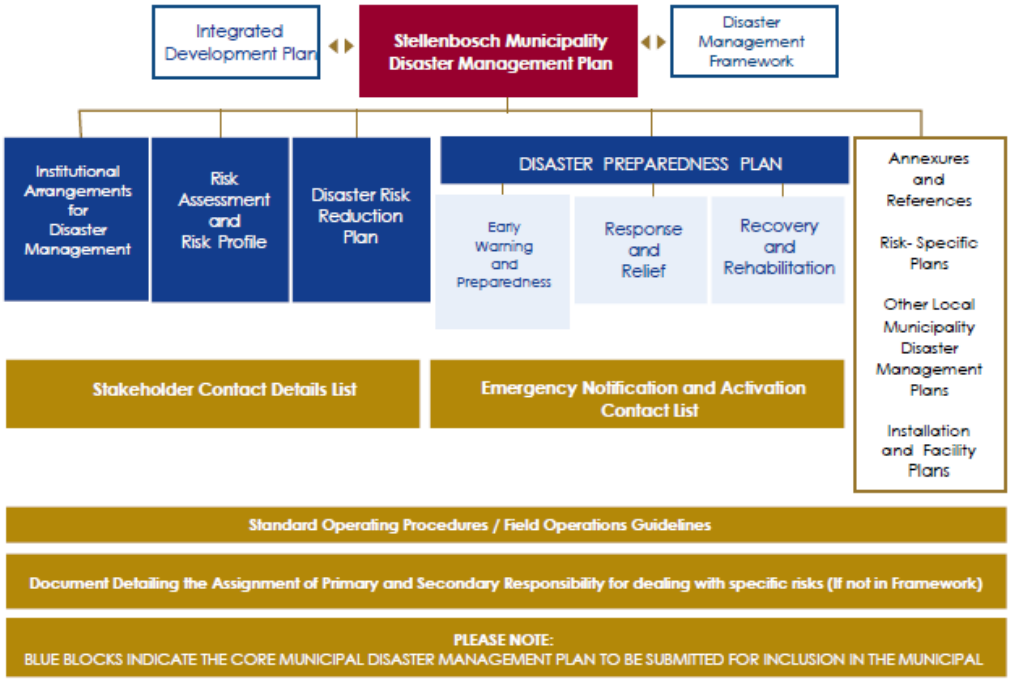
Most of the maintenance work currently carried out on the water and sewerage infrastructure are re-active and it is critical for the Municipality to increase their maintenance budget for water and sewerage infrastructure in order to ensure that the required preventative maintenance work is also carried out. The Asset Management Plan needs to indicate the risks associated with the inadequate refurbishment and maintenance of the various water and sewerage infrastructure.

3.1.2 Disaster Management Plan



The purpose of Stellenbosch Municipality Disaster Management is to ensure coordination of multi-disciplinary and multi-sectorial risk reduction through the integrated institutional capacity for disaster risk management, risk assessment, response and recovery, and implementation of measures aimed at:

- Preventing or reducing the risk of disasters;
- Mitigating the severity or consequences of disasters;
- Emergency preparedness;
- Rapid and effective response to disasters; and
- Post-disaster recovery and rehabilitation.

Stellenbosch Municipality's Disaster Management Plan is reviewed annually and:

- anticipates the types of disasters that are likely to occur in its area of jurisdiction and their possible effect;
- places emphasis on measures that reduce the vulnerability of disaster-prone areas, communities, and households at risk;
- promotes disaster management research;
- identifies and addresses weaknesses in capacity to deal with disasters;
- provides for appropriate prevention and mitigation strategies;
- facilitates a rapid and effective response to disaster; and
- Post-disaster recovery and rehabilitation.

The Municipal Disaster Management Plan consists of the components as indicated in the figure below:

3.1.3 Untreated Effluent Management Plan

All effluent discharged in the urban areas in Stellenbosch Municipality are treated at the existing WWTWs and there is no known untreated effluent discharged to the environment. W_2RAPs were prepared for all the WWTWs and sewer drainage networks.

EXISTING MAIN INFRASTRUCTURE

Water Infrastructure: The table below gives an overview of the existing water infrastructure components, for the various distribution systems, in Stellenbosch Municipality's Management Area.

Table 3.1: Existing water infrastructure

Water Distribution System	Bulk Water Resources and Water Services Provider	Water Treatment Works	Network Bulk and Reticulation		Number of Water PS		Municipal Reservoirs and Towers (Total Storage)
			Bulk (km)	Ret. (km)	RW	TW	
Stellenbosch	Eerste River, WCWSS, CCT	Idas Valley WTW and Paradyskloof WTW	75.865	345.335	2	12	18 (56.950Ml)
Franschhoek	Perdekloof and CCT	Franschhoek WTW and Wemmershoek WTW	21.014	68.015	-	5	8 (10.900 Ml)
Dwars River	CCT	Wemmershoek WTW	14.232	38.042	-	5	6 (9.800 Ml)
Klapmuts	CCT	Wemmershoek WTW	2.779	29.522	-	1	3 (9.400 Ml)
Raithby	CCT	Faure WTW	3.916	5.187	-	1	1 (0.180 Ml)
Faure	CCT	Faure WTW	-	10.640	-	2	-
Polkadraai	CCT	Blackheath WTW	0.983	49.787	-	1	4 (16.736 Ml)
Koelenhof	CCT	Wemmershoek WTW	2.910	47.646	-	3	3 (6.127 Ml)
Muldersvlei	CCT	Wemmershoek WTW	-	7.768	-	-	-
Meerlust	CCT	Wemmershoek WTW	0.824	0.763	-	-	-
Helderberg / Croydon	CCT	Steenbras	-	3.443	-	1	-
Total			**122.523**	**606.148**	**2**	**31**	**43 (110.093 Ml)**

Note: The number of PS in the above table exclude decommissioned and private pump stations

Sewerage Infrastructure: The table below gives an overview of the existing sewerage infrastructure components, for the various sewer drainage systems, in Stellenbosch Municipality's Management Area.

Table 3.2: Existing sewerage infrastructure

Sewer Drainage Systems	Sewer Drainage Network		Number of Municipal Sewer Pump Stations	Waste Water Treatment Works		
	Rising Pipelines	Gravity Pipelines		Name of WWTW	Capacity	
					Hydraulic	Organic
	km	km			Ml/d	Kg COD/day
Stellenbosch	13.791	320.721	10	Stellenbosch	35.000	35 000
Franschhoek	1.813	73.863	1	Wemmershoek	3.600	4 350
Dwars River	3.627	37.376	4	Pniel	4.500	4 500
Klapmuts	1.412	27.189	3	Klapmuts	2.400	2 700
Raithby	-	5.605	-	Raithby	0.150	53
Faure	-	-	-	-	-	-
Polkadraai	-	-	-	-	-	-
Koelenhof	-	-	-	-	-	-
Muldersvlei	-	-	-	-	-	-
Meerlust	-	-	-	-	-	-
Helderberg / Croydon	-	-	-	-	-	-
Total	**20.643**	**464.754**	**18**		**45.650**	**46 603**

Stellenbosch System: The large town of Stellenbosch (including Kayamandi):

Stellenbosch mainly relies on its own water supply from the Eerste River in the Jonkershoek Valley which is treated at the Idas Valley WTW. During summer when shortfalls occur, water is drawn from the WCWSS, obtained from the Theewaterskloof Dam and treated at Paradyskloof WTW.

The existing water and sewerage infrastructure and the proposed master plan items for the Stellenbosch system are included on the following maps, figures and tables.

Table 3.3: List of maps, figures and tables for the existing water and sewerage infrastructure and the proposed master plan items for Stellenbosch

Franschhoek System: Franschhoek, Groendal, La Motte, Wemmershoek and Robertsvlei:

The eastern part of Franschhoek is currently supplied with water from the Municipality's own source in the adjacent mountains, the so-called Perdekloof source. The raw water from the Perdekloof source is treated at the Franschhoek WTW (Package plant). The western part of Franschhoek, La Motte and Wemmershoek are supplied with potable water purchased from the CCT, which is supplied from the Wemmershoek WTW.

The existing water and sewerage infrastructure and the proposed master plan items for the Franschhoek system are included on the following maps, figures and tables.

Table 3.4: List of maps, figures and tables for the existing water and sewerage infrastructure and the proposed master plan items for Franschhoek

Dwars River System: Pniel, Kylemore, Lanquedoc, Johannesdal and Groot Drakenstein:

The Dwars River system obtains potable water from the Wemmershoek pipeline, operated by the CCT and which forms part of the WCWSS. The water is treated at the Wemmershoek WTW.

The existing water and sewerage infrastructure and the proposed master plan items for the Dwars River system are included on the following maps, figures and tables.

Klapmuts System: Klapmuts:

The Klapmuts system obtains potable water from the Wemmershoek pipeline, operated by the CCT and which forms part of the WCWSS. The water is treated at the Wemmershoek WTW.

The existing water and sewerage infrastructure and the proposed master plan items for the Klapmuts system are included on the following maps, figures and tables.

Stellenbosch Municipality's Management Area also includes the following Rural water distribution systems:

- ***Faure / Raithby / Jamestown System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the urban users in Raithby, rural consumers along the pipeline and can also supply water to the De Zalze Estate and Jamestown in Stellenbosch. The system is supplied with bulk potable water by the CCT from their Faure WTW.

  The town of Raithby is serviced with a formal sewer reticulation system consisting of ±5.0km gravity sewer pipelines. The hydraulic capacity of the Raithby WWTW (Activated Sludge) is 0.150 ML/d.

- ***Polkadraai System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the rural consumers in the Polkadraai area along the pipeline. Water can also in emergency conditions be supplied from the Faure system to the Polkadraai system. The system is supplied with bulk potable water by the CCT from their Blackheath WTW.

- ***Koelenhof System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the urban users in the Koelenhof rural area. The system is supplied with bulk potable water by the CCT from their Wemmershoek scheme.

- ***Muldersvlei System***: The system, owned and operated by Stellenbosch Municipality, supplies potable water to the urban users in the Muldersvlei rural are. The system is supplied with bulk potable water by the CCT from their Bloekombos reservoir (supplied from the Wemmershoek pipeline).

- ***Meerlust, Croydon and Helderberg Systems***: These systems supplies potable water to the urban users in these areas. Bulk potable water is supplied by the CCT. The Meerlust area is supplied with bulk water from the Wemmershoek scheme and the Helderberg and Croydon areas with bulk water from the Steenbras dam through the CCT's reticulation network.

EXISTING GROUNDWATER INFRASTRUCTURE (BOREHOLES)

Boreholes were drilled and water treatment package plants constructed as part of the Bulk Water Resources: Drought Intervention Planning Project, June 2019. These WTWs were commissioned, but none are currently in use. The package plants are discussed in the more detail under the Existing Water Treatment Works Infrastructure section.

EXISTING WATER TREATMENT WORKS INFRASTRUCTURE

IDAS VALLEY WTW: The Idas Valley WTW is fed from both the Eerste River Scheme and Idas Valley dams. For the majority of the time, the system feeds the plant directly and any surplus water is sent to the Idas Valley dams. During periods of high demand or low supply, there exists a shortage from the Eerste River Scheme and the shortfall is supplemented by supplying from the dams. The WTW includes the following treatment processes:

- Flow measurement (Inflow)
- Aeration: Three aerators
- Filtration: Seventeen slow sand filters
- Stabilisation: Three lime stone tanks
- Disinfection (Chlorine gas or Chlorine HTH tablets)

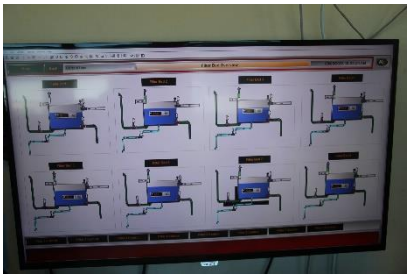
The Process Flow Diagram below provides an overview of the Idas Valley WTW (Planning Report: Upgrade Idas Valley WTW, Zutari, 2022/06/29):

Raw water supply from Eerste River

Aeration: Air Tower No.2

Filtration: Slow sand filters No.1-5

Stabilisation: Three lime stone tanks



Disinfection with HTH chlorine tablets

Chlorination building

PARADYSKLOOF WTW: The Paradyskloof WTW if fed with raw water from the WCWSS, through the Theewaterskloof tunnel. The WTW include the following treatment processes.

- Flow measurement (Inflow)
- Coagulation (Sodium Aluminate and Aluminium Sulphate)
- Flocculation
- Sedimentation: Two parallel rectangular settling tanks
- Filtration: Eight rapid gravity sand filters
- Stabilisation (Pre and Post Lime)
- Disinfection (Chlorine gas and Chlorine HTH tablets)

Scada system for Paradyskloof WTW

Raw water inlet (Supply from WCWSS)

Sedimentation: Settling tanks

Filtration: New filters No.5 - 8

Disinfection: HTH chlorine tablets

Three Aluminium Sulphate storage tanks.

FRANSCHHOEK WTW: The Franschhoek WTW treats water from the Perdekloof source. The western part of Franschhoek, La Motte and Wemmershoek are supplied with potable water from the CCT. The Franschhoek WTW process consists of filtration (Israeli Arkal System), disinfection (Sodium hypochlorite) and stabilisation (Sodium carbonate).

Franschhoek WTW Building (No Access)

Disinfection with HTH chlorine tablets (Estate Lower Reservoir)

De Braak Package Plant: The De Braak Package Plant was commissioned as part of the 2019 Drought Intervention to treat water from the De Braak Borehole. The plant is currently not in use.

De Braak Package Plant

Van Der Stel Package Plant: The Van Der Stel Package Plant was commissioned as part of the 2019 Drought Intervention to treat water from the Van Der Stel Borehole. The plant is currently not in use.

Van Der Stel Package Plant

Wemmershoek Package Plant: The Wemmershoek Package Plant was commissioned as part of the 2019 Drought Intervention to treat water from the Wemmershoek Borehole. The plant is currently not in use.

Wemmershoek Package Plant

3.3 Functionality Observation												
Refurbishment needs (High, Medium, Low, None)	None	Low	Low	High	Low	Medium	Low	Low	Low			
General physical condition (Dysfunctional, Operational, Prime Condition, Vandalised, Destitute)	Prime Condition	Operational	Operational	Decommissioned	Operational	Decommissioned	Prime Condition	Operational	Operational			
Total refurbishment needs %	6.7%	10.0%	10.0%	20.0%	10%	15.0%	10.0%	10%	10%			
Total refurbishment needs cost for next 15 years (RM)	R0.360	R0.233	R0.233	R0.542	R0.504	R0.665	R0.385	R0.325	R0.311			
Refurbishment cost for the next 5 years (RM)	R0.000	R0.077	R0.077	R0.361	R0.168	R0.443	R0.128	R0.108	R0.104			
Refurbishment cost for the next 6 - 10 years (RM)	R0.180	R0.078	R0.078	R0.000	R0.168	R0.000	R0.128	R0.108	R0.104			
Refurbishment cost for the next 11 - 15 years (RM)	R0.180	R0.078	R0.078	R0.181	R0.168	R0.222	R0.129	R0.109	R0.104			
Total replacement needs %	6.7%	10.0%	10.0%	20.0%	10%	15.0%	10.0%	10%	10%			
Total replacement needs cost for next 15 years (RM)	R0.360	R0.233	R0.233	R0.542	R0.504	R0.665	R0.385	R0.325	R0.311			
Replacement cost for the next 5 years (RM)	R0.000	R0.077	R0.077	R0.361	R0.168	R0.443	R0.128	R0.108	R0.104			
Replacement cost for the next 6 - 10 years (RM)	R0.180	R0.078	R0.078	R0.000	R0.168	R0.000	R0.128	R0.108	R0.104			
Replacement cost for the next 11 - 15 years (RM)	R0.180	R0.078	R0.078	R0.181	R0.168	R0.222	R0.129	R0.109	R0.104			
Total new development cost for next 15 years (RM)	R5.875	R6.668	R0.000	R0.000	R0.000	R0.000	R13.861	R0.000	R0.000			
New development cost for the next 5 years (RM)	R1.616	R6.668	R0.000	R0.000	R0.000	R0.000	R2.327	R0.000	R0.000			
New development cost for the next 6 - 10 years (RM)	R4.259	R0.000	R0.000	R0.000	R0.000	R0.000	R8.282	R0.000	R0.000			
New development cost for the next 11 - 15 years (RM)	R0.000	R0.000	R0.000	R0.000	R0.000	R0.000	R3.252	R0.000	R0.000			
% Where of the WSA Self is the Current Owner	100%	100%	100%	100%	100%	100%	100%	100%	100%			
% Where of the WSA Self is the Current Operator	100%	100%	100%	100%	100%	100%	100%	100%	100%			
3.4 Asset Assessment Spectrum												
Total expected lifespan (Short, Medium, Long)	Long	Long	Long	Short	Long	Medium	Long	Long	Long			
Estimated replacement value (RM): CRC	R5.403	R2.329	R2.329	R2.771	R5.039	R4.434	R3.848	R3.251	R3.113			
Already reached Useful Life (Yes/No)	No	No	No	No	No	No	No	No	No			
Annual Operating Cost (RM) (1.0% of CRC)	R0.054	R0.023	R0.023	R0.028	R0.050	R0.044	R0.038	R0.033	R0.031			
Annual Maintenance Cost (RM) (0.5% of CRC)	R0.027	R0.012	R0.012	R0.014	R0.025	R0.022	R0.019	R0.017	R0.016			
Delivery capacity (l/s)	62.7	2.0	Unknown	6.4	60.0	34.0	50.0	10.0	10.0			
Type of Motor	Motorelli (x2), Western Electric (x1)	TEE Q2E FC 100L2D-41 H (x3)	Unknown	WEG (z1), Motorelli (x1)	Western Electric (x2)	Motorelli (x2)	EBERLE (x2)	BMM (x1), Motorelli (x1)	EML (x2)			
Type of Pump	Grundfos Type NK 80-250/270 (x1) KSB WKLn 100/4 (x2)	Unknown	Unknown	KSB Type WKLn 50/5Na (x1), KSB Type WKLn 50/4Na (x1),	KSB Type WKLn 100/6 (x2)	Unknown (x2)	FPS Type SF 80/250 Cl-Cl-MS M&B Normaflow	KSB Type WKLn 50/6 (x2)	Rapid-Allweiler Type L 63-3ST6761/B7/P6 (x2)			
Motor (kW)	75kW (x1), 45kW (x2)	4kW (x3)	Unknown	2.2 kW (x2)	55 kW (x2)	45kW (x2)	74kW (x2)	30 kW (x1), Unknown (x1)	55 kW (x2)
